Abstract

I describe parameterizations of realistic e^\pm - and γ -beam spectra at future linear e^+e^- -colliders. Emphasis is put on simplicity and reproducibility of the parameterizations, supporting reproducible physics simulations. The parameterizations are implemented in a library of distribution functions and event generators.

Program Summary:

- **Title of program:** Circe1 (March 2014)
- **Program obtainable** by anonymous ftp from the host `crunch.ikp.physik.th-darmstadt.de` in the directory `pub/ohl/circe`.
- **Licensing provisions:** Free software under the GNU General Public License.
- **Programming language used:** Fortran77 originally, transferred to Fortran90
- **Number of program lines in distributed program, including test data, etc.:** ≈ 1100 (excluding comments)
- **Computer/Operating System:** Any with a Fortran90 programming environment.
- **Memory required to execute with typical data:** Negligible on the scale of typical applications calling the library.
- **Typical running time:** A small fraction (typically a few percent) of the running time of applications calling the library.
- **Purpose of program:** Provide simple and reproducible, yet realistic, parameterizations of the e^\pm - and γ -beam spectra for linear colliders.
- **Nature of physical problem:** The intricate beam dynamics in the interaction region of a high luminosity linear collider at $\sqrt{s} = 500\text{GeV}$ result in non-trivial energy spectra of the scattering electrons, positrons and photons. Physics simulations require simple and reproducible, yet realistic, parameterizations of these spectra.
- **Method of solution:** Parameterization, curve fitting, Monte Carlo event generation.
- **Keywords:** Event generation, beamstrahlung, linear colliders.

1 Introduction

Despite the enormous quantitative success of the electro-weak standard model up to energies of 200GeV, neither the nature of electro-weak symmetry breaking (EWSB) nor the origin of mass are understood.

From theoretical considerations, we know that clues to the answer of these open questions are hidden in the energy range below $\Lambda_{\text{EWSB}} = 4\pi v \approx 3.1\text{TeV}$. Either we will discover a Higgs particle in this energy range or signatures for a strongly interacting EWSB sector will be found. Experiments at CERN's Large Hadron Collider (LHC) will shed a first light on this regime in the next decade. In the past it has been very fruitful to complement experiments at high energy hadron colliders with experiments at e^+e^- -colliders. The simpler initial state allows more precise measurements with smaller theoretical errors. Lucid expositions of the physics opportunities of high energy e^+e^- colliders with references to the literature can be found in [1].

However, the power emitted by circular storage rings in form of synchrotron radiation scales like $(E/m)^4/R^2$ with the energy and mass of the particle and the radius of the ring. This cost becomes prohibitive after LEP2 and a Linear Collider (LC) has to be built instead.

Unfortunately, the “interesting” hard cross sections scale like $1/s$ with the square of the center of mass energy and a LC will have to operate at extremely high luminosities in excess of $10^{33}\text{cm}^{-2}\text{s}^{-1}$. To achieve such luminosities, the bunches of electrons and positrons have to be very dense. Under these conditions, the electrons undergo acceleration from strong electromagnetic forces from the positron bunch (and vice versa). The resulting synchrotron radiation is called *beamstrahlung* [2] and has a strong effect on the energy spectrum $D(x_1, x_2)$ of the colliding particles. This changes the observable e^+e^- cross sections

$$\frac{d\sigma_0^{e^+e^-}}{d\Omega}(s) \rightarrow \frac{d\sigma^{e^+e^-}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{e^+e^-}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{e^+e^-}}{d\Omega'}(x_1 x_2 s) \quad (1a)$$

and produces luminosity for $e^\pm\gamma$ and $\gamma\gamma$ collisions:

$$\frac{d\sigma^{e^\pm\gamma}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{e^\pm\gamma}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{e^\pm\gamma}}{d\Omega'}(x_1 x_2 s) \quad (1b)$$

$$\frac{d\sigma^{\gamma\gamma}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{\gamma\gamma}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{\gamma\gamma}}{d\Omega'}(x_1 x_2 s) \quad (1c)$$

Therefore, simulations of the physics expected at a LC need to know the spectra of the e^\pm and γ beams precisely.

Microscopic simulations of the beam dynamics are available (e.g. **ABEL**[3], **CAIN**[4] and **Guinea-Pig**[5]) and their predictions are compatible with each other. But they require too much computer time and memory for direct use in physics programs. **Circe1** provides a fast and simple parameterization of the results from these simulations. Furthermore, even if the computational cost of the simulations would be negligible, the input parameters for microscopic simulations are not convenient for particle physics applications. Due to the highly

Table 1: Accelerator parameters for three typical designs at $\sqrt{s} = 500\text{GeV}$ and $\sqrt{s} = 1\text{TeV}$. The resulting distributions are shown in figure 1. The design efforts are currently concentrated on a 350GeV-800GeV LC. Therefore the Tesla parameters for 1TeV are slightly out of date.

non-linear beam dynamics, the optimization of LC designs is a subtle art [6], that is best practiced by the experts. Furthermore, particle physics applications need benchmarking and easily reproducible parameterizations are required for this purpose.

The parameterizations in `Circe1` are not based on approximate solutions (cf. [7]) of the beamstrahlung dynamics. Instead, they provide a “phenomenological” description of the results from full simulations. The parameterizations are as simple as possible while remaining consistent with basic physical principles:

1. *positivity*: the distribution functions $D(x_1, x_2)$ *must not* be negative in the physical region $[0, 1] \times [0, 1]$.
2. *integrability*: the definite integral of the distribution functions over the physical region $[0, 1] \times [0, 1]$ *must* exist, even though the distributions can have singularities.

This paper is organized as follows: I start in section 2 with a discussion of the input for the microscopic simulations. In section 3 I describe the usage of the `Circe1` library and in section 4 I discuss some technical details of the implementation. After discussing the parameterizations available (in internal version 2.2) in section 5, I conclude in section 8.

2 Parameters

The microscopic simulation program `Guinea-Pig` [5] used for the current version of the parameterizations in `Circe1` simulates the passage of electrons through a

bunch of electrons (and vice versa). It takes the following accelerator parameters as input:

E : the energy of the particles before the beam-beam interaction.

$N_{\text{particles}}$: the number of particles per bunch.

$\epsilon_{x,y}$: the normalized horizontal and vertical emittances.

$\beta_{x,y}^*$: the horizontal and vertical beta functions.

$\sigma_{x,y,z}$: the horizontal, vertical and longitudinal beam size. A Gaussian shape is used for the charge distribution in the bunches.

f_{rep} : the repetition rate.

n_{bunch} : the number of bunches per train.

The transversal beam sizes, beta functions and normalized emittances for relativistic particles are related by

$$\beta_{x,y}^* = \frac{\sigma_{x,y}^2 E}{\epsilon_{x,y} m_e} \quad (2)$$

The parameters used in the most recent revision of the parameterizations are collected in tables 1 and 2. The resulting factorized electron/positron and photon distributions in version 1 of the parameterizations are depicted in figures 1 and 2.

The most important purpose of **Circe1** is to map the manifold of possible beam spectra for the NLC to a *finite* number of *reproducible* parameterizations. The distributions

$$D_{p_1 p_2}^{\alpha \nu \rho}(x_1, x_2; \sqrt{s}) \quad (3)$$

provided by **Circe1** are indexed by three integers

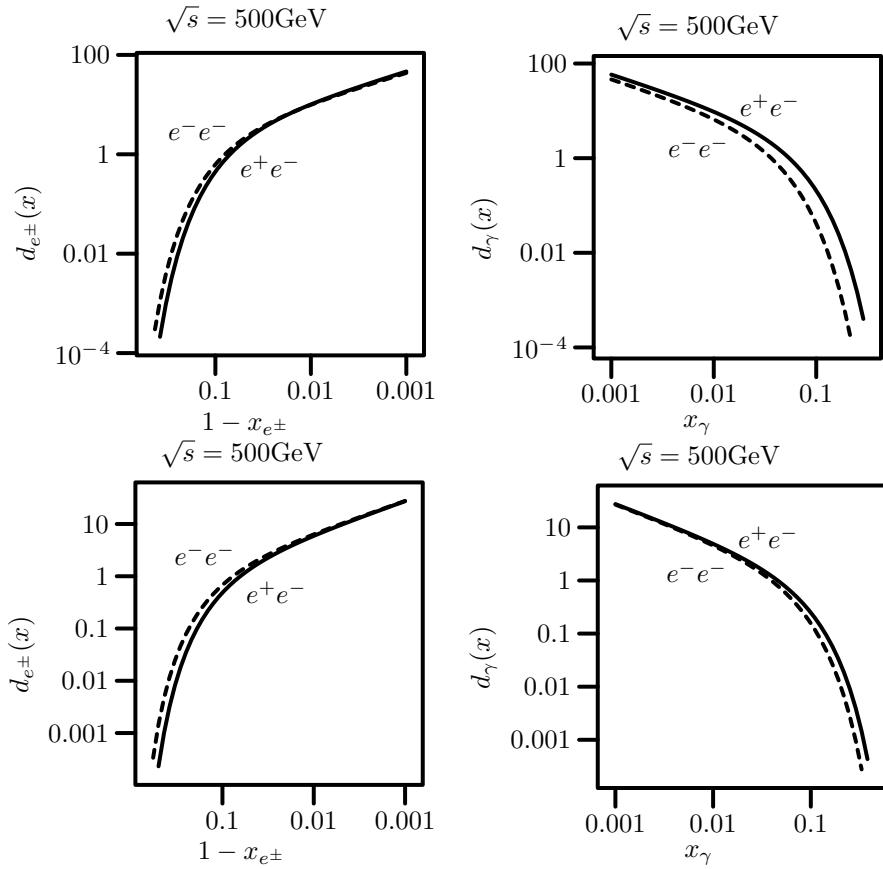

Figure 4: *Experimental:* Version 1, revision 0 of the factorized e^- - and γ -distributions for Tesla- e^-e^- in a doubly logarithmic plot. The accelerator parameters are taken from table 2 and have *not* been endorsed for use in an e^-e^- -machine yet!.

α : the *accelerator design class*: currently there are three options: S-band [9], Tesla [8], X-band [10, 11]. More variety will be added later, in particular the e^-e^- mode and the $e^-\gamma$ and $\gamma\gamma$ laser backscattering modes of these designs.

ν : the *version of the parameterization*: over the years, the form of the parameterizations can change, either because better approximations are found or because new simulation programs become available. All versions will remain available in order to be able to reproduce calculations.

ρ : the *revision date for the parameterization*: a particular parameterization can contain bugs, which will be fixed in subsequent revisions. While only the most recent revision should be used for new calculations, old revisions will remain available in order to be able to reproduce calculations.

The continuous parameter \sqrt{s} in (3) is misleading, because accelerator parameters have been optimized for discrete values of the energy. Therefore the distributions are not available for all values of \sqrt{s} .

The usage of the distributions in application programs is discussed in section 3.1. `Circe1` provides for each of the distributions a non-uniform random variate generator, that generates energy fractions according to the distributions. The usage of these generators is discussed in section 3.2.

3 Usage

3.1 Distributions

A generic interface to all distributions $D_{p_1 p_2}(x_1, x_2)$ is given by the `circe` function

11a *⟨API documentation 11a⟩≡*
`function circe, d, x1, x2`
`real(kind=double) :: circe`
`integer :: p1, p2`
`d = circe (x1, x2, p1, p2)`

12a▷

Uses `circe 31b`.

where the energy fractions are specified by $x_{1,2}$ and the particles $p_{1,2}$ are identified by their standard Monte Carlo codes (we use C1 as a prefix to avoid name clashes when using CIRCE1 inside WHIZARD):[13]

11b *⟨Particle codes 11b⟩≡*
`integer, parameter, public :: C1_ELECTRON = 11`
`integer, parameter, public :: C1_POSITRON = -11`
`integer, parameter, public :: C1_PHOTON = 22`

(30b)

Defines:

`C1_ELECTRON`, used in chunks 21e, 31b, 73b, 80c, and 81a.
`C1_PHOTON`, used in chunks 31b, 73b, 80c, 81a, and 87.
`C1_POSITRON`, used in chunks 22 and 81a.

The distributions can have integrable singularities at the end points, therefore the calling functions *must not* evaluate them at the endpoints 0 and 1. This is usually not a problem, since standard mapping techniques (cf. (10) below) will have to be used to take care of the singularity anyway. Nevertheless, all applications should favor open quadrature formulae (i.e. formulae not involving the endpoints) over closed formulae. The distributions are guaranteed to vanish unless $0 < x_{1,2} < 1$, with two exceptions. Firstly, the value -1 allows to pick up the integral of the continuum contribution:

$$D_{p_1 p_2}(-1, x_2) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_1 D_{p_1 p_2}(x_1, x_2) \quad (4a)$$

$$D_{p_1 p_2}(x_1, -1) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_2 D_{p_1 p_2}(x_1, x_2) \quad (4b)$$

$$D_{p_1 p_2}(-1, -1) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_1 dx_2 D_{p_1 p_2}(x_1, x_2) \quad (4c)$$

The other exception is that the strength of δ -function contributions at the endpoint can be picked up from the value at this endpoint:

$$D_{e^+ e^-}(x_1, x_2) = D_{e^+ e^-}(1, 1)\delta(1 - x_1)\delta(1 - x_2) + \text{smooth and single } \delta \quad (5a)$$

$$D_{e^\pm \gamma}(x_1, x_2) = D_{e^\pm \gamma}(1, x_2)\delta(1 - x_1) + \text{smooth} \quad (5b)$$

$$D_{\gamma e^\pm}(x_1, x_2) = D_{\gamma e^\pm}(x_1, 1)\delta(1 - x_2) + \text{smooth} \quad (5c)$$

The use of these special values is demonstrated in an example in section 3.1.1 below.

The distributions are normalized such that

$$\lim_{\epsilon \rightarrow +0} \int_{-\epsilon}^{1+\epsilon} dx_1 dx_2 D_{e^+ e^-}(x_1, x_2) = 1. \quad (6)$$

and the nominal $e^+ e^-$ -luminosity of the currently active accelerator design can be retrieved from the database with the subroutine **circel**. The value is given in units of

$$\text{fb}^{-1} v^{-1} = 10^{32} \text{cm}^{-2} \text{sec}^{-1} \quad (7)$$

where $v = 10^7 \text{sec} \approx \text{year}/\pi$ is an “effective year” of running with about 30% up-time.

12a *(API documentation 11a)*+≡ ◀11a 12b▶
`real(kind=double) :: lumi
call circel (lumi)`

Uses **circel** 41e.

A particular parameterization is selected by the **circles** function:

12b *(API documentation 11a)*+≡ ◀12a 14▶
`real(kind=double) :: x1m, x2m, roots
integer :: acc, ver, rev, chat
call circles (x1m, x2m, roots, acc, ver, rev, chat)`

Uses **circles** 32a.

The parameter `roots` corresponds to the nominal center of mass energy \sqrt{s}/GeV of the collider. Currently $\sqrt{s} = 350\text{GeV}, 500\text{GeV}, 800\text{GeV}, 1\text{TeV}$ (i.e. 350D0, 500D0, 800D0 and 1000D0) are supported. Application programs can *not* assume that energy values are interpolated. For convenience, e.g. in top threshold scans around 350GeV, a small interval around the supported values will be accepted as synonymous with the central value, but a warning will be printed. Section 5 should be consulted for the discrete values supported by a particular version of the parameterizations. Negative values of `roots` will keep the currently active value for \sqrt{s} .

The parameters `x1m` and `x2m` will set thresholds $x_{1,\min}$ and $x_{2,\min}$ for the event generation in the routines described in section 3.2.

The parameter `acc` selects the accelerator design. Currently the following accelerator codes are recognized:

13a $\langle \text{Accelerator codes } 13a \rangle \equiv$

(17b 30b 35f 92) 13b>

```
integer, parameter :: SBAND = 1
integer, parameter :: TESLA = 2
integer, parameter :: XBAND = 3
integer, parameter :: JLCNLc = 3
integer, parameter :: SBNDEE = 4
integer, parameter :: TESLEE = 5
integer, parameter :: XBNDEE = 6
integer, parameter :: NLCH = 7
integer, parameter :: ILC = 8
integer, parameter :: CLIC = 9
```

Defines:

`CLIC`, used in chunk 35d.

`ILC`, used in chunks 35d, 69–71, and 92.

`JLCNLc`, used in chunks 17b, 18, 35d, 57a, 60–63, 66c, 67c, and 92.

`SBAND`, used in chunks 35d, 40, 44–47, 49b, 50a, 92, 107c, and 108c.

`SBNDEE`, used in chunks 34b, 35d, 41b, 44c, 46–49, and 92.

`TESLA`, used in chunks 32, 35d, 40, 44–47, 49–54, 56, 57, 59d, 60b, 62, 66b, 67b, 91b, 92, 107c, 108c, and 110a.

`TESLEE`, used in chunks 34b, 35d, 48, and 92.

`XBAND`, used in chunks 40, 44–47, 49b, 50a, 57d, 107c, and 108c.

`XBNDEE`, used in chunks 34b, 35d, 48, 49a, 91b, and 92.

The total number of accelerator codes

13b $\langle \text{Accelerator codes } 13a \rangle + \equiv$

(17b 30b 35f 92) <13a

```
integer, parameter :: NACC = 9
```

Defines:

`NACC`, used in chunks 17b, 34, 35, 40, 41, 44–47, 51d, 53e, 56a, 59c, 62a, and 66a.

The `ver` parameter is used to determine the version as follows:

`ver > 0` : a frozen version which is documented in section 5. For example, version 1 is a family of factorized Beta distributions: $D(x_1, x_2) \propto x_1^{a_1}(1 - x_1)^{b_1}x_2^{a_2}(1 - x_2)^{b_2}$.

`ver = 0` : the latest experimental version, which is usually not documented and can change at any time without announcement.

`ver < 0` : keep the currently active version.

The `rev` parameter is used to determine the revision of a version as follows:

`rev > 0` : a frozen revision which is documented in section 5. The integer `rev` is constructed from the date as follows: $\text{rev} = 10^4 \cdot \text{year} + 10^2 \cdot \text{month} + \text{day}$, where the year is greater than 1995. Since Fortran77 ignored whitespace, it could be written like 1996 07 11 for readability. In Fortran90 the white space have been erased. If there is no exact match, the most recent revision before the specified date is chosen.

`rev = 0` : the most recent revision.

`rev < 0` : keep the currently active revision.

Finally, the parameter `chat` controls the “chattiness” of `circe`. If it is 0, only error messages are printed. If it is 1, the parameters in use are printed whenever they change. Higher values of `chat` can produce even more diagnostics.

In addition to the generic interface `circe`, there are specialized functions for particular particle distributions. Obviously

$$D_{e^\pm\gamma}^{\alpha\nu\rho}(x_1, x_2, s) = D_{\gamma e^\pm}^{\alpha\nu\rho}(x_2, x_1, s) \quad (8)$$

and there are three independent functions $D_{e^-e^+}$, $D_{e^-\gamma}$ and $D_{\gamma\gamma}$ for the e^+e^- colliders with reasonable mnemonics:

14 `<API documentation 11a>+≡` ◀ 12b ▶ 20a ▷
`real(kind=double) :: circee, circdeg, circgg`
`d = circee (x1, x2)`
`d = circdeg (x1, x2)`
`d = circgg (x1, x2)`

Uses `circee` 41g, `circdeg` 42c, and `circgg` 43c.

Calling the latter three functions is marginally faster in the current implementation, but this can change in the future.

3.1.1 Example

For clarification, let me give a simple example. Imagine we want to calculate the integrated production cross section

$$\sigma_X(s) = \int dx_1 dx_2 \sigma_{e^+e^- \rightarrow X}(x_1 x_2 s) D_{e^+e^-}(x_1, x_2, s) \quad (9)$$

Since the distributions are singular in the $x_{1,2} \rightarrow 1$ limit, we have to map away this singularity with

$$x \rightarrow t = (1 - x)^{1/\eta} \quad (10a)$$

Therefore

$$\int_0^1 dx f(x) = \int_0^1 dt \eta t^{\eta-1} f(1 - t^\eta) \quad (10b)$$

with η sufficiently large to give the integrand a finite limit at $x \rightarrow 1$. If f diverges like a power $f(x) \propto 1/(1-x)^\beta$, this means $\eta > 1/\beta$.

As a specific example, let us “measure” a one particle s -channel exchange cross section

$$\sigma(s) \propto \frac{1}{s} \quad (11)$$

```

15a <circe1_sample.f90: public 15a>≡ (17b) 15d▷
    public :: sigma
    Uses sigma 15b.

15b <circe1_sample.f90: subroutines 15b>≡ (17b) 15e▷
    function sigma (s)
        real(kind=double) :: s, sigma
        sigma = 1d0 / s
    end function sigma

```

Defines:

sigma, used in chunks 15–18 and 20d.

I will present the example code in a bottom-up fashion, which should be intuitive and is described in some more detail in appendix A. Assuming the existence of a one- and a two-dimensional Gaussian integration function `gauss1` and `gauss2`,¹ we can perform the integral as follows:

```

15c <Gauss integration 15c>≡ (17b)
    s = sigma (1d0) * circee (1d0, 1d0) &
        + gauss1 (d1, 0d0, 1d0, EPS) &
        + gauss1 (d2, 0d0, 1d0, EPS) &
        + gauss2 (d12, 0d0, 1d0, 0d0, 1d0, EPS)
    write (*, 1000) 'delta(sigma) (Gauss) =', (s-1d0)*100d0
    1000 format (1X, A22, 1X, F6.2, '%')

```

Uses `circee` 41g, `d1` 16a, `d12` 15e, `d2` 16c, `gauss1` 89f, `gauss2` 90d, and `sigma` 15b.

Note how the four combinations of continuum and δ -peak are integrated separately, where you have to use three auxiliary functions `d1`, `d2` and `d12`. The continuum contribution, including the Jacobian:

```

15d <circe1_sample.f90: public 15a>+≡ (17b) ▷15a 15f▷
    public :: d12
    Uses d12 15e.

```

```

15e <circe1_sample.f90: subroutines 15b>+≡ (17b) ▷15b 16a▷
    function d12 (t1, t2)
        real(kind=double) :: d12, t1, t2, x1, x2
        <EPS & PWR 16d>
        x1 = 1d0 - t1**PWR
        x2 = 1d0 - t2**PWR
        d12 = PWR*PWR * (t1*t2)**(PWR-1d0) &
            * sigma (x1*x2) * circee (x1, x2)
    end function d12

```

Defines:

d12, used in chunk 15.

Uses `circee` 41g and `sigma` 15b.

the first product of continuum and δ -peak:

```

15f <circe1_sample.f90: public 15a>+≡ (17b) ▷15d 16b▷
    public :: d1
    Uses d1 16a.

```

¹They are provided in the example program `circe1_sample.f90`.

```

16a  <circe1_sample.f90: subroutines 15b>+≡          (17b) ◁ 15e 16c▷
      function d1 (t1)
        real(kind=double) :: t1, x1, d1
        <EPS & PWR 16d>
        x1 = 1d0 - t1**PWR
        d1 = PWR * t1**(PWR-1d0) * sigma (x1) * circee (x1, 1d0)
      end function d1

```

Defines:

d1, used in chunks 15, 41–43, and 74–77.

Uses circee 41g and sigma 15b.

and the second one:

```

16b  <circe1_sample.f90: public 15a>+≡          (17b) ◁ 15f 16g▷
      public :: d2
      Uses d2 16c.

```

```

16c  <circe1_sample.f90: subroutines 15b>+≡          (17b) ◁ 16a 17a▷
      function d2 (t2)
        real(kind=double) :: t2, x2, d2
        <EPS & PWR 16d>
        x2 = 1d0 - t2**PWR
        d2 = PWR * t2**(PWR-1d0) * sigma (x2) * circee (1d0, x2)
      end function d2

```

Defines:

d2, used in chunks 15c, 16b, 41–43, and 74–77.

Uses circee 41g and sigma 15b.

Below you will see that the power of the singularity of the e^+e^- distributions at $x \rightarrow 1$ is $\approx -2/3$. To be on the safe side, we choose the power η in (10) as 5. It is kept in the parameter PWR, while EPS is the desired accuracy of the Gaussian integration:

```

16d  <EPS & PWR 16d>≡          (15–17) 16f▷
      real(kind=double), parameter :: EPS = 1d-6, PWR = 5d0

```

The Gauss integration of the non-singular version converges to the correct value only if the final bin is integrated separately:

```

16e  <Second Gauss integration 16e>≡          (17b)
      s = gauss2 (d12a, 0d0, 1d0-KIREPS, 0d0, 1d0-KIREPS, EPS) &
           + gauss2 (d12a, 0d0, 1d0-KIREPS, 1d0-KIREPS, 1d0, EPS) &
           + gauss2 (d12a, 1d0-KIREPS, 1d0, 0d0, 1d0-KIREPS, EPS) &
           + gauss2 (d12a, 1d0-KIREPS, 1d0, 1d0-KIREPS, 1d0, EPS)
      write (*, 1000) 'delta(sigma) (Gauss) =', (s-1d0)*100d0
      Uses d12a 17a, gauss2 90d, and sigma 15b.

```

```

16f  <EPS & PWR 16d>+≡          (15–17) ◁ 16d
      real(kind=double), parameter :: KIREPS = 1D-6

```

```

16g  <circe1_sample.f90: public 15a>+≡          (17b) ◁ 16b 21a▷
      public :: d12a
      Uses d12a 17a.

```

```

17a  <circe1_sample.f90: subroutines 15b>+≡          (17b) <16c 21b>
      function d12a (x1, x2)
        real(kind=double) :: x1, x2, d12a
        d12a = sigma (x1*x2) * kirkee (x1, x2)
      end function d12a

Defines:
  d12a, used in chunk 16.
Uses kirkee 74b and sigma 15b.

These code fragments can now be used in a main program that loops over
energies and accelerator designs

We almost forgot to declare the variables in the main program

19 ⟨Other variables in sample 19⟩≡ (17b) 20e▷
real(kind=double) :: s

This concludes the integration example. It should have made it obvious how to proceed in a realistic application.

In section 3.2.1 below, I will describe a Monte Carlo method for calculating such integrals efficiently.

3.2 Generators

The function `circe` and its companions are opaque to the user. Since they will in general contain singularities, applications will *not* be able to generate corresponding samples of random numbers efficiently. To fill this gap, four random number generators are provided. The subroutine `girce` will generate particle types $p_{1,2}$ and energy fractions $x_{1,2}$ in one step, according to the selected distribution.² Particle p_1 will be either a positron or a photon and p_2 will be

²The implementation of the flavor selection with non-vanishing thresholds $x_{1,\min}$ and $x_{2,\min}$ is moderately inefficient at the moment. It can be improved by a factor of two.

either an electron or a photon. The energy fractions are guaranteed to be above the currently active thresholds: $x_i \geq x_{i,\min}$. This can be used to cut on soft events—the photon distributions are rather soft—which might not be interesting in most simulations.

20a $\langle API \text{ documentation } 11a \rangle + \equiv$ ◀14 ▶20b
`call girce (x1, x2, p1, p2, rng)`
 Uses `girce 80c`.

The output parameters of `girce` are identical to the input parameters of `circe`, with the exception of `rng`. The latter is a subroutine with a single double precision argument, which will be assigned a uniform deviate from the interval $[0, 1]$ after each call:

20b $\langle API \text{ documentation } 11a \rangle + \equiv$ ◀20a ▶20c
`subroutine rng (r)`
`real(kind=double) :: r`
`r = <uniform deviate on [0, 1] (never defined)>`
`end subroutine rng`

Typically, it will be just a wrapper around the standard random number generator of the application program. For studies with a definite initial state, three generator functions are available.

20c $\langle API \text{ documentation } 11a \rangle + \equiv$ ◀20b
`call gircee (x1, x2, rng)`
`call girceg (x1, x2, rng)`
`call gircgg (x1, x2, rng)`
 Uses `gircee 81e`, `girceg 82c`, and `gircgg 83c`.

3.2.1 Example

Returning to the example from section 3.2.1, I present a concise Monte Carlo algorithm for calculating the same integral:

20d $\langle \text{Monte Carlo integration } 20d \rangle + \equiv$ (17b)
`s = 0d0`
`s2 = 0d0`
`do n = 1, NEVENT`
 `call gircee (x1, x2, random)`
 `w = sigma (x1*x2)`
 `s = s + w`
 `s2 = s2 + w*w`
`end do`
`s = s / dble(NEVENT)`
`s2 = s2 / dble(NEVENT)`
`write (*, 1000) 'delta(sigma) (MC) =', (s-1d0)*100d0`
`write (*, 1000) ' +/-', sqrt((s2-s*s)/dble(NEVENT))*100d0`
 Uses `gircee 81e`, `random 21b`, and `sigma 15b`.

20e $\langle \text{Other variables in sample } 19 \rangle + \equiv$ (17b) ▶19
`real(kind=double) :: w, s2, x1, x2`
`integer, parameter :: NEVENT = 10000`
`integer :: n`

Here is a simple linear congruential random number generator for the sample program. Real applications will use their more sophisticated generators instead.

```
21a <circle1_sample.f90: public 15a>+≡ (17b) ◁16g 89e▷
    public :: random
    Uses random 21b.

21b <circle1_sample.f90: subroutines 15b>+≡ (17b) ◁17a 89f▷
    subroutine random (r)
        real(kind=double), intent(out) :: r
        integer :: m = 259200, a = 7141, c = 54773
        integer, save :: n = 0
        ! data n /0/
        n = mod(n*a+c,m)
        r = real (n, kind=double) / real (m, kind=double)
    end subroutine random
```

Defines:

random, used in chunks 20 and 21.

If the cross section is slowly varying on the range where the $x_{1,2}$ distributions are non-zero, this algorithm is very efficient.

However, if this condition is not met, the explicit form of the parameterizations in section 5 should be consulted and appropriate mapping techniques should be applied. The typical example for this problem is a narrow resonance just below the nominal beam energy.

3.2.2 Event Generators

For Monte Carlo event generators that use the standard /hepevt/ common block [14], the addition of the `Circe1` library is trivial. During the initialization of the event generator, the `circles` subroutine is called to set up `Circe1`'s internal state. For example:

```
21c <Initialize event generator 21c>≡
    call circles (0d0, 0d0, roots, acc, ver, 1996 07 11, 1)
Uses circles 32a.
```

During event generation, before setting up the e^+e^- initial state, the `gircee` subroutine is called with the event generator's random number generator:

```
21d <Event generation 21d>≡ (21e) ◁
    call gircee (x1, x2, random)
```

Uses `gircee` 81e and `random` 21b.

The resulting energy fractions x_1 and x_2 are now available for defining the initial state electron

```
21e <Event generation 21d>+≡ (21d 22) ◁
    isthep(1) = 101
    idhep(1) = C1_ELECTRON
    phep(1,1) = 0d0
    phep(2,1) = 0d0
    phep(3,1) = x1 * ebeam
    phep(4,1) = x1 * ebeam
    phep(5,1) = 0d0
```

Uses `C1_ELECTRON` 11b.

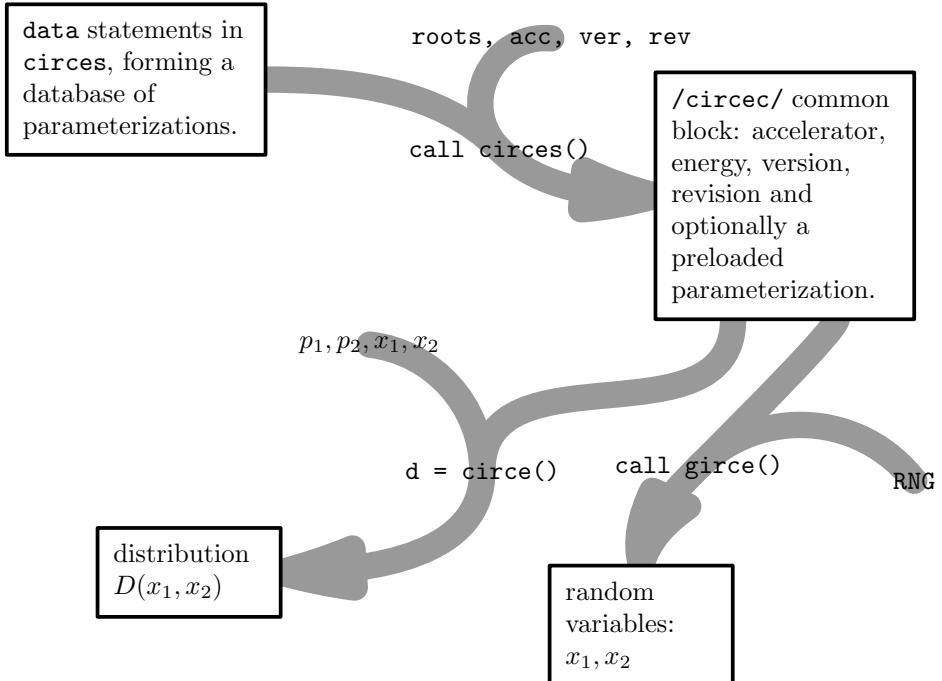

Figure 5: Architecture of `Circe1`: `circles()` selects energy and accelerator and loads the parameterization. The function `circe()` calculates the values of the selected distribution function at the given energy fractions. The subroutine `girce()` generates energy fractions using a specified random number generator in accordance with the selected distribution.

and positron.

```
22 <Event generation 21d>+≡ ◁21e
    isthep(2) = 102
    idhep(2) = C1_POSITRON
    phep(1,2) = 0d0
    phep(2,2) = 0d0
    phep(3,2) = - x2 * ebeam
    phep(4,2) = x2 * ebeam
    phep(5,2) = 0d0
```

Uses C1_POSITRON 11b.

Using `Circe1` with other event generators should be straightforward as well.

4 Technical Notes

The structure of `Circe1` is extremely simple (cf. figure 5) and is mainly a book-keeping excercise. All that needs to be done is to maintain a database of available parameterizations and to evaluate the corresponding functions. The only non trivial algorithms are used for the efficient generation of random deviates.

Table 5: Version 1, revision 1997 04 16 of the beam spectra at 500 GeV. The rows correspond to the luminosity per effective year, the integral over the continuum and the powers in the factorized Beta distributions (12).

I have avoided the use of initialized `common` blocks (i.e. `block data` subroutines), because the Fortran77 standard does not provide a *portable* way of ensuring that `block data` subroutines are actually executed at loading time³. Instead, the `/circcom/` common block is tagged by a “magic number” to check for initialization and its members are filled by the `circses` subroutine when necessary.

A more flexible method would be to replace the `data` statements by reading external files. This option causes portability problems, however, because I would have to make sure that the names of the external files are valid in all file systems of the target operating systems. More significantly, splitting the implementation into several parts forces the user to keep all files up to date. This can be a problem, because Fortran source files and data input files will typically be kept in different parts of the file system.

The option of implementing `Circe1` statelessly, i.e. with pure function calls and without `common` blocks, has been dismissed. While it would have been more straightforward on the side of the library, it would have placed the burden of maintaining state (accelerator, energy, etc.) on the application program, thereby complicating them considerably. Keeping an explicit state in `Circe1` has the additional benefit of allowing to precompute certain internal variables, resulting in a more efficient implementation.

5 Parameterizations

The internal Version 2.2 of `Circe11` supports just one version of the parameterizations. Future versions will provide additional parameterizations.

5.1 Version 1

The first version of the parameterization uses a simple factorized *ansatz*

$$D_{p_1 p_2}^{\alpha 1 \rho}(x_1, x_2, s) = d_{p_1}^{\alpha 1 \rho}(x_1) d_{p_2}^{\alpha 1 \rho}(x_2) \quad (12a)$$

³In Fortran90 the common blocks have been replaced by saved module variables.

Table 10: *Experimental* Version 1, revision 0 of the beam spectra at 1 TeV.

where the distributions are simple Beta distributions:

$$d_{e^\pm}^{\alpha 1 \rho}(x) = a_0^{\alpha \rho} \delta(1-x) + a_1^{\alpha \rho} x^{a_2^{\alpha \rho}} (1-x)^{a_3^{\alpha \rho}} \quad (12b)$$

$$d_\gamma^{\alpha 1 \rho}(x) = a_4^{\alpha \rho} x^{a_5^{\alpha \rho}} (1-x)^{a_6^{\alpha \rho}} \quad (12c)$$

This form of the distributions is motivated by the observation [2] that the e^\pm distributions diverge like a power for $x \rightarrow 1$ and vanish at $x \rightarrow 0$. The behavior of the γ distributions is similar with the borders exchanged.

5.1.1 Fitting

The parameters a_i in (12) have been obtained by a least-square fit of (12) to histograms of simulation results from **Guinea-Pig**. Some care has to be taken when fitting singular distributions to histogrammed data. Obviously equidistant bins are not a good idea, because most bins will be almost empty (cf. figures 1 and 2) and consequently a lot of information will be wasted. One solution to this problem is the use of logarithmic bins. This, however, maps the compact region $[0, 1] \times [0, 1]$ to $[-\infty, 0] \times [-\infty, 0]$, which is inconvenient because of the missing lower bounds.

x_γ^α	$-.7040^{+0.0011}_{-0.0011}$	$-.7039^{+0.0009}_{-0.0009}$	$-.7046^{+0.0009}_{-0.0009}$
$(1 - x_\gamma)^\alpha$	$60.1882^{+0.5882}_{-0.5797}$	$36.1286^{+0.3027}_{-0.2991}$	$19.3944^{+0.1681}_{-0.1660}$

Table 11: *Experimental* Version 1, revision 0 of the beam spectra for TESLEE.

The more appropriate solution is to use two maps

$$\begin{aligned}\phi : [0, 1] &\rightarrow [0, 1] \\ x \mapsto y &= x^{1/\eta}\end{aligned}\tag{13}$$

where $x = x_\gamma$ or $x = 1 - x_{e^\pm}$, and to bin the result equidistantly. If η is chosen properly (cf. (10)), the bin contents will then fall off at the singularity. The fits in tables 5, 6, and 7 have been performed with $\eta = 5$ and the resulting bin contents can be read off from figures 6–9.

Using this procedure for binning the results of the simulations, the popular fitting package MINUIT [15] converges quickly in all cases considered. The resulting parameters are given in tables 5, 6, and 7. Plots of the corresponding distributions have been shown in figures 1 and 2. It is obvious that an *ansatz* like (12) is able to distinguish among the accelerator designs. Thus it can provide a solid basis for physics studies.

In figures 6–9 I give a graphical impression of the quality of the fit, which appears to be as good as one could reasonably expect for a simple *ansatz* like (12). Note that the histograms have non-equidistant bins and that the resulting Jacobians have not been removed. Therefore the bin contents falls off at the singularities, as discussed above.

The errors used for the least-square fit had to be taken from a Monte Carlo (MC) study. *Guinea-Pig* only provides the \sqrt{n} from Poissonian statistics for each bin, but the error accumulation during tracking the particles through phase space is not available. The MC studies shows that the latter error dominates the former, but appears to be reasonably Gaussian. A complete MC study of all parameter sets is computationally expensive (more than a week of processor time on a fast SGI). From an exemplary MC study of a few parameter sets, it appears that the errors can be described reasonably well by rescaling the Poissonian error in each bin with appropriate factors for electrons/positrons and photons and for continuum and delta. This procedure has been adopted.

The $\chi^2/\text{d.o.f.}'s$ of the fits are less than $\mathcal{O}(10)$. The simple *ansatz* (12) is therefore very satisfactory. In fact, trying to improve the ad-hoc factorized Beta distributions by the better motivated approximations from [7] or [16], it turns out [17] that (12) provides a significantly better fit of the results of the simulations. The price to pay is that the parameters in (12) have no direct

physical interpretation.

5.1.2 Generators

For this version of the parameterizations we need a fast generator of Beta distributions:

$$\beta^{a,b}(x) \propto x^{a-1}(1-x)^{b-1} \quad (14)$$

This problem has been studied extensively and we can use a published algorithm [18] that is guaranteed to be very fast for all a, b such that $0 < a \leq 1 \leq b$, which turns out to be always the case (cf. tables 5, 6, and 7).

5.2 Future Versions

There are two ways in which the parameterizations can be improved:

more complicated functions: the factorized fits can only be improved marginally by adding more positive semi-definite factors to (12). More improvement is possible by using sums of functions, but in this case, the best fits violate the positivity requirement and have to be discarded.

correlations: the parameterization in section 5.1 is factorized. While this is a good approximation, the simulations nevertheless show correlations among x_1 and x_2 . These correlations can be included in a future version.

interpolation: the parameterization in section 5.1 is based on fitting the simulation results by simple functions. Again, this appears to be a good approximation. But such fits can not uncover any fine structure of the distributions. Therefore it will be worthwhile to study interpolations of the simulation results in the future. A proper interpolation of results with statistical errors is however far from trivial: straightforward polynomial or spline interpolations will be oscillatory and violate the positivity requirement. Smoothing algorithms have to be investigated in depth before such a parameterization can be released.

other simulations: besides [5], other simulation codes are invited to contribute their results for inclusion in the `Circe1` library.

6 Implementation of `circe1`

```

6.2 Distributions

6.2.1 Version 1

We start with a convenience function which dispatches over the valid particle types. The hardest part is of course to avoid typos in such trivial functions ...

31a *(Public subroutines 31a)≡* (30b) 31c▷
 public :: **circe**
 Uses **circe** 31b.

31b *(Module subroutines 31b)≡* (30b) 32a▷
 function **circe** (x1, x2, p1, p2)
 real(kind=double) :: x1, x2
 integer :: p1, p2
 real(kind=double) :: **circe**
(Initialization check 32g)
circe = -1.0
 if (abs(p1) .eq. C1_ELECTRON) then
 if (abs(p2) .eq. C1_ELECTRON) then
circe = **circee** (x1, x2)
 else if (p2 .eq. C1_PHOTON) then
circe = **circg** (x1, x2)
 end if
 else if (p1 .eq. C1_PHOTON) then
 if (abs(p2) .eq. C1_ELECTRON) then
circe = **circg** (x2, x1)
 else if (p2 .eq. C1_PHOTON) then
circe = **circgg** (x1, x2)
 end if
 end if
end function **circe**

Defines:

circe, used in chunks 11a, 30a, 31a, 87, 93b, 110b, and 115d.
 Uses C1_ELECTRON 11b, C1_PHOTON 11b, **circee** 41g, **circg** 42c, and **circgg** 43c.

31c *(Public subroutines 31a)+≡* (30b) <31a 32b>
 public :: **circes**
 Uses **circes** 32a.

```

32a  ⟨Module subroutines 31b⟩+≡                               (30b) ◁31b 35f▷
      subroutine circles (xx1m, xx2m, xroots, xacc, xver, xrev, xchat)
          real(kind=double) :: xx1m, xx2m, xroots
          integer :: xacc, xver, xrev, xchat
      ⟨Local variables for circles 33b⟩
      ⟨Initializations for circles 35b⟩
          if (circe1_params%magic .ne. 19040616) then
              circe1_params%magic = 19040616
          ⟨Initialize circe1 parameters 32h⟩
          end if
      ⟨Update circe1 parameters 33a⟩
      ⟨formats for circles 38d⟩
      end subroutine circles
Defines:
circles, used in chunks 12b, 17b, 21c, 31c, 32g, 35f, 87, and 91b.

32b  ⟨Public subroutines 31a⟩+≡                               (30b) ◁31c 35e▷
      public :: circe1_params_t

32c  ⟨Declaration: circe1 parameters 32c⟩≡                  (30b)
      type :: circe1_params_t
      ⟨8-byte aligned part of circe1 parameters 32d⟩
      ⟨4-byte aligned part of circe1 parameters 32e⟩
      end type circe1_params_t

32d  ⟨8-byte aligned part of circe1 parameters 32d⟩≡          (32c) 40a▷

6.4 Non-Singular Distributions

73a *<Public subroutines 31a>*+≡
 public :: kirke

(30b) ▷ 43b 74a▷

Uses kirke 73b.

73b *<Module subroutines 31b>*+≡
 function kirke (x1, x2, p1, p2)
 real(kind=double) :: x1, x2
 real(kind=double) :: kirke
 integer :: p1, p2
<Initialization check 32g>
 kirke = -1.0
 if (abs(p1) .eq. C1_ELECTRON) then
 if (abs(p2) .eq. C1_ELECTRON) then
 kirke = kirkee (x1, x2)
 else if (p2 .eq. C1_PHOTON) then
 kirke = kirkeg (x1, x2)
 end if
 else if (p1 .eq. C1_PHOTON) then
 if (abs(p2) .eq. C1_ELECTRON) then
 kirke = kirkeg (x2, x1)

(30b) ▷ 71f 74b▷

```

        else if (p2 .eq. C1_PHOTON) then
            kirke = kirkgg (x1, x2)
        end if
    endif
end function kirke

```

Defines:

kirke, used in chunk 73a.
Uses C1_ELECTRON 11b, C1_PHOTON 11b, kirkee 74b, kirkeg 76c, and kirkgg 77a.

74a \langle Public subroutines 31a $\rangle + \equiv$ (30b) \triangleleft 73a 76b \triangleright
 public :: kirkee

Uses kirkee 74b.

74b \langle Module subroutines 31b $\rangle + \equiv$ (30b) \triangleleft 73b 76c \triangleright
 function kirkee (x1, x2)
 real(kind=double) :: x1, x2
 real(kind=double) :: kirkee
 real(kind=double) :: d1, d2
(Initialization check 32g)
 kirkee = -1.0
 if ((circe1_params%ver .eq. 1) .or. (circe1_params%ver .eq. 0)) then
(Calculate version 1 of the non-singular e^+e^- distribution 75c)
(else handle invalid versions 37b)
 end function kirkee

Defines:

kirkee, used in chunks 17a and 73–75.
Uses d1 16a and d2 16c.

74c \langle 8-byte aligned part of circe1 parameters 32d $\rangle + \equiv$ (32c) \triangleleft 40a
 real(kind=double) :: elect0, gamma0

$$\int_{1-\epsilon}^{1^+} dx d_{e^\pm}^{\alpha_1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{1-\epsilon}^{1^-} dx x^{a_2^{\alpha\rho}} (1-x)^{a_3^{\alpha\rho}} \quad (18)$$

Approximately

$$\int_{1-\epsilon}^{1^+} dx d_{e^\pm}^{\alpha_1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{1-\epsilon}^{1^-} dx (1-x)^{a_3^{\alpha\rho}} = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{0^+}^{\epsilon} d\xi \xi^{a_3^{\alpha\rho}} \quad (19)$$

and therefore

$$\int_{1-\epsilon}^{1^+} dx d_{e^\pm}^{\alpha_1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \frac{1 - \epsilon^{a_3^{\alpha\rho}+1}}{a_3^{\alpha\rho} + 1} \quad (20)$$

This simple approximation is good enough

74d \langle Update circe1 parameters 33a $\rangle + \equiv$ (32a) \triangleleft 36d
 circe1_params%elect0 = circe1_params%a1(0) + circe1_params%a1(1) * KIREPS** (circe1_params%a1(2) / KIREPS)

```

6.5 Generators

6.5.1 Random-Number Generator

The generator routines do not fix or provide a random-number generator. The caller has to provide an implementation which is transferred to the subroutines in one of two possible forms:

1. as a subroutine which generates a single random number, working on an implicit external state
2. as an object with a method that generates a single random number, working on an internal state

These snippets should be used by the procedures that use a RNG:

78a $\langle \text{RNG dummy arguments } 78a \rangle \equiv$ (79–84)
`rng, rng_obj`

78b $\langle \text{RNG dummy declarations } 78b \rangle \equiv$ (79–84)
`procedure(rng_proc), optional :: rng
 class(rng_type), intent(inout), optional :: rng_obj`
 Uses `rng_proc` 79c and `rng_type` 79e.

79a $\langle RNG: generate u \rangle \equiv$ (81 82 84b 85a)
 call **rng_call** (u, $\langle RNG \text{ dummy arguments } \rangle$)
 Uses **rng_call** 79b.

79b $\langle \text{Module subroutines } \rangle + \equiv$ (30b) $\triangleleft 77a \ 80c \triangleright$
 subroutine **rng_call** (u, $\langle RNG \text{ dummy arguments } \rangle$)
 real(kind=double), intent(out) :: u
 (RNG dummy declarations 78b)
 if (present (rng)) then
 call rng (u)
 else if (present (rng_obj)) then
 call rng_obj%generate (u)
 else
 call **circem** ('PANIC', &
 'generator requires either rng or rng_obj argument')
 end if
 end subroutine **rng_call**

Defines:

rng_call, used in chunk 79a.
 Uses **circem** 86e.

This defines the procedure version of the RNG, corresponding to the traditional F77 **external** interface. The abstract interface enables the compiler to check conformance.

79c $\langle \text{Abstract interfaces } \rangle \equiv$ (30b) 80a \triangleright
 abstract interface
 subroutine **rng_proc** (u)
 import :: double
 real(kind=double), intent(out) :: u
 end subroutine **rng_proc**
 end interface

Defines:

rng_proc, used in chunk 78b.

Here we define the object version of the RNG. It has to implement a **generate** method which parallels the **rng_proc** procedure above.

79d $\langle \text{Public types } \rangle \equiv$ (30b)
 public :: **rng_type**
 Uses **rng_type** 79e.

79e $\langle \text{Abstract types } \rangle \equiv$ (30b)
 type, abstract :: **rng_type**
 contains
 procedure(**rng_generate**), deferred :: generate
 end type **rng_type**

Defines:

rng_type, used in chunks 78–80.
 Uses **rng_generate** 80a.

```

The flavor selection is incorrect, because the relative weights depend on the
minimum energy fractions. We resort to a moderately inefficient kludge, because
we don't have the distribution functions available yet. We'll have to implement
incomplete Beta functions and other horrible things for this. Fortunately, the
efficiency can not drop below the relative contribution of  $e^+e^-$ .

6.5.3 Version 2

Retired.

6.5.4 Version 3 and 4

Identical to version 1.

6.6 Utilities

For version 1 of the parametrizations we need a fast generator of β -distributions:

$$\beta_{x_{\min}, x_{\max}}^{a,b}(x) = x^{a-1}(1-x)^{b-1} \cdot \frac{\Theta(x_{\max} - x)\Theta(x - x_{\min})}{I(x_{\min}, a, b) - I(x_{\max}, a, b)} \quad (23)$$

with the *incomplete Beta-function* I :

$$I(x, a, b) = \int_x^1 d\xi \xi^{a-1}(1-\xi)^{b-1} \quad (24)$$

$$B(a, b) = I(0, a, b) \quad (25)$$

This problem has been studied extensively [?] and we can use an algorithm [18] that is very fast for $0 < a \leq 1 \leq b$, which turns out to be the case in our application.

84a *⟨Public subroutines 31a⟩+≡* (30b) ◀83a 86d▶
 public :: **girceb**
 Uses **girceb** 84b.

84b *⟨Module subroutines 31b⟩+≡* (30b) ◀83b 86e▶
 function **girceb** (xmin, xmax, a, b, *⟨RNG dummy arguments 78a⟩*)
 real(kind=double) :: xmin, xmax, a, b
 real(kind=double) :: **girceb**
⟨RNG dummy declarations 78b⟩
 real(kind=double) :: t, p, u, umin, umax, x, w
⟨Check a and b 84c⟩
⟨Set up girceb parameters 84d⟩
 do
⟨Generate a trial x and calculate its weight w 85a⟩
⟨RNG: generate u 79a⟩
 if (w .gt. u) exit
 end do
girceb = x
end function **girceb**

Defines:

girceb, used in chunks 82–84 and 86b.

In fact, this algorithm works for $0 < a \leq 1 \leq b$ only:

84c *⟨Check a and b 84c⟩≡* (84b)
 if ((a .ge. 1d0) .or. (b .le. 1d0)) then
girceb = -1d0
 call **circem** ('ERROR', 'beta-distribution expects a<1<b')
 return
 end if

Uses **circem** 86e and **girceb** 84b.

The trick is to split the interval $[0, 1]$ into two parts $[0, t]$ and $[t, 1]$. In these intervals we obviously have

$$x^{a-1}(1-x)^{b-1} \leq \begin{cases} x^{a-1} & \text{for } x \leq t \\ t^{a-1}(1-x)^{b-1} & \text{for } x \geq t \end{cases} \quad (26)$$

because we have assumed that $0 < a < 1 < b$. The integrals of the two dominating distributions are t^a/a and $t^{a-1}(1-t)^b/b$ respectively and therefore the probability for picking a random number from the first interval is

$$P(x \leq t) = \frac{bt}{bt + a(1-t)^b} \quad (27)$$

We postpone the discussion of the choice of t until later:

84d *⟨Set up girceb parameters 84d⟩≡* (84b) 85b▶
⟨Set up best value for t 86c⟩
 p = b*t / (b*t + a * (1d0 - t)**b)

The dominating distributions can be generated by simple mappings

$$\phi : [0, 1] \rightarrow [0, 1] \quad (28)$$

$$u \mapsto \begin{cases} t \left(\frac{u}{p} \right)^{\frac{1}{a}} & < t \text{ for } u < p \\ t & = t \text{ for } u = p \\ 1 - (1 - t) \left(\frac{1-u}{1-p} \right)^{\frac{1}{b}} & > t \text{ for } u > p \end{cases} \quad (29)$$

The beauty of the algorithm is that we can use a single uniform deviate u for both intervals:

85a *⟨Generate a trial x and calculate its weight w 85a⟩≡* (84b)
⟨RNG: generate u 79a⟩
 $u = \text{umin} + (\text{umax} - \text{umin}) * u$
 $\text{if } (u \leq p) \text{ then}$
 $x = t * (u/p)^{(1d0/a)}$
 $w = (1d0 - x)^{(b-1d0)}$
 else
 $x = 1d0 - (1d0 - t) * ((1d0 - u)/(1d0 - p))^{(1d0/b)}$
 $w = (x/t)^{(a-1d0)}$
 end if

The weights that are derived by dividing the distribution by the dominating distributions are already normalized correctly:

$$w : [0, 1] \rightarrow [0, 1] \quad (30)$$

$$x \mapsto \begin{cases} (1-x)^{b-1} & \in [(1-t)^{b-1}, 1] \text{ for } x \leq t \\ \left(\frac{x}{t}\right)^{a-1} & \in [t^{1-a}, 1] \text{ for } x \geq t \end{cases} \quad (31)$$

To derive $u_{\min,\max}$ from $x_{\min,\max}$ we can use ϕ^{-1} :

$$\phi^{-1} : [0, 1] \rightarrow [0, 1] \quad (32)$$

$$x \mapsto \begin{cases} p \left(\frac{x}{t} \right)^a & < p \text{ for } x < t \\ p & = p \text{ for } x = t \\ 1 - (1 - p) \left(\frac{1-x}{1-t} \right)^b & > p \text{ for } x > t \end{cases} \quad (33)$$

We start with u_{\min} . For efficiency, we handle the most common cases (small x_{\min}) first:

85b *⟨Set up girceb parameters 84d⟩+≡* (84b) *◀84d 86a▶*
 $\text{if } (xmin \leq 0d0) \text{ then}$
 $\text{umin} = 0d0$
 $\text{elseif } (xmin < t) \text{ then}$
 $\text{umin} = p * (xmin/t)^{a}$
 $\text{elseif } (xmin \text{ eq. } t) \text{ then}$
 $\text{umin} = p$
 $\text{elseif } (xmin < 1d0) \text{ then}$
 $\text{umin} = 1d0 - (1d0 - p) * ((1d0 - xmin)/(1d0 - t))^{b}$
 else
 $\text{umin} = 1d0$
 endif

Same procedure for u_{\max} ; again, handle the most common cases (large x_{\max}) first:

```
86a  ⟨Set up girceb parameters 84d⟩+≡                                (84b) ▷85b 86b▷
      if (xmax .ge. 1d0) then
          umax = 1d0
      elseif (xmax .gt. t) then
          umax = 1d0 - (1d0 - p) * ((1d0 - xmax)/(1d0 - t))**b
      elseif (xmax .eq. t) then
          umax = p
      elseif (xmax .gt. 0d0) then
          umax = p * (xmax/t)**a
      else
          umax = 0d0
      endif
```

Check for absurd cases.

```
86b  ⟨Set up girceb parameters 84d⟩+≡                                (84b) ▷86a
      if (umax .lt. umin) then
          girceb = -1d0
          return
      endif
```

Uses `girceb` 84b.

It remains to choose the best value for t . The rejection efficiency ϵ of the algorithm is given by the ratio of the dominating distribution and the distribution

$$\frac{1}{\epsilon(t)} = \frac{B(a, b)}{ab} (bt^a + at^{a-1}(1-t)^b). \quad (34)$$

It is maximized for

$$bt - bt(1-t)^{b-1} + (a-1)(1-t)^b = 0 \quad (35)$$

This equation has a solution which can be determined numerically. While this determination is far too expensive compared to a moderate loss in efficiency, we could perform it once after fitting the coefficients a, b . Nevertheless, it has been shown,[18] that

$$t = \frac{1-a}{b+1-a} \quad (36)$$

results in non-vanishing efficiency for all values $1 < a \leq 1 \leq b$. Empirically we have found efficiencies of at least 80% for this choice, which is enough for our needs.

```
86c  ⟨Set up best value for t 86c⟩+≡                                (84d)
      t = (1d0 - a) / (b + 1d0 - a)
```

```
86d  ⟨Public subroutines 31a⟩+≡                                (30b) ▷84a
      public :: circem
      Uses circem 86e.
```

```
86e  ⟨Module subroutines 31b⟩+≡                                (30b) ▷84b
      subroutine circem (errlvl, errmsg)
          character(len=*) :: errlvl, errmsg
          integer, save :: errcnt = 0
```

```

end do
end program circe1_plot

```

6.7.2 Library functions

If Fortran77 only had first class functions, then the following cruft would not be necessary. OK, here's the outline of the adaptive Gauss integration routine from CERNLIB:

```

88 <Part one of Gaussian integration 88>≡ (89 90)
      real(kind=double) :: f, a, b, eps
      external f
      real(kind=double), parameter :: Z1 = 1, HF = Z1/2, CST = 5*Z1/1000
      integer :: i
      real(kind=double) :: h, const, aa, bb, c1, c2, s8, s16, u
      <Gaussian weights 91a>
      h = 0
      if (b .eq. a) go to 99
      const = CST / dabs(b-a)
      bb = a
      1 continue
          aa = bb
          bb = b
      2 continue
          c1 = HF*(bb+aa)
          c2 = HF*(bb-aa)
          s8 = 0

```

```

do i = 1, 4
u = c2*x(i)

```

Here are now the first two function calls that we have to fill in later in various ways:

89a *<Function call stub 89a>* \equiv 89c \triangleright
 $s8 = s8 + w(i) * (f(c1+u) + f(c1-u))$

Continuing

89b *<Part two of Gaussian integration 89b>* \equiv (89 90)
end do
s16 = 0
do i = 5, 12
u = c2*x(i)

And here are the other two function calls:

89c *<Function call stub 89a>* \equiv 89a
 $s16 = s16 + w(i) * (f(c1+u) + f(c1-u))$

Terminating:

89d *<Part three of Gaussian integration 89d>* \equiv (89 90)
end do
s16 = c2*s16
if (dabs(s16-c2*s8) .le. eps*(1+dabs(s16))) then
h = h + s16
if (bb .ne. b) go to 1
else
bb = c1
if (1 + const*dabs(c2) .ne. 1) go to 2
h = 0
print *, 'gauss: too high accuracy required'
go to 99
end if
99 continue

This one is still reasonably straightforward

$$\text{gauss1} : (f, a, b) \mapsto \int_a^b dx f(x) \quad (37)$$

89e *<circe1_sample.f90: public 15a>* \equiv (17b) \triangleleft 21a 90a \triangleright
public :: gauss1

Uses gauss1 89f.

89f *<circe1_sample.f90: subroutines 15b>* \equiv (17b) \triangleleft 21b 90b \triangleright
function gauss1 (f, a, b, eps)
real(kind=double) :: gauss1
<Part one of Gaussian integration 88>
s8 = s8 + w(i) * (f(c1+u) + f(c1-u))
<Part two of Gaussian integration 89b>
s16 = s16 + w(i) * (f(c1+u) + f(c1-u))
<Part three of Gaussian integration 89d>
gauss1 = h
end function gauss1

Defines:

gauss1, used in chunks 15c and 89e.

But this almost identical repeat

$$\text{gaussx} : (f, a, b) \mapsto \left(y \mapsto \int_a^b dx f(y, x) \right) \quad (38)$$

would not be necessary in a modern programming language with currying:

90a `<circe1_sample.f90: public 15a>+≡` (17b) ▷89e 90c▷
 `public :: gaussx`
 Uses gaussx 90b.

90b `<circe1_sample.f90: subroutines 15b>+≡` (17b) ▷89f 90d▷
 `function gaussx (f, y, a, b, eps)`
 `real(kind=double) :: y`
 `real(kind=double) :: gaussx`
 (Part one of Gaussian integration 88)
 `s8 = s8 + w(i) * (f (y, c1+u) + f (y, c1-u))`
 (Part two of Gaussian integration 89b)
 `s16 = s16 + w(i) * (f (y, c1+u) + f (y, c1-u))`
 (Part three of Gaussian integration 89d)
 `gaussx = h`
 `end function gaussx`

Defines:

gaussx, used in chunk 90.

Fortunately, this is the last one we need

$$\text{gauss2} : (f, a, b, a_1, b_1) \mapsto \int_a^b dx \int_{a_1}^{b_1} dy f(x, y) \\ = \text{gauss1}(\text{gaussx}(f, a, b), a_1, b_1) \quad (39)$$

90c `<circe1_sample.f90: public 15a>+≡` (17b) ▷90a
 `public :: gauss2`
 Uses gauss2 90d.

90d `<circe1_sample.f90: subroutines 15b>+≡` (17b) ▷90b
 `function gauss2 (f, a, b, a1, b1, eps)`
 `real(kind=double) :: a1, b1`
 `real(kind=double) :: gauss2`
 (Part one of Gaussian integration 88)
 `s8 = s8 + w(i) * (gaussx (f, c1+u, a1, b1, eps) &`
 `+ gaussx (f, c1-u, a1, b1, eps))`
 (Part two of Gaussian integration 89b)
 `s16 = s16 + w(i) * (gaussx (f, c1+u, a1, b1, eps) &`
 `+ gaussx (f, c1-u, a1, b1, eps))`
 (Part three of Gaussian integration 89d)
 `gauss2 = h`
 `end function gauss2`

Defines:

 gauss2, used in chunks 15c, 16e, and 90c.

Uses gaussx 90b.

```

Guinea-Pig does not provide the full error. A Monte Carlo study shows that it is a reasonable approximation to rescale the bin error by suitable factors. These factors are different for each distribution and the factors for the  $\delta$ -pieces are bigger than those for the continuum parts. The follows factors are for the `slow` parameter set.

```

Uses **NPARAM** 94a.

The average elektron energy in the continuum can be calculated analytically:

$$\langle E_{e^\pm} \rangle_{\text{cont}} = E_{\text{beam}} \langle x_{e^\pm} \rangle_{\text{cont}} = E_{\text{beam}} \frac{\int dx x^{a_2} (1-x)^{a_3} x}{B(a_2, a_3)} \\ = E_{\text{beam}} \frac{B(a_2 + 1, a_3)}{B(a_2, a_3)} = E_{\text{beam}} \frac{a_2 + 1}{a_2 + a_3 + 2} \quad (40)$$

```

101c <Write output (v1) 101a>+≡ (95b) ▷101a 101d▷
 delta = 1d0 - a1(1) * beta(a1(2)+1d0,a1(3)+1d0)
 print *, '< x_e > = ', delta + (1d0-delta)*(a1(2)+1d0)/(a1(2)+a1(3)+2d0)

```

Uses **beta** 105.

similarly:

$$\langle E_\gamma \rangle = E_{\text{beam}} \frac{a_5 + 1}{a_5 + a_6 + 2} \quad (41)$$

```

101d <Write output (v1) 101a>+≡ (95b) ▷101c 101e▷
 print *, '< x_g > = ', (a1(5)+1d0)/(a1(5)+a1(6)+2d0)

```

Count the degrees of freedom in **ndof**:

```

101e <Write output (v1) 101a>+≡ (95b) ▷101d 102b▷
 ndof = 0
 do i = 0, ndata+1
 do j = 0, ndata+1
 if (dfee(i,j) .gt. 0d0) ndof = ndof + 1
 if (dfeg(i,j) .gt. 0d0) ndof = ndof + 1
 if (dfge(i,j) .gt. 0d0) ndof = ndof + 1

```

```

 if (dfgg(i,j) .gt. 0d0) ndof = ndof + 1
 end do
end do
print *, 'CHI2 = ', f / ndof
102a <Local variables for fct (v1) 95e>+≡ (95b) ◁101b 102d▷
 integer :: ndof

```

The error on the luminosity is just the (possibly rescaled) counting error:

```

102b <Write output (v1) 101a>+≡ (95b) ◁101e 102c▷
 open (10, file = 'Errors.tex')
 write (10, 1099) tee / 1d32, dtee / 1d32, dtee / 1d32
 1099 format ('$', F8.2, '_{-', F4.2, '}^{+', F4.2, '}$')

```

After retrieving the error from MINUIT, we have to take care of the mapping of the parameters

$$a'_{1/4} = e^{a_{1/4}} B(a_{2/5} + 1, a_{3/6} + 1) N_{\text{bins}} \eta^{-1} \implies \delta a'_{1/4} = a'_{1/4} \delta a_{1/4} \quad (42)$$

ignoring the errors in the integral (i.e. the Beta function).

```

102c <Write output (v1) 101a>+≡ (95b) ◁102b 102e▷
 call mnerrs (1, eplus, eminus, epara, corr)
 ab = a1(1) * beta(a1(2)+1d0, a1(3)+1d0)
 write (10, 1100) ab, abs (ab*eminus), abs (ab*eplus)
 1100 format ('$', F8.4, '_{-', F6.4, '}^{+', F6.4, '}$')

```

Uses `beta` 105.

```

102d <Local variables for fct (v1) 95e>+≡ (95b) ◁102a 102f▷
 real(kind=double) :: ab

```

The other mappings are even more trivial:

$$a'_{2/6} = a_{2/6} - 1 + \eta^{-1} \implies \delta a'_{2/6} = \delta a_{2/6} \quad a'_{3/5} = a_{3/5} - 1 + \eta^{-1} \implies \delta a'_{3/5} = \delta a_{3/5} \quad (43)$$

```

102e <Write output (v1) 101a>+≡ (95b) ◁102c 103a▷

### 7.3 Version 2

## 8 Conclusions

I have presented a library of simple parameterizations of realistic  $e^\pm$ - and  $\gamma$ -beam spectra at future linear  $e^+e^-$ -colliders. The library can be used for integration and event generation. Emphasis is put on simplicity and reproducibility of the parameterizations for supporting reproducible physics simulations.

### Acknowledgements

Daniel Schulte made his simulation code **Guinea-Pig** available and answered questions. Harald Anlauf and Torbjörn Sjöstrand have contributed useful suggestions. The Tesla group at DESY/Zeuthen made error estimates feasible by donating time on the multi-headed number cruncher **Hydra**. The 1996 ECFA/Desy Linear Collider Workshop got me started and provided support. Thanks to all of them.

## A Literate Programming

### A.1 Paradigm

I have presented the sample code in this paper using the *literate programming* paradigm. This paradigm has been introduced by Donald Knuth [19] and his programs TEX [20] and METAFONT [21] provide excellent examples of the virtues of literate programming. Knuth summarized his intention as follows ([19], p. 99)

“Let us change our traditional attitude to the construction of programs. Instead of imagining that our main task is to instruct a computer what to do, let us concentrate rather on explaining to *human beings* what we want a computer to do.”

Usually, literate programming uses two utility programs to produce two kinds of files from the source

`tangle` produces the computer program that is acceptable to an “illiterate” (Fortran, C, etc.) compiler. This process consists of stripping documentation and reordering code. Therefore it frees the author from having to present the code in the particular order enforced by a compiler for purely technical reasons. Instead, the author can present the code in the order that is most comprehensible.

`weave` produces a document that describes the program. Extensive cross referencing of the code sections is usually provided, which has been suppressed in this paper. If a powerful typesetting system (such a TEX) is used, the document can present the algorithms in clear mathematical notation alongside the code. These features improve readability and maintainability of scientific code immensely.

### A.2 Practice

Circe1 uses the `noweb` [22] system. This system has the advantage to work with any traditional programming language and support the essential features described in section A.1 with minimal effort. `noweb`’s `tangle` program only reorders the code sections, but does not reformat them. Therefore its output can be used just like any other “illiterate” program.

The examples above should be almost self-explaining, but in order to avoid any ambiguities, I give another example:

125a *⟨Literate programming example 125a⟩≡  
⟨Code that has to be at the top 125c⟩  
⟨Other code 125b⟩*

I can start the presentation with the first line of the “other code”:

125b *⟨Other code 125b⟩≡  
line 1 of the other code* (125a) 126a▷

If appropriate, the first line of the code that has to appear *before* the other code can be presented later:

125c *⟨Code that has to be at the top 125c⟩≡  
line 1 of the code at the top* (125a) 126b▷

Now I can augment the sections:

126a *(Other code 125b)* +≡ (125a) ↳ 125b

line 2 of the other code

126b *(Code that has to be at the top 125c)* +≡ (125a) ↳ 125c

line 2 of the code at the top

The complete “program” will be presented to the compiler as

```
line 1 of the code at the top
line 2 of the code at the top
line 1 of the other code
line 2 of the other code
```

The examples in section 3.1.1 show that this reordering is particularly useful for declaring variables when they are first used (rather than at the beginning) and for zooming in on code inside of loops.

## B Fortran Name Space

In addition to the ten procedures and one `common` block discussed in section 3

- `circe`, `circee`, `circeg`, `circgg`,
- `girce`, `gircee`, `girceg`, `gircgg`,
- `circes`, `circel`, `/circom/`,

there are two more globally visible functions which are used internally:

- `circem`: error message handler,
- `girceb`: efficient Beta distribution generator.

Even if the `/circom/` is globally visible, application programs *must not* manipulate it directly. The `circes`, subroutine is provided for this purpose and updates some internal parameters as well.

With features from the current Fortran standard (Fortran90), I could have kept the last two functions and the `common` block private.

Application programs wishing to remain compatible with future versions of `Circe1` must not use `common` blocks or procedures starting with `circe` or `girce`.

## C Updates

Information about updates can be obtained

- on the World Wide Web:

<http://projects.hepforge.org/whizard/>

Contributions of results from other simulation programs and updated accelerator designs are welcome at
