Structure function instance configuration

We create a structure-function chain instance which implements a configured structure-function chain. We link the momentum entries in the interactions and compute kinematics.

We do not actually connect the interactions and create evaluators. We skip this step and manually advance the status of the chain instead.

```

10.4.1 Physics

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (10.27)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of ϵ results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit $m^2 \ll s$ are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \quad (10.28)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \quad (10.29)$$

so the integration over the propagator $1/(t-m^2)$ yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \quad (10.30)$$

In $f_0(x)$, there is an integrable singularity at $x = 1$ which does not spoil the integration, but would lead to an unbounded f_{\max} . Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \quad (10.31)$$

such that

$$\int dx f_0(x) = \int dx' \quad (10.32)$$

The structure function has three parameters: α , m_{in} of the incoming particle and s , the hard scale. Internally, we store the exponent ϵ which is the relevant parameter. (In conventional notation, $\epsilon = \beta/2$.) As defaults, we take the actual

values of α (which is probably $\alpha(s)$), the actual mass m_{in} and the squared total c.m. energy s .

Including ϵ , ϵ^2 , and ϵ^3 corrections, the successive approximation of the ISR structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad (10.33)$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \quad (10.34)$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \quad (10.35)$$

$$\begin{aligned} f_3(x) = & g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \\ & - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \\ & - \frac{\epsilon^3}{48} \left((1+x) [6 \text{Li}_2(x) + 12 \ln^2(1-x) - 3\pi^2] + 6(x+5) \ln(1-x) \right. \\ & \quad \left. + \frac{1}{1-x} \left[\frac{3}{2}(1+8x+3x^2) \ln x + 12(1+x^2) \ln x \ln(1-x) \right. \right. \\ & \quad \left. \left. - \frac{1}{2}(1+7x^2) \ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \right) \end{aligned} \quad (10.36)$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp(\epsilon(-\gamma_E + \frac{3}{4}))}{\Gamma(1+\epsilon)}, \quad (10.37)$$

are given by

$$g_0(\epsilon) = 1 \quad (10.38)$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \quad (10.39)$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (10.40)$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 + \frac{27-24\pi^2+128\zeta(3)}{384}\epsilon^3, \quad (10.41)$$

where, numerically

$$\zeta(3) = 1.20205690315959428539973816151 \dots \quad (10.42)$$

Although one could calculate the function $g(\epsilon)$ exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx f_i(x) = 1 \quad \text{for all } i. \quad (10.43)$$

Effectively, the $O(\epsilon)$ correction reduces the low- x tail of the structure function by 50% while increasing the coefficient of the singularity by $O(\epsilon)$. Relative

to this, the $O(\epsilon^2)$ correction slightly enhances $x > \frac{1}{2}$ compared to $x < \frac{1}{2}$. At $x = 0$, $f_2(x)$ introduces a logarithmic singularity which should be cut off at $x_0 = O(e^{-1/\epsilon})$: for lower x the perturbative series breaks down. The f_3 correction is slightly positive for low x values and negative near $x = 1$, where the Li_2 piece slightly softens the singularity at $x = 1$.

Instead of the definition for ϵ given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left(\ln \frac{s}{m^2} - 1 \right) \quad (10.44)$$

10.4.2 Implementation

In the concrete implementation, the zeroth order mapping (10.31) is implemented, and the Jacobian is equal to $f_i(x)/f_0(x)$. This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (10.45)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1-x^2}{2(1-x')} \quad (10.46)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 - \frac{1-x^2}{2(1-x')} \\ - \frac{(1+3x^2)\ln x + (1-x)(4(1+x)\ln(1-x) + 5+x)}{8(1-x')}\epsilon \end{aligned} \quad (10.47)$$

For $x = 1$ (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (10.48)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (10.49)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (10.50)$$

The last line in (10.47) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (10.51)$$

(Mathematica result), independent of ϵ . For x values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

10.4.4 The ISR object

The `isr_t` data type is a $1 \rightarrow 2$ interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```
<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
    type(isr_data_t), pointer :: data => null ()
    real(default) :: x = 0
    real(default) :: xb= 0
  contains
    <SF isr: isr: TBP>
  end type isr_t
```

Type string: has to be here, but there is no string variable on which ISR depends. Hence, a dummy routine.

```
<SF isr: isr: TBP>≡
  procedure :: type_string => isr_type_string

<SF isr: procedures>+≡
  function isr_type_string (object) result (string)

    end if
end subroutine isr_write

```

10.4.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number \mathbf{r} to generate the momentum fraction \mathbf{x} and the function value \mathbf{f} . For numerical stability reasons, we also output \mathbf{xb} , which is $\bar{x} = 1 - x$.

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian \mathbf{f} and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian \mathbf{f} includes the value of the (zeroth-order) structure function, and strongly peaked.

```

<SF isr: isr: TBP>+=
    procedure :: complete_kinematics => isr_complete_kinematics

<SF isr: procedures>+=
    subroutine isr_complete_kinematics (sf_int, x, f, r, rb, map)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: r
        real(default), dimension(:), intent(in) :: rb
        logical, intent(in) :: map
        real(default) :: eps
        eps = sf_int%data%eps
        if (map) then
            call map_power_1 (sf_int%xb, f, rb(1), eps)
        else
            sf_int%xb = rb(1)
            if (rb(1) > 0) then
                f = 1
            else
                f = 0
            end if
        end if
        sf_int%x = 1 - sf_int%xb
        x(1) = sf_int%x
        if (size (x) == 3) x(2:3) = r(2:3)
        call sf_int%split_momentum (x, sf_int%xb)
        select case (sf_int%status)
        case (SF_FAILED_KINEMATICS)
            sf_int%x = 0
            sf_int%xb= 0

```

```

        f = 0
    end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the x array from the momentum configuration. In the specific case of ISR, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF isr: isr: TBP>+≡
    procedure :: recover_x => sf_isr_recover_x

<SF isr: procedures>+≡
    subroutine sf_isr_recover_x (sf_int, x, x_free)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(inout), optional :: x_free
        call sf_int%base_recover_x (x, x_free)
        sf_int%x = x(1)
        sf_int%xb = 1 - x(1)
    end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the x array and compute the “input” r values and the Jacobian f . After this, we can set momenta by the same formula as for normal kinematics.

For extracting x , we rely on the stored \bar{x} value, since the x value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

10.4.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

10.5.1 Physics

The EPA structure function for a photon inside an (elementary) particle p with energy E , mass m and charge q_p (e.g., electron) is given by ($\bar{x} \equiv 1 - x$)

$$\begin{aligned}
 f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} & \left[\left(\bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right. \\
 & \left. - \left(1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left(1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (10.52)
 \end{aligned}$$

If no explicit Q bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (10.53)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (10.54)$$

The second and third terms in (10.52) are negative definite (and subleading). Noting that $\bar{x} + x^2/2$ is bounded between $1/2$ and 1 , we derive that $f(x)$ is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (10.55)$$

where we allow for explicit Q bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (10.56)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4 [x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (10.57)$$

such that $x(0) = x_0$ and $x(1) = x_1$ and

$$\frac{dx}{dx'} = \left(\frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (10.58)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (10.59)$$

such that (10.56) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (10.60)$$

where x' is calculated from x via (10.57).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x (L - \log x) - \log x_0 (L - \log x_0)}{\log x_1 (L - \log x_1) - \log x_0 (L - \log x_0)}. \quad (10.61)$$

10.5.2 The EPA data block

The EPA parameters are: α , E_{\max} , m , Q_{\min} , and x_{\min} . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1} (L - \ln x_{0/1})$, the c.m. energy squared and the incoming particle mass.

10.5.3 The EPA object

The `epa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

10.5.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The x value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

  end select
end if
end subroutine epa_inverse_kinematics

```

Overriding the default method: we compute the \mathbf{x} array from the momentum configuration. In the specific case of EPA, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF epa: epa: TBP>+≡
  procedure :: recover_x => sf_epa_recover_x

<SF epa: procedures>+≡
  subroutine sf_epa_recover_x (sf_int, x, x_free)
    class(epa_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, x_free)
    sf_int%x = x(1)
    sf_int%xb = 1 - x(1)
  end subroutine sf_epa_recover_x

```

10.5.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for x , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

<SF epa: epa: TBP>+≡
  procedure :: apply => epa_apply

```

```

<SF epa: procedures>+≡
subroutine epa_apply (sf_int, scale)
  class(epa_t), intent(inout) :: sf_int

10.6.1 Physics

The EWA structure function for a Z or W inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal (\pm) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (10.62)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (10.63)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (10.64)$$

where $p_{\perp,\max}$ is the cutoff in transversal momentum, M is the vector-boson mass, v and a are the vector and axial-vector couplings, and $\bar{x} \equiv 1-x$. Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (10.65)$$

The vector and axial couplings for a fermion branching into a W are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (10.66)$$

For Z emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (10.67)$$

where $t_3 = \pm\frac{1}{2}$ is the fermion isospin, and q its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of v and a is irrelevant.

The EWA depends on the parameters g , $\sin^2\theta_w$, M_W , and M_Z . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a $1/x$ singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial x bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (10.68)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (10.69)$$

As a user parameter, we have the cutoff $p_{\perp,\max}$. The divergence $1/x$ also requires a x_0 cutoff; and for completeness we introduce a corresponding x_1 . Physically, the minimal sensible value of x is M^2/s , although the approximation loses its value already at higher x values.

10.6.2 The EWA data block

The EWA parameters are: $p_{T,\max}$, c_V , c_A , and m . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a W or a Z is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors $g/2 = e/2/\sin\theta_W$.

In principle, for EWA it would make sense to allow the user to also set the upper bound for x , x_{\max} , but we fix it to one here.

10.6.3 The EWA object

The `ewa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision: W/Z bosons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated, W/Z), where the W/Z initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the W/Z polarization. If we are having Z bosons, both up- and down-type fermions can participate. Otherwise, with a W^+ an up-type fermion is transferred to a down-type fermion, and the other way round.

```

10.6.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, the exponential mapping for the $1/x$ singularity discussed above is applied.

```

```

10.6.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for x , one for Q^2 , and two for the polar and azimuthal angles. Alternatively, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

10.7.1 Physics

Beamstrahlung is applied before ISR. The CIRCE1 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the CIRCE1 parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1 - x)^\gamma \quad (10.70)$$

for $x < 1 - \epsilon$ (resp. $x > \epsilon$ in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at $x = 1$ (resp. $x = 0$). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the `kirke` version of the `CIRCE1` subroutines, and is used here.

The parameter `circe1_eps` sets the peak mapping of the `CIRCE1` structure function. Its default value is 10^{-5} . The other parameters are the parameterization version and revision number, the accelerator type, and the \sqrt{s} value used by `CIRCE1`. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1_epsilon` which is taken from the `CIRCE1` internal data structure.

The \sqrt{s} value, if not explicitly set, is taken from the process data. Note that interpolating \sqrt{s} is not recommended; one should rather choose one of the distinct values known to `CIRCE1`.

10.7.2 The CIRCE1 data block

The `CIRCE1` parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter ϵ , \sqrt{s} and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the x values are actually discarded and a random number generator is used instead.

    allocate (circe1_t :: sf_int)
  end subroutine circe1_data_allocate_sf_int

```

10.7.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe1: types>+=
  type, extends (circe1_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe1: procedures>+=
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

10.7.4 The CIRCE1 object

This is a $2 \rightarrow 4$ interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

```

<SF circe1: types>+=
  type, extends (sf_int_t) :: circe1_t
    type(circe1_data_t), pointer :: data => null ()
    real(default), dimension(2) :: x = 0

```

```

    real(default) :: f = 0
    logical, dimension(2) :: continuum = .true.
    logical, dimension(2) :: peak = .true.
    type(rng_obj_t) :: rng_obj
contains
  <SF circe1: circe1: TBP>
end type circe1_t

```

Type string: has to be here, but there is no string variable on which CIRCE1 depends. Hence, a dummy routine.

```

<SF circe1: circe1: TBP>≡
  procedure :: type_string => circe1_type_string

<SF circe1: procedures>+≡
  function circe1_type_string (object) result (string)

10.8.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

10.8.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `cir2lm`.

```

10.8.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```
<SF circe2: types>+≡
  type, extends (circe2_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t
```

```
<SF circe2: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate
```

10.8.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a $2 \rightarrow 2$ interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

10.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum $f(x)$, applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (10.71)$$

We want to compute the distribution of $E = \sqrt{\hat{s}} = \sqrt{xs}$, i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (10.72)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (10.73)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (10.74)$$

We implement this as a spectrum with a single parameter x . The parameters for the individual beams are computed as $x_i = \sqrt{x}$, so they are equal and the kinematics is always symmetric.

10.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and \sqrt{s} if it should be normalized to the total energy. In the latter case, the differential distribution $d\sigma/d\sqrt{\hat{s}}$ coincides with the partonic cross section $\hat{\sigma}$ as a function of $\sqrt{\hat{s}}$.

10.10 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of x values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

```

    integer, intent(in) :: set, mem
  end subroutine InitPDFM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine numberPDFM (set, n_members)
    integer, intent(in) :: set
    integer, intent(out) :: n_members
  end subroutine numberPDFM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine evolvePDFM (set, x, q, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine evolvePDFphotonM (set, x, q, ff, fphot)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q
    double precision, dimension(-6:6), intent(out) :: ff
    double precision, intent(out) :: fphot
  end subroutine evolvePDFphotonM
end interface
```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine evolvePDFpM (set, x, q, s, scheme, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q, s
    integer, intent(in) :: scheme
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFpM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXminM (set, mem, xmin)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmin
  end subroutine GetXminM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXmaxM (set, mem, xmax)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmax
  end subroutine GetXmaxM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2minM (set, mem, q2min)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: q2min
  end subroutine GetQ2minM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2maxM (set, mem, q2max)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: q2max
  end subroutine GetQ2maxM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  function has_photon () result(flag)
    logical :: flag
  end function has_photon
end interface

```

10.11.3 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

```
<SF lhpdf: public>≡
    public :: lhpdf_status_t

<SF lhpdf: types>≡
    type :: lhpdf_status_t
    private
        logical, dimension(3) :: initialized = .false.
    end type lhpdf_status_t

<SF lhpdf: public>+≡
    public :: lhpdf_status_reset

<SF lhpdf: procedures>≡
    subroutine lhpdf_status_reset (lhpdf_status)
        type(lhpdf_status_t), intent(inout) :: lhpdf_status
        lhpdf_status%initialized = .false.
    end subroutine lhpdf_status_reset

<SF lhpdf: procedures>+≡
    function lhpdf_status_is_initialized (lhpdf_status, set) result (flag)
        logical :: flag
        type(lhpdf_status_t), intent(in) :: lhpdf_status
        integer, intent(in), optional :: set
        if (present (set)) then
            select case (set)
                case (1:3);    flag = lhpdf_status%initialized(set)
                case default;  flag = .false.
            end select
        else
            flag = any (lhpdf_status%initialized)
        end if
    end function lhpdf_status_is_initialized

<SF lhpdf: procedures>+≡
    subroutine lhpdf_status_set_initialized (lhpdf_status, set)
        type(lhpdf_status_t), intent(inout) :: lhpdf_status
        integer, intent(in) :: set
        lhpdf_status%initialized(set) = .true.
    end subroutine lhpdf_status_set_initialized
```

10.11.4 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an α_s formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to

reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf_builtin` is that these things are outsourced to a separate module (inc. `lhpdf_status` etc.).

```

<SF lhpdf: public>+≡
    public :: lhpdf_initialize

<SF lhpdf: procedures>+≡
    subroutine lhpdf_initialize (status, set, prefix, file, member, b_match)
        type(lhpdf_status_t), intent(inout) :: status
        integer, intent(in) :: set
        type(string_t), intent(inout) :: prefix
        type(string_t), intent(inout) :: file
        integer, intent(inout) :: member

10.11.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

```

<SF lhpdf: lhpdf: TBP>≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

10.11.7 The LHAPDF object

The `lhpdf_t` data type is a $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the x momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

10.12.3 The PDF object

The PDF $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton

is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

```

Initialize. We know that `data` will be of concrete type `sf_test_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass, but keep the radiated mass zero.

Optionally, we can provide minimum and maximum values for the momentum transfer.

10.12.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

```

⟨SF pdf builtin: pdf builtin: TBP⟩+≡
    procedure :: complete_kinematics => pdf_builtin_complete_kinematics

⟨SF pdf builtin: procedures⟩+≡
    subroutine pdf_builtin_complete_kinematics (sf_int, x, f, r, rb, map)
        class(pdf_builtin_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x

    end type user_data_t

```

Assign procedure pointers from a dynamically loaded library, given the specified name.

We have to distinguish three cases: (1) Both beams are affected, and the user spectrum implements both beams. There is a single data object. (2) Both

beams are affected, and the user spectrum applies to single beams. Fill two different objects. (3) A single beam is affected.

```

10.13.3 The interaction

We fill the interaction by looking up the table of states using the interface functions.

For particles which have a known flavor (as indicated by the mask), we compute the mass squared, so we can use it for the invariant mass of the particle objects.

```

10.13.4 The user structure function

For maximal flexibility, user structure functions separate kinematics from dynamics just as the PDF interface does. (JRR: Ok, I guess this now done for all structure functions, right?) We create `c_prt_t` particle objects from the incoming momenta (all other quantum numbers are irrelevant) and call the user-supplied kinematics function to compute the outgoing momenta, along with other variables that will be needed for matrix element evaluation. If known, we use the mass squared computed above. !!! JRR: WK please check (#529) I don't know actually whether this really fits into the setup done by WK.

```

<SF user: types>+=
  !!! JRR: WK please check (#529)
  type, extends (sf_int_t) :: user_t
    type(user_data_t), pointer :: data => null ()

  end subroutine hoppet_eval

end module hoppet_interface

```

Chapter 11

Phase space and hard matrix elements

These modules contain the internal representation and evaluation of phase space and the interface to (hard-)process evaluation.

mappings Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

phs_trees Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

phs_forests The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

cascades This module is a Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

11.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

```
<process_constants.f90>≡  
  <File header>
```

```
  module process_constants
```

```
    <Use kinds>
```

```
    <Use strings>
```

```
    <Standard module head>
```

```
    <Process constants: public>
```

```
    <Process constants: types>
```

```
  end module process_constants
```

The data type is just a block of public objects, only elementary types, no type-bound procedures.

```
<Process constants: public>≡  
  public :: process_constants_t  
  
<Process constants: types>≡  
  type :: process_constants_t  
    type(string_t) :: id  
    type(string_t) :: model_name  
    character(32) :: md5sum = ""  
    logical :: openmp_supported = .false.  
    integer :: n_in = 0  
    integer :: n_out = 0  
    integer :: n_flv = 0  
    integer :: n_hel = 0  
    integer :: n_col = 0  
    integer :: n_cin = 0  
    integer :: n_cf = 0  
    integer, dimension(:,:), allocatable :: flv_state  
    integer, dimension(:,:), allocatable :: hel_state  
    integer, dimension(:,:), allocatable :: col_state  
    logical, dimension(:,:), allocatable :: ghost_flag  
    complex(default), dimension(:), allocatable :: color_factors  
    integer, dimension(:,:), allocatable :: cf_index  
  end type process_constants_t
```

11.2 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

```
<phs_base.f90>≡  
<File header>  
  
module phs_base  
  
  <Use kinds>  
  <Use strings>  
  <Use file utils>  
  use limits, only: FMT_19 !NODEP!  
  use constants !NODEP!  
  use diagnostics !NODEP!  
  use lorentz !NODEP!  
  use unit_tests  
  use os_interface  
  use md5  
  use variables  
  use models  
  use flavors  
  use process_constants  
  use sf_mappings  
  use sf_base  
  
  <Standard module head>  
  
  <PHS base: public>  
  
  <PHS base: types>  
  
  <PHS base: interfaces>  
  
  <PHS base: test types>  
  
  contains  
  
  <PHS base: procedures>  
  
  <PHS base: tests>  
  
end module phs_base
```

11.2.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

```
<PHS base: public>≡
  public :: channel_prop_t

<PHS base: types>≡
  type, abstract :: channel_prop_t
  contains
    procedure (channel_prop_to_string), deferred :: to_string
    generic :: operator (==) => is_equal
    procedure (channel_eq), deferred :: is_equal

```

Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

```

<PHS base: types>+≡
type :: phs_equivalence_t
  integer :: c = 0
  integer, dimension(:), allocatable :: perm
  integer, dimension(:), allocatable :: mode
contains
  <PHS base: phs equivalence: TBP>
end type phs_equivalence_t

```

The mapping modes are

```

<PHS base: types>+≡
integer, parameter, public :: &
  EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3

```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the integrand can be assumed to be symmetric w.r.t. a reflection $x \rightarrow 1 - x$ of the corresponding integration variable.

These are the associated tags, for output:

```

<PHS base: types>+≡
character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]

```

Write an equivalence.

```

<PHS base: phs equivalence: TBP>≡
procedure :: write => phs_equivalence_write

<PHS base: procedures>+≡
subroutine phs_equivalence_write (object, unit)
  class(phs_equivalence_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, j
  u = output_unit (unit)
  write (u, "(5x,'=',1x,I0,1x)", advance = "no") object%c
  if (allocated (object%perm)) then
    write (u, "(A)", advance = "no") "("
    do j = 1, size (object%perm)
      if (j > 1) write (u, "(1x)", advance = "no")
      write (u, "(I0,A1)", advance = "no") &
        object%perm(j), TAG(object%mode(j))
    end do
  end if
end subroutine phs_equivalence_write

```

```

        write (u, "(A)" " ")
    else
        write (u, "(A)")
    end if
end subroutine phs_equivalence_write

```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

```

<PHS base: phs equivalence: TBP>+≡
    procedure :: init => phs_equivalence_init

<PHS base: procedures>+≡
    subroutine phs_equivalence_init (eq, n_dim)
        class(phs_equivalence_t), intent(out) :: eq

```

11.2.3 Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It doesn't depend on the QCD setup.)

```

<PHS base: public>+≡
public :: phs_config_t

<PHS base: types>+≡
type, abstract :: phs_config_t
! private
type(string_t) :: id
integer :: n_in = 0

    phs_config%md5sum_phs_config = ""
    u = free_unit ()
    open (u, status = "scratch", action = "readwrite")
    call phs_config%write (u)
    rewind (u)
    phs_config%md5sum_phs_config = md5sum (u)
    close (u)
  end subroutine phs_config_compute_md5sum

```

Print an informative message after phase-space configuration.

```

(PHS base: phs config: TBP)+≡
  procedure (phs_startup_message), deferred :: startup_message
  procedure :: base_startup_message => phs_startup_message

(PHS base: procedures)+≡
  subroutine phs_startup_message (phs_config, unit)
    class(phs_config_t), intent(in) :: phs_config
    integer, intent(in), optional :: unit
    write (msg_buffer, "(A,3(1x,I0,1x,A))") &
      "Phase space:", &
      phs_config%n_channel, "channels,", &
      phs_config%n_par, "dimensions"
    call msg_message (unit = unit)
  end subroutine phs_startup_message

```

This procedure should be implemented such that the phase-space configuration object allocates a phase-space instance of matching type.

```

(PHS base: phs config: TBP)+≡
  procedure (phs_config_allocate_instance), nopass, deferred :: &
    allocate_instance

(PHS base: interfaces)+≡
  abstract interface
    subroutine phs_config_allocate_instance (phs)
      import
      class(phs_t), intent(inout), pointer :: phs
    end subroutine phs_config_allocate_instance
  end interface

```

11.2.4 Extract data

Return the number of MC input parameters.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_par => phs_config_get_n_par

<PHS base: procedures>+≡
  function phs_config_get_n_par (phs_config) result (n)
    class(phs_config_t), intent(in) :: phs_config
    integer :: n
    n = phs_config%n_par
  end function phs_config_get_n_par
```

Return dimensions (parameter indices) for which the phase-space dimension is flat, so integration and event generation can be simplified.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_flat_dimensions => phs_config_get_flat_dimensions

<PHS base: procedures>+≡
  function phs_config_get_flat_dimensions (phs_config) result (dim_flat)
    class(phs_config_t), intent(in) :: phs_config
    integer, dimension(:), allocatable :: dim_flat
    if (allocated (phs_config%dim_flat)) then
      allocate (dim_flat (size (phs_config%dim_flat)))
      dim_flat = phs_config%dim_flat
    else
      allocate (dim_flat (0))
    end if
  end function phs_config_get_flat_dimensions
```

Return the number of phase-space channels.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_channel => phs_config_get_n_channel

<PHS base: procedures>+≡
  function phs_config_get_n_channel (phs_config) result (n)
    class(phs_config_t), intent(in) :: phs_config
    integer :: n
    n = phs_config%n_channel
  end function phs_config_get_n_channel
```

Return the structure-function channel that corresponds to the phase-space channel *c*. If the channel array is not allocated (which happens if there is no structure function), return zero.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_sf_channel => phs_config_get_sf_channel

<PHS base: procedures>+≡
  function phs_config_get_sf_channel (phs_config, c) result (c_sf)
    class(phs_config_t), intent(in) :: phs_config
    integer, intent(in) :: c
    integer :: c_sf
    if (allocated (phs_config%channel)) then
      c_sf = phs_config%channel(c)%sf_channel
    end if
  end function phs_config_get_sf_channel
```

```

    else
      c_sf = 0
    end if
  end function phs_config_get_sf_channel

```

Return the mass(es) of the incoming particle(s). We take the first flavor combination in the array, assuming that masses must be degenerate among flavors.

```

<PHS base: phs config: TBP>+≡
  procedure :: get_masses_in => phs_config_get_masses_in

<PHS base: procedures>+≡
  subroutine phs_config_get_masses_in (phs_config, m)
    class(phs_config_t), intent(in) :: phs_config
    real(default), dimension(:), intent(out) :: m
    integer :: i
    do i = 1, phs_config%n_in
      m(i) = flavor_get_mass (phs_config%flv(i,1))
    end do
  end subroutine phs_config_get_masses_in

```

Return the MD5 sum of the configuration.

```

<PHS base: phs config: TBP>+≡
  procedure :: get_md5sum => phs_config_get_md5sum

<PHS base: procedures>+≡
  function phs_config_get_md5sum (phs_config) result (md5sum)
    class(phs_config_t), intent(in) :: phs_config
    character(32) :: md5sum
    md5sum = phs_config%md5sum_phs_config
  end function phs_config_get_md5sum

```

11.2.5 Phase-space point instance

The `phs_t` object holds the workspace for phase-space generation. In the base object, we have the MC input parameters `r` and the Jacobian factor `f`, for each channel, and the incoming and outgoing momenta.

Note: The `active_channel` array is not used yet, all elements are initialized with `.true..` It should be touched by the integrator if it decides to drop irrelevant channels.

```

<PHS base: public>+≡
  public :: phs_t

<PHS base: types>+≡
  type, abstract :: phs_t
    class(phs_config_t), pointer :: config => null ()
    logical :: r_defined = .false.
    integer :: selected_channel = 0
    logical, dimension(:), allocatable :: active_channel
    real(default), dimension(:, :), allocatable :: r
    real(default), dimension(:), allocatable :: f
    real(default), dimension(:), allocatable :: m_in
    real(default), dimension(:), allocatable :: m_out

```

```

    real(default) :: flux = 0
    real(default) :: volume = 0
    type(lorentz_transformation_t) :: lt_cm_to_lab
    logical :: p_defined = .false.
    real(default) :: sqrts_hat = 0
    type(vector4_t), dimension(:), allocatable :: p
    logical :: q_defined = .false.
    type(vector4_t), dimension(:), allocatable :: q
contains
  <PHS base: phs: TBP>
end type phs_t

```

Output. Since phase space may get complicated, we include a `verbose` option for the abstract `write` procedure.

```

<PHS base: phs: TBP>≡
  procedure (phs_write), deferred :: write
<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_write (object, unit, verbose)
      import

    end if
  end subroutine phs_base_select_channel

```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the z axis is the direction of the first beam, the second beam is along the negative z axis. The transformation from the c.m. to the lab frame is a rotation from the z axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

```

        real(default) :: f
        f = phs%flux * phs%volume
    end function phs_get_overall_factor

```

Compute flux factor. We do this during initialization (when the incoming momenta \mathbf{p} are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \quad (11.1)$$

2. For a $2 \rightarrow n$ scattering process with $n > 1$, the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \quad (11.2)$$

where for massless incoming particles, $\sqrt{\lambda} = s$.

3. For a $2 \rightarrow 1$ on-shell production process, the factor includes an extra $1/(2\pi)^3$ factor and a $1/m^2$ factor from the phase-space delta function $\delta(x_1 x_2 - m^2/s)$, which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \quad (11.3)$$

The delta function is handled by the structure-function parameterization.

```

      import
      class(phs_t), intent(inout) :: phs
      integer, intent(in) :: c_in
    end subroutine phs_evaluate_other_channels
  end interface

```

Inverse evaluation. If all momenta are known, we compute the inverse mappings to fill the **r** and **f** arrays.

```

(PHS base: phs: TBP)+≡
  procedure (phs_inverse), deferred :: inverse

(PHS base: interfaces)+≡
  abstract interface
    subroutine phs_inverse (phs)
      import
      class(phs_t), intent(inout) :: phs
    end subroutine phs_inverse
  end interface

```

11.2.6 Auxiliary stuff

The **pacify** subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a **tolerance** parameter) considered equivalent with zero. This is useful for numerical checks.

```

(PHS base: public)+≡
  public :: pacify

(PHS base: interfaces)+≡
  interface pacify
    module procedure pacify_phs
  end interface pacify

(PHS base: procedures)+≡
  subroutine pacify_phs (phs)
    class(phs_t), intent(inout) :: phs
    if (phs%p_defined) then
      call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
      call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
    end if
    if (phs%q_defined) then
      call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
    end if
  end subroutine pacify_phs

```

11.2.7 Unit tests

```

(PHS base: public)+≡
  public :: phs_base_test

```

```

<PHS base: tests>+=
  subroutine phs_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <PHS base: execute tests>
end subroutine phs_base_test

```

Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

```

<PHS base: public>+=
  public :: init_test_process_data

<PHS base: tests>+=
  subroutine init_test_process_data (id, data)
    type(process_constants_t), intent(out) :: data
    type(string_t), intent(in), optional :: id
    if (present (id)) then
      data%id = id

    data%flv_state(:,1) = [25, 6, -6]
  end subroutine init_test_decay_data

```

Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

```
<PHS base: public>+≡
    public :: phs_test_config_t
<PHS base: test types>≡
    type, extends (phs_config_t) :: phs_test_config_t
        logical :: create_equivalences = .false.
    contains
        procedure :: final => phs_test_config_final
        procedure :: write => phs_test_config_write
        procedure :: configure => phs_test_config_configure
        procedure :: startup_message => phs_test_config_startup_message
        procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t
```

The finalizer is empty.

```
<PHS base: tests>+≡
    subroutine phs_test_config_final (object)
        class(phs_test_config_t), intent(inout) :: object
    end subroutine phs_test_config_final
```

The `cm_frame` parameter is not tested here; we defer this to the `phs_single` implementation.

```
<PHS base: tests>+≡
    subroutine phs_test_config_write (object, unit)
        class(phs_test_config_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = output_unit (unit)
        write (u, "(1x,A)") "Partonic phase-space configuration:"
        call object%base_write (unit)
    end subroutine phs_test_config_write

    subroutine phs_test_config_configure (phs_config, sqrts, &
        sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, ignore_mismatch)
        class(phs_test_config_t), intent(inout) :: phs_config
        real(default), intent(in) :: sqrts
        logical, intent(in), optional :: sqrts_fixed
        logical, intent(in), optional :: cm_frame
        logical, intent(in), optional :: azimuthal_dependence
        logical, intent(in), optional :: rebuild
        logical, intent(in), optional :: ignore_mismatch
        phs_config%n_channel = 2
        phs_config%n_par = 2
        phs_config%sqrts = sqrts
        if (present (sqrts_fixed)) then
            phs_config%sqrts_fixed = sqrts_fixed
        end if
        if (present (cm_frame)) then
            phs_config%cm_frame = cm_frame
        end if
```

```

    if (present (azimuthal_dependence)) then
        phs_config%azimuthal_dependence = azimuthal_dependence
    end if
    if (allocated (phs_config%channel)) deallocate (phs_config%channel)
    allocate (phs_config%channel (phs_config%n_channel))
    if (phs_config%create_equivalences) then
        call setup_test_equivalences (phs_config)
        call setup_test_channel_props (phs_config)
    end if
    call phs_config%compute_md5sum ()
end subroutine phs_test_config_configure

```

If requested, we make up an arbitrary set of equivalences.

(PHS base: tests)+≡

```

subroutine setup_test_equivalences (phs_config)
    class(phs_test_config_t), intent(inout) :: phs_config
    integer :: i
    associate (channel => phs_config%channel(1))
        allocate (channel%eq (2))
        do i = 1, size (channel%eq)
            call channel%eq(i)%init (phs_config%n_par)
        end do
        associate (eq => channel%eq(1))
            eq%c = 1; eq%perm = [1, 2]; eq%mode = [EQ_IDENTITY, EQ_SYMMETRIC]
        end associate
        associate (eq => channel%eq(2))
            eq%c = 2; eq%perm = [2, 1]; eq%mode = [EQ_INVARIANT, EQ_IDENTITY]
        end associate
    end associate
end subroutine setup_test_equivalences

```

Ditto, for channel properties.

(PHS base: tests)+≡

```

subroutine setup_test_channel_props (phs_config)
    class(phs_test_config_t), intent(inout) :: phs_config
    associate (channel => phs_config%channel(2))
        call channel%set_resonant (140._default, 3.1415_default)
    end associate
end subroutine setup_test_channel_props

```

Startup message

(PHS base: tests)+≡

```

subroutine phs_test_config_startup_message (phs_config, unit)
    class(phs_test_config_t), intent(in) :: phs_config
    integer, intent(in), optional :: unit
    call phs_config%base_startup_message (unit)
    write (msg_buffer, "(A)") "Phase space: Test"
    call msg_message (unit = unit)
end subroutine phs_test_config_startup_message

```

The instance type that matches `phs_test_config_t` is `phs_test_t`.

(PHS base: tests)+≡

```

subroutine phs_test_config_allocate_instance (phs)
  class(phs_t), intent(inout), pointer :: phs
  allocate (phs_test_t :: phs)
end subroutine phs_test_config_allocate_instance

```

Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates $\cos\theta$ and ϕ uniformly, in the other channel we map the r_1 parameter which belongs to $\cos\theta$.

We should store the mass parameter that we need.

```

<PHS base: public>+≡
  public :: phs_test_t
<PHS base: test types>+≡
  type, extends (phs_t) :: phs_test_t
    real(default) :: m = 0
    real(default), dimension(:), allocatable :: x
  contains
    <PHS base: phs test: TBP>
  end type phs_test_t

```

Output. The specific data are displayed only if **verbose** is set.

```

<PHS base: phs test: TBP>≡
  procedure :: write => phs_test_write
<PHS base: tests>+≡
  subroutine phs_test_write (object, unit, verbose)
    class(phs_test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    logical :: verb
    u = output_unit (unit)
    verb = .false.; if (present (verbose)) verb = verbose
    if (verb) then
      write (u, "(1x,A)") "Partonic phase space: data"
      write (u, "(3x,A," // FMT_19 // ")") "m = ", object%m
    end if
    call object%base_write (u)
  end subroutine phs_test_write

```

The finalizer is empty.

```

<PHS base: phs test: TBP>+≡
  procedure :: final => phs_test_final
<PHS base: tests>+≡
  subroutine phs_test_final (object)
    class(phs_test_t), intent(inout) :: object
  end subroutine phs_test_final

```

Initialization: set the mass value.

```

(PHS base: phs test: TBP)+≡
  procedure :: init => phs_test_init

(PHS base: tests)+≡
  subroutine phs_test_init (phs, phs_config)
    class(phs_test_t), intent(out) :: phs
    class(phs_config_t), intent(in), target :: phs_config
    call phs%base_init (phs_config)
    phs%m = flavor_get_mass (phs%config%flv(1,1))
    allocate (phs%x (phs_config%n_par), source = 0._default)
  end subroutine phs_test_init

```

Evaluation. In channel 1, we uniformly generate $\cos\theta$ and ϕ , with Jacobian normalized to one. In channel 2, we prepend a mapping $r_1 \rightarrow r_1^{(1/3)}$ with Jacobian $f = 3r_1^2$.

The component \mathbf{x} is allocated in the first subroutine, used and deallocated in the second one.

```

            end if
            phs%volume = 1
            phs%r_defined = .true.
        end if
    end subroutine phs_test_inverse

```

Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters x_1 and x_2 :

$$\cos \theta = 1 - 2x_1, \quad \phi = 2\pi x_2 \quad (11.4)$$

We generate a rotation (Lorentz transformation) which rotates the positive z axis into this point on the unit sphere. This rotation is applied to the \mathbf{p} momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

```
<PHS base: public>+≡
  public :: compute_kinematics_solid_angle
<PHS base: tests>+≡
  subroutine compute_kinematics_solid_angle (p, q, x)
    type(vector4_t), dimension(2), intent(in) :: p
    type(vector4_t), dimension(2), intent(out) :: q
    real(default), dimension(2), intent(in) :: x
    real(default) :: ct, st, phi
    type(lorentz_transformation_t) :: rot
    integer :: i
    ct = 1 - 2*x(1)
    st = sqrt (1 - ct**2)
    phi = twopi * x(2)
    rot = rotation (phi, 3) * rotation (ct, st, 2)
    do i = 1, 2
      q(i) = rot * p(i)
    end do
  end subroutine compute_kinematics_solid_angle
```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from $q(1)$ alone. p is unused.

```
<PHS base: public>+≡
  public :: inverse_kinematics_solid_angle
<PHS base: tests>+≡
  subroutine inverse_kinematics_solid_angle (p, q, x)
    type(vector4_t), dimension(:), intent(in) :: p
    type(vector4_t), dimension(2), intent(in) :: q
    real(default), dimension(2), intent(out) :: x
    real(default) :: ct, phi
    ct = polar_angle_ct (q(1))
    phi = azimuthal_angle (q(1))
    x(1) = (1 - ct) / 2
    x(2) = phi / twopi
  end subroutine inverse_kinematics_solid_angle
```

11.3 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for $1 \rightarrow 2$ decays or for $2 \rightarrow 2$ scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic $2 \rightarrow 2$ situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

<PHS single: phs single: TBP>+≡
  procedure :: final => phs_single_final

<PHS single: procedures>+≡
  subroutine phs_single_final (object)
    class(phs_single_t), intent(inout) :: object
  end subroutine phs_single_final

```

Initialization. We allocate arrays (**base_init**) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \quad (11.5)$$

For a decay with nonvanishing masses (m_3, m_4), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (11.6)$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (11.7)$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying \hat{s} .

```

<PHS single: phs single: TBP>+≡
  procedure :: init => phs_single_init

<PHS single: procedures>+≡
  subroutine phs_single_init (phs, phs_config)
    class(phs_single_t), intent(out) :: phs
    class(phs_config_t), intent(in), target :: phs_config
    call phs%base_init (phs_config)
    phs%volume = 1 / (4 * twopi5)
    call phs%compute_factor ()
  end subroutine phs_single_init

```

Compute the correction factor for nonzero masses. We do this during initialization (when the incoming momenta **p** are undefined), unless **sqrts** is variable. We do this again once for each phase-space point, but then we skip the calculation if **sqrts** is fixed.

```

<PHS single: phs single: TBP>+≡
  procedure :: compute_factor => phs_single_compute_factor

```

```

11.4 Mappings

Mappings are objects that encode the transformation of the interval $(0,1)$ to a physical variable m^2 or $\cos\theta$ (and back), as it is used in the phase space parameterization. The mapping objects contain fixed parameters, the associated methods implement the mapping and inverse mapping operations, including the computation of the Jacobian (phase space factor).

```
<mappings.f90>≡  
<File header>  
  
module mappings  
  
  <Use kinds>  
    use kinds, only: TC !NODEP!  
  <Use strings>

    end function mapping_defaults_md5sum

```

11.4.2 The Mapping type

Each mapping has a type (e.g., s-channel, infrared), a binary code (redundant, but useful for debugging), and a reference particle. The flavor code of this particle is stored for bookkeeping reasons, what matters are the mass and width of this particle. Furthermore, depending on the type, various mapping parameters can be set and used.

The parameters **a1** to **a3** (for m^2 mappings) and **b1** to **b3** (for $\cos \theta$ mappings) are values that are stored once to speed up the calculation, if **variable_limits** is false. The exact meaning of these parameters depends on the mapping type. The limits are fixed if there is a fixed c.m. energy.

```

⟨Mappings: public⟩+≡
    public :: mapping_t

⟨Mappings: types⟩+≡
    type :: mapping_t
    private
        integer :: type = NO_MAPPING
        integer(TC) :: bincode

      end select
    end if
  end if
end if
end subroutine mapping_write

```

11.4.4 Define a mapping

The initialization routine sets the mapping type and the particle (binary code and flavor code) for which the mapping applies (e.g., a Z resonance in branch #3). We only need the absolute value of the flavor code.

(Mappings: public)+≡

public :: mapping_init

(Mappings: procedures)+≡

subroutine mapping_init (mapping, bincode, type, f, model)
 type(mapping_t), intent(inout) :: mapping

```

integer(TC), intent(in) :: bincode
type(string_t), intent(in) :: type
integer, intent(in), optional :: f
type(model_t), intent(in), optional, target :: model
mapping%bincode = bincode
select case (char (type))
case ("s_channel"); mapping%type = S_CHANNEL
case ("collinear"); mapping%type = COLLINEAR
case ("infrared"); mapping%type = INFRARED
case ("radiation"); mapping%type = RADIATION
case ("t_channel"); mapping%type = T_CHANNEL
case ("u_channel"); mapping%type = U_CHANNEL
case ("step_exp"); mapping%type = STEP_MAPPING_E
case ("step_hyp"); mapping%type = STEP_MAPPING_H
case ("on_shell"); mapping%type = ON_SHELL
case default
    call msg_bug ("Mappings: encountered undefined mapping key '" &
        // char (type) // "'")
end select
if (present (f) .and. present (model)) &
    call flavor_init (mapping%flv, abs (f), model)
end subroutine mapping_init

```

This sets the actual mass and width, using a parameter set. Since the auxiliary parameters will only be determined when the mapping is first called, they are marked as unknown.

```

<Mappings: public>+≡
    public :: mapping_set_parameters

<Mappings: procedures>+≡
    subroutine mapping_set_parameters (map, mapping_defaults, variable_limits)
        type(mapping_t), intent(inout) :: map
        type(mapping_defaults_t), intent(in) :: mapping_defaults
        logical, intent(in) :: variable_limits
        if (map%type /= NO_MAPPING) then
            map%mass = flavor_get_mass (map%flv)
            map%width = flavor_get_width (map%flv)
            map%variable_limits = variable_limits
            map%a_unknown = .true.
            map%b_unknown = .true.
            select case (map%type)
            case (S_CHANNEL)
                if (map%mass <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive mass")
                else if (map%width <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive width")
                end if
            case (RADIATION)
                map%width = max (map%width, mapping_defaults%energy_scale)
            case (INFRARED, COLLINEAR)

```

```

        map%mass = max (map%mass, mapping_defaults%invariant_mass_scale)
    case (T_CHANNEL, U_CHANNEL)
        map%mass = max (map%mass, mapping_defaults%momentum_transfer_scale)
    end select
end if
end subroutine mapping_set_parameters

```

For a step mapping the mass and width are set directly, instead of being determined from the flavor parameter (which is meaningless here). They correspond to the effective upper bound of phase space due to a resonance, as opposed to the absolute upper bound.

```

                equal = (m1%mass == m2%mass) .and. (m1%width == m2%width)
            case default
                equal = (m1%mass == m2%mass)
            end select
        else
            equal = .false.
        end if
    end function mapping_equal

```

11.4.7 Mappings of the invariant mass

Inserting an x value between 0 and 1, we want to compute the corresponding invariant mass $m^2(x)$ and the jacobian, aka phase space factor $f(x)$. We also need the reverse operation.

In general, the phase space factor f is defined by

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx \frac{1}{s} \frac{dm^2}{dx} g(m^2(x)) = \int_0^1 dx f(x) g(x), \quad (11.8)$$

where thus

$$f(x) = \frac{1}{s} \frac{dm^2}{dx}. \quad (11.9)$$

With this mapping, a function of the form

$$g(m^2) = c \frac{dx(m^2)}{dm^2} \quad (11.10)$$

is mapped to a constant:

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx f(x) g(m^2(x)) = \int_0^1 dx \frac{c}{s}. \quad (11.11)$$

Here is the mapping routine. Input are the available energy squared s , the limits for m^2 , and the x value. Output are the m^2 value and the phase space factor f .

```

Trivial mapping

We simply map the boundaries of the interval (m_{\min}, m_{\max}) to $(0, 1)$:

$$m^2 = (1 - x)m_{\min}^2 + xm_{\max}^2; \quad (11.12)$$

the inverse is

$$x = \frac{m^2 - m_{\min}^2}{m_{\max}^2 - m_{\min}^2}. \quad (11.13)$$

Hence

$$f(x) = \frac{m_{\max}^2 - m_{\min}^2}{s}, \quad (11.14)$$

and we have, as required,

$$f(x) \frac{dx}{dm^2} = \frac{1}{s}. \quad (11.15)$$

We store the constant parameters the first time the mapping is called – or, if limits vary, recompute them each time.

```

⟨Constants for trivial msq mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a1 = 0
    map%a2 = msq_max - msq_min
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply trivial msq mapping⟩≡
  msq = (1-x) * msq_min + x * msq_max
  f = map%a3

⟨Apply inverse trivial msq mapping⟩≡
  if (map%a2 /= 0) then
    x = (msq - msq_min) / map%a2
  else
    x = 0
  end if
  f = map%a3

```

Resonance or step mapping does not make much sense if the resonance mass is outside the kinematical bounds. If this is the case, revert to `NO_MAPPING`. This is possible even if the kinematical bounds vary from event to event.

```

⟨Modify mapping type if necessary⟩≡
  select case (type)
  case (S_CHANNEL, STEP_MAPPING_E, STEP_MAPPING_H)
    msq0 = map%mass**2
    if (msq0 < msq_min .or. msq0 > msq_max) type = NO_MAPPING
  end select

```

Breit-Wigner mapping

A Breit-Wigner resonance with mass M and width Γ is flattened by the following mapping:

This mapping does not make much sense if the resonance mass is too low. If this is the case, revert to `NO_MAPPING`. There is a tricky point with this if the

mass is too high: `msq_max` is not a constant if structure functions are around. However, switching the type depending on the overall energy does not change the integral, it is just another branching point.

$$m^2 = M(M + t\Gamma), \quad (11.16)$$

where

$$t = \tan \left[(1-x) \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} + x \arctan \frac{m_{\max}^2 - M^2}{M\Gamma} \right]. \quad (11.17)$$

The inverse:

$$x = \frac{\arctan \frac{m^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}}{\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}} \quad (11.18)$$

The phase-space factor of this transformation is

$$f(x) = \frac{M\Gamma}{s} \left(\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} \right) (1 + t^2). \quad (11.19)$$

This maps any function proportional to

$$g(m^2) = \frac{M\Gamma}{(m^2 - M^2)^2 + M^2\Gamma^2} \quad (11.20)$$

to a constant times $1/s$.

  f = map%a3 * (1 + tmp**2)

```

Mapping for massless splittings

This mapping accounts for approximately scale-invariant behavior where $\ln M^2$ is evenly distributed.

$$m^2 = m_{\min}^2 + M^2 (\exp(xL) - 1) \quad (11.21)$$

where

$$L = \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{M^2} + 1 \right). \quad (11.22)$$

The inverse:

$$x = \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) \quad (11.23)$$

The constant M is a characteristic scale. Above this scale ($m^2 - m_{\min}^2 \gg M^2$), this mapping behaves like $x \propto \ln m^2$, while below the scale it reverts to a linear mapping.

The phase-space factor is

$$f(x) = \frac{M^2}{s} \exp(xL) L. \quad (11.24)$$

A function proportional to

$$g(m^2) = \frac{1}{(m^2 - m_{\min}^2) + M^2} \quad (11.25)$$

is mapped to a constant, i.e., a simple pole near m_{\min} with a regulator mass M .

This type of mapping is useful for massless collinear and infrared singularities, where the scale is stored as the mass parameter. In the radiation case (IR radiation off massive particle), the heavy particle width is the characteristic scale.

```

⟨Constants for s-channel pole mapping⟩≡

    x = log (msq1 / map%a1) / map%a2
    f = map%a3 * msq1

```

Mapping for t-channel poles

This is also approximately scale-invariant, and we use the same type of mapping as before. However, we map $1/x$ singularities at both ends of the interval; again, the mapping becomes linear when the distance is less than M^2 :

$$m^2 = \begin{cases} m_{\min}^2 + M^2 (\exp(xL) - 1) & \text{for } 0 < x < \frac{1}{2} \\ m_{\max}^2 - M^2 (\exp((1-x)L) - 1) & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (11.26)$$

where

$$L = 2 \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{2M^2} + 1 \right). \quad (11.27)$$

The inverse:

$$x = \begin{cases} \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1 - \frac{1}{L} \ln \left(\frac{m_{\max}^2 - m^2}{M^2} + 1 \right) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (11.28)$$

The phase-space factor is

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L. & \text{for } 0 < x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L. & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (11.29)$$

A (continuous) function proportional to

$$g(m^2) = \begin{cases} 1/(m^2 - m_{\min}^2) + M^2 & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1/((m_{\max}^2 - m^2) + M^2) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (11.30)$$

is mapped to a constant by this mapping, i.e., poles near both ends of the interval.

```

end if
f = map%a3 * msq1

```

11.4.8 Step mapping

Step mapping is useful when the allowed range for a squared-mass variable is large, but only a fraction at the lower end is populated because the particle in question is an (off-shell) decay product of a narrow resonance. I.e., if the resonance was forced to be on-shell, the upper end of the range would be the resonance mass, minus the effective (real or resonance) mass of the particle(s) in the sibling branch of the decay.

The edge of this phase space section has a width which is determined by the width of the parent, plus the width of the sibling branch. (The widths might be added in quadrature, but this precision is probably not important.)

Fermi function

A possible mapping is derived from the Fermi function which has precisely this behavior. The Fermi function is given by

$$f(x) = \frac{1}{1 + \exp \frac{x-\mu}{\gamma}} \quad (11.31)$$

where x is taken as the invariant mass squared, μ is the invariant mass squared of the edge, and γ is the effective width which is given by the widths of the parent and the sibling branch. (Widths might be added in quadrature, but we do not require this level of precision.)

$$x = \frac{m^2 - m_{\min}^2}{\Delta m^2} \quad (11.32)$$

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (11.33)$$

$$\gamma = \frac{2m_{\max, \text{eff}}\Gamma}{\Delta m^2} \quad (11.34)$$

with

$$\Delta m^2 = m_{\max}^2 - m_{\min}^2 \quad (11.35)$$

m^2 is thus given by

$$m^2(x) = xm_{\max}^2 + (1-x)m_{\min}^2 \quad (11.36)$$

For the mapping, we compute the integral $g(x)$ of the Fermi function, normalized such that $g(0) = 0$ and $g(1) = 1$. We introduce the abbreviations

$$\alpha = 1 - \gamma \ln \frac{1 + \beta e^{1/\gamma}}{1 + \beta} \quad (11.37)$$

$$\beta = e^{-\mu/\gamma} \quad (11.38)$$

and obtain

$$g(x) = \frac{1}{\alpha} \left(x - \gamma \ln \frac{1 + \beta e^{x/\gamma}}{1 + \beta} \right) \quad (11.39)$$

The actual mapping is the inverse function $h(y) = g^{-1}(y)$,

$$h(y) = -\gamma \ln \left(e^{-\alpha y/\gamma} (1 + \beta) - \beta \right) \quad (11.40)$$

The Jacobian is

$$\frac{dh}{dy} = \alpha \left(1 - e^{\alpha y/\gamma} \frac{\beta}{1 + \beta} \right)^{-1} \quad (11.41)$$

which is equal to $1/(dg/dx)$, namely

$$\frac{dg}{dx} = \frac{1}{\alpha} \frac{1}{1 + \beta e^{x/\gamma}} \quad (11.42)$$

The final result is

$$\int_{m_{\min}^2}^{m_{\max}^2} dm^2 F(m^2) = \Delta m^2 \int_0^1 dx F(m^2(x)) \quad (11.43)$$

$$= \Delta m^2 \int_0^1 dy F(m^2(h(y))) \frac{dh}{dy} \quad (11.44)$$

Here is the implementation. We fill `a1`, `a2`, `a3` with α, β, γ , respectively.

```

<Constants for exponential step mapping>≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a3 = max (2 * map%mass * map%width / (msq_max - msq_min), 0.01_default)
    map%a2 = exp (- (map%mass**2 - msq_min) / (msq_max - msq_min) &
                  / map%a3)
    map%a1 = 1 - map%a3 * log ((1 + map%a2 * exp (1 / map%a3)) / (1 + map%a2))
  end if

  tmp = exp (- x * map%a1 / map%a3) * (1 + map%a2)
  z = - map%a3 * log (tmp - map%a2)
  msq = z * msq_max + (1 - z) * msq_min
  f = map%a1 / (1 - map%a2 / tmp) * (msq_max - msq_min) / s

<Apply inverse exponential step mapping>≡
  z = (msq - msq_min) / (msq_max - msq_min)
  tmp = 1 + map%a2 * exp (z / map%a3)
  x = (z - map%a3 * log (tmp / (1 + map%a2))) &
      / map%a1
  f = map%a1 * tmp * (msq_max - msq_min) / s

```

Hyperbolic mapping

The Fermi function has the drawback that it decreases exponentially. It might be preferable to take a function with a power-law decrease, such that the high-mass region is not completely depopulated.

Here, we start with the actual mapping which we take as

$$h(y) = \frac{b}{a - y} - \frac{b}{a} + \mu y \quad (11.45)$$

with the abbreviation

$$a = \frac{1}{2} \left(1 + \sqrt{1 + \frac{4b}{1-\mu}} \right) \quad (11.46)$$

This is a hyperbola in the xy plane. The derivative is

$$\frac{dh}{dy} = \frac{b}{(a-y)^2} + \mu \quad (11.47)$$

The constants correspond to

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (11.48)$$

$$b = \frac{1}{\mu} \left(\frac{2m_{\max, \text{eff}} \Gamma}{\Delta m^2} \right)^2 \quad (11.49)$$

The inverse function is the solution of a quadratic equation,

$$g(x) = \frac{1}{2} \left[\left(a + \frac{x}{\mu} + \frac{b}{a\mu} \right) - \sqrt{\left(a - \frac{x}{\mu} \right)^2 + 2 \frac{b}{a\mu} \left(a + \frac{x}{\mu} \right) + \left(\frac{b}{a\mu} \right)^2} \right] \quad (11.50)$$

The constants $a_{1,2,3}$ are identified with a, b, μ .

```

<Constants for hyperbolic step mapping>≡

  z = (msq - msq_min) / (msq_max - msq_min)
  tmp = map%a2 / (map%a1 * map%a3)
  x = ((map%a1 + z / map%a3 + tmp) &
        - sqrt ((map%a1 - z / map%a3)**2 + 2 * tmp * (map%a1 + z / map%a3) &
                + tmp**2)) / 2
  f = (map%a2 / (map%a1 - x)**2 + map%a3) * (msq_max - msq_min) / s

```

11.4.9 Mappings of the polar angle

The other type of singularity, a simple pole just outside the integration region, can occur in the integration over $\cos \theta$. This applies to exchange of massless (or light) particles.

Double poles (Coulomb scattering) are also possible, but only in certain cases. These are also handled by the single-pole mapping.

The mapping is analogous to the previous m^2 pole mapping, but with a different normalization and notation of variables:

$$\frac{1}{2} \int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx \frac{d \cos \theta}{dx} g(\theta(x)) = \int_0^1 dx f(x) g(x), \quad (11.51)$$

where thus

$$f(x) = \frac{1}{2} \frac{d \cos \theta}{dx}. \quad (11.52)$$

With this mapping, a function of the form

$$g(\theta) = c \frac{dx(\cos \theta)}{d \cos \theta} \quad (11.53)$$

is mapped to a constant:

$$\int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx f(x) g(\theta(x)) = \int_0^1 dx c. \quad (11.54)$$

```

Trivial mapping

This is just the mapping of the interval $(-1, 1)$ to $(0, 1)$:

$$\cos \theta = -1 + 2x \quad (11.55)$$

and

$$f(x) = 1 \quad (11.56)$$

with the inverse

$$x = \frac{1 + \cos \theta}{2} \quad (11.57)$$

```

<Apply trivial ct mapping>≡
  tmp = 2 * (1-x)
  ct = 1 - tmp
  st = sqrt (tmp * (2-tmp))
  f = 1
<Apply inverse trivial ct mapping>≡
  x = (ct + 1) / 2
  f = 1

```

Pole mapping

As above for m^2 , we simultaneously map poles at both ends of the $\cos \theta$ interval. The formulae are completely analogous:

$$\cos \theta = \begin{cases} \frac{M^2}{s} [\exp(xL) - 1] - 1 & \text{for } x < \frac{1}{2} \\ -\frac{M^2}{s} [\exp((1-x)L) - 1] + 1 & \text{for } x \geq \frac{1}{2} \end{cases} \quad (11.58)$$

where

$$L = 2 \ln \frac{M^2 + s}{M^2}. \quad (11.59)$$

Inverse:

$$x = \begin{cases} \frac{1}{2L} \ln \frac{1 + \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta < 0 \\ 1 - \frac{1}{2L} \ln \frac{1 - \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta \geq 0 \end{cases} \quad (11.60)$$

The phase-space factor:

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L & \text{for } x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L & \text{for } x \geq \frac{1}{2} \end{cases} \quad (11.61)$$

```

    end if
    f = ct1 * map%b2

```

11.5 Phase-space trees

The phase space evaluation is organized in terms of trees, where each branch corresponds to three integrations: m^2 , $\cos\theta$, and ϕ . The complete tree thus makes up a specific parameterization of the multidimensional phase-space integral. For the multi-channel integration, the phase-space tree is a single channel.

The trees imply mappings of formal Feynman tree graphs into arrays of integer numbers: Each branch, corresponding to a particular line in the graph, is assigned an integer code c (with kind value $\text{TC} = \text{tree code}$).

In this integer, each bit determines whether a particular external momentum flows through the line. The external branches therefore have codes 1, 2, 4, 8, ... An internal branch has those bits ORed corresponding to the momenta flowing through it. For example, a branch with momentum $p_1 + p_4$ has code $2^0 + 2^3 = 1 + 8 = 9$.

There is a two-fold ambiguity: Momentum conservation implies that the branch with code

$$c_0 = \sum_{i=1}^{n(\text{ext})} 2^{i-1} \quad (11.62)$$

i.e. the branch with momentum $p_1 + p_2 + \dots p_n$ has momentum zero, which is equivalent to tree code 0 by definition. Correspondingly,

$$c \quad \text{and} \quad c_0 - c = c \text{ XOR } c_0 \quad (11.63)$$

are equivalent. E.g., if there are five externals with codes $c = 1, 2, 4, 8, 16$, then $c = 9$ and $\bar{c} = 31 - 9 = 22$ are equivalent.

This ambiguity may be used to assign a direction to the line: If all momenta are understood as outgoing, $c = 9$ in the example above means $p_1 + p_4$, but $c = 22$ means $p_2 + p_3 + p_5 = -(p_1 + p_4)$.

Here we make use of the ambiguity in a slightly different way. First, the initial particles are singled out as those externals with the highest bits, the IN-bits. (Here: 8 and 16 for a $2 \rightarrow 3$ scattering process, 16 only for a $1 \rightarrow 4$ decay.) Then we invert those codes where all IN-bits are set. For a decay process this maps each tree of an equivalence class onto a unique representative (that one with the smallest integer codes). For a scattering process we proceed further:

The ambiguity remains in all branches where only one IN-bit is set, including the initial particles. If there are only externals with this property, we have an s -channel graph which we leave as it is. In all other cases, an internal with only one IN-bit is a t -channel line, which for phase space integration should be associated with one of the initial momenta as a reference axis. We take that one whose bit is set in the current tree code. (E.g., for branch $c = 9$ we use the initial particle $c = 8$ as reference axis, whereas for the same branch we would take $c = 16$ if it had been assigned $\bar{c} = 31 - 9 = 22$ as tree code.) Thus, different ways of coding the same t -channel graph imply different phase space parameterizations.

s -channel graphs have a unique parameterization. The same sets of parameterizations are used for t -channel graphs, except for the reference frames of their angular parts. We map each t -channel graph onto an s -channel graph as follows:

Working in ascending order, for each t -channel line (whose code has exactly one IN-bit set) the attached initial line is flipped upstream, while the outgoing

line is flipped downstream. (This works only if t -channel graphs are always parameterized beginning at their outer vertices, which we require as a restriction.) After all possible flips have been applied, we have an s -channel graph. We only have to remember the initial particle a vertex was originally attached to.

11.5.2 The phase-space tree type

Definition

In the concrete implementation, each branch c may have two *daughters* c_1 and c_2 such that $c_1 + c_2 = c$, a *sibling* c_s and a *mother* c_m such that $c + c_s = c_m$, and a *friend* which is kept during flips, such that it can indicate a fixed reference frame. Absent entries are set $c = 0$.

First, declare the branch type. There is some need to have this public. Give initializations for all components, so no `init` routine is necessary. The branch has some information about the associated coordinates and about connections.

```

<PHS trees: types>+≡
    type :: phs_branch_t
        private
        logical :: set = .false.
        logical :: inverted_decay = .false.
        logical :: inverted_axis = .false.
        integer(TC) :: mother = 0
        integer(TC) :: sibling = 0
        integer(TC) :: friend = 0
        integer(TC) :: origin = 0

```

```

integer(TC), dimension(2) :: daughter = 0
integer :: firstborn = 0
logical :: has_children = .false.
logical :: has_friend = .false.
end type phs_branch_t

```

The tree type: No initialization, this is done by `phs_tree_init`. In addition to the branch array which

The branches are collected in an array which holds all possible branches, of which only a few are set. After flips have been applied, the branch $c_M = \sum_{i=1}^{n(\text{fin})} 2^{i-1}$ must be there, indicating the mother of all decay products. In addition, we should check for consistency at the beginning.

`n_branches` is the number of those actually set. `n_externals` defines the number of significant bit, and `mask` is a code where all bits are set. Analogous: `n_in` and `mask_in` for the incoming particles.

The mapping array contains the mappings associated to the branches (corresponding indices). The array `mass_sum` contains the sum of the real masses of the external final-state particles associated to the branch. During phase-space evaluation, this determines the boundaries.

```

<PHS trees: public>+≡
  public :: phs_tree_t
<PHS trees: types>+≡
  type :: phs_tree_t
  private
  integer :: n_branches, n_externals, n_in, n_msq, n_angles
  integer(TC) :: n_branches_tot, n_branches_out
  integer(TC) :: mask, mask_in, mask_out
  type(phs_branch_t), dimension(:), allocatable :: branch
  type(mapping_t), dimension(:), allocatable :: mapping
  real(default), dimension(:), allocatable :: mass_sum
  real(default), dimension(:), allocatable :: effective_mass
  real(default), dimension(:), allocatable :: effective_width
end type phs_tree_t

```

The maximum number of external particles that can be represented is related to the bit size of the integer that stores binary codes. With the default integer of 32 bit on common machines, this is more than enough space. If TC is actually the default integer kind, there is no need to keep it separate, but doing so marks this as a special type of integer. So, just state that the maximum number is 32:

```

<Limits: public parameters>+≡
  integer, parameter, public :: MAX_EXTERNAL = 32

```

Constructor and destructor

Allocate memory for a phase-space tree with given number of externals and incoming. The number of allocated branches can easily become large, but appears manageable for realistic cases, e.g., for `n_in=2` and `n_out=8` we get $2^{10} - 1 = 1023$.

```

<PHS trees: public>+≡
  public :: phs_tree_init
  public :: phs_tree_final

```

Here we set the masks for incoming and for all externals.

```

<PHS trees: procedures>+≡
  elemental subroutine phs_tree_init (tree, n_in, n_out, n_masses, n_angles)

```

11.5.3 PHS tree setup

Transformation into an array of branch codes and back

Assume that the tree/array has been created before with the appropriate length and is empty.

```

<PHS trees: public>+≡
    public :: phs_tree_from_array

<PHS trees: procedures>+≡
    subroutine phs_tree_from_array (tree, a)
        type(phs_tree_t), intent(inout) :: tree
        integer(TC), dimension(:), intent(in) :: a
        integer :: i
        integer(TC) :: k
        <Set branches from array a>
        <Set external branches if necessary>
        <Check number of branches>
        <Determine the connections>
    contains
        <Subroutine: set relatives>
    end subroutine phs_tree_from_array

```

First, set all branches specified by the user. If all IN-bits are set, we invert the branch code.

```

<Set branches from array a>≡
    do i=1, size(a)
        k = a(i)
        if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
        tree%branch(k)%set = .true.
        tree%n_branches = tree%n_branches+1
    end do

```

The external branches are understood, so set them now if not yet done. In all cases ensure that the representative with one bit set is used, except for decays where the in-particle is represented by all OUT-bits set instead.

```

<Set external branches if necessary>≡
do i=0, tree%n_externals-1
  k = ibset(0,i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  if (tree%branch(ieor(tree%mask, k))%set) then
    tree%branch(ieor(tree%mask, k))%set = .false.
    tree%branch(k)%set = .true.
  else if (.not.tree%branch(k)%set) then
    tree%branch(k)%set = .true.
    tree%n_branches = tree%n_branches+1
  end if
end do

```

Now the number of branches set can be checked. Here we assume that the tree is binary. For three externals there are three branches in total, and for each additional external branch we get another internal one.

```

<Check number of branches>≡
if (tree%n_branches /= tree%n_externals*2-3) then
  call phs_tree_write (tree)
  call msg_bug &
    & (" Wrong number of branches set in phase space tree")
end if

```

For all branches that are set, except for the externals, we try to find the daughter branches:

```

<Determine the connections>≡
do k=1, size (tree%branch)
  if (tree%branch(k)%set .and. tc_decay_level (k) /= 1) then
    call branch_set_relatives(k)
  end if
end do

```

To this end, we scan all codes less than the current code, whether we can find two branches which are set and which together give the current code. After that, the tree may still not be connected, but at least we know if a branch does not have daughters: This indicates some inconsistency.

The algorithm ensures that, at this stage, the first daughter has a smaller code value than the second one.

```

<Subroutine: set relatives>≡
subroutine branch_set_relatives (k)
  integer(TC), intent(in) :: k
  integer(TC) :: m,n
  do m=1, k-1
    if(iand(k,m)==m) then
      n = ieor(k,m)
      if ( tree%branch(m)%set .and. tree%branch(n)%set ) then
        tree%branch(k)%daughter(1) = m; tree%branch(k)%daughter(2) = n
        tree%branch(m)%mother      = k; tree%branch(n)%mother      = k
        tree%branch(m)%sibling      = n; tree%branch(n)%sibling      = m
        tree%branch(k)%has_children = .true.
      return
    end if
  end do
end subroutine

```

```

        end if
    end if
end do
call phs_tree_write (tree)
call msg_bug &
    & (" Missing daughter branch(es) in phase space tree")
end subroutine branch_set_relatives

```

The inverse: this is trivial, fortunately.

Flip t -channel into s -channel

Flipping the tree is done upwards, beginning from the decay products. First we select a t -channel branch k : one which is set, which does have an IN-bit, and which is not an external particle.

Next, we determine the adjacent in-particle (called the 'friend' f here, since it will provide the reference axis for the angular integration). In addition, we look for the 'mother' and 'sibling' of this particle. If the latter field is empty, we select the (unique) other out-particle which has no mother, calling the internal subroutine `find_orphan`.

The flip is done as follows: We assume that the first daughter d is an s -channel line, which is true if the daughters are sorted. This will stay the first daughter. The second one is a t -channel line; it is exchanged with the 'sibling' s . The new line which replaces the branch k is just the sum of s and d . In addition, we have to rearrange the relatives of s and d , as well of f .

Finally, we flip 'sibling' and 'friend' and set the new s -channel branch n which replaces the t -channel branch k . After this is complete, we are ready to execute another flip.

[Although the friend is not needed for the final flip, since it would be an initial particle anyway, we need to know whether we have t - or u -channel.]

```

<PHS trees: public>+≡
    public :: phs_tree_flip_t_to_s_channel

<PHS trees: procedures>+≡
    subroutine phs_tree_flip_t_to_s_channel (tree)
        type(phs_tree_t), intent(inout) :: tree
        integer(TC) :: k, f, m, n, d, s
        if (tree%n_in == 2) then
            FLIP: do k=3, tree%mask-1
                if (.not. tree%branch(k)%set) cycle FLIP
                f = iand(k,tree%mask_in)
                if (f==0 .or. f==k) cycle FLIP
                m = tree%branch(k)%mother
                s = tree%branch(k)%sibling
                if (s==0) call find_orphan(s)
                d = tree%branch(k)%daughter(1)
                n = ior(d,s)
                tree%branch(k)%set = .false.
                tree%branch(n)%set = .true.
                tree%branch(n)%origin = k
                tree%branch(n)%daughter(1) = d; tree%branch(d)%mother = n
                tree%branch(n)%daughter(2) = s; tree%branch(s)%mother = n

end subroutine phs_tree_flip_t_to_s_channel

```

After the tree has been flipped, one may need to determine what has become of a particular *t*-channel branch. This function gives the bincode of the flipped tree. If the original bincode does not contain IN-bits, we leave it as it is.

(PHS trees: procedures)+≡

```

function tc_flipped (tree, kt) result (ks)
    type(phs_tree_t), intent(in) :: tree
    integer(TC), intent(in) :: kt
    integer(TC) :: ks
    if (iand (kt, tree%mask_in) == 0) then
        ks = kt
    else
        ks = tree%branch(iand (kt, tree%mask_out))%mother
    end if
end function tc_flipped

```

Scan a tree and make sure that the first daughter has always a smaller code than the second one. Furthermore, delete any `friend` entry in the root branch – this branching has the incoming particle direction as axis anyway. Keep track of reordering by updating `inverted_axis`, `inverted_decay` and `firstborn`.

    type(mapping_t), intent(out) :: mapping
    mapping = tree%mapping(tree%mask_out)
  end subroutine phs_tree_assign_s_mapping

```

Kinematics

Fill the mass sum array, starting from the external particles and working down to the tree root. For each bincode k we scan the bits in k ; if only one is set, we take the physical mass of the corresponding external particle; if more than one is set, we sum up the two masses (which we know have already been set).

```

<PHS trees: public>+≡
  public :: phs_tree_set_mass_sum

<PHS trees: procedures>+≡
  subroutine phs_tree_set_mass_sum (tree, flv)
    type(phs_tree_t), intent(inout) :: tree
    type(flavor_t), dimension(:), intent(in) :: flv
    integer(TC) :: k
    integer :: i

              tree%mass_sum(ibclr(k,i)) + tree%mass_sum(ibset(0,i))
          end if
        end if
      end do
    end do
  end subroutine phs_tree_set_mass_sum

```

```

        end do
    end do
end subroutine phs_tree_set_mass_sum

```

Set the effective masses and widths. For each non-resonant branch in a tree, the effective mass is equal to the sum of the effective masses of the children (and analogous for the width). External particles have their real mass and width zero. For resonant branches, we insert mass and width from the corresponding mapping.

This routine has `phs_tree_set_mass_sum` and `phs_tree_set_mapping_parameters` as prerequisites.

(PHS trees: public)+≡

```

public :: phs_tree_set_effective_masses

```

(PHS trees: procedures)+≡

```

            tree%effective_mass(k) = tree%mass_sum(k)
        end if
    end subroutine set_masses_x
end subroutine phs_tree_set_effective_masses

```

Define step mappings, recursively, for the decay products of all intermediate resonances. Step mappings account for the fact that a branch may originate from a resonance, which almost replaces the upper limit on the possible invariant mass. The step mapping implements a smooth cutoff that interpolates between the resonance and the real kinematic limit. The mapping width determines the sharpness of the cutoff.

Step mappings are inserted only for branches that are not mapped otherwise.

At each branch, we record the mass that is effectively available for phase

space, by taking the previous limit and subtracting the effective mass of the sibling branch. Widths are added, not subtracted.

If we encounter a resonance decay, we discard the previous limit and replace it by the mass and width of the resonance, also subtracting the sibling branch.

Initially, the limit is zero, so it becomes negative at any branch. Only if there is a resonance, the limit becomes positive. Whenever the limit is positive, and the current branch decays, we activate a step mapping for the current branch.

As a result, step mappings are implemented for all internal lines that originate from an intermediate resonance decay.

The flag `variable_limits` applies to the ultimate limit from the available energy, not to the intermediate resonances whose masses are always fixed.

This routine requires `phs_tree_set_effective_masses`

```

Structural comparison

This function allows to check whether one tree is the permutation of another one. The permutation is applied to the second tree in the argument list. We do not make up a temporary permuted tree, but compare the two trees directly. The branches are scanned recursively, where for each daughter we check the friend and the mapping as well. Once a discrepancy is found, the recursion is exited immediately.

11.5.4 Phase-space evaluation

Phase-space volume

We compute the phase-space volume recursively, following the same path as for computing other kinematical variables. However, the volume depends just on $\sqrt{\hat{s}}$, not on the momentum configuration.

Note: counting branches, we may replace this by a simple formula.

```

(PHS trees: public)+≡
    public :: phs_tree_compute_volume

(PHS trees: procedures)+≡

Determine momenta

This is done in two steps: First the masses are determined. This step may fail, in which case `ok` is set to false. If successful, we generate angles and the actual momenta. The array `decay_p` serves for transferring the individual three-momenta of the daughter particles in their mother rest frame from the mass generation to the momentum generation step.

```

Mass generation is done recursively. The `ok` flag causes the filled tree to be discarded if set to `.false.`. This happens if a three-momentum turns out to be imaginary, indicating impossible kinematics. The index `ix` tells us how far we have used up the input array `x`.

The heart of phase space generation: Now we have the invariant masses, let us generate angles. At each branch, we take a Lorentz transformation and augment it by a boost to the current particle rest frame, and by rotations ϕ and θ around the z and y axis, respectively. This transformation is passed down to the daughter particles, if present.

```

This subroutine is the most time-critical part of the whole program. Therefore, we do not exactly parallel the angle generation routine above but make sure that things get evaluated only if they are really needed, at the expense of readability. Particularly important is to have as few multiplications of Lorentz transformations as possible.

11.6 The phase-space forest

Simply stated, a phase-space forest is a collection of phase-space trees. More precisely, a `phs_forest` object contains all parameterizations of phase space that `WHIZARD` will use for a single hard process, prepared in the form of `phs_tree` objects. This is suitable for evaluation by the `VAMP` integration package: each parameterization (tree) is a valid channel in the multi-channel adaptive integration, and each variable in a tree corresponds to an integration dimension, defined by an appropriate mapping of the $(0, 1)$ interval to the allowed range of the integration variable.

The trees are grouped in groves. The trees (integration channels) within a grove share a common weight, assuming that they are related by some approximate symmetry.

Trees/channels that are related by an exact symmetry are connected by an array of equivalences; each equivalence object holds the data that relate one channel to another.

The phase-space setup, i.e., the detailed structure of trees and forest, are read from a file. Therefore, this module also contains the syntax definition and the parser needed for interpreting this file.

```

11.6.1 Phase-space setup parameters

This transparent container holds the parameters that the algorithm needs for phase-space setup, with reasonable defaults.

The threshold mass (for considering a particle as effectively massless) is specified separately for s- and t-channel. The default is to treat W and Z bosons as massive in the s-channel, but as massless in the t-channel. The b -quark is treated always massless, the t -quark always massive.

```

11.6.2 Equivalences

This type holds information about equivalences between phase-space trees. We make a linked list, where each node contains the two trees which are equivalent and the corresponding permutation of external particles. Two more arrays are

to be filled: The permutation of mass variables and the permutation of angular variables, where the signature indicates a necessary exchange of daughter branches.

```

(PHS forests: types)+≡
  type :: equivalence_t
  private
    integer :: left, right
    type(permutation_t) :: perm
    type(permutation_t) :: msq_perm, angle_perm
    logical, dimension(:), allocatable :: angle_sig
    type(equivalence_t), pointer :: next => null ()
  end type equivalence_t

```

```

(PHS forests: types)+≡
  type :: equivalence_list_t
  private
    integer :: length = 0
    type(equivalence_t), pointer :: first => null ()
    type(equivalence_t), pointer :: last => null ()
  end type equivalence_list_t

```

Append an equivalence to the list

```

(PHS forests: procedures)+≡
  subroutine equivalence_list_add (eql, left, right, perm)
    type(equivalence_list_t), intent(inout) :: eql
    integer, intent(in) :: left, right

  if (associated (eq%next)) call equivalence_write_rec (eq%next, u)
end subroutine equivalence_write_rec
end subroutine equivalence_list_write

```

11.6.3 Groves

A grove is a group of trees (phase-space channels) that share a common weight in the integration. Within a grove, channels can be declared equivalent, so they also share their integration grids (up to symmetries). The grove contains a list of equivalences. The `tree_count_offset` is the total number of trees of the preceding groves; when the trees are counted per forest (integration channels), the offset has to be added to all tree indices.

```

<PHS forests: types>+≡
  type :: phs_grove_t
  private
  integer :: tree_count_offset
  type(phs_tree_t), dimension(:), allocatable :: tree
  type(equivalence_list_t) :: equivalence_list
end type phs_grove_t

```

Call `phs_tree_init` which is also elemental:

```

<PHS forests: procedures>+≡
  elemental subroutine phs_grove_init &
    (grove, n_trees, n_in, n_out, n_masses, n_angles)
  type(phs_grove_t), intent(inout) :: grove
  integer, intent(in) :: n_trees, n_in, n_out, n_masses, n_angles
  grove%tree_count_offset = 0
  allocate (grove%tree (n_trees))
  call phs_tree_init (grove%tree, n_in, n_out, n_masses, n_angles)

```

```
end subroutine phs_grove_init
```

The trees do not have pointer components, thus no call to `phs_tree_final`:

```
(PHS forests: procedures)+≡
  elemental subroutine phs_grove_final (grove)
    type(phs_grove_t), intent(inout) :: grove
    deallocate (grove%tree)
    call equivalence_list_final (grove%equivalence_list)
  end subroutine phs_grove_final
```

Deep copy.

```
(PHS forests: interfaces)+≡
  interface assignment(=)
    module procedure phs_grove_assign0
    module procedure phs_grove_assign1
  end interface

(PHS forests: procedures)+≡
  subroutine phs_grove_assign0 (grove_out, grove_in)
    type(phs_grove_t), intent(out) :: grove_out
    type(phs_grove_t), intent(in) :: grove_in
    grove_out%tree_count_offset = grove_in%tree_count_offset
    if (allocated (grove_in%tree)) then
      allocate (grove_out%tree (size (grove_in%tree)))
      grove_out%tree = grove_in%tree
    end if
    grove_out%equivalence_list = grove_in%equivalence_list
  end subroutine phs_grove_assign0

  subroutine phs_grove_assign1 (grove_out, grove_in)
    type(phs_grove_t), dimension(:), intent(out) :: grove_out
    type(phs_grove_t), dimension(:), intent(in) :: grove_in
    integer :: i
    do i = 1, size (grove_in)
      call phs_grove_assign0 (grove_out(i), grove_in(i))
    end do
  end subroutine phs_grove_assign1
```

Get the global (s-channel) mappings. Implemented as a subroutine which returns an array (slice).

```
(PHS forests: procedures)+≡
  subroutine phs_grove_assign_s_mappings (grove, mapping)
    type(phs_grove_t), intent(in) :: grove
    type(mapping_t), dimension(:), intent(out) :: mapping
    integer :: i
    if (size (mapping) == size (grove%tree)) then
      do i = 1, size (mapping)
        call phs_tree_assign_s_mapping (grove%tree(i), mapping(i))
      end do
    else
      call msg_bug ("phs_grove_assign_s_mappings: array size mismatch")
    end if
```

```
end subroutine phs_grove_assign_s_mappings
```

11.6.4 The forest type

This is a collection of trees and associated particles. In a given tree, each branch code corresponds to a particle in the `prt` array. Furthermore, we have an array of mass sums which is independent of the decay tree and of the particular event. The mappings directly correspond to the decay trees, and the decay groves collect the trees in classes. The permutation list consists of all permutations of outgoing particles that map the decay forest onto itself.

The particle codes `flv` (one for each external particle) are needed for determining masses and such. The trees and associated information are collected in the `grove` array, together with a lookup table that associates tree indices to groves. Finally, the `prt` array serves as workspace for phase-space evaluation.

The `prt_combination` is a list of index pairs, namely the particle momenta pairs that need to be combined in order to provide all momentum combinations that the phase-space trees need to know.

```
<PHS forests: public>+≡
  public :: phs_forest_t

<PHS forests: types>+≡
  type :: phs_forest_t
    private
    integer :: n_in, n_out, n_tot
    integer :: n_masses, n_angles, n_dimensions
    integer :: n_trees, n_equivalences
    type(flavor_t), dimension(:), allocatable :: flv
    type(phs_grove_t), dimension(:), allocatable :: grove
    integer, dimension(:), allocatable :: grove_lookup
    type(phs_prt_t), dimension(:), allocatable :: prt_in
    type(phs_prt_t), dimension(:), allocatable :: prt_out
    type(phs_prt_t), dimension(:), allocatable :: prt
    integer(TC), dimension(:,:), allocatable :: prt_combination
    type(mapping_t), dimension(:), allocatable :: s_mapping
  contains
    <PHS forests: phs forest: TBP>
  end type phs_forest_t
```

The initialization merely allocates memory. We have to know how many trees there are in each grove, so we can initialize everything. The number of groves is the size of the `n_tree` array.

In the `grove_lookup` table we store the grove index that belongs to each absolute tree index. The difference between the absolute index and the relative (to the grove) index is stored, for each grove, as `tree_count_offset`.

The particle array is allocated according to the total number of branches each tree has, but not filled.

```
<PHS forests: public>+≡
  public :: phs_forest_init
```

(PHS forests: procedures)+≡

```

subroutine phs_forest_init (forest, n_tree, n_in, n_out)
  type(phs_forest_t), intent(inout) :: forest
  integer, dimension(:), intent(in) :: n_tree
  integer, intent(in) :: n_in, n_out
  integer :: g, count, k_root
  forest%n_in = n_in
  forest%n_out = n_out
  forest%n_tot = n_in + n_out
  forest%n_masses = max (n_out - 2, 0)
  forest%n_angles = max (2*n_out - 2, 0)
  forest%n_dimensions = forest%n_masses + forest%n_angles
  forest%n_trees = sum (n_tree)
  forest%n_equivalences = 0
  allocate (forest%grove (size (n_tree)))
  call phs_grove_init &
    (forest%grove, n_tree, n_in, n_out, forest%n_masses, forest%n_angles)
  allocate (forest%grove_lookup (forest%n_trees))
  count = 0
  do g = 1, size (forest%grove)
    forest%grove(g)%tree_count_offset = count
    forest%grove_lookup (count+1:count+n_tree(g)) = g
    count = count + n_tree(g)
  end do
  allocate (forest%pvt_in (n_in))
  allocate (forest%pvt_out (n_out))
  k_root = 2**forest%n_tot - 1
  allocate (forest%pvt (k_root))
  allocate (forest%pvt_combination (2, k_root))
  allocate (forest%s_mapping (forest%n_trees))
end subroutine phs_forest_init

```

Assign the global (s-channel) mappings.

(PHS forests: public)+≡

```

public :: phs_forest_set_s_mappings

```

(PHS forests: procedures)+≡

```

subroutine phs_forest_set_s_mappings (forest)
  type(phs_forest_t), intent(inout) :: forest
  integer :: g, i0, i1, n
  do g = 1, size (forest%grove)
    call phs_forest_get_grove_bounds (forest, g, i0, i1, n)
    call phs_grove_assign_s_mappings &
      (forest%grove(g), forest%s_mapping(i0:i1))
  end do
end subroutine phs_forest_set_s_mappings

```

The grove finalizer is called because it contains the equivalence list:

(PHS forests: public)+≡

```

public :: phs_forest_final

11.6.7 Read the phase space setup from file

The phase space setup is stored in a file. The file may be generated by the `cascades` module below, or by other means. This file has to be read and parsed to create the PHS forest as the internal phase-space representation.

Create lexer and syntax:

```

<PHS forests: procedures>+≡
subroutine define_phs_forest_syntax (ifile)
  type(ifile_t) :: ifile
  call ifile_append (ifile, "SEQ phase_space_list = process_phase_space*")
  call ifile_append (ifile, "SEQ process_phase_space = " &
    // "process_def process_header phase_space")
  call ifile_append (ifile, "SEQ process_def = process process_list")
  call ifile_append (ifile, "KEY process")
  call ifile_append (ifile, "LIS process_list = process_tag*")
  call ifile_append (ifile, "IDE process_tag")
  call ifile_append (ifile, "SEQ process_header = " &
    // "md5sum_process = md5sum " &
    // "md5sum_model_par = md5sum " &
    // "md5sum_phs_config = md5sum " &
    // "sqrts = real " &
    // "m_threshold_s = real " &
    // "m_threshold_t = real " &

```

```

// "off_shell = integer " &
// "t_channel = integer " &
// "keep_nonresonant = logical")
call ifile_append (ifile, "KEY '='")
call ifile_append (ifile, "KEY md5sum_process")
call ifile_append (ifile, "KEY md5sum_model_par")
call ifile_append (ifile, "KEY md5sum_phs_config")
call ifile_append (ifile, "KEY sqrts")
call ifile_append (ifile, "KEY m_threshold_s")
call ifile_append (ifile, "KEY m_threshold_t")
call ifile_append (ifile, "KEY off_shell")
call ifile_append (ifile, "KEY t_channel")
call ifile_append (ifile, "KEY keep_nonresonant")
call ifile_append (ifile, "QUO md5sum = '""' ... '""'")
call ifile_append (ifile, "REA real")
call ifile_append (ifile, "INT integer")
call ifile_append (ifile, "IDE logical")
call ifile_append (ifile, "SEQ phase_space = grove_def+")
call ifile_append (ifile, "SEQ grove_def = grove tree_def+")
call ifile_append (ifile, "KEY grove")
call ifile_append (ifile, "SEQ tree_def = tree bincodes mapping*")
call ifile_append (ifile, "KEY tree")
call ifile_append (ifile, "SEQ bincodes = bincodes*")
call ifile_append (ifile, "INT bincodes")
call ifile_append (ifile, "SEQ mapping = map bincodes channel pdg")
call ifile_append (ifile, "KEY map")
call ifile_append (ifile, "ALT channel = &
    &s_channel | t_channel | u_channel | &
    &collinear | infrared | radiation | on_shell")
call ifile_append (ifile, "KEY s_channel")
! call ifile_append (ifile, "KEY t_channel")    !!! Key already exists
call ifile_append (ifile, "KEY u_channel")
call ifile_append (ifile, "KEY collinear")
call ifile_append (ifile, "KEY infrared")
call ifile_append (ifile, "KEY radiation")
call ifile_append (ifile, "KEY on_shell")
call ifile_append (ifile, "INT pdg")
end subroutine define_phs_forest_syntax

```

The model-file syntax and lexer are fixed, therefore stored as module variables:

```

<PHS forests: variables>≡
type(syntax_t), target, save :: syntax_phs_forest

```

```

<PHS forests: public>+≡
public :: syntax_phs_forest_init

```

```

end do
end subroutine phs_tree_set

```

11.6.8 Preparation

The trees that we read from file do not carry flavor information. This is set separately:

The flavor list must be unique for a unique set of masses; if a given particle can have different flavor, the mass must be degenerate, so we can choose one of the possible flavor combinations.

```

<PHS forests: public>+≡
public :: phs_forest_set_flavors

```

```

(PHS forests: procedures)+≡
  subroutine phs_forest_set_flavors (forest, flv)
    type(phs_forest_t), intent(inout) :: forest
    type(flavor_t), dimension(:), intent(in) :: flv
    allocate (forest%flv (size (flv)))
    forest%flv = flv
  end subroutine phs_forest_set_flavors

```

Once the parameter set is fixed, the masses and the widths of the particles are known and the `mass_sum` arrays as well as the mapping parameters can be computed. Note that order is important: we first compute the mass sums, then the ordinary mappings. The resonances obtained here determine the effective masses, which in turn are used to implement step mappings for resonance decay products that are not mapped otherwise.

```

(PHS forests: public)+≡
  public :: phs_forest_set_parameters

(PHS forests: procedures)+≡
  subroutine phs_forest_set_parameters &
    (forest, mapping_defaults, variable_limits)
    type(phs_forest_t), intent(inout) :: forest

        end if
      end do
    end do
  end subroutine phs_forest_set_parameters

```

Generate the particle combination table. Scan all trees and merge their individual combination tables. At the end, valid entries are non-zero, and they indicate the indices of a pair of particles to be combined to a new particle. If a particle is accessible by more than one tree (this is usual), only keep the first possibility.

```

11.6.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

<PHS forests: procedures>+≡

11.7 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should generate one.

The idea is to construct all Feynman diagrams subject to certain constraints which eliminate everything that is probably irrelevant for the integration. These Feynman diagrams (cascades) are grouped in groves by finding equivalence classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the integration.

This module may eventually disappear and be replaced by CAML code. In particular, we need here a set of Feynman rules (vertices with particle codes, but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program only via the generated ASCII phase-space configuration file.

`<cascades.f90>`≡

```

<File header>

module cascades

  <Use kinds>
    use kinds, only: TC, i8, i32 !NODEP!

```

11.7.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

```

<Mapping modes>≡
  integer, parameter :: &
    & EXTERNAL_PRT = -1, &
    & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &
    & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &
    & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &
    & ON_SHELL = 99

  <Cascades: parameters>≡
    <Mapping modes>

```

11.7.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascade has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a t -channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of t -channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

(Cascades: types)≡

```

type :: cascade_t
  private
  ! counters
  integer :: index = 0
  integer :: grove = 0
  ! status
  logical :: active = .false.

```

11.7.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry in the tree is set undefined because the cascade is not resonant. However, the flavor entry is set, so the cascade flavor is identified nevertheless.

(Cascades: procedures)+≡

```

subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flv
    cascade%pdg = abs (flavor_get_pdg (cascade%flv))
    cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
    cascade%m_min = flavor_get_mass (flv)
    cascade%m_rea = cascade%m_min
    if (cascade%m_rea >= m_thr) then
        cascade%m_eff = cascade%m_rea
    end if
    cascade%on_shell = .true.
    cascade%multiplicity = 1
    cascade%tree(1) = cascade%bincode
    cascade%tree_pdg(1) = cascade%pdg
    cascade%tree_mapping(1) = EXTERNAL_PRT
    cascade%tree_resonant(1) = .false.
end subroutine cascade_init_outgoing

```

The same for an incoming line:

(Cascades: procedures)+≡

```

subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%incoming = .true.
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flavor_anti (flv)
    cascade%pdg = abs (flavor_get_pdg (flv))
    cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
    cascade%m_min = flavor_get_mass (flv)
    cascade%m_rea = cascade%m_min
    if (cascade%m_rea >= m_thr) then
        cascade%m_eff = cascade%m_rea
    end if
end subroutine cascade_init_incoming

```

```

cascade%on_shell = .true.
cascade%n_t_channel = 0
cascade%n_off_shell = 0
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_incoming

```

11.7.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

```

<Cascades: interfaces>≡
  interface operator(.disjunct.)
    module procedure cascade_disjunct
  end interface

<Cascades: procedures>+≡
  function cascade_disjunct (cascade1, cascade2) result (flag)
    logical :: flag
    type(cascade_t), intent(in) :: cascade1, cascade2
    flag = iand (cascade1%bincode, cascade2%bincode) == 0
  end function cascade_disjunct

```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to i8 integers, and compute the hash code from this byte stream.

```

<Cascades: procedures>+≡
  subroutine cascade_assign_resonance_hash (cascade)
    type(cascade_t), intent(inout) :: cascade
    integer(i8), dimension(1) :: mold
    cascade%res_hash = hash (transfer &
      (concat (sort (pack (cascade%tree_pdg, &
        cascade%tree_resonant)), &
        sort (pack (cascade%tree_pdg, &
          cascade%tree_mapping == T_CHANNEL .or. &
          cascade%tree_mapping == U_CHANNEL))), &
      mold))
  end subroutine cascade_assign_resonance_hash

```

11.7.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

```

<Cascades: types>+≡

```

```

type :: cascade_p
type(cascade_t), pointer :: cascade => null ()
type(cascade_p), pointer :: next => null ()
end type cascade_p

```

Here is the bucket or hash entry type:

```

<Cascades: types>+≡
type :: hash_entry_t
integer(i32) :: hashval = 0
integer(i8), dimension(:), allocatable :: key
type(cascade_p), pointer :: first => null ()
type(cascade_p), pointer :: last => null ()
end type hash_entry_t

```

Finalize: just deallocate the list; the contents are just pointers.

```

<Cascades: procedures>+≡
subroutine hash_entry_final (hash_entry)
type(hash_entry_t), intent(inout) :: hash_entry
type(cascade_p), pointer :: current
do while (associated (hash_entry%first))
current => hash_entry%first
hash_entry%first => current%next
deallocate (current)
end do
end subroutine hash_entry_final

```

Output: concise format for debugging, just list cascade indices.

```

<Cascades: procedures>+≡
subroutine hash_entry_write (hash_entry, unit)
type(hash_entry_t), intent(in) :: hash_entry
integer, intent(in), optional :: unit
type(cascade_p), pointer :: current
integer :: u, i
u = output_unit (unit); if (u < 0) return
write (u, "(1x,A)", advance="no") "Entry:"
do i = 1, size (hash_entry%key)
write (u, "(1x,I0)", advance="no") hash_entry%key(i)
end do
write (u, "(1x,A)", advance="no") "->"
current => hash_entry%first
do while (associated (current))
write (u, "(1x,I7)", advance="no") current%cascade%index
current => current%next
end do
write (u, *)
end subroutine hash_entry_write

```

This function adds a cascade pointer to the bucket. If `ok` is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

```

<Cascades: procedures>+≡

```

```

subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(inout) :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out), optional :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  if (present (ok)) then
    call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    if (.not. ok) return
  end if
  allocate (current)
  current%cascade => cascade
  if (associated (hash_entry%last)) then
    hash_entry%last%next => current
  else
    hash_entry%first => current
  end if
  hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr

```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguished only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

(Cascades: procedures) +=

```

subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(in), target :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out) :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  integer, dimension(:), allocatable :: tree_pdg
  ok = .true.
  allocate (tree_pdg (size (cascade%tree_pdg)))
  if (cascade%complete) then
    where (cascade%tree_mapping == INFRARED .or. &
           cascade%tree_mapping == COLLINEAR .or. &
           cascade%tree_mapping == T_CHANNEL .or. &
           cascade%tree_mapping == U_CHANNEL)
      tree_pdg = 0
    elsewhere

    select case (pdg1)
    case (0)
      flag = .true.
    case default
      select case (pdg2)
      case (0)
        flag = .true.
      case default
        flag = pdg1 == pdg2
      end select
    end select
  end function pdg_match

```

11.7.6 The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a linked list. In addition to the usual **first** and **last** pointers, there is a **first_t** pointer which points to the first t-channel cascade (after all s-channel cascades), and a **first_k** pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated parameters where an additional pointer is stored for each cascade. The keys are

made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

```

<Cascades: public>≡
    public :: cascade_set_t

<Cascades: types>+≡
    type :: cascade_set_t
    private

```

11.7.7 Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original, but the pointers are nullified. We do not care whether insertion was successful or not. The pointer argument, if present, is assigned to the input cascade, or to the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-copied and added to the cascade set before the current copy is added.

(*Cascades: procedures*)+≡

```

recursive subroutine cascade_set_add_copy &
    (cascade_set, cascade_in, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in) :: cascade_in
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_t), pointer :: cascade
    logical :: ok
    allocate (cascade)
    cascade = cascade_in
    if (associated (cascade_in%daughter1)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter1, cascade%daughter1)
    if (associated (cascade_in%daughter2)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter2, cascade%daughter2)
    if (associated (cascade_in%mother)) call cascade_set_add_copy &
        (cascade_set, cascade_in%mother, cascade%mother)
    cascade%next => null ()
    call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    if (.not. ok) deallocate (cascade)
end subroutine cascade_set_add_copy

```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

```

<Cascades: procedures>+=
  subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    integer(i8), dimension(1) :: mold
    call cascade_set_hash_insert &
      (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
    if (ok) call cascade_set_list_add (cascade_set, cascade)
  end subroutine cascade_set_add

```

Add a new cascade to the list:

```

<Cascades: procedures>+=
  subroutine cascade_set_list_add (cascade_set, cascade)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    if (associated (cascade_set%last)) then
      cascade_set%last%next => cascade
    else
      cascade_set%first => cascade
    end if
    cascade_set%last => cascade
  end subroutine cascade_set_list_add

```

Add a cascade entry to the hash array:

```

<Cascades: procedures>+=
  subroutine cascade_set_hash_insert &
    (cascade_set, key, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    integer(i8), dimension(:), intent(in) :: key
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    integer(i32) :: h
    if (cascade_set%n_entries >= cascade_set%n_entries_max) &
      call cascade_set_hash_expand (cascade_set)
    h = hash (key)
    call cascade_set_hash_insert_rec &
      (cascade_set, h, h, key, cascade, ok, cascade_ptr)
  end subroutine cascade_set_hash_insert

```

Double the hashtable size when necessary:

```

<Cascades: procedures>+=
  subroutine cascade_set_hash_expand (cascade_set)

```

```

type(cascade_set_t), intent(inout), target :: cascade_set
type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
type(cascade_p), pointer :: current
integer :: i, s
allocate (table_tmp (0:cascade_set%mask))
table_tmp = cascade_set%entry
deallocate (cascade_set%entry)
s = 2 * size (table_tmp)
cascade_set%n_entries = 0
cascade_set%n_entries_max = s * cascade_set%fill_ratio
cascade_set%mask = s - 1
allocate (cascade_set%entry (0:cascade_set%mask))
do i = 0, ubound (table_tmp, 1)
  current => table_tmp(i)%first
  do while (associated (current))
    call cascade_set_hash_insert_rec &
      (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
        table_tmp(i)%key, current%cascade)
    current => current%next
  end do
end do
end subroutine cascade_set_hash_expand

```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If ok is present, before insertion we check whether the cascade is already stored, and return failure if yes.

(Cascades: procedures)+≡

```

recursive subroutine cascade_set_hash_insert_rec &
  (cascade_set, h, hashval, key, cascade, ok, cascade_ptr)
type(cascade_set_t), intent(inout) :: cascade_set
integer(i32), intent(in) :: h, hashval
integer(i8), dimension(:), intent(in) :: key
type(cascade_t), intent(in), target :: cascade
logical, intent(out), optional :: ok
type(cascade_t), optional, pointer :: cascade_ptr
integer(i32) :: i
i = iand (h, cascade_set%mask)
if (allocated (cascade_set%entry(i)%key)) then
  if (size (cascade_set%entry(i)%key) /= size (key)) then
    call cascade_set_hash_insert_rec &
      (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
  else if (any (cascade_set%entry(i)%key /= key)) then
    call cascade_set_hash_insert_rec &
      (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
  else
    call hash_entry_add_cascade_ptr &
      (cascade_set%entry(i), cascade, ok, cascade_ptr)
  end if
else

```

```

        cascade_set%entry(i)%hashval = hashval
        allocate (cascade_set%entry(i)%key (size (key)))
        cascade_set%entry(i)%key = key
        call hash_entry_add_cascade_ptr &
            (cascade_set%entry(i), cascade, ok, cascade_ptr)
        cascade_set%n_entries = cascade_set%n_entries + 1
    end if
end subroutine cascade_set_hash_insert_rec

```

11.7.8 External particles

We want to initialize the cascade set with the outgoing particles. In case of multiple processes, initial cascades are prepared for all of them. The hash array check ensures that no particle appears more than once at the same place.

(Cascades: interfaces)+≡

```

interface cascade_set_add_outgoing
    module procedure cascade_set_add_outgoing1
    module procedure cascade_set_add_outgoing2
end interface

```

(Cascades: procedures)+≡

```

subroutine cascade_set_add_outgoing2 (cascade_set, flv)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(flavor_t), dimension(:,:), intent(in) :: flv
    integer :: pos, prc, n_out, n_prc
    type(cascade_t), pointer :: cascade
    logical :: ok
    n_out = size (flv, dim=1)
    n_prc = size (flv, dim=2)
    do prc = 1, n_prc
        do pos = 1, n_out
            allocate (cascade)
            call cascade_init_outgoing &
                (cascade, flv(pos,prc), pos, cascade_set%m_threshold_s)
            call cascade_set_add (cascade_set, cascade, ok)
            if (.not. ok) then
                deallocate (cascade)
            end if
        end do
    end do
end subroutine cascade_set_add_outgoing2

subroutine cascade_set_add_outgoing1 (cascade_set, flv)

        cascade_set%first_t => cascade
    end if
else
    deallocate (cascade)
end if
end subroutine cascade_set_add_incoming0

```

11.7.9 Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

(Cascades: procedures)+≡

```

subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2
    logical, intent(in) :: s_channel
    integer, dimension(:), allocatable :: pdg3
    integer :: i, depth_max
    type(flavor_t) :: flv
    if (s_channel) then
        depth_max = cascade_set%depth_out
    else
        depth_max = cascade_set%depth_tot
    end if
    if (cascade1%depth + cascade2%depth < depth_max) then
        call model_match_vertex (cascade_set%model, &
            flavor_get_pdg (cascade1%flv), &
            flavor_get_pdg (cascade2%flv), &
            pdg3)
        do i = 1, size (pdg3)
            call flavor_init (flv, pdg3(i), cascade_set%model)
            if (s_channel) then
                call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
            else
                call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
            end if
        end do
        deallocate (pdg3)
    end if
end subroutine cascade_match_pair

```

```

    end if
end subroutine cascade_match_pair

```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

```

(Cascades: procedures)+≡
subroutine cascade_match_triplet &
    (cascade_set, cascade1, cascade2, cascade3, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
    logical, intent(in) :: s_channel
    integer :: depth_max
    depth_max = cascade_set%depth_tot
    if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
        if (model_check_vertex (cascade_set%model, &
            flavor_get_pdg (cascade1%flv), &
            flavor_get_pdg (cascade2%flv), &
            flavor_get_pdg (cascade3%flv))) then
            call cascade_combine_keystone &
                (cascade_set, cascade1, cascade2, cascade3, s_channel)
        end if
    end if
end subroutine cascade_match_triplet

```

11.7.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

```

(Cascades: procedures)+≡
subroutine cascade_combine_s (cascade_set, cascade1, cascade2, flv)

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a $2 \rightarrow 1$ process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

11.7.11 Cascade combination III: node connections and tree fusion

Here we assign global tree properties. If the allowed number of off-shell lines is exceeded, discard the new cascade. Otherwise, assign the trees, sort them, and assign connections. Finally, append the cascade to the list. This may fail (because in the hash array there is already an equivalent cascade). On failure, discard the cascade.

(Cascades: procedures)+≡

11.7.13 Groves

Before assigning groves, assign hashcodes to the resonance patterns, so they can easily be compared.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_resonance_hash (cascade_set)
  type(cascade_set_t), intent(inout) :: cascade_set
  type(cascade_t), pointer :: cascade
  cascade => cascade_set%first_k
  do while (associated (cascade))
    call cascade_assign_resonance_hash (cascade)
    cascade => cascade%next
  end do
end subroutine cascade_set_assign_resonance_hash

```

After all cascades are recorded, we group the complete cascades in groves. A grove consists of cascades with identical multiplicity, number of resonances, log-enhanced, t-channel lines, and resonance flavors.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_groves (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  integer :: multiplicity
  integer :: n_resonances, n_log_enhanced, n_t_channel, n_off_shell
  integer :: res_hash

```

```

integer :: grove
grove = 0
cascade1 => cascade_set%first_k
do while (associated (cascade1))
  if (cascade1%active .and. cascade1%complete &
      .and. cascade1%grove == 0) then
    grove = grove + 1
    cascade1%grove = grove
    multiplicity = cascade1%multiplicity
    n_resonances = cascade1%n_resonances
    n_log_enhanced = cascade1%n_log_enhanced
    n_off_shell = cascade1%n_off_shell
    n_t_channel = cascade1%n_t_channel
    res_hash = cascade1%res_hash
    cascade2 => cascade1%next
    do while (associated (cascade2))
      if (cascade2%grove == 0) then
        if (cascade2%multiplicity == multiplicity &
            .and. cascade2%n_resonances == n_resonances &
            .and. cascade2%n_log_enhanced == n_log_enhanced &
            .and. cascade2%n_off_shell == n_off_shell &
            .and. cascade2%n_t_channel == n_t_channel &
            .and. cascade2%res_hash == res_hash) then
          cascade2%grove = grove
        end if
      end if
      call terminate_now_if_signal ()
      cascade2 => cascade2%next
    end do
  end if
  call terminate_now_if_signal ()
  cascade1 => cascade1%next
end do
cascade_set%n_groves = grove
end subroutine cascade_set_assign_groves

```

11.7.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redundancies between flavor assignments.

```

<Cascades: public>+=
  public :: cascade_set_generate

<Cascades: procedures>+=
  subroutine cascade_set_generate &
    (cascade_set, model, n_in, n_out, flv, phs_par, fatal_beam_decay)

```

```

type(cascade_set_t), intent(out) :: cascade_set
type(model_t), intent(in), target :: model
integer, intent(in) :: n_in, n_out
type(flavor_t), dimension(:,:), intent(in) :: flv
type(phs_parameters_t), intent(in) :: phs_par
logical, intent(in) :: fatal_beam_decay
type(cascade_set_t), dimension(:), allocatable :: cset
type(cascade_t), pointer :: cascade
integer :: i
if (phase_space_vanishes (phs_par%sqrts, n_in, flv)) return
call cascade_set_init (cascade_set, model, n_in, n_out, phs_par, &
    fatal_beam_decay, flv)
allocate (cset (size (flv, 2)))
do i = 1, size (cset)
    call cascade_set_generate_single (cset(i), &
        model, n_in, n_out, flv(:,i), phs_par, fatal_beam_decay)
    cascade => cset(i)%first_k
    do while (associated (cascade))
        if (cascade%active .and. cascade%complete) then
            call cascade_set_add_copy (cascade_set, cascade)
        end if
        cascade => cascade%next
    end do
    call cascade_set_final (cset(i))
end do
cascade_set%first_k => cascade_set%first
call cascade_set_assign_resonance_hash (cascade_set)
call cascade_set_assign_groves (cascade_set)
end subroutine cascade_set_generate

```

This generates phase space for a single channel, without assigning groves.

(Cascades: procedures)+≡

```

11.8 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and the `cascades` module for generating phase-space channels. As an extension of the `phs_base` abstract type, the phase-space configuration and instance implement the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD. For trivial two-particle phase space, there is `phs_wood` as an alternative.)

`<phs_wood.f90>`≡

11.8.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

```

        phs%forest = phs_config%forest
      end select
  end subroutine phs_wood_init

```

11.8.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

```

Chapter 12

Random Number Generation

The integration and event generation modules need a random-number generator. Here, we provide an abstract interface for a random-number generator and a concrete implementation.

Module `rng_base`: Abstract type for interfacing or implementing a r.n.g.

Module `rng_tao`: Implementation as an interface to the TAO random number generator which the VAMP package provides.

Module `selectors`: Select from a range of integers based on a set of weights and a random-number generator.

12.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

```
<rng_base.f90>≡  
  <File header>
```

```
module rng_base
```

```
  use kinds !NODEP!
```

```
  <Use file utils>
```

```
  use unit_tests
```

```
  <Standard module head>
```

```
  <RNG base: public>
```

```
  <RNG base: types>
```

<RNG base: interfaces>

<RNG base: test types>

contains

<RNG base: tests>

end module rng_base

12.1.1 Generator type

The `rng` object is actually the state of the random-number generator. The methods `initialize/reset` and `call` the generator for this state.

<RNG base: public>≡

public :: rng_t

<RNG base: types>≡

type, abstract :: rng_t

contains

<RNG base: rng: TBP>

end type rng_t

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The behavior without seed is not defined, however.

<RNG base: rng: TBP>≡

procedure (rng_init), deferred :: init

<RNG base: interfaces>≡

abstract interface

subroutine rng_init (rng, seed)

import

class(rng_t), intent(out) :: rng

integer, intent(in), optional :: seed

end subroutine rng_init

end interface

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

<RNG base: rng: TBP>+≡

procedure (rng_final), deferred :: final

<RNG base: interfaces>+≡

abstract interface

subroutine rng_final (rng)

import

class(rng_t), intent(inout) :: rng

end subroutine rng_final

end interface

Output. We should, at least, identify the generator.

```

<RNG base: rng: TBP>+≡
  procedure (rng_write), deferred :: write
<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_write (rng, unit, indent)
      import
      class(rng_t), intent(in) :: rng
      integer, intent(in), optional :: unit, indent
    end subroutine rng_write
  end interface

```

These routines generate a single and an array of default-precision random numbers, respectively.

```

<RNG base: rng: TBP>+≡
  generic :: generate => generate_single, generate_array
  procedure (rng_generate_single), deferred :: generate_single
  procedure (rng_generate_array), deferred :: generate_array
<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_generate_single (rng, x)
      import
      class(rng_t), intent(inout) :: rng
      real(default), intent(out) :: x
    end subroutine rng_generate_single
  end interface

  abstract interface
    subroutine rng_generate_array (rng, x)
      import
      class(rng_t), intent(inout) :: rng
      real(default), dimension(:), intent(out) :: x
    end subroutine rng_generate_array
  end interface

```

12.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

```

<RNG base: public>+≡
  public :: rng_factory_t
<RNG base: types>+≡
  type, abstract :: rng_factory_t
    contains
    <RNG base: rng factory: TBP>
  end type rng_factory_t

```

Output. Should be short, just report the seed and current state of the factory.

```

<RNG base: rng factory: TBP>≡
  procedure (rng_factory_write), deferred :: write

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_write (object, unit)
      import
      class(rng_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine rng_factory_write
  end interface

```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

```

<RNG base: rng factory: TBP>+≡
  procedure (rng_factory_init), deferred :: init

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_init (factory, seed)
      import
      class(rng_factory_t), intent(out) :: factory
      integer(i16), intent(in), optional :: seed
    end subroutine rng_factory_init
  end interface

```

Spawn a new generator.

```

<RNG base: rng factory: TBP>+≡
  procedure (rng_factory_make), deferred :: make

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_make (factory, rng)
      import
      class(rng_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
    end subroutine rng_factory_make
  end interface

```

12.1.3 Unit tests

```

<RNG base: public>+≡
  public :: rng_base_test

<RNG base: tests>≡
  subroutine rng_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <RNG base: execute tests>
  end subroutine rng_base_test

```

Test generator

The test 'mock' random generator generates a repeating series with the numbers 0.1, 0.3, 0.5, 0.7, 0.9. It has an integer stored as state. The integer must be one of 1, 3, 5, 7, 9.

```
<RNG base: public>+≡
    public :: rng_test_t

<RNG base: test types>≡
    type, extends (rng_t) :: rng_test_t
        integer :: state = 1
    contains
        procedure :: write => rng_test_write
        procedure :: init => rng_test_init
        procedure :: final => rng_test_final
        procedure :: generate_single => rng_test_generate_single
        procedure :: generate_array => rng_test_generate_array
    end type rng_test_t
```

Output. The state is a single number, so print it.

```
<RNG base: tests>+≡
    subroutine rng_test_write (rng, unit, indent)
        class(rng_test_t), intent(in) :: rng
        integer, intent(in), optional :: unit, indent
        integer :: u, ind
        u = output_unit (unit)
        ind = 0; if (present (indent)) ind = indent
        call write_indent (u, ind)
        write (u, "(A,IO,A)") "Random-number generator: &
            &test (state = ", rng%state, ")"
    end subroutine rng_test_write
```

The default seed is 1.

```
<RNG base: tests>+≡
    subroutine rng_test_init (rng, seed)
        class(rng_test_t), intent(out) :: rng
        integer, intent(in), optional :: seed
        if (present (seed)) rng%state = seed
    end subroutine rng_test_init
```

Nothing to finalize:

```
<RNG base: tests>+≡
    subroutine rng_test_final (rng)
        class(rng_test_t), intent(inout) :: rng
    end subroutine rng_test_final
```

Generate a single number and advance the state.

```
<RNG base: tests>+≡
    subroutine rng_test_generate_single (rng, x)
        class(rng_test_t), intent(inout) :: rng
        real(default), intent(out) :: x
        x = rng%state / 10._default
```

```

    rng%state = mod (rng%state + 2, 10)
end subroutine rng_test_generate_single

```

The array generator calls the single-item generator multiple times.

```

<RNG base: tests>+≡
subroutine rng_test_generate_array (rng, x)
  class(rng_test_t), intent(inout) :: rng
  real(default), dimension(:), intent(out) :: x
  integer :: i
  do i = 1, size (x)
    call rng%generate (x(i))
  end do
end subroutine rng_test_generate_array

```

Test Factory

This factory makes `rng_test_t` generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

```

<RNG base: public>+≡
  public :: rng_test_factory_t

<RNG base: test types>+≡
  type, extends (rng_factory_t) :: rng_test_factory_t
    integer :: seed = 1
    contains
    <RNG base: rng test factory: TBP>
  end type rng_test_factory_t

```

Output.

```

<RNG base: rng test factory: TBP>≡
  procedure :: write => rng_test_factory_write

<RNG base: tests>+≡
subroutine rng_test_factory_write (object, unit)
  class(rng_test_factory_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(1x,A,I0,A)") "RNG factory: test (", object%seed, ")"
end subroutine rng_test_factory_write

```

Initialize, translating the given seed.

```

<RNG base: rng test factory: TBP>+≡
  procedure :: init => rng_test_factory_init

<RNG base: tests>+≡
subroutine rng_test_factory_init (factory, seed)
  class(rng_test_factory_t), intent(out) :: factory
  integer(i16), intent(in), optional :: seed
  if (present (seed)) factory%seed = mod (seed * 2 + 1, 10)
end subroutine rng_test_factory_init

```

```

(RNG base: rng test factory: TBP)+≡
  procedure :: make => rng_test_factory_make

(RNG base: tests)+≡
  subroutine rng_test_factory_make (factory, rng)
    class(rng_test_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
    allocate (rng_test_t :: rng)

```

12.2 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

```
<rng_tao.f90>≡  
<File header>  
  
module rng_tao  
  
    use kinds !NODEP!  
<Use file utils>  
    use unit_tests  
    use tao_random_numbers !NODEP!  
  
    use rng_base  
  
<Standard module head>  
  
<RNG tao: public>  
  
<RNG tao: types>  
  
contains  
  
<RNG tao: procedures>  
  
<RNG tao: tests>  
  
end module rng_tao
```

12.2.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

```
<RNG tao: public>≡  
    public :: rng_tao_t  
  
<RNG tao: types>≡  
    type, extends (rng_t) :: rng_tao_t  
        integer :: seed = 0  
        integer :: n_calls = 0  
        type(tao_random_state) :: state  
    contains  
        <RNG tao: rng tao: TBP>  
    end type rng_tao_t
```

Output: Display seed and number of calls.

```

(RNG tao: rng tao: TBP)≡
  procedure :: write => rng_tao_write

(RNG tao: procedures)≡
  subroutine rng_tao_write (rng, unit, indent)
    class(rng_tao_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A)") "TA0 random-number generator:"
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "seed = ", rng%seed
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "calls = ", rng%n_calls
  end subroutine rng_tao_write

```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

```

(RNG tao: rng tao: TBP)+≡
  procedure :: init => rng_tao_init

(RNG tao: procedures)+≡
  subroutine rng_tao_init (rng, seed)
    class(rng_tao_t), intent(out) :: rng
    integer, intent(in), optional :: seed
    if (present (seed)) rng%seed = seed
    call tao_random_create (rng%state, rng%seed)
  end subroutine rng_tao_init

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

(RNG tao: rng tao: TBP)+≡
  procedure :: final => rng_tao_final

(RNG tao: procedures)+≡
  subroutine rng_tao_final (rng)
    class(rng_tao_t), intent(inout) :: rng
    call tao_random_destroy (rng%state)
  end subroutine rng_tao_final

```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

```

(RNG tao: rng tao: TBP)+≡
  procedure :: generate_single => rng_tao_generate_single
  procedure :: generate_array => rng_tao_generate_array

```

```

<RNG tao: procedures>+=
  subroutine rng_tao_generate_single (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), intent(out) :: x
    real(default) :: r
    call tao_random_number (rng%state, r)
    x = r
    rng%n_calls = rng%n_calls + 1
  end subroutine rng_tao_generate_single

  subroutine rng_tao_generate_array (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    real(default) :: r
    integer :: i
    do i = 1, size (x)
      call tao_random_number (rng%state, r)
      x(i) = r
    end do
    rng%n_calls = rng%n_calls + size (x)
  end subroutine rng_tao_generate_array

```

Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \quad (12.1)$$

where s_0 is the seed (a 16-bit integer) given to the factory object, and i is the index in the generated sequence of generators, starting with zero.

```

<RNG tao: public>+=
  public :: rng_tao_factory_t

<RNG tao: types>+=
  type, extends (rng_factory_t) :: rng_tao_factory_t
    integer(i16) :: s = 0
    integer(i16) :: i = 0
  contains
    <RNG tao: rng tao factory: TBP>
  end type rng_tao_factory_t

```

Output.

```

<RNG tao: rng tao factory: TBP>=
  procedure :: write => rng_tao_factory_write

<RNG tao: procedures>+=
  subroutine rng_tao_factory_write (object, unit)
    class(rng_tao_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = output_unit (unit)
    write (u, "(1x,A,2(I0,A))") &
      "RNG factory: tao (" , object%s, ", ", object%i, ")"

```

```
end subroutine rng_tao_factory_write
```

Initialize, translating the given seed.

```
<RNG tao: rng tao factory: TBP>+≡
  procedure :: init => rng_tao_factory_init

<RNG tao: procedures>+≡
  subroutine rng_tao_factory_init (factory, seed)
    class(rng_tao_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    if (present (seed)) factory%s = seed
  end subroutine rng_tao_factory_init

<RNG tao: rng tao factory: TBP>+≡
  procedure :: make => rng_tao_factory_make

<RNG tao: procedures>+≡
  subroutine rng_tao_factory_make (factory, rng)
    class(rng_tao_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
    allocate (rng_tao_t :: rng)
    select type (rng)
      type is (rng_tao_t)
        call rng%init (factory%s * 65536 + factory%i)
        factory%i = int (factory%i + 1, kind = i16)
      end select
  end subroutine rng_tao_factory_make
```

12.2.2 Unit tests

Chapter 13

Multi-Channel Integration

In this chapter we provide a generic module for handling multi-channel phase space and concrete implementations.

Module mci_base: The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

Module mci_midpoint: A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

Module mci_vamp: Interface for the VAMP package.

13.1 Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

```
<mci_base.f90>≡  
<File header>  
  
module mci_base  
  
    use kinds !NODEP!  
    <Use strings>  
    <Use file utils>  
    use limits, only: FMT_14, FMT_17 !NODEP!  
    use diagnostics !NODEP!  
    use unit_tests  
    use cputime  
  
    use phs_base  
    use rng_base  
  
    <Standard module head>  
  
    <MCI base: public>
```

```

    <MCI base: types>

    <MCI base: interfaces>

    <MCI base: test types>

contains

    <MCI base: procedures>

    <MCI base: tests>

end module mci_base

```

13.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as `rng`. It may or may not be used for integration. It will be used for event generation.

```

<MCI base: public>≡
    public :: mci_t

<MCI base: types>≡

  end subroutine mci_startup_message

```

Record the index of the MCI object within a process. For multi-component processes with more than one integrator, the integrator should know about its own index, so file names can be unique, etc. The default implementation does nothing, however.

```

<MCI base: mci: TBP>+=
  procedure :: record_index => mci_record_index

<MCI base: procedures>+=
  subroutine mci_record_index (mci, i_mci)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: i_mci
  end subroutine mci_record_index

```

There is no Initializer for the abstract type, but a generic setter for the number of channels and dimensions. We make two aliases available, to be able to override it.

```

<MCI base: mci: TBP>+=
  procedure :: set_dimensions => mci_set_dimensions
  procedure :: base_set_dimensions => mci_set_dimensions

<MCI base: procedures>+=
  subroutine mci_set_dimensions (mci, n_dim, n_channel)
    class(mci_t), intent(inout) :: mci

```

```

integer, intent(in) :: n_dim
integer, intent(in) :: n_channel
mci%n_dim = n_dim
mci%n_channel = n_channel
end subroutine mci_set_dimensions

```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions

<MCI base: interfaces>≡
  abstract interface
    subroutine mci_declare_flat_dimensions (mci, dim_flat)
      import
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_declare_flat_dimensions
  end interface

```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_equivalences), deferred :: declare_equivalences

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_equivalences (mci, channel, dim_offset)
      import
      class(mci_t), intent(inout) :: mci

    integer :: i, c
    allocate (x_in (mci%n_dim))
    allocate (f (mci%n_channel))

```

```

allocate (x_out (mci%n_dim, mci%n_channel))
do i = 1, n_calls
  c = mod (i, mci%n_channel) + 1
  call mci%rng%generate_array (x_in)
  call sampler%evaluate (c, x_in, val, x_out, f)
end do
end subroutine mci_sampler_test

```

Integrate: this depends on the implementation. We foresee a pacify flag to take care of small numerical noise on different platforms.

```

⟨MCI base: mci: TBP⟩+≡
  procedure (mci_integrate), deferred :: integrate

⟨MCI base: interfaces⟩+≡
  abstract interface
    subroutine mci_integrate (mci, instance, sampler, &
      n_it, n_calls, results, pacify)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      logical, intent(in), optional :: pacify
      class(mci_results_t), intent(inout), optional :: results
    end subroutine mci_integrate
  end interface

```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box **simulate** method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has **intent(inout)** for the **mci** passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the **mci** record.

```

⟨MCI base: mci: TBP⟩+≡
  procedure (mci_prepare_simulation), deferred :: prepare_simulation

⟨MCI base: interfaces⟩+≡
  abstract interface
    subroutine mci_prepare_simulation (mci)
      import
      class(mci_t), intent(inout) :: mci
    end subroutine mci_prepare_simulation
  end interface

```

The generated event will reside in in the **instance** object (overall results and weight) and in the **sampler** object (detailed data). In the real application, we can subsequently call methods of the **sampler** in order to further process the generated event.

The `target` attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

```

(MCI base: mci: TBP)+≡
  procedure (mci_generate), deferred :: generate_weighted_event
  procedure (mci_generate), deferred :: generate_unweighted_event

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_generate (mci, instance, sampler)

        md5sum = mci%md5sum
    end function mci_get_md5sum

```

13.1.2 MCI instance

The base type contains an array of channel weights. The value `mci_weight` is the combined MCI weight that corresponds to a particular sampling point.

For convenience, we also store the `x` and Jacobian values for this sampling point.

```

<MCI base: public>+≡
    public :: mci_instance_t

```

```

<MCI base: types>+≡
  type, abstract :: mci_instance_t
    logical :: valid = .false.
    real(default), dimension(:), allocatable :: w
    real(default), dimension(:), allocatable :: f
    real(default), dimension(:,:), allocatable :: x
    integer :: selected_channel = 0
    real(default) :: mci_weight = 0
    real(default) :: integrand = 0
  contains
    <MCI base: mci instance: TBP>
  end type mci_instance_t

```

Output: deferred

```

<MCI base: mci instance: TBP>≡
  procedure (mci_instance_write), deferred :: write
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_instance_write (object, unit, pacify)
      import
      class(mci_instance_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: pacify
    end subroutine mci_instance_write
  end interface

```

A finalizer, just in case.

```

<MCI base: mci instance: TBP>+≡
  procedure (mci_instance_final), deferred :: final
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_instance_final (object)
      import
      class(mci_instance_t), intent(inout) :: object
    end subroutine mci_instance_final
  end interface

```

Init: basic initializer for the arrays, otherwise deferred. Assigning the mci object is also deferred, because it depends on the concrete type.

The weights are initialized with an uniform normalized value.

```

<MCI base: mci instance: TBP>+≡
  procedure (mci_instance_base_init), deferred :: init
  procedure :: base_init => mci_instance_base_init
<MCI base: procedures>+≡
  subroutine mci_instance_base_init (mci_instance, mci)
    class(mci_instance_t), intent(out) :: mci_instance
    class(mci_t), intent(in), target :: mci
    allocate (mci_instance%w (mci%n_channel))
    allocate (mci_instance%f (mci%n_channel))
    allocate (mci_instance%x (mci%n_dim, mci%n_channel))

```

```

    if (size (mci_instance%w) /= 0) then
        mci_instance%w = 1._default / size (mci_instance%w)
    end if
    mci_instance%f = 0
    mci_instance%x = 0
end subroutine mci_instance_base_init

```

Compute the overall weight factor for a configuration of x values and Jacobians f . The x values come in `n_channel` rows with `n_dim` entries each. The f factors constitute an array with `n_channel` entries.

We assume that the x and f arrays are already stored inside the MC instance. The result is also stored there.

```

<MCI base: mci_instance: TBP>+≡
    procedure (mci_instance_compute_weight), deferred :: compute_weight

<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_compute_weight (mci, c)
            import
            class(mci_instance_t), intent(inout) :: mci
            integer, intent(in) :: c
        end subroutine mci_instance_compute_weight
    end interface

```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

```

<MCI base: mci_instance: TBP>+≡
    procedure (mci_instance_record_integrand), deferred :: record_integrand

<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_record_integrand (mci, integrand)
            import
            class(mci_instance_t), intent(inout) :: mci
            real(default), intent(in) :: integrand
        end subroutine mci_instance_record_integrand
    end interface

```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

```

<MCI base: mci_instance: TBP>+≡
    procedure :: evaluate => mci_instance_evaluate

<MCI base: procedures>+≡
    subroutine mci_instance_evaluate (mci, sampler, c, x)
        class(mci_instance_t), intent(inout) :: mci

```

```

class(mci_sampler_t), intent(inout) :: sampler
integer, intent(in) :: c
real(default), dimension(:), intent(in) :: x
real(default) :: val
call sampler%evaluate (c, x, val, mci%x, mci%f)
mci%valid = sampler%is_valid ()
if (mci%valid) then
  call mci%compute_weight (c)
  call mci%record_integrand (val)
end if
end subroutine mci_instance_evaluate

```

Initiate and terminate simulation. In contrast to integration, we implement these as methods of the process instance, since the `mci` configuration object is unchanged.

The safety factor reduces the acceptance probability for unweighted events. The implementation of this feature depends on the concrete type.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure (mci_instance_init_simulation), deferred :: init_simulation
  procedure (mci_instance_final_simulation), deferred :: final_simulation

⟨MCI base: interfaces⟩+≡

    end if
  end subroutine mci_instance_fetch

```

```

        end if
    end subroutine mci_instance_fetch

```

The value, i.e., the weighted integrand, is the integrand (which should be taken as-is from the sampler) multiplied by the MCI weight.

```

⟨MCI base: mci instance: TBP⟩+≡
    procedure :: get_value => mci_instance_get_value

⟨MCI base: procedures⟩+≡
    function mci_instance_get_value (mci) result (value)
        class(mci_instance_t), intent(in) :: mci
        real(default) :: value
        if (mci%valid) then
            value = mci%integrand * mci%mci_weight
        else
            value = 0
        end if
    end function mci_instance_get_value

```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

```

⟨MCI base: mci instance: TBP⟩+≡
    procedure :: get_event_weight => mci_instance_get_value

```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized in the same way as the event weight above (which for unweighted events becomes unity).

```

⟨MCI base: mci instance: TBP⟩+≡
    procedure (mci_instance_get_event_excess), deferred :: get_event_excess

⟨MCI base: interfaces⟩+≡
    abstract interface
        function mci_instance_get_event_excess (mci) result (excess)
            import
            class(mci_instance_t), intent(in) :: mci
            real(default) :: excess
        end function mci_instance_get_event_excess
    end interface

```

13.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

```

<MCI base: public>+≡
  public :: mci_state_t

<MCI base: types>+≡
  type :: mci_state_t
    integer :: selected_channel = 0
    real(default), dimension(:), allocatable :: x_in
    real(default) :: val
  contains
    <MCI base: mci state: TBP>
  end type mci_state_t

```

Output:

```

<MCI base: mci state: TBP>≡
  procedure :: write => mci_state_write

<MCI base: procedures>+≡
  subroutine mci_state_write (object, unit)
    class(mci_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = output_unit (unit)
    write (u, "(1x,A)") "MCI state:"
    write (u, "(3x,A,I0)") "Channel   = ", object%selected_channel
    write (u, "(3x,A,999(1x,F12.10))") "x (in)   =", object%x_in
    write (u, "(3x,A,ES19.12)") "Integrand = ", object%val
  end subroutine mci_state_write

```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

```

<MCI base: mci instance: TBP>+≡
  procedure :: store => mci_instance_store

<MCI base: procedures>+≡
  subroutine mci_instance_store (mci, state)
    class(mci_instance_t), intent(in) :: mci
    class(mci_state_t), intent(out) :: state
    state%selected_channel = mci%selected_channel
    allocate (state%x_in (size (mci%x, 1)))
    state%x_in = mci%x(:,mci%selected_channel)
    state%val = mci%integrand
  end subroutine mci_instance_store

```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

```

<MCI base: mci instance: TBP>+≡
  procedure :: recall => mci_instance_recall

```

```

<MCI base: procedures>+≡
subroutine mci_instance_recall (mci, sampler, state)
  class(mci_instance_t), intent(inout) :: mci
  class(mci_sampler_t), intent(inout) :: sampler
  class(mci_state_t), intent(in) :: state
  if (size (state%x_in) == size (mci%x, 1) &
      .and. state%selected_channel <= size (mci%x, 2)) then
    call sampler%rebuild (state%selected_channel, &
        state%x_in, state%val, mci%x, mci%f)
    call mci%compute_weight (state%selected_channel)
    call mci%record_integrand (state%val)
  else
    call msg_fatal ("Recalling event: mismatch in channel or dimension")
  end if
end subroutine mci_instance_recall

```

13.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of x MC parameter values, a the complete set of x values and associated Jacobian factors f for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

```

<MCI base: public>+≡
public :: mci_sampler_t

<MCI base: types>+≡
type, abstract :: mci_sampler_t
contains
  <MCI base: mci sampler: TBP>
end type mci_sampler_t

```

Output, deferred to the implementation.

```

<MCI base: mci sampler: TBP>≡
procedure (mci_sampler_write), deferred :: write

<MCI base: interfaces>+≡
abstract interface
  subroutine mci_sampler_write (object, unit, testflag)
    import
    class(mci_sampler_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
  end subroutine mci_sampler_write
end interface

```

The evaluation routine. Input is the channel index `c` and the one-dimensional parameter array `x_in`. Output are the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

(MCI base: mci_sampler: TBP)+≡
  procedure (mci_sampler_evaluate), deferred :: evaluate

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_evaluate
  end interface

```

Query the validity of the sampling point. Can be called after `evaluate`.

```

(MCI base: mci_sampler: TBP)+≡
  procedure (mci_sampler_is_valid), deferred :: is_valid

(MCI base: interfaces)+≡
  abstract interface
    function mci_sampler_is_valid (sampler) result (valid)
      import
      class(mci_sampler_t), intent(in) :: sampler
      logical :: valid
    end function mci_sampler_is_valid
  end interface

```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

```

(MCI base: mci_sampler: TBP)+≡
  procedure (mci_sampler_rebuild), deferred :: rebuild

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_rebuild
  end interface

```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_fetch), deferred :: fetch

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_fetch (sampler, val, x, f)
      import
      class(mci_sampler_t), intent(in) :: sampler
      real(default), intent(out) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_fetch
  end interface

```

13.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

```

<MCI base: public>+≡
  public :: mci_results_t

<MCI base: types>+≡
  type, abstract :: mci_results_t
  contains
    <MCI base: mci_results: TBP>
  end type mci_results_t

```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

```

<MCI base: mci_results: TBP>≡
  procedure (mci_results_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_write (object, unit, verbose, suppress)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, suppress
    end subroutine mci_results_write
  end interface

```

This is the `record` method, which can be called directly from the integrator.

```

<MCI base: mci_results: TBP>+≡
  procedure (mci_results_record), deferred :: record

```

```

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_record (object, n_it, &
      n_calls, integral, error, efficiency, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      real(default), intent(in) :: integral
      real(default), intent(in) :: error
      real(default), intent(in) :: efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      logical, intent(in), optional :: suppress
    end subroutine mci_results_record
  end interface

```

13.1.6 Unit tests

```

<MCI base: public>+≡
  public :: mci_base_test

<MCI base: tests>≡
  subroutine mci_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <MCI base: execute tests>
  end subroutine mci_base_test

```

Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

```

<MCI base: public>+≡
  public :: mci_test_t

<MCI base: test types>≡
  type, extends (mci_t) :: mci_test_t
    integer :: divisions = 0
    integer :: tries = 0
    real(default) :: max_factor = 1
  contains
    procedure :: final => mci_test_final
    procedure :: write => mci_test_write
    procedure :: startup_message => mci_test_startup_message
    procedure :: declare_flat_dimensions => mci_test_ignore_flat_dimensions
    procedure :: declare_equivalences => mci_test_ignore_equivalences
    procedure :: set_divisions => mci_test_set_divisions
    procedure :: set_max_factor => mci_test_set_max_factor

```

```

select type (instance)
type is (mci_test_instance_t)
    call instance%recall (sampler, state)
end select
end subroutine mci_test_rebuild_event

```

Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions g_i smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have n mappings of the unit hypercube

$$x = x(x^{(k)}) \quad \text{where } x = (x_1, \dots). \quad (13.1)$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \quad (13.2)$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \quad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \quad (13.3)$$

and weights

$$w_k \quad \text{with} \quad \sum_k w_k = 1 \quad (13.4)$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \quad (13.5)$$

which also satisfies

$$\int g(x) dx = 1. \quad (13.6)$$

The algorithm implements a resolution of unity as follows

$$\begin{aligned}
1 &= \int dx = \int \frac{g(x)}{g(x)} dx \\
&= \sum_k w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\
&= \sum_k w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x(x^{(k)}))}
\end{aligned} \quad (13.7)$$

where each of the integrals in the sum is evaluated using the channel-specific variables $x^{(k)}$.

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$\begin{aligned} x(x^{(1)}) &= (x_1^{(1)}, x_2^{(1)}) \\ x(x^{(2)}) &= (x_1^{(2)2}, x_2^{(2)}) \end{aligned} \quad (13.8)$$

hence

$$f^{(1)} \equiv 1, \quad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \quad (13.9)$$

The probability functions are

$$g^{(1)} \equiv 1, \quad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \quad (13.10)$$

In the concrete implementation of the integrator instance we store values for the channel probabilities g_i and the accumulated probability g .

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

```

Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to $x_1 = x_1^{(2)2}$, so we have $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$.

For display purposes, we store the return values inside the object. This is not strictly necessary.

13.2 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order h^2 , where h is the bin width. Given that $h = N^{-1/d}$, where d is the integration dimension and N is the total number of sampling points, we get a relative error of order $N^{-2/d}$. This is superior to MC integration if $d < 4$, and equivalent if $d = 4$. It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

```

  end module mci_midpoint
```

13.2.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This

is required for event generation.

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can `fetch` results.

```

<MCI midpoint: test types>≡
  type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
  contains
  <MCI midpoint: test sampler 1: TBP>
  end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI midpoint: test sampler 1: TBP>≡
  procedure :: write => test_sampler_1_write

<MCI midpoint: procedures>+≡
  subroutine test_sampler_1_write (object, unit, testflag)
    class(test_sampler_1_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    integer :: u
    u = output_unit (unit)
    write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"
  end subroutine test_sampler_1_write

```

Evaluation: compute the function value. The output x parameter (only one channel) is identical to the input x , and the Jacobian is 1.

```

13.3 VAMP interface

The standard method for integration is **VAMP**: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic **VAMP** algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

Update the MCI record (i.e., the integration passes) by reading from input stream. The stream should contain a `write` output from a previous run. We first check the MD5 sum of the configuration parameters. If that matches, we proceed directly to the stored integration passes. If successful, we may continue to read the file; the position will be after a blank line that must follow the MCI record.

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

13.3.5 Sampler as Workspace

In the full setup, the sampling function requires the process instance object as workspace. We implement this by (i) implementing the process instance as a type extension of the abstract `sampler_t` object used by the MCI implementation and (ii) providing such an object as an extra argument to the sampling function that VAMP can call. To minimize cross-package dependencies, we use an abstract type `vamp_workspace` that VAMP declares and extend this by including a pointer to the `sampler` and `instance` objects. In the body of the sampling function, we dereference this pointer and can then work with the contents.

```

<MCI vamp: types>+=
  type, extends (vamp_data_t) :: mci_workspace_t
    class(mci_sampler_t), pointer :: sampler => null ()
    class(mci_vamp_instance_t), pointer :: instance => null ()
  end type mci_workspace_t

```

13.3.6 Integrator instance

The history entries should point to the corresponding history entry in the `pass_t` object. If there is none, we may allocate a local history, which is then just transient.

```

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set **reshape** if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together with the MCI instance object.

```

Reset a grid set, so we can start a fresh integration pass. In effect, we delete results of previous integrations, but keep the grid shapes, weights, and variance arrays, so adaptation is still possible. The grids are prepared for a specific number of calls (per iteration) and sampling mode (stratified/importance).

The `vamp_discard_integrals` implementation will reshape the grids only if the argument `num_calls` is present.

```

Integration: sample the VAMP grids. The number of calls etc. are already stored inside the grids. We provide the random-number generator, the sampling function, and a link to the workspace object, which happens to contain a pointer to the sampler object. The sampler object thus becomes the workspace of the sampling function.

Note: in the current implementation, the random-number generator must be the TAO generator. This explicit dependence should be removed from the VAMP implementation.

13.3.7 Sampling function

The VAMP sampling function has a well-defined interface which we have to implement. The `data` argument allows us to pass pointers to the `sampler` and `instance` objects, so we can access configuration data and fill point-dependent contents within these objects.

The `weights` and `channel` argument must be present in the call.

Note: we would normally declare the `instance` pointer with the concrete type, or just use the `data` component directly. Unfortunately, gfortran 4.6 forgets the inherited base-type methods in that case.

Note: this is the place where we must look for external signals, i.e., interrupt from the OS. We would like to raise a VAMP exception which is then caught by `vamp_sample_grids` as the caller, so it dumps its current state and returns (with the signal still pending). WHIZARD will then terminate gracefully. Of course, VAMP should be able to resume from the dump.

In the current implementation, we handle the exception in place and terminate immediately. The incomplete current integration pass is lost.

```

(MCI vamp: procedures)+≡
function vamp_sampling_function &
  (xi, data, weights, channel, grids) result (f)
  real(default) :: f
  real(default), dimension(:), intent(in) :: xi
  class(vamp_data_t), intent(in) :: data
  real(default), dimension(:), intent(in), optional :: weights
  integer, intent(in), optional :: channel
  type(vamp_grid), dimension(:), intent(in), optional :: grids
  type(exception) :: exc
  class(mci_instance_t), pointer :: instance
  logical :: verbose
  character(*), parameter :: FN = "WHIZARD sampling function"
  select type (data)
  type is (mci_workspace_t)
    instance => data%instance
    select type (instance)
    class is (mci_vamp_instance_t)
      instance%calls = instance%calls + 1
      verbose = instance%mci%verbose
    end select
    call instance%evaluate (data%sampler, channel, xi)
    if (signal_is_pending ()) then
      call raise_exception (exc, EXC_FATAL, FN, "signal received")
      call handle_vamp_exception (exc, verbose)
      call terminate_now_if_signal ()
    end if
    f = instance%get_value ()
  end select
end function vamp_sampling_function

```

This is supposed to be the mapping between integration channels. The VAMP event generating procedures technically require it, but it is meaningless in our setup where all transformations happen inside the sampler object. So, this implementation is trivial:

```

(MCI vamp: procedures)+≡
pure function phi_trivial (xi, channel_dummy) result (x)
  real(default), dimension(:), intent(in) :: xi
  integer, intent(in) :: channel_dummy
  real(default), dimension(size(xi)) :: x
  x = xi
end function phi_trivial

```

13.3.8 Integrator instance: evaluation

Here, we compute the multi-channel reweighting factor for the current channel, that accounts for the Jacobians of the transformations from/to all other channels.

The computation of the VAMP probabilities may consume considerable time, therefore we enable parallel evaluation. (Collecting the contributions to `mci%g` is a reduction, which we should also implement via OpenMP.)

```

<MCI vamp: mci vamp instance: TBP>+=
  procedure :: compute_weight => mci_vamp_instance_compute_weight

<MCI vamp: procedures>+=
  subroutine mci_vamp_instance_compute_weight (mci, c)
    class(mci_vamp_instance_t), intent(inout) :: mci
    integer, intent(in) :: c

    real(default), intent(in) :: integrand

```

```

    mci%integrand = integrand
end subroutine mci_vamp_instance_record_integrand

```

Get the event weight. The default routine returns the same value that we would use for integration. This is correct if we select the integration channel according to the channel weight. `vamp_next_event` does differently, so we should rather rely on the weight that VAMP returns. This is the value stored in `vamp_weight`. We override the default TBP accordingly.

```

<MCI vamp: mci vamp instance: TBP>+=
  procedure :: get_event_weight => mci_vamp_instance_get_event_weight
  procedure :: get_event_excess => mci_vamp_instance_get_event_excess

<MCI vamp: procedures>+=
  function mci_vamp_instance_get_event_weight (mci) result (value)
    class(mci_vamp_instance_t), intent(in) :: mci
    real(default) :: value
    if (mci%vamp_weight_set) then
      value = mci%vamp_weight
    else
      call msg_bug ("VAMP: attempt to read undefined event weight")
    end if
  end function mci_vamp_instance_get_event_weight

  function mci_vamp_instance_get_event_excess (mci) result (value)
    class(mci_vamp_instance_t), intent(in) :: mci

    end if
  end function mci_vamp_instance_get_event_excess

```

13.3.9 VAMP exceptions

A VAMP routine may have raised an exception. Turn this into a WHIZARD error message.

An external signal could raise a fatal exception, but this should be delayed and handled by the correct termination routine.

```

<MCI vamp: procedures>+=
  subroutine handle_vamp_exception (exc, verbose)
    type(exception), intent(in) :: exc
    logical, intent(in) :: verbose
    integer :: exc_level
    if (verbose) then
      exc_level = EXC_INFO
    else
      exc_level = EXC_ERROR
    end if
    if (exc%level >= exc_level) then
      write (msg_buffer, "(A,':',1x,A)") trim (exc%origin), trim (exc%message)
    end if
  end subroutine handle_vamp_exception

```

```

select case (exc%level)
case (EXC_INFO); call msg_message ()
case (EXC_WARN); call msg_warning ()
case (EXC_ERROR); call msg_error ()
case (EXC_FATAL)
  if (signal_is_pending ()) then
    call msg_message ()
  else
    call msg_fatal ()
  end if
end select
end if
end subroutine handle_vamp_exception

```

13.3.10 Unit tests

```

⟨MCI vamp: public⟩+=
  public :: mci_vamp_test

⟨MCI vamp: tests⟩+=
  subroutine mci_vamp_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  ⟨MCI vamp: execute tests⟩
  end subroutine mci_vamp_test

```

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is $11x^{10}$, also with integral 1.

```

⟨MCI vamp: test types⟩=
  type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
    integer :: mode = 1
  contains
    ⟨MCI vamp: test sampler 1: TBP⟩
  end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

⟨MCI vamp: test sampler 1: TBP⟩=
  procedure :: write => test_sampler_1_write

⟨MCI vamp: tests⟩+=
  subroutine test_sampler_1_write (object, unit, testflag)
    class(test_sampler_1_t), intent(in) :: object
    integer, intent(in), optional :: unit

```

```

logical, intent(in), optional :: testflag
integer :: u
u = output_unit (unit)
select case (object%mode)
case (1)
    write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"
case (2)
    write (u, "(1x,A)") "Test sampler: f(x) = 11 x^10"
case (3)
    write (u, "(1x,A)") "Test sampler: f(x) = 11 x^10 * 2 * cos^2 (2 pi y)"
end select
end subroutine test_sampler_1_write

```

Evaluation: compute the function value. The output x parameter (only one channel) is identical to the input x , and the Jacobian is 1.

(MCI vamp: test sampler 1: TBP)+≡

Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \quad (13.11)$$

where

$$x = u^v \quad u = xy \quad (13.12)$$

$$y = u^{(1-v)} \quad v = \frac{1}{2} \left(1 + \frac{\log(x/y)}{\log xy} \right) \quad (13.13)$$

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates x and y , while the second term is peaked along the diagonal $x = y$.

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \quad (13.14)$$

```

Two-channel, one dimension test sampler

This sampler implements the function

$$f(x, y) = a * 5x^4 + b * 5(1 - x)^4 \quad (13.15)$$

Each term contributes 1 to the integral, multiplied by a or b , respectively. The first term is peaked at $x = 1$, the second one at $x = 0$.

We implement the two mappings

$$x = u^{1/5} \quad \text{and} \quad x = 1 - v^{1/5}, \quad (13.16)$$

with Jacobians

$$\frac{\partial(x)}{\partial(u)} = u^{-4/5}/5 \quad \text{and} \quad v^{-4/5}/5, \quad (13.17)$$

respectively. The first mapping concentrates points near $x = 1$, the second one near $x = 0$.

Chapter 14

Process Libraries

This chapter consists of two modules which organize and interface the interaction matrix elements for a variety of elementary processes.

prclib_interfaces This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

prc_core_def This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

process_libraries This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

test_me This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

14.1 Process library interface

The module `prclib_interfaces` handles external matrix-element code.

14.1.1 Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.
2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.
3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.
4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and C-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, `O'MEGA` matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

14.1.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.

2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.
3. The `generate_driver_code` writes the common driver as source code to file.
4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.
5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

14.1.3 The module

```

<prclib_interfaces.f90>≡
  <File header>

  module prclib_interfaces

    use iso_c_binding !NODEP!
    use kinds !NODEP!
    <Use strings>
    <Use file utils>
    use diagnostics !NODEP!
    use limits, only: TAB !NODEP!
    use unit_tests
    use os_interface

    <Standard module head>

    <Prclib interfaces: public>

    <Prclib interfaces: types>

    <Prclib interfaces: interfaces>

    <Prclib interfaces: test types>

    contains

    <Prclib interfaces: procedures>

    <Prclib interfaces: tests>

  end module prclib_interfaces

```

14.1.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of `bind(C)` procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such as O'MEGA.

```
<Prclib interfaces: public>≡
  public :: prc_writer_t

<Prclib interfaces: types>≡
  type, abstract :: prc_writer_t
    character(32) :: md5sum = ""
    contains
    <Prclib interfaces: prc writer: TBP>
  end type prc_writer_t
```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

```
<Prclib interfaces: prc writer: TBP>≡
  procedure(get_const_string), nopass, deferred :: type_name

<Prclib interfaces: interfaces>≡
  abstract interface
    function get_const_string () result (string)
      import
      type(string_t) :: string
    end function get_const_string
  end interface
```

Return the name of a procedure that implements a given feature, as it is provided by the external matrix-element code. For a reasonable default, we take the feature name unchanged.

```
<Prclib interfaces: prc writer: TBP>+≡
  procedure, nopass :: get_procname => prc_writer_get_procname
```

```

<Prclib interfaces: procedures>≡
function prc_writer_get_procname (feature) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: feature
  name = feature
end function prc_writer_get_procname

```

Return the name of a procedure that implements a given feature with the bind(C) property, so it can be accessed via a C procedure pointer and handled by dlopen. We need this for all special features of a matrix element, since the interface has to return a C function pointer for it. For a default implementation, we prefix the external procedure name by the process ID.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: get_c_procname => prc_writer_get_c_procname

<Prclib interfaces: procedures>+≡
function prc_writer_get_c_procname (writer, id, feature) result (name)
  class(prc_writer_t), intent(in) :: writer
  type(string_t), intent(in) :: id, feature
  type(string_t) :: name
  name = id // "_" // feature
end function prc_writer_get_c_procname

```

Common signature of code-writing procedures. The procedure may use the process ID, and the feature name. (Not necessarily all of them.)

```

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine write_code_file (writer, id)
      import
      class(prc_writer_t), intent(in) :: writer
      type(string_t), intent(in) :: id
    end subroutine write_code_file
  end interface

  abstract interface
    subroutine write_code (writer, unit, id)
      import
      class(prc_writer_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
    end subroutine write_code
  end interface

  abstract interface
    subroutine write_code_os (writer, unit, id, os_data, testflag)
      import
      class(prc_writer_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: testflag
    end subroutine write_code_os
  end interface

```

```

abstract interface
  subroutine write_feature_code (writer, unit, id, feature)
    import
    class(prc_writer_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id, feature
  end subroutine write_feature_code
end interface

```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_feature_code), deferred :: write_interface

```

There must also be a procedure which writes Makefile code which is specific for the current process, but not the feature.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code_os), deferred :: write_makefile_code

```

This procedure writes code process-specific source-code file (which need not be Fortran). It may be a no-op, if the source code is generated by Make instead.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code_file), deferred :: write_source_code

```

Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require `bind(C)` wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

<Prclib interfaces: public>+≡
  public :: prc_writer_f_module_t

<Prclib interfaces: types>+≡
  type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
  contains
    <Prclib interfaces: prc writer f module: TBP>
  end type prc_writer_f_module_t

```

Return the name of the Fortran module. As a default implementation, we take the process ID unchanged.

```

<Prclib interfaces: prc writer f module: TBP>≡
  procedure, nopass :: get_module_name => prc_writer_get_module_name

<Prclib interfaces: procedures>+≡
  function prc_writer_get_module_name (id) result (name)
    type(string_t) :: name
    type(string_t), intent(in) :: id
    name = id
  end function prc_writer_get_module_name

```

Write a `use` directive that associates the driver reference with the procedure in the matrix element code. By default, we use the C name for this.

```

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure :: write_use_line => prc_writer_write_use_line

<Prclib interfaces: procedures>+≡
  subroutine prc_writer_write_use_line (writer, unit, id, feature)
    class(prc_writer_f_module_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t) :: id, feature
    write (unit, "(2x,9A)") "use ", char (writer%get_module_name (id)), &
      ", only: ", char (writer%get_c_procname (id, feature)), &
      " => ", char (writer%get_procname (feature))
  end subroutine prc_writer_write_use_line

```

Write a wrapper routine for a feature. This also associates a C name the module procedure. The details depend on the writer variant.

```

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure(prc_write_wrapper), deferred :: write_wrapper

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_write_wrapper (writer, unit, id, feature)
      import
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
    end subroutine prc_write_wrapper
  end interface

```

This is used for testing only: initialize the writer with a specific MD5 sum string.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: init_test => prc_writer_init_test

<Prclib interfaces: procedures>+≡
  subroutine prc_writer_init_test (writer)
    class(prc_writer_t), intent(out) :: writer
    writer%md5sum = "1234567890abcdef1234567890abcdef"
  end subroutine prc_writer_init_test

```

Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library with `bind(C)` compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

<Prclib interfaces: types>+≡
  type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
  contains
    <Prclib interfaces: prc writer c lib: TBP>
  end type prc_writer_c_lib_t

```

14.1.5 Process records in the library driver

A process record holds the process (component) ID, the physics `model_name`, and the array of `features` that are implemented by the corresponding matrix element code.

The `writer` component holds procedures. The procedures write source code for the current record, either for the driver or for the Makefile.

```

<Prclib interfaces: types>+≡
  type :: prclib_driver_record_t
    type(string_t) :: id
    type(string_t) :: model_name
    type(string_t), dimension(:), allocatable :: feature
    class(prc_writer_t), pointer :: writer => null ()
  contains
    <Prclib interfaces: prclib driver record: TBP>
  end type prclib_driver_record_t

```

Output routine. We indent the output, so it smoothly integrates into the output routine for the whole driver.

Note: the pointer `writer` is introduced as a workaround for a NAG compiler bug.

```

<Prclib interfaces: prclib driver record: TBP>≡
  procedure :: write => prclib_driver_record_write

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write (object, unit)
    class(prclib_driver_record_t), intent(in) :: object
    integer, intent(in) :: unit
    integer :: j
    class(prc_writer_t), pointer :: writer
    write (unit, "(3x,A,2x,['',A,']')") &
      char (object%id), char (object%model_name)
    if (allocated (object%feature)) then
      writer => object%writer
      write (unit, "(5x,A,A)", advance="no") &
        char (writer%type_name ()), ":"
      do j = 1, size (object%feature)
        write (unit, "(1x,A)", advance="no") &
          char (object%feature(j))
      end do
      write (unit, *)
    end if
  end subroutine prclib_driver_record_write

```

Get the C procedure name for a feature.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: get_c_procname => prclib_driver_record_get_c_procname

<Prclib interfaces: procedures>+≡
  function prclib_driver_record_get_c_procname (record, feature) result (name)
    type(string_t) :: name
    class(prclib_driver_record_t), intent(in) :: record
    type(string_t), intent(in) :: feature

```

```

        name = record%writer%get_c_procname (record%id, feature)
    end function prclib_driver_record_get_c_procname

```

Write a USE directive for a given feature. Applies only if the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_use_line => prclib_driver_record_write_use_line
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_use_line (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        select type (writer => record%writer)
            class is (prc_writer_f_module_t)
                call writer%write_use_line (unit, record%id, feature)
            end select
        end subroutine prclib_driver_record_write_use_line

```

The alternative: write an interface block for a given feature, unless the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_interface => prclib_driver_record_write_interface
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_interface (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        select type (writer => record%writer)
            class is (prc_writer_f_module_t)
                class default
                    call writer%write_interface (unit, record%id, feature)
                end select
            end select
        end subroutine prclib_driver_record_write_interface

```

Write all special feature interfaces for the current record. Do this for all process variants.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_interfaces => prclib_driver_record_write_interfaces
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_interfaces (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        integer :: i
        do i = 1, size (record%feature)
            call record%writer%write_interface (unit, record%id, record%feature(i))
        end do
    end subroutine prclib_driver_record_write_interfaces

```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_wrappers => prclib_driver_record_write_wrappers

```

```

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_wrappers (record, unit)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    integer :: i
    select type (writer => record%writer)
    class is (prc_writer_f_module_t)
      do i = 1, size (record%feature)
        call writer%write_wrapper (unit, record%id, record%feature(i))
      end do
    end select
  end subroutine prclib_driver_record_write_wrappers

```

Write the Makefile code for this record.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_makefile_code => prclib_driver_record_write_makefile_code

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_makefile_code &
    (record, unit, os_data, testflag)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    type(os_data_t), intent(in) :: os_data
    logical, intent(in), optional :: testflag
    call record%writer%write_makefile_code (unit, record%id, os_data, testflag)
  end subroutine prclib_driver_record_write_makefile_code

```

Write source-code files for this record. (Does nothing if the source code is handled by Makefile rules.)

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_source_code => prclib_driver_record_write_source_code

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_source_code (record)
    class(prclib_driver_record_t), intent(in) :: record
    call record%writer%write_source_code (record%id)
  end subroutine prclib_driver_record_write_source_code

```

14.1.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The `basename` identifies the library, both by file names and by Fortran variable names.

The `loaded` flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a `dlaccess` object.

`n_processes` is the number of external process code components that are referenced by this library. The code is addressed by index (`i_lib` in the process library entry above). This number should be equal to the number returned by `get_n_prc`.

For each external process, there is a separate **record** which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The `get_fptr` procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the `unload_hook` and `reload_hook` pointers allow for the insertion of additional code when a library is loaded.

      do i = 1, object%n_processes
        call object%record(i)%write (unit)
      end do
    else
      write (unit, "(1x,A)") "Matrix-element code entries: [undefined]"
    end if
  end subroutine prclib_driver_write

```

```

        end if
    end subroutine prclib_driver_write

```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name.

Note: `intent(out)` for the `driver` argument segfaults with gfortran 4.7.

```

<Prclib interfaces: public>+≡
    public :: dispatch_prclib_driver

<Prclib interfaces: procedures>+≡
    subroutine dispatch_prclib_driver &
        (driver, basename, modellibs_ldflags)
        class(prclib_driver_t), intent(inout), allocatable :: driver
        type(string_t), intent(in) :: basename
        type(string_t), intent(in), optional :: modellibs_ldflags
        procedure(dispatch_prclib_driver) :: dispatch_prclib_static
        if (allocated (driver)) deallocate (driver)
        call dispatch_prclib_static (driver, basename)
        if (.not. allocated (driver)) then
            allocate (prclib_driver_dynamic_t :: driver)
        end if
        driver%basename = basename

14.1.8 Write driver file

This procedure writes the process library driver source code to the specified output unit. The individual routines for writing source-code procedures are given below.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: generate_driver_code => prclib_driver_generate_code

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_generate_code (driver, unit)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t) :: prefix
        integer :: i

        prefix = driver%basename // "_"

        write (unit, "(A)") "! WHIZARD matrix-element code interface"
        write (unit, "(A)") "!"
        write (unit, "(A)") "! Automatically generated file, do not edit"
        call driver%write_module (unit, prefix)
        call driver%write_lib_md5sum_fun (unit, prefix)
        call driver%write_get_n_processes_fun (unit, prefix)
        call driver%write_get_process_id_fun (unit, prefix)
        call driver%write_get_model_name_fun (unit, prefix)
        call driver%write_get_md5sum_fun (unit, prefix)
        call driver%write_string_to_array_fun (unit, prefix)
        call driver%write_get_omp_status_fun (unit, prefix)
        call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
        call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
        call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
        call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))
        call driver%write_set_col_state_sub (unit, prefix)
        call driver%write_set_color_factors_sub (unit, prefix)
        call driver%write_get_fptr_sub (unit, prefix)
        do i = 1, driver%n_processes
            call driver%record(i)%write_wrappers (unit)
        end do
    end subroutine prclib_driver_generate_code

```

The driver module is used and required *only* if we intend to link the library statically. Then, it provides the (static) driver type as a concrete implementation of the abstract library driver. This type contains the internal dispatcher for assigning the library procedures to their appropriate procedure pointers. In

the dynamical case, the assignment is done via the base-type dispatcher which invokes the DL mechanism.

However, compiling this together with the rest in any case should not do any harm.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure, nopass :: write_module => prclib_driver_write_module

```

14.1.9 Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main program) and the process-library driver. The procedures are all `BIND(C)`, so they can safely be exposed by the library and handled by the `dlopen` mechanism, which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself and a procedure that writes the corresponding procedure as source code to the process library driver.

Process count

Return the number of processes contained in the library.

```

<Prclib interfaces: public>+≡
    public :: prc_get_n_processes

<Prclib interfaces: interfaces>+≡
    abstract interface
        function prc_get_n_processes () result (n) bind(C)
            import
            integer(c_int) :: n
        end function prc_get_n_processes
    end interface

```

Here is the code.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: write_get_n_processes_fun

<Prclib interfaces: procedures>+≡
    subroutine write_get_n_processes_fun (driver, unit, prefix)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix

```

```

write (unit, "(A)") ""
write (unit, "(A)") "! Return the number of processes in this library"
write (unit, "(A)") "function " // char (prefix) &
    // "get_n_processes () result (n) bind(C)"
write (unit, "(A)") " use iso_c_binding"
write (unit, "(A)") " implicit none"
write (unit, "(A)") " integer(c_int) :: n"
write (unit, "(A,I0)") " n = ", driver%n_processes
write (unit, "(A)") "end function " // char (prefix) &
    // "get_n_processes"
end subroutine write_get_n_processes_fun

```

Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

```

<Prclib interfaces: public>+≡
public :: prc_get_stringptr

<Prclib interfaces: interfaces>+≡
abstract interface
  subroutine prc_get_stringptr (i, cptr, len) bind(C)
    import
    integer(c_int), intent(in) :: i
    type(c_ptr), intent(out) :: cptr
    integer(c_int), intent(out) :: len
  end subroutine prc_get_stringptr
end interface

```

To hide this complication, we introduce a subroutine that converts the returned C pointer to a `string_t` object. As a side effect, we deallocate the original after conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran character array pointer, length 1 and size `len`. Using argument association and an internal subroutine, we convert this to a character array with length `len` and size 1. Using ordinary assignment, we finally convert this to `string_t`.

The function takes the pointer-returning function as an argument. The index `i` identifies the process in the library.

```

<Prclib interfaces: procedures>+≡
subroutine get_string_via_cptr (string, i, get_stringptr)
  type(string_t), intent(out) :: string
  integer, intent(in) :: i
  procedure(prc_get_stringptr) :: get_stringptr
  type(c_ptr) :: cptr
  integer(c_int) :: pid, len
  character(kind=c_char), dimension(:), pointer :: c_array
  pid = i
  call get_stringptr (pid, cptr, len)
  if (c_associated (cptr)) then
    call c_f_pointer (cptr, c_array, shape = [len])
  end if
end subroutine

```

```

        call set_string (c_array)
        call get_stringptr (0_c_int, cptr, len)
    else
        string = ""
    end if
contains
    subroutine set_string (buffer)
        character(len, kind=c_char), dimension(1), intent(in) :: buffer
        string = buffer(1)
    end subroutine set_string
end subroutine get_string_via_cptr

```

Since the module procedures return Fortran strings, we have to convert them. This is the necessary auxiliary routine. The routine is not BIND(C), it is not accessed from outside.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure, nopass :: write_string_to_array_fun

<Prclib interfaces: procedures>+≡
    subroutine write_string_to_array_fun (unit, prefix)
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        write (unit, "(A)") ""
        write (unit, "(A)") "! Auxiliary: convert character string &
            &to array pointer"
        write (unit, "(A)") "subroutine " // char (prefix) &
            // "string_to_array (string, a)"
        write (unit, "(A)") " use iso_c_binding"
        write (unit, "(A)") " implicit none"
        write (unit, "(A)") " character(*), intent(in) :: string"
        write (unit, "(A)") " character(kind=c_char), dimension(:), &
            &allocatable, intent(out) :: a"
        write (unit, "(A)") " integer :: i"
        write (unit, "(A)") " allocate (a (len (string)))"
        write (unit, "(A)") " do i = 1, size (a)"
        write (unit, "(A)") "     a(i) = string(i:i)"
        write (unit, "(A)") " end do"
        write (unit, "(A)") "end subroutine " // char (prefix) &
            // "string_to_array"
    end subroutine write_string_to_array_fun

```

The above routine is called by other functions. It is not in a module, so they need its interface explicitly.

```

<Prclib interfaces: procedures>+≡
    subroutine write_string_to_array_interface (unit, prefix)
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        write (unit, "(2x,A)") "interface"
        write (unit, "(2x,A)") " subroutine " // char (prefix) &
            // "string_to_array (string, a)"
        write (unit, "(2x,A)") " use iso_c_binding"
        write (unit, "(2x,A)") " implicit none"
        write (unit, "(2x,A)") " character(*), intent(in) :: string"
    end subroutine write_string_to_array_interface

```

```

write (unit, "(2x,A)") "      character(kind=c_char), dimension(:), &
&allocatable, intent(out) :: a"
write (unit, "(2x,A)") "      end subroutine " // char (prefix) &
// "string_to_array"
write (unit, "(2x,A)") "end interface"
end subroutine write_string_to_array_interface

```

Here are the info functions which return strings, implementing the interface `prc_get_stringptr`.

Return the process ID for each process.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_process_id_fun

<Prclib interfaces: procedures>+≡
  subroutine write_get_process_id_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the process ID of process #i &
&(as a C pointer to a character array)"
    write (unit, "(A)") "subroutine " // char (prefix) &
// "get_process_id_ptr (i, cptr, len) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " implicit none"
    write (unit, "(A)") " integer(c_int), intent(in) :: i"
    write (unit, "(A)") " type(c_ptr), intent(out) :: cptr"
    write (unit, "(A)") " integer(c_int), intent(out) :: len"
    write (unit, "(A)") " character(kind=c_char), dimension(:), &

    call write_string_to_array_interface (unit, prefix)
    write (unit, "(A)") " select case (i)"
    write (unit, "(A)") " case (0); if (allocated (a)) deallocate (a)"
    do i = 1, driver%n_processes
      write (unit, "(A,I0,9A)") " case (" , i, "); ", &
"call ", char (prefix), "string_to_array ('", &
char (driver%record(i)%id), "'", a)"
    end do
    write (unit, "(A)") " end select"
    write (unit, "(A)") " if (allocated (a)) then"
    write (unit, "(A)") "   cptr = c_loc (a)"
    write (unit, "(A)") "   len = size (a)"
    write (unit, "(A)") " else"
    write (unit, "(A)") "   cptr = c_null_ptr"
    write (unit, "(A)") "   len = 0"
    write (unit, "(A)") " end if"
    write (unit, "(A)") "end subroutine " // char (prefix) &
// "get_process_id_ptr"
  end subroutine write_get_process_id_fun

```

Return the model name, given explicitly.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_model_name_fun

```

<Prclib interfaces: procedures>+≡

```

subroutine write_get_model_name_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  write (unit, "(A)") ""
  write (unit, "(A)") "! Return the model name for process #i &
    &(as a C pointer to a character array)"
  write (unit, "(A)") "subroutine " // char (prefix) &
    // "get_model_name_ptr (i, cptr, len) bind(C)"
  write (unit, "(A)") " use iso_c_binding"
  write (unit, "(A)") " implicit none"
  write (unit, "(A)") " integer(c_int), intent(in) :: i"
  write (unit, "(A)") " type(c_ptr), intent(out) :: cptr"
  write (unit, "(A)") " integer(c_int), intent(out) :: len"
  write (unit, "(A)") " character(kind=c_char), dimension(:), &
    &allocatable, target, save :: a"
  call write_string_to_array_interface (unit, prefix)
  write (unit, "(A)") " select case (i)"
  write (unit, "(A)") " case (0); if (allocated (a)) deallocate (a)"
  do i = 1, driver%n_processes
    write (unit, "(A,I0,9A)") " case (" , i, ")"; " , &
      "call " , char (prefix), "string_to_array ('" , &
      char (driver%record(i)%model_name), &
      "' , a)"
  end do
  write (unit, "(A)") " end select"
  write (unit, "(A)") " if (allocated (a)) then"
  write (unit, "(A)") "   cptr = c_loc (a)"
  write (unit, "(A)") "   len = size (a)"
  write (unit, "(A)") " else"
  write (unit, "(A)") "   cptr = c_null_ptr"
  write (unit, "(A)") "   len = 0"
  write (unit, "(A)") " end if"
  write (unit, "(A)") "end subroutine " // char (prefix) &
    // "get_model_name_ptr"
end subroutine write_get_model_name_fun

```

Call the MD5 sum function for the process. The function calls the corresponding function of the matrix-element code, and it returns the C address of a character array with length 32.

<Prclib interfaces: prclib driver: TBP>+≡

procedure :: write_get_md5sum_fun

<Prclib interfaces: procedures>+≡

```

subroutine write_get_md5sum_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  write (unit, "(A)") ""
  write (unit, "(A)") "! Return the MD5 sum for the process configuration &
    &(as a C pointer to a character array)"

```

```

write (unit, "(A)") "subroutine " // char (prefix) &
// "get_md5sum_ptr (i, cptr, len) bind(C)"
write (unit, "(A)") " use iso_c_binding"
call driver%write_interfaces (unit, var_str ("md5sum"))
write (unit, "(A)") " interface"
write (unit, "(A)") " function " // char (prefix) &
// "md5sum () result (md5sum)"
write (unit, "(A)") " character(32) :: md5sum"
write (unit, "(A)") " end function " // char (prefix) // "md5sum"
write (unit, "(A)") " end interface"
write (unit, "(A)") " integer(c_int), intent(in) :: i"
write (unit, "(A)") " type(c_ptr), intent(out) :: cptr"
write (unit, "(A)") " integer(c_int), intent(out) :: len"
write (unit, "(A)") " character(kind=c_char), dimension(32), &
&target, save :: md5sum"
write (unit, "(A)") " select case (i)"
write (unit, "(A)") " case (0)"
write (unit, "(A)") " call copy (" // char (prefix) // "md5sum ())"
write (unit, "(A)") " cptr = c_loc (md5sum)"
do i = 1, driver%n_processes
write (unit, "(A,I0,A)") " case (" , i, ")"
call driver%record(i)%write_md5sum_call (unit)
end do
write (unit, "(A)") " case default"
write (unit, "(A)") " cptr = c_null_ptr"
write (unit, "(A)") " end select"
write (unit, "(A)") " len = 32"
write (unit, "(A)") "contains"
write (unit, "(A)") " subroutine copy (md5sum_tmp)"
write (unit, "(A)") " character, dimension(32), intent(in) :: &
&md5sum_tmp"
write (unit, "(A)") " md5sum = md5sum_tmp"
write (unit, "(A)") " end subroutine copy"
write (unit, "(A)") "end subroutine " // char (prefix) &
// "get_md5sum_ptr"
end subroutine write_get_md5sum_fun

```

The actual call depends on the type of matrix element.

<Prclib interfaces: prclib driver record: TBP>+≡

```
procedure :: write_md5sum_call => prclib_driver_record_write_md5sum_call
```

<Prclib interfaces: procedures>+≡

```

subroutine prclib_driver_record_write_md5sum_call (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
call record%writer%write_md5sum_call (unit, record%id)
end subroutine prclib_driver_record_write_md5sum_call

```

The interface goes into the writer base type:

<Prclib interfaces: prc writer: TBP>+≡

```
procedure(write_code), deferred :: write_md5sum_call
```

In the Fortran module case, we take a detour. The string returned by the Fortran function is copied into a fixed-size array. The copy routine is an internal

subroutine of `get_md5sum_ptr`. We return the C address of the target array.

```

<Prclib interfaces: prc writer f module: TBP>+=
  procedure :: write_md5sum_call => prc_writer_f_module_write_md5sum_call

<Prclib interfaces: procedures>+=
  subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
    class(prc_writer_f_module_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    write (unit, "(5x,9A)") "call copy (" , &
      char (writer%get_c_procname (id, var_str ("md5sum"))), " ()"
    write (unit, "(5x,9A)") "cptr = c_loc (md5sum)"
  end subroutine prc_writer_f_module_write_md5sum_call

```

In the C library case, the library function returns a C pointer, which we can just copy.

```

<Prclib interfaces: prc writer c lib: TBP>=
  procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call

<Prclib interfaces: procedures>+=
  subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    write (unit, "(5x,9A)") &
      "cptr = ", &
      char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
  end subroutine prc_writer_c_lib_write_md5sum_call

```

Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into `string_t` objects.

```

<Prclib interfaces: prclib driver: TBP>+=
  procedure :: get_process_id => prclib_driver_get_process_id
  procedure :: get_model_name => prclib_driver_get_model_name
  procedure :: get_md5sum => prclib_driver_get_md5sum

<Prclib interfaces: procedures>+=
  function prclib_driver_get_process_id (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    call get_string_via_cptr (string, i, driver%get_process_id_ptr)
  end function prclib_driver_get_process_id

  function prclib_driver_get_model_name (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    call get_string_via_cptr (string, i, driver%get_model_name_ptr)
  end function prclib_driver_get_model_name

```

```

function prclib_driver_get_md5sum (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptra (string, i, driver%get_md5sum_ptr)
end function prclib_driver_get_md5sum

```

Informational logical functions

When returning a logical value, we use the C boolean type, which may differ from Fortran.

```

<Prclib interfaces: public>+≡
  public :: prc_get_log

<Prclib interfaces: interfaces>+≡
  abstract interface
    function prc_get_log (pid) result (l) bind(C)
      import
      integer(c_int), intent(in) :: pid
      logical(c_bool) :: l
    end function prc_get_log
  end interface

```

Return a logical flag which tells whether OpenMP is supported for a specific process code.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_openmp_status_fun

<Prclib interfaces: procedures>+≡
  subroutine write_get_openmp_status_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the OpenMP support status"
    write (unit, "(A)") "function " // char (prefix) &
      // "get_openmp_status (i) result (openmp_status) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    call driver%write_interfaces (unit, var_str ("openmp_supported"))
    write (unit, "(A)") " integer(c_int), intent(in) :: i"
    write (unit, "(A)") " logical(c_bool) :: openmp_status"
    write (unit, "(A)") " select case (i)"
    do i = 1, driver%n_processes
      write (unit, "(A,I0,9A)") " case (" , i, "); ", &
        "openmp_status = ", &
        char (driver%record(i)%get_c_procname &
          (var_str ("openmp_supported"))), " ()"
    end do
    write (unit, "(A)") " end select"
    write (unit, "(A)") "end function " // char (prefix) &
      // "get_openmp_status"
  end subroutine write_get_openmp_status_fun

```

Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

```
<Prclib interfaces: public>+≡
    public :: prc_get_int

<Prclib interfaces: interfaces>+≡
    abstract interface
        function prc_get_int (pid) result (n) bind(C)
        import
            integer(c_int), intent(in) :: pid
            integer(c_int) :: n
        end function prc_get_int
    end interface
```

This function returns any data of type integer, for each process.

```
<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: write_get_int_fun

<Prclib interfaces: procedures>+≡
    subroutine write_get_int_fun (driver, unit, prefix, feature)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        type(string_t), intent(in) :: feature
        integer :: i
        write (unit, "(A)") ""
        write (unit, "(9A)") "! Return the value of ", char (feature)
        write (unit, "(9A)") "function ", char (prefix), &
            "get_", char (feature), " (pid)", &
            " result (" , char (feature), ") bind(C)"
        write (unit, "(9A)") " use iso_c_binding"
        call driver%write_interfaces (unit, feature)
        write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
        write (unit, "(9A)") " integer(c_int) :: ", char (feature)
        write (unit, "(9A)") " select case (pid)"
        do i = 1, driver%n_processes
            write (unit, "(2x,A,I0,9A)") "case (" , i, "); ", &
                char (feature), " = ", &
                char (driver%record(i)%get_c_procname (feature)), &
                " ()"
        end do
        write (unit, "(9A)") " end select"
        write (unit, "(9A)") "end function ", char (prefix), &
            "get_", char (feature)
    end subroutine write_get_int_fun
```

Write a case line that assigns the value of the external function to the current return value.

```
<Prclib interfaces: procedures>+≡
    subroutine write_case_int_fun (record, unit, i, feature)
```

```

class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
integer, intent(in) :: i
type(string_t), intent(in) :: feature
write (unit, "(5x,A,I0,9A)") "case (" , i, " ); " , &
      char (feature), " = " , char (record%get_c_procname (feature))
end subroutine write_case_int_fun

```

Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

<Prclib interfaces: public>+≡

```
public :: prc_set_int_tab1
```

<Prclib interfaces: interfaces>+≡

```

abstract interface
  subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), dimension(*), intent(out) :: tab
    integer(c_int), dimension(2), intent(in) :: shape
  end subroutine prc_set_int_tab1
end interface

```

This subroutine returns a table of integers.

<Prclib interfaces: prclib driver: TBP>+≡

```
procedure :: write_set_int_sub
```

<Prclib interfaces: procedures>+≡

```

subroutine write_set_int_sub (driver, unit, prefix, feature)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  type(string_t), intent(in) :: feature
  integer :: i
  write (unit, "(A)") ""
  write (unit, "(9A)") "! Set table: " , char (feature)
  write (unit, "(9A)") "subroutine " , char (prefix), &
    "set_" , char (feature), "_ptr (pid, " , char (feature), &
    " , shape) bind(C)"
  write (unit, "(9A)") " use iso_c_binding"
  call driver%write_interfaces (unit, feature)
  write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
  write (unit, "(9A)") " integer(c_int), dimension(*), intent(out) :: " , &
    char (feature)
  write (unit, "(9A)") " integer(c_int), dimension(2), intent(in) :: shape"
  write (unit, "(9A)") " integer, dimension(:,:), allocatable :: " , &
    char (feature), "_tmp"
  write (unit, "(9A)") " integer :: i, j"
  write (unit, "(9A)") " select case (pid)"
  do i = 1, driver%n_processes
    write (unit, "(2x,A,I0,A)") "case (" , i, " )"
    call driver%record(i)%write_int_sub_call (unit, feature)
  end do

```

```

        write (unit, "(9A)") " end select"
        write (unit, "(9A)") "end subroutine ", char (prefix), &
            "set_", char (feature), "_ptr"
    end subroutine write_set_int_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        call record%writer%write_int_sub_call (unit, record%id, feature)
    end subroutine prclib_driver_record_write_int_sub_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_feature_code), deferred :: write_int_sub_call

```

In the Fortran module case, we need an extra copy in the (academical) situation where default integer and `c_int` differ. Otherwise, we just associate a Fortran array with the C pointer and let the matrix-element subroutine fill the array.

```

<Prclib interfaces: prc writer f module: TBP>+≡
    procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "allocate (", char (feature), "_tmp ", &
            "(shape(1), shape(2)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), &
            " (", char (feature), "_tmp)"
        write (unit, "(5x,9A)") "forall (i=1:shape(1), j=1:shape(2)) "
        write (unit, "(8x,9A)") char (feature), "(i + shape(1)*(j-1)) = ", &
            char (feature), "_tmp", "(i,j)"
        write (unit, "(5x,9A)") "end forall"
    end subroutine prc_writer_f_module_write_int_sub_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
    procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_c_lib_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), " (", char (feature), ")"

```

```
end subroutine prc_writer_c_lib_write_int_sub_call
```

Color state table

The color-state specification needs a table of integers (one array per color flow) and a corresponding array of color-ghost flags.

```
<Prclib interfaces: public>+≡
  public :: prc_set_col_state

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), dimension(*), intent(out) :: col_state
    logical(c_bool), dimension(*), intent(out) :: ghost_flag
    integer(c_int), dimension(3), intent(in) :: shape
  end subroutine prc_set_col_state
end interface

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_set_col_state_sub

<Prclib interfaces: procedures>+≡
  subroutine write_set_col_state_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    type(string_t) :: feature
    feature = "col_state"
    write (unit, "(A)") ""
    write (unit, "(9A)") "! Set tables: col_state, ghost_flag"
    write (unit, "(9A)") "subroutine ", char (prefix), &
      "set_col_state_ptr (pid, col_state, ghost_flag, shape) bind(C)"
    write (unit, "(9A)") " use iso_c_binding"
    call driver%write_interfaces (unit, feature)
    write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(9A)") &
      " integer(c_int), dimension(*), intent(out) :: col_state"
    write (unit, "(9A)") &
      " logical(c_bool), dimension(*), intent(out) :: ghost_flag"
    write (unit, "(9A)") &
      " integer(c_int), dimension(3), intent(in) :: shape"
    write (unit, "(9A)") &
      " integer, dimension(:, :, :), allocatable :: col_state_tmp"
    write (unit, "(9A)") &
      " logical, dimension(:, :, :), allocatable :: ghost_flag_tmp"
    write (unit, "(9A)") " integer :: i, j, k"
    write (unit, "(A)") " select case (pid)"
    do i = 1, driver%n_processes
      write (unit, "(A,I0,A)") " case (" , i, ")"
      call driver%record(i)%write_col_state_call (unit)
    end do
```

```

        write (unit, "(A)") " end select"
        write (unit, "(9A)") "end subroutine ", char (prefix), &
            "set_col_state_ptr"
    end subroutine write_set_col_state_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_col_state_call => prclib_driver_record_write_col_state_call

```

```

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_col_state_call (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        call record%writer%write_col_state_call (unit, record%id)
    end subroutine prclib_driver_record_write_col_state_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_code), deferred :: write_col_state_call

```

In the Fortran module case, we need an extra copy in the (academical) situation where default integer and `c_int` differ. Otherwise, we just associate a Fortran array with the C pointer and let the matrix-element subroutine fill the array.

```

<Prclib interfaces: prc writer f module: TBP>+≡
    procedure :: write_col_state_call => prc_writer_f_module_write_col_state_call

```

```

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(9A)") " allocate (col_state_tmp ", &
            "(shape(1), shape(2), shape(3)))"
        write (unit, "(5x,9A)") "allocate (ghost_flag_tmp ", &
            "(shape(2), shape(3)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, var_str ("col_state"))), &
            " (col_state_tmp, ghost_flag_tmp)"
        write (unit, "(5x,9A)") "forall (i = 1:shape(2), j = 1:shape(3))"
        write (unit, "(8x,9A)") "forall (k = 1:shape(1))"
        write (unit, "(11x,9A)") &
            "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
            "= col_state_tmp(k,i,j)"
        write (unit, "(8x,9A)") "end forall"
        write (unit, "(8x,9A)") &
            "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
        write (unit, "(5x,9A)") "end forall"
    end subroutine prc_writer_f_module_write_col_state_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
    procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call

```

```

<Prclib interfaces: procedures>+≡
subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)" "call ", &
    char (writer%get_c_procname (id, var_str ("col_state"))), &
    " (col_state, ghost_flag)"
  end subroutine prc_writer_c_lib_write_col_state_call

```

Color factors

For the color-factor information, we return two integer arrays and a complex array.

```

<Prclib interfaces: public>+≡
public :: prc_set_color_factors

<Prclib interfaces: interfaces>+≡
abstract interface
  subroutine prc_set_color_factors &
    (pid, cf_index1, cf_index2, color_factors, shape) bind(C)
  import
  integer(c_int), intent(in) :: pid
  integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
  complex(c_default_complex), dimension(*), intent(out) :: color_factors
  integer(c_int), dimension(1), intent(in) :: shape
end subroutine prc_set_color_factors
end interface

```

This subroutine returns the color-flavor factor table.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_set_color_factors_sub

<Prclib interfaces: procedures>+≡
subroutine write_set_color_factors_sub (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  type(string_t) :: feature
  feature = "color_factors"
  write (unit, "(A)" "")
  write (unit, "(A)" "! Set tables: color factors")
  write (unit, "(9A)" "subroutine ", char (prefix), &
    "set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
    "shape) bind(C)"
  write (unit, "(A)" " use iso_c_binding")
  write (unit, "(A)" " use kinds")
  write (unit, "(A)" " use omega_color")
  call driver%write_interfaces (unit, feature)
  write (unit, "(A)" " integer(c_int), intent(in) :: pid")
  write (unit, "(A)" " integer(c_int), dimension(1), intent(in) :: shape")
  write (unit, "(A)" " integer(c_int), dimension(*), intent(out) :: &

```

```

        &cf_index1, cf_index2"
write (unit, "(A)") " complex(c_default_complex), dimension(*), &
    &intent(out) :: color_factors"
write (unit, "(A)") " type(omega_color_factor), dimension(:), &
    &allocatable :: cf"
write (unit, "(A)") " select case (pid)"
do i = 1, driver%n_processes
    write (unit, "(2x,A,IO,A)") "case (" , i, ")"
    call driver%record(i)%write_color_factors_call (unit)
end do
write (unit, "(A)") " end select"
write (unit, "(A)") "end subroutine " // char (prefix) &
    // "set_color_factors_ptr"
end subroutine write_set_color_factors_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_color_factors_call (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        call record%writer%write_color_factors_call (unit, record%id)
    end subroutine prclib_driver_record_write_color_factors_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_code), deferred :: write_color_factors_call

In the Fortran module case, the matrix-element procedure fills an array of
omega_color_factor elements. We distribute this array among two integer
arrays and one complex-valued array, for which we have the C pointers.

<Prclib interfaces: prc writer f module: TBP>+≡
    procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,A)") "allocate (cf (shape(1)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
        write (unit, "(5x,9A)") "cf_index1(1:shape(1)) = cf%i1"
        write (unit, "(5x,9A)") "cf_index2(1:shape(1)) = cf%i2"
        write (unit, "(5x,9A)") "color_factors(1:shape(1)) = cf%factor"
    end subroutine prc_writer_f_module_write_color_factors_call

```

In the C library case, we just transfer the C pointers to the library function.
There are three arrays.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
    procedure :: write_color_factors_call => &
        prc_writer_c_lib_write_color_factors_call

```

```

<Prclib interfaces: procedures>+≡
subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)" "call ", &
    char (writer%get_c_procname (id, var_str ("color_factors"))), &
    " (cf_index1, cf_index2, color_factors)"
  end subroutine prc_writer_c_lib_write_color_factors_call

```

14.1.10 Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or bind(C) Fortran library, we need explicit interfaces for the library functions. They are not identical to the Fortran module versions. They transfer pointers directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as base type for all C-library writers. It writes specific interfaces depending on the feature.

We bind this as the method `write_standard_interface` instead of `write_interface`, because we have to override the latter. Otherwise we could not call the method because the writer type is abstract.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_standard_interface => prc_writer_c_lib_write_interface

<Prclib interfaces: procedures>+≡
subroutine prc_writer_c_lib_write_interface (writer, unit, id, feature)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  select case (char (feature))
  case ("md5sum")
    write (unit, "(2x,9A)" "interface"
    write (unit, "(5x,9A)" "function ", &
      char (writer%get_c_procname (id, var_str ("get_md5sum"))), &
      " () result (cptr) bind(C)"
    write (unit, "(7x,9A)" "import"
    write (unit, "(7x,9A)" "implicit none"
    write (unit, "(7x,9A)" "type(c_ptr) :: cptr"
    write (unit, "(5x,9A)" "end function ", &
      char (writer%get_c_procname (id, var_str ("get_md5sum")))
    write (unit, "(2x,9A)" "end interface"
  case ("openmp_supported")
    write (unit, "(2x,9A)" "interface"
    write (unit, "(5x,9A)" "function ", &
      char (writer%get_c_procname (id, feature)), &
      " () result (status) bind(C)"
    write (unit, "(7x,9A)" "import"
    write (unit, "(7x,9A)" "implicit none"
    write (unit, "(7x,9A)" "logical(c_bool) :: status"
    write (unit, "(5x,9A)" "end function ", &
      char (writer%get_c_procname (id, feature))

```

```

        write (unit, "(2x,9A)" "end interface"
case ("n_in", "n_out", "n_flv", "n_hel", "n_col", "n_cin", "n_cf")
    write (unit, "(2x,9A)" "interface"
    write (unit, "(5x,9A)" "function ", &
        char (writer%get_c_procname (id, feature)), &

        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)" "end interface"
case ("col_state")
    write (unit, "(2x,9A)" "interface"
    write (unit, "(5x,9A)" "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (col_state, ghost_flag) bind(C)"
    write (unit, "(7x,9A)" "import"
    write (unit, "(7x,9A)" "implicit none"
    write (unit, "(7x,9A)" "integer(c_int), dimension(*), intent(out) ", &
        ":: col_state"
    write (unit, "(7x,9A)" "logical(c_bool), dimension(*), intent(out) ", &
        ":: ghost_flag"
    write (unit, "(5x,9A)" "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)" "end interface"
case ("color_factors")
    write (unit, "(2x,9A)" "interface"
    write (unit, "(5x,9A)" "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (cf_index1, cf_index2, color_factors) bind(C)"
    write (unit, "(7x,9A)" "import"
    write (unit, "(7x,9A)" "implicit none"
    write (unit, "(7x,9A)" "integer(c_int), dimension(*), &
        &intent(out) :: cf_index1"
    write (unit, "(7x,9A)" "integer(c_int), dimension(*), &
        &intent(out) :: cf_index2"
    write (unit, "(7x,9A)" "complex(c_default_complex), dimension(*), &
        &intent(out) :: color_factors"
    write (unit, "(5x,9A)" "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)" "end interface"

```

```

end select
end subroutine prc_writer_c_lib_write_interface

```

14.1.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return tables, actually C pointers to tables. Here, we write convenience routines that unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use intermediate storage for correctly transforming C to Fortran data types.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: set_flv_state => prclib_driver_set_flv_state
  procedure :: set_hel_state => prclib_driver_set_hel_state

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_set_flv_state (driver, i, flv_state)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    integer, dimension(:,,:), allocatable, intent(out) :: flv_state
    integer :: n_tot, n_flv
    integer(c_int) :: pid
    integer(c_int), dimension(:,,:), allocatable :: c_flv_state
    pid = i
    n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
    n_flv = driver%get_n_flv (pid)
    allocate (flv_state (n_tot, n_flv))
    allocate (c_flv_state (n_tot, n_flv))
    call driver%set_flv_state_ptr &
      (pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
    flv_state = c_flv_state
  end subroutine prclib_driver_set_flv_state

  subroutine prclib_driver_set_hel_state (driver, i, hel_state)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    integer, dimension(:,,:), allocatable, intent(out) :: hel_state
    integer :: n_tot, n_hel
    integer(c_int) :: pid
    integer(c_int), dimension(:,,:), allocatable, target :: c_hel_state
    pid = i
    n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
    n_hel = driver%get_n_hel (pid)
    allocate (hel_state (n_tot, n_hel))
    allocate (c_hel_state (n_tot, n_hel))
    call driver%set_hel_state_ptr &
      (pid, c_hel_state, int ([n_tot, n_hel], kind=c_int))
    hel_state = c_hel_state
  end subroutine prclib_driver_set_hel_state

```

The color-flow table is three-dimensional, otherwise similar. We simultaneously set the ghost-flag table, which consists of logical entries.

```

<Prclib interfaces: prclib driver: TBP>+≡

```

```

        procedure :: set_col_state => prclib_driver_set_col_state
    (Prclib interfaces: procedures)+≡
        subroutine prclib_driver_set_col_state (driver, i, col_state, ghost_flag)
            class(prclib_driver_t), intent(in) :: driver
            integer, intent(in) :: i
            integer, dimension(:,:), allocatable, intent(out) :: col_state
            logical, dimension(:,:), allocatable, intent(out) :: ghost_flag
            integer :: n_cin, n_tot, n_col
            integer(c_int) :: pid
            integer(c_int), dimension(:,:), allocatable :: c_col_state
            logical(c_bool), dimension(:,:), allocatable :: c_ghost_flag
            pid = i
            n_cin = driver%get_n_cin (pid)
            n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
            n_col = driver%get_n_col (pid)
            allocate (col_state (n_cin, n_tot, n_col))
            allocate (c_col_state (n_cin, n_tot, n_col))
            allocate (ghost_flag (n_tot, n_col))
            allocate (c_ghost_flag (n_tot, n_col))
            call driver%set_col_state_ptr (pid, &
                c_col_state, c_ghost_flag, int ([n_cin, n_tot, n_col], kind=c_int))
            col_state = c_col_state
            ghost_flag = c_ghost_flag
        end subroutine prclib_driver_set_col_state

```

The color-factor table is a sparse matrix: a two-column array of indices and one array which contains the corresponding factors.

```

    (Prclib interfaces: prclib driver: TBP)+≡
        procedure :: set_color_factors => prclib_driver_set_color_factors
    (Prclib interfaces: procedures)+≡
        subroutine prclib_driver_set_color_factors (driver, i, color_factors, cf_index)
            class(prclib_driver_t), intent(in) :: driver
            integer, intent(in) :: i
            complex(default), dimension(:), allocatable, intent(out) :: color_factors
            integer, dimension(:,:), allocatable, intent(out) :: cf_index
            integer :: n_cf
            integer(c_int) :: pid
            complex(c_default_complex), dimension(:), allocatable, target :: c_color_factors
            integer(c_int), dimension(:), allocatable, target :: c_cf_index1
            integer(c_int), dimension(:), allocatable, target :: c_cf_index2
            pid = i
            n_cf = driver%get_n_cf (pid)
            allocate (color_factors (n_cf))
            allocate (c_color_factors (n_cf))
            allocate (c_cf_index1 (n_cf))
            allocate (c_cf_index2 (n_cf))
            call driver%set_color_factors_ptr (pid, &
                c_cf_index1, c_cf_index2, &
                c_color_factors, int ([n_cf], kind=c_int))
            color_factors = c_color_factors
            allocate (cf_index (2, n_cf))
            cf_index(1,:) = c_cf_index1
            cf_index(2,:) = c_cf_index2

```

```
end subroutine prclib_driver_set_color_factors
```

14.1.12 Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

```
<Prclib interfaces: public>+≡
  public :: prc_get_fptr

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_get_fptr (pid, fid, fptr) bind(C)
      import
      integer(c_int), intent(in) :: pid
      integer(c_int), intent(in) :: fid
      type(c_funptr), intent(out) :: fptr
    end subroutine prc_get_fptr
  end interface
```

This procedure writes the source code for the procedure pointer returning subroutine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered `select case` construct.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_fptr_sub

<Prclib interfaces: procedures>+≡
  subroutine write_get_fptr_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i, j
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return C pointer to a procedure:"
    write (unit, "(A)") "! pid = process index; fid = function index"
    write (unit, "(4A)") "subroutine ", char(prefix), "get_fptr ", &
      "(pid, fid, fptr) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " use kinds"
    write (unit, "(A)") " implicit none"
    write (unit, "(A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(A)") " integer(c_int), intent(in) :: fid"
    write (unit, "(A)") " type(c_funptr), intent(out) :: fptr"
    do i = 1, driver%n_processes
      call driver%record(i)%write_interfaces (unit)
    end do
    write (unit, "(A)") " select case (pid)"
    do i = 1, driver%n_processes
      write (unit, "(2x,A,I0,A)") "case (", i, ")"
      write (unit, "(5x,A)") "select case (fid)"
```

```

        associate (record => driver%record(i))
        do j = 1, size (record%feature)
            write (unit, "(5x,A,I0,9A)") "case (" , j, "); ", &
                "fptr = c_funloc (" , &
                char (record%get_c_procname (record%feature(j))), &
                ")"
        end do
        end associate
        write (unit, "(5x,A)") "end select"
    end do
    write (unit, "(A)") " end select"
    write (unit, "(3A)") "end subroutine ", char (prefix), "get_fptr"
end subroutine write_get_fptr_sub

```

The procedures for which we want to return a pointer (the 'features' of the matrix element code) are actually Fortran module procedures. If we want to have a C signature, we must write wrapper functions for all of them. The procedures, their signatures, and the appropriate writer routines are specific for the process type.

To keep this generic, we do not provide the writer routines here, but just the interface for a writer routine. The actual routines are stored in the process record.

The `prefix` indicates the library, the `id` indicates the process, and `procname` is the bare name of the procedure to be written.

```

<Prclib interfaces: public>+≡
    public :: write_driver_code

<Prclib interfaces: interfaces>+≡
    abstract interface
        subroutine write_driver_code (unit, prefix, id, procname)
            import
            integer, intent(in) :: unit
            type(string_t), intent(in) :: prefix
            type(string_t), intent(in) :: id
            type(string_t), intent(in) :: procname
        end subroutine write_driver_code
    end interface

```

14.1.13 Hooks

Interface for additional library unload / reload hooks (currently unused!)

```

<Prclib interfaces: public>+≡
    public :: prclib_unload_hook
    public :: prclib_reload_hook

<Prclib interfaces: interfaces>+≡
    abstract interface
        subroutine prclib_unload_hook (libname)
            import
            type(string_t), intent(in) :: libname
        end subroutine prclib_unload_hook
    end interface

```

```

subroutine prclib_reload_hook (libname)
  import
  type(string_t), intent(in) :: libname
end subroutine prclib_reload_hook
end interface

```

14.1.14 Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple `make` calls. Note that the Makefile targets depend on each other, so calling `link` executes also the `source` and `compile` steps, when necessary.

The first routine writes source-code files for the individual processes. First it calls the writer routines directly for each process, then it calls `make source`. The `make` command may either post-process the files, or it may do the complete work, e.g., calling an external program that generates the files.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_source => prclib_driver_make_source

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_make_source (driver, os_data)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    integer :: i
    do i = 1, driver%n_processes
      call driver%record(i)%write_source_code ()
    end do
    call os_system_call ("make source " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end subroutine prclib_driver_make_source

```

Compile matrix element source code and the driver source code.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_compile => prclib_driver_make_compile

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_make_compile (driver, os_data)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    call os_system_call ("make compile " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end subroutine prclib_driver_make_compile

```

Combine all matrix-element code together with the driver in a process library on disk.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_link => prclib_driver_make_link

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_make_link (driver, os_data)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    call os_system_call ("make link " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end subroutine prclib_driver_make_link

```

```
end subroutine prclib_driver_make_link
```

14.1.15 Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile targets. Apart from removing everything, removing specific files may be useful for partial rebuilds. (Note that removing the makefile itself can only be done once, for obvious reasons.)

If there is no makefile, do nothing.

(Prclib interfaces: prclib_driver: TBP)+≡

```
procedure :: clean_library => prclib_driver_clean_library
procedure :: clean_objects => prclib_driver_clean_objects
procedure :: clean_source => prclib_driver_clean_source
procedure :: clean_driver => prclib_driver_clean_driver
procedure :: clean_makefile => prclib_driver_clean_makefile
procedure :: clean => prclib_driver_clean
procedure :: distclean => prclib_driver_distclean
```

(Prclib interfaces: procedures)+≡

```
subroutine prclib_driver_clean_library (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean-library " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_clean_library

subroutine prclib_driver_clean_objects (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean-objects " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_clean_objects

subroutine prclib_driver_clean_source (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean-source " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_clean_source

subroutine prclib_driver_clean_driver (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean-driver " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
```

```

end if
end subroutine prclib_driver_clean_driver

subroutine prclib_driver_clean_makefile (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean-makefile " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_clean_makefile

subroutine prclib_driver_clean (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make clean " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_clean

subroutine prclib_driver_distclean (driver, os_data)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  if (driver%makefile_exists ()) then
    call os_system_call ("make distclean " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end if
end subroutine prclib_driver_distclean

```

This Make target should remove all files that apply to a specific process. We execute this when we want to force remaking source code. Note that source targets need not have prerequisites, so just calling `make_source` would not do anything if the files exist.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: clean_proc => prclib_driver_clean_proc

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_clean_proc (driver, i, os_data)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    type(os_data_t), intent(in) :: os_data
    type(string_t) :: id
    if (driver%makefile_exists ()) then
      id = driver%record(i)%id
      call os_system_call ("make clean-" // driver%record(i)%id // " " &
        // os_data%makeflags &
        // " -f " // driver%basename // ".makefile")
    end if
  end subroutine prclib_driver_clean_proc

```

14.1.16 Further Tools

Check for the appropriate makefile.

```
<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: makefile_exists => prclib_driver_makefile_exists

<Prclib interfaces: procedures>+≡
    function prclib_driver_makefile_exists (driver) result (flag)
        class(prclib_driver_t), intent(in) :: driver
        logical :: flag
        inquire (file = char (driver%basename) // ".makefile", exist = flag)
    end function prclib_driver_makefile_exists
```

14.1.17 Load the library

Once the library has been linked, we can dlopen it and assign all procedure pointers to their proper places in the library driver object. The loaded flag is set only if all required pointers have become assigned.

```
<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: load => prclib_driver_load

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_load (driver, os_data, noerror)
        class(prclib_driver_t), intent(inout) :: driver
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: noerror
        type(c_funptr) :: c_fptr
        logical :: ignore

        ignore = .false.; if (present (noerror)) ignore = noerror

        driver%libname = os_get_dlname (driver%basename, os_data, noerror, noerror)
        if (driver%libname == "") return
        select type (driver)
        type is (prclib_driver_dynamic_t)
            if (.not. dlaccess_is_open (driver%dlaccess)) then
                call dlaccess_init &
                    (driver%dlaccess, var_str ("."), driver%libname, os_data)
                if (.not. ignore) call driver%check_dLError ()
            end if
            driver%loaded = dlaccess_is_open (driver%dlaccess)
        class default
            driver%loaded = .true.
        end select
        if (.not. driver%loaded) return

        c_fptr = driver%get_c_funptr (var_str ("get_n_processes"))
        call c_f_procpointer (c_fptr, driver%get_n_processes)
        driver%loaded = driver%loaded .and. associated (driver%get_n_processes)

        c_fptr = driver%get_c_funptr (var_str ("get_process_id_ptr"))
        call c_f_procpointer (c_fptr, driver%get_process_id_ptr)
        driver%loaded = driver%loaded .and. associated (driver%get_process_id_ptr)
```

```

```

This subroutine checks the `dlerror` content and issues a fatal error if it finds an error there.

```

<Prclib interfaces: prclib driver dynamic: TBP>≡
  procedure :: check_dlerror => prclib_driver_check_dlerror

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_check_dlerror (driver)
    class(prclib_driver_dynamic_t), intent(in) :: driver
    if (dlaccess_has_error (driver%dlaccess)) then
      call msg_fatal (char (dlaccess_get_error (driver%dlaccess)))
    end if
  end subroutine

```

```
end subroutine prclib_driver_check_dlerror
```

Get the handle (C function pointer) for a given “feature” of the matrix element code, so it can be assigned to the appropriate procedure pointer slot. In the static case, this is a trivial pointer assignment, hard-coded into the driver type implementation.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure (prclib_driver_get_c_funptr), deferred :: get_c_funptr

<Prclib interfaces: interfaces>+≡
  abstract interface
    function prclib_driver_get_c_funptr (driver, feature) result (c_fptr)
      import
      class(prclib_driver_t), intent(inout) :: driver
      type(string_t), intent(in) :: feature
      type(c_funptr) :: c_fptr
    end function prclib_driver_get_c_funptr
  end interface
```

In the dynamic-library case, we call the DL interface to retrieve the C pointer to a named procedure.

```
<Prclib interfaces: prclib driver dynamic: TBP>+≡
  procedure :: get_c_funptr => prclib_driver_dynamic_get_c_funptr

<Prclib interfaces: procedures>+≡
  function prclib_driver_dynamic_get_c_funptr (driver, feature) result (c_fptr)
    class(prclib_driver_dynamic_t), intent(inout) :: driver
    type(string_t), intent(in) :: feature
    type(c_funptr) :: c_fptr
    type(string_t) :: prefix, full_name
    prefix = driver%basename // "_"
    full_name = prefix // feature
    c_fptr = dlaccess_get_c_funptr (driver%dlaccess, full_name)
    call driver%check_dlerror ()
  end function prclib_driver_dynamic_get_c_funptr
```

14.1.18 MD5 sums

Recall the MD5 sum written in the Makefile

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: get_md5sum_makefile => prclib_driver_get_md5sum_makefile

<Prclib interfaces: procedures>+≡
  function prclib_driver_get_md5sum_makefile (driver) result (md5sum)
    class(prclib_driver_t), intent(in) :: driver

14.2 Abstract process core configuration

In this module, we define abstract data types that handle the method-specific part of defining a process (including all of its options) and accessing an external matrix element.

There are no unit tests, these are deferred to the `process_libraries` module below.

```

<prc_core_def.f90>≡
<File header>

module prc_core_def

  <Use strings>
  <Use file utils>
  use diagnostics !NODEP!

  use process_constants
  use prclib_interfaces

  <Standard module head>

  <Prc core def: public>

```

```

    <Prc core def: types>

    <Prc core def: interfaces>

    contains

    <Prc core def: procedures>

    end module prc_core_def

```

14.2.1 Process core definition type

For storing configuration data that depend on the specific process variant, we introduce a polymorphic type. At this point, we just declare an abstract base type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we would have to call a finalizer from the `process_component_def_t` wrapper.

```

<Prc core def: public>≡
    public :: prc_core_def_t

<Prc core def: types>≡
    type, abstract :: prc_core_def_t
        class(prc_writer_t), allocatable :: writer
    contains
        <Prc core def: process core def: TBP>
    end type prc_core_def_t

```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

```

<Prc core def: process core def: TBP>≡
    procedure (prc_core_def_get_string), nopass, deferred :: type_string

<Prc core def: interfaces>≡
    abstract interface
        function prc_core_def_get_string () result (string)
            import
                type(string_t) :: string
            end function prc_core_def_get_string
    end interface

```

The `write` method should display the content completely.

```

<Prc core def: process core def: TBP>+≡
    procedure (prc_core_def_write), deferred :: write

<Prc core def: interfaces>+≡
    abstract interface
        subroutine prc_core_def_write (object, unit)
            import
                class(prc_core_def_t), intent(in) :: object
                integer, intent(in) :: unit
            end subroutine prc_core_def_write

```

```
end interface
```

The `read` method should fill the content completely.

```
<Prc core def: process core def: TBP>+≡
  procedure (prc_core_def_read), deferred :: read
<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_read (object, unit)
      import
      class(prc_core_def_t), intent(out) :: object
      integer, intent(in) :: unit
    end subroutine prc_core_def_read
  end interface
```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

```
<Prc core def: process core def: TBP>+≡
  procedure :: set_md5sum => prc_core_def_set_md5sum
<Prc core def: procedures>≡
  subroutine prc_core_def_set_md5sum (core_def, md5sum)
    class(prc_core_def_t), intent(inout) :: core_def
    character(32) :: md5sum
    if (allocated (core_def%writer)) core_def%writer%md5sum = md5sum
  end subroutine prc_core_def_set_md5sum
```

Allocate an appropriate driver object which corresponds to the chosen process core definition.

For internal matrix element (i.e., those which do not need external code), the driver should have access to all matrix element information from the beginning. In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix element code.

```
<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_allocate_driver), deferred :: allocate_driver
<Prc core def: interfaces>+≡
  interface
    subroutine prc_core_def_allocate_driver (object, driver, basename)
      import
      class(prc_core_def_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
    end subroutine prc_core_def_allocate_driver
  end interface
```

This flag tells whether the particular variant needs external code. We implement a default function which returns false. The flag depends only on the type, therefore we implement it as `nopass`.

```
<Prc core def: process core def: TBP>+≡
  procedure, nopass :: needs_code => prc_core_def_needs_code
```

```

<Prc core def: procedures>+≡
  function prc_core_def_needs_code () result (flag)
    logical :: flag
    flag = .false.
  end function prc_core_def_needs_code

```

This subroutine allocates an array which holds the name of all features that this process core implements. This feature applies to matrix element code that is not coded as a Fortran module but communicates via independent library functions, which follow the C calling conventions. The addresses of those functions are returned as C function pointers, which can be converted into Fortran procedure pointers. The conversion is done in code specific for the process variant; here we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code. The driver interfaces only those C functions which are supported for the given process core.

If the process core does not require external code, this array is meaningless.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_get_features), nopass, deferred &
    :: get_features

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_get_features (features)
      import
      type(string_t), dimension(:), allocatable, intent(out) :: features
    end subroutine prc_core_def_get_features
  end interface

```

Assign pointers to the process-specific procedures to the driver, if the process is external.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_connect), deferred :: connect

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
      import
      class(prc_core_def_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prc_core_def_connect
  end interface

```

14.2.2 Process core template

We must be able to automatically allocate a process core definition object with the appropriate type, given only the type name.

To this end, we introduce a `prc_template_t` type which is simply a wrapper for an empty `prc_core_def_t` object. Choosing one of the templates from an array, we can allocate the target object.

```

<Prc core def: public>+≡
    public :: prc_template_t

<Prc core def: types>+≡
    type :: prc_template_t
        class(prc_core_def_t), allocatable :: core_def
    end type prc_template_t

```

The allocation routine. We use the `source` option of the `allocate` statement. The `mold` option would probably more appropriate, but is a F2008 feature.

```

<Prc core def: public>+≡
    public :: allocate_core_def

<Prc core def: procedures>+≡
    subroutine allocate_core_def (template, name, core_def)
        type(prc_template_t), dimension(:), intent(in) :: template
        type(string_t), intent(in) :: name
        class(prc_core_def_t), allocatable :: core_def
        integer :: i
        do i = 1, size (template)
            if (template(i)%core_def%type_string () == name) then
                allocate (core_def, source = template(i)%core_def)
                return
            end if
        end do
    end subroutine allocate_core_def

```

14.2.3 Process driver

For each process component, we implement a driver object which holds the calls to the matrix element and various auxiliary routines as procedure pointers. Any actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding `prc_core_def` object), the procedure pointers may refer to external or internal code, and there may be additional procedures for certain types. The base type defined here is abstract.

```

<Prc core def: public>+≡
    public :: prc_core_driver_t

<Prc core def: types>+≡
    type, abstract :: prc_core_driver_t
        contains
        <Prc core def: process driver: TBP>
    end type prc_core_driver_t

```

This returns the process type. No reference to contents.

```

<Prc core def: process driver: TBP>≡
    procedure(prc_core_driver_type_name), nopass, deferred :: type_name

```

```

<Prc core def: interfaces>+≡
  abstract interface
    function prc_core_driver_type_name () result (type)
      import
        type(string_t) :: type
      end function prc_core_driver_type_name
  end interface

```

14.2.4 Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method, namely a subroutine that fills the record of constant process data. For an external process, this task is performed by the external library driver instead.

```

<Prc core def: public>+≡
  public :: process_driver_internal_t

<Prc core def: types>+≡
  type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
  contains
    <Prc core def: process driver internal: TBP>
  end type process_driver_internal_t

<Prc core def: process driver internal: TBP>≡
  procedure(process_driver_fill_constants), deferred :: fill_constants

<Prc core def: interfaces>+≡
  abstract interface
    subroutine process_driver_fill_constants (driver, data)
      import
        class(process_driver_internal_t), intent(in) :: driver
        type(process_constants_t), intent(out) :: data
      end subroutine process_driver_fill_constants
  end interface

```

14.3 Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag **polarized** and a string **decay**. If the **polarized** flag is set, particle polarization information should be kept when generating events for this process. If the **decay** string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the **polarized** flag is indicated by an asterisk (*) in brackets, and the **decay** is indicated by its ID in brackets.

The **read** and **write** procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

```

<particle_specifiers.f90>≡
  <File header>

```

```

module particle_specifiers

  <Use strings>
  <Use file utils>
  use diagnostics !NODEP!
  use unit_tests

  <Standard module head>

  <Particle specifiers: public>

  <Particle specifiers: types>

  <Particle specifiers: interfaces>

  contains

  <Particle specifiers: procedures>

  <Particle specifiers: tests>

end module particle_specifiers

```

14.3.1 Base type

This is an abstract type which can hold a single particle or an expression.

```

<Particle specifiers: types>≡
  type, abstract :: prt_spec_expr_t
  contains
  <Particle specifiers: prt spec expr: TBP>
end type prt_spec_expr_t

```

Output, as a string.

```

<Particle specifiers: prt spec expr: TBP>≡
  procedure (prt_spec_expr_to_string), deferred :: to_string

<Particle specifiers: interfaces>≡
  abstract interface
    function prt_spec_expr_to_string (object) result (string)
      import
      class(prt_spec_expr_t), intent(in) :: object
      type(string_t) :: string
    end function prt_spec_expr_to_string
  end interface

```

Call an `expand` method for all enclosed subexpressions (before handling the current expression).

```

<Particle specifiers: prt spec expr: TBP>+≡
  procedure (prt_spec_expr_expand_sub), deferred :: expand_sub

<Particle specifiers: interfaces>+≡
  abstract interface
    subroutine prt_spec_expr_expand_sub (object)

```

```

import
class(prt_spec_expr_t), intent(inout) :: object
end subroutine prt_spec_expr_expand_sub
end interface

```

14.3.2 Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can make variadic arrays.

```

⟨Particle specifiers: public⟩≡
  public :: prt_expr_t
⟨Particle specifiers: types⟩+≡
  type :: prt_expr_t
    class(prt_spec_expr_t), allocatable :: x
    contains
    ⟨Particle specifiers: prt expr: TBP⟩
  end type prt_expr_t

```

Output as a string: delegate.

```

⟨Particle specifiers: prt expr: TBP⟩≡
  procedure :: to_string => prt_expr_to_string
⟨Particle specifiers: procedures⟩≡
  recursive function prt_expr_to_string (object) result (string)
    class(prt_expr_t), intent(in) :: object
    type(string_t) :: string
    if (allocated (object%x)) then
      string = object%x%to_string ()
    else
      string = ""
    end if
  end function prt_expr_to_string

```

Allocate the expression as a particle specifier and copy the value.

```

⟨Particle specifiers: prt expr: TBP⟩+≡
  procedure :: init_spec => prt_expr_init_spec
⟨Particle specifiers: procedures⟩+≡
  subroutine prt_expr_init_spec (object, spec)
    class(prt_expr_t), intent(out) :: object
    type(prt_spec_t), intent(in) :: spec
    allocate (prt_spec_t :: object%x)
    select type (x => object%x)
    type is (prt_spec_t)
      x = spec
    end select
  end subroutine prt_expr_init_spec

```

Allocate as a list/sum and allocate for a given length

```

⟨Particle specifiers: prt expr: TBP⟩+≡
  procedure :: init_list => prt_expr_init_list
  procedure :: init_sum => prt_expr_init_sum

```

```

(Particle specifiers: procedures)+≡
subroutine prt_expr_init_list (object, n)
  class(prt_expr_t), intent(out) :: object
  integer, intent(in) :: n
  allocate (prt_spec_list_t :: object%x)
  select type (x => object%x)
  type is (prt_spec_list_t)
    allocate (x%expr (n))
  end select
end subroutine prt_expr_init_list

subroutine prt_expr_init_sum (object, n)
  class(prt_expr_t), intent(out) :: object
  integer, intent(in) :: n
  allocate (prt_spec_sum_t :: object%x)
  select type (x => object%x)
  type is (prt_spec_sum_t)
    allocate (x%expr (n))
  end select
end subroutine prt_expr_init_sum

```

Return the number of terms. This is unity, except if the expression is a sum.

```

(Particle specifiers: prt expr: TBP)+≡
procedure :: get_n_terms => prt_expr_get_n_terms

```

```

(Particle specifiers: procedures)+≡
function prt_expr_get_n_terms (object) result (n)
  class(prt_expr_t), intent(in) :: object
  integer :: n
  if (allocated (object%x)) then
    select type (x => object%x)
    type is (prt_spec_sum_t)
      n = size (x%expr)
    class default
      n = 1
    end select
  else
    n = 0
  end if
end function prt_expr_get_n_terms

```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

```

(Particle specifiers: prt expr: TBP)+≡
procedure :: term_to_array => prt_expr_term_to_array

(Particle specifiers: procedures)+≡
recursive subroutine prt_expr_term_to_array (object, array, i)
  class(prt_expr_t), intent(in) :: object
  type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
  integer, intent(in) :: i
  integer :: j

```

```

if (allocated (array)) deallocate (array)
select type (x => object%x)
type is (prt_spec_t)
  allocate (array (1))
  array(1) = x
type is (prt_spec_list_t)
  allocate (array (size (x%expr)))
  do j = 1, size (array)
    select type (y => x%expr(j)%x)
    type is (prt_spec_t)
      array(j) = y
    end select
  end do
type is (prt_spec_sum_t)
  call x%expr(i)%term_to_array (array, 1)
end select
end subroutine prt_expr_term_to_array

```

14.3.3 The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and decays may not be set simultaneously.

```

<Particle specifiers: public>+≡
  public :: prt_spec_t

<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_t
  private
  type(string_t) :: name
  logical :: polarized = .false.
  type(string_t), dimension(:), allocatable :: decay
  contains
  <Particle specifiers: prt spec: TBP>
  end type prt_spec_t

```

I/O

Output. Old-style subroutines.

```

<Particle specifiers: public>+≡
  public :: prt_spec_write

<Particle specifiers: interfaces>+≡
  interface prt_spec_write
    module procedure prt_spec_write1
    module procedure prt_spec_write2
  end interface prt_spec_write

```

<Particle specifiers: procedures>+≡

```

subroutine prt_spec_write1 (object, unit, advance)
  type(prt_spec_t), intent(in) :: object
  integer, intent(in), optional :: unit
  character(len=*), intent(in), optional :: advance
  character(3) :: adv
  integer :: u
  u = output_unit (unit)
  adv = "yes"; if (present (advance)) adv = advance
  write (u, "(A)", advance = adv) char (object%to_string ())
end subroutine prt_spec_write1

```

Write an array as a list of particle specifiers.

<Particle specifiers: procedures>+≡

```

subroutine prt_spec_write2 (prt_spec, unit, advance)
  type(prt_spec_t), dimension(:), intent(in) :: prt_spec
  integer, intent(in), optional :: unit
  character(len=*), intent(in), optional :: advance
  character(3) :: adv
  integer :: u, i
  u = output_unit (unit)
  adv = "yes"; if (present (advance)) adv = advance
  do i = 1, size (prt_spec)
    if (i > 1) write (u, "(A)", advance="no") " ", "
    call prt_spec_write (prt_spec(i), u, advance="no")
  end do
  write (u, "(A)", advance = adv)
end subroutine prt_spec_write2

```

Read. Input may be string or array of strings.

<Particle specifiers: public>+≡

```

public :: prt_spec_read

```

<Particle specifiers: interfaces>+≡

```

    else
      allocate (decay (0))
    end if
  end subroutine prt_spec_get_decays

```

Miscellaneous

There is nothing to expand here:

```

<Particle specifiers: prt spec: TBP>+≡
  procedure :: expand_sub => prt_spec_expand_sub

<Particle specifiers: procedures>+≡
  subroutine prt_spec_expand_sub (object)
    class(prt_spec_t), intent(inout) :: object
  end subroutine prt_spec_expand_sub

```

14.3.4 List

A list of particle specifiers, indicating, e.g., the final state of a process.

```

<Particle specifiers: public>+≡
  public :: prt_spec_list_t

<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_list_t
    type(prt_spec_expr_t), dimension(:), allocatable :: expr
  contains
    <Particle specifiers: prt spec list: TBP>
  end type prt_spec_list_t

```

Output: Concatenate the components. Insert brackets if the component is also a list. The components of the `expr` array, if any, should all be filled.

```

<Particle specifiers: prt spec list: TBP>≡
  procedure :: to_string => prt_spec_list_to_string

<Particle specifiers: procedures>+≡
  recursive function prt_spec_list_to_string (object) result (string)
    class(prt_spec_list_t), intent(in) :: object
    type(string_t) :: string
    integer :: i
    string = ""
    if (allocated (object%expr)) then

```

```

do i = 1, size (object%expr)
  if (i > 1) string = string // ", "
  select type (x => object%expr(i)%x)
  type is (prt_spec_list_t)
    string = string // "(" // x%to_string () // ")"
  class default
    string = string // x%to_string ()
  end select
end do
end if
end function prt_spec_list_to_string

```

Flatten: if there is a subexpression which is also a list, include the components as direct members of the current list.

```

⟨Particle specifiers: prt spec list: TBP⟩+≡
  procedure :: flatten => prt_spec_list_flatten

⟨Particle specifiers: procedures⟩+≡
  subroutine prt_spec_list_flatten (object)
    class(prt_spec_list_t), intent(inout) :: object
    type(prt_expr_t), dimension(:), allocatable :: tmp_expr
    integer :: i, n_flat, i_flat
    n_flat = 0
    do i = 1, size (object%expr)
      select type (y => object%expr(i)%x)
      type is (prt_spec_list_t)
        n_flat = n_flat + size (y%expr)
      class default
        n_flat = n_flat + 1
      end select
    end do
    if (n_flat > size (object%expr)) then
      allocate (tmp_expr (n_flat))
      i_flat = 0
      do i = 1, size (object%expr)
        select type (y => object%expr(i)%x)
        type is (prt_spec_list_t)
          tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
          i_flat = i_flat + size (y%expr)
        class default
          tmp_expr (i_flat + 1) = object%expr(i)
          i_flat = i_flat + 1
        end select
      end do
    end if
    if (allocated (tmp_expr)) &
      call move_alloc (from = tmp_expr, to = object%expr)
  end subroutine prt_spec_list_flatten

```

Convert a list of sums into a sum of lists. (Subexpressions which are not sums are left untouched.)

```

⟨Particle specifiers: procedures⟩+≡

    end do
  end if
end subroutine prt_spec_list_expand_sub

```

14.3.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

```

<Particle specifiers: public>+≡
  public :: prt_spec_sum_t

<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_sum_t
    type(prt_expr_t), dimension(:), allocatable :: expr
  contains
    <Particle specifiers: prt spec sum: TBP>
  end type prt_spec_sum_t

```

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the `expr` array, if any, should all be filled.

```

<Particle specifiers: prt spec sum: TBP>≡
  procedure :: to_string => prt_spec_sum_to_string

<Particle specifiers: procedures>+≡
recursive function prt_spec_sum_to_string (object) result (string)

    class(prt_spec_sum_t), intent(inout) :: object
    integer :: i
    if (allocated (object%expr)) then
      do i = 1, size (object%expr)
        call object%expr(i)%expand ()
      end do
    end if
  end subroutine prt_spec_sum_expand_sub

```

14.3.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \rightarrow a, b, c \quad (14.1)$$

$$a + (b + c) \rightarrow a + b + c \quad (14.2)$$

$$a, b + c \rightarrow (a, b) + (a, c) \quad (14.3)$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated.

```

<Particle specifiers: prt expr: TBP>+≡
  procedure :: expand => prt_expr_expand

<Particle specifiers: procedures>+≡
  recursive subroutine prt_expr_expand (expr)
    class(prt_expr_t), intent(inout) :: expr

14.4 Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process

configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

```

<process_libraries.f90>≡
  <File header>

  module process_libraries

    use iso_c_binding !NODEP!
    use kinds !NODEP!

    <Process libraries: test declarations>

    contains

    <Process libraries: procedures>

    <Process libraries: tests>

  end module process_libraries

```

14.4.1 Auxiliary stuff

Here is a small subroutine that strips the left-hand side and the equals sign off an equation.

```
(Process libraries: procedures)≡  
  subroutine strip_prefix (buffer)  
    character(*), intent(inout) :: buffer  
    type(string_t) :: string, prefix  
    string = buffer  
    call split (string, prefix, "=")  
    buffer = string  
  end subroutine strip_prefix
```

14.4.2 Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

```
(Process libraries: public)≡  
  public :: process_component_def_t
```

```

Compute the MD5 sum of a process component. We reset the stored MD5 sum to the empty string (so a previous value is not included in the calculation), the write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

```

Process definition

The process component definitions are collected in a common process definition object.

The `id` is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number `n_in` is 1 or 2 for a decay or scattering process, respectively. This must be identical to `n_in` for all components.

The initial and extra component definitions (see above) are allocated as the `initial` and `extra` arrays, respectively. The latter are determined from the former.

The `md5sum` is used to verify the integrity of the configuration.

```

<Process libraries: public>+≡

```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

```

end subroutine process_def_init

```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

We assume that the particle arrays match the `n_in` and `n_out` values in size. The model is referred to by name; it is identified as an existing model later. The index `i` must refer to an existing element of the component array.

Data specific for the process core of a component are imported as the `core_def` argument. We should allocate an object of class `prc_core_def_t` with the appropriate specific type, fill it, and transfer it to the process component definition here. The allocation is moved, so the original allocated object is returned empty.

    do i = 1, def%n_initial
      call def%initial(i)%compute_md5sum (def%model)
      buffer = buffer // def%initial(i)%md5sum
    end do
    do i = 1, def%n_extra
      call def%extra(i)%compute_md5sum (def%model)
      buffer = buffer // def%initial(i)%md5sum
    end do
    def%md5sum = md5sum (char (buffer))
  end subroutine process_def_compute_md5sum

```

Return the MD5 sum of the process or of a process component.

```

(Process libraries: process def: TBP)+≡
  procedure :: get_md5sum => process_def_get_md5sum

(Process libraries: procedures)+≡
  function process_def_get_md5sum (def, i_component) result (md5sum)
    class(process_def_t), intent(in) :: def
    integer, intent(in), optional :: i_component
    character(32) :: md5sum
    if (present (i_component)) then
      md5sum = def%initial(i_component)%md5sum
    else
      md5sum = def%md5sum
    end if
  end function process_def_get_md5sum

```

```

    end if
end function process_def_get_md5sum

```

This query tells whether a specific process component relies on external code. This includes all traditional WHIZARD matrix elements which rely on O'MEGA for code generation. Other process components (trivial decays, subtraction terms) do not require external code.

NOTE: Implemented only for initial component.

The query is passed to the process component.

```

<Process libraries: process def: TBP>+≡
  procedure :: needs_code => process_def_needs_code

<Process libraries: procedures>+≡
  function process_def_needs_code (def, i_component) result (flag)
    class(process_def_t), intent(in) :: def
    integer, intent(in) :: i_component
    logical :: flag
    flag = def%initial(i_component)%needs_code ()
  end function process_def_needs_code

```

Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

```

<Process libraries: public>+≡
  public :: process_def_entry_t

<Process libraries: types>+≡
  type, extends (process_def_t) :: process_def_entry_t
  private
    type(process_def_entry_t), pointer :: next => null ()
  end type process_def_entry_t

```

This is the type for the list itself.

```

<Process libraries: types>+≡
  type :: process_def_list_t
  private
    type(process_def_entry_t), pointer :: first => null ()
    type(process_def_entry_t), pointer :: last => null ()
  contains
    <Process libraries: process def list: TBP>
  end type process_def_list_t

```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

```

<Process libraries: process def list: TBP>≡
  procedure :: final => process_def_list_final

```

```

<Process libraries: procedures>+≡
subroutine process_def_list_final (list)
  class(process_def_list_t), intent(inout) :: list
  type(process_def_entry_t), pointer :: current
  nullify (list%last)
  do while (associated (list%first))
    current => list%first
    list%first => current%next
    deallocate (current)
  end do
end subroutine process_def_list_final

```

Write the complete list.

```

<Process libraries: process def list: TBP>+≡
  procedure :: write => process_def_list_write

<Process libraries: procedures>+≡
subroutine process_def_list_write (object, unit, libpath)
  class(process_def_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: libpath
  type(process_def_entry_t), pointer :: entry
  integer :: i, u
  u = output_unit (unit)
  if (associated (object%first)) then
    i = 1
    entry => object%first
    do while (associated (entry))
      write (u, "(1x,A,I0,A)") "Process #", i, ":"
      call entry%write (u)
      i = i + 1
      entry => entry%next
      if (associated (entry)) write (u, *)
    end do
  else
    write (u, "(1x,A)") "Process definition list: [empty]"
  end if
end subroutine process_def_list_write

```

Short account.

```

<Process libraries: process def list: TBP>+≡
  procedure :: show => process_def_list_show

<Process libraries: procedures>+≡
subroutine process_def_list_show (object, unit)
  class(process_def_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  type(process_def_entry_t), pointer :: entry
  integer :: u
  u = output_unit (unit)
  if (associated (object%first)) then
    write (u, "(2x,A)") "Processes:"
    entry => object%first
    do while (associated (entry))

```

```

        call entry%show (u)
        entry => entry%next
    end do
else
    write (u, "(2x,A)") "Processes: [empty]"
end if
end subroutine process_def_list_show

```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

```

<Process libraries: process def list: TBP>+≡
    procedure :: read => process_def_list_read

<Process libraries: procedures>+≡
    subroutine process_def_list_read (object, unit, core_def_templates)
        class(process_def_list_t), intent(out) :: object
        integer, intent(in) :: unit
        type(prc_template_t), dimension(:), intent(in) :: core_def_templates
        type(process_def_entry_t), pointer :: entry
        character(80) :: buffer, ref
        integer :: i
        read (unit, "(A)") buffer
        write (ref, "(1x,A)") "Process definition list: [empty]"
        if (buffer == ref) return ! OK: empty library
        backspace (unit)
        READ_ENTRIES: do i = 1, huge (0)
            if (i > 1) read (unit, *, end=1)
            read (unit, "(A)") buffer

            write (ref, "(1x,A,I0,A)") "Process #", i, ":"
            if (buffer /= ref) return ! Wrong process header: done.
            allocate (entry)
            call entry%read (unit, core_def_templates)
            call object%append (entry)
        end do READ_ENTRIES
1    continue ! EOF: done
    end subroutine process_def_list_read

```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

```

<Process libraries: process def list: TBP>+≡
    procedure :: append => process_def_list_append

<Process libraries: procedures>+≡
    subroutine process_def_list_append (list, entry)
        class(process_def_list_t), intent(inout) :: list
        type(process_def_entry_t), intent(inout), pointer :: entry
        if (list%contains (entry%id)) then
            call msg_fatal ("Recording process: '" // char (entry%id) &
                // "' has already been defined")

```

```

end if
if (associated (list%first)) then
    list%last%next => entry
else
    list%first => entry
end if
list%last => entry
entry => null ()
end subroutine process_def_list_append

```

Probe the process definition list

Return the number of processes supported by the library.

```

14.4.3 Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

Process library entry

For each process component that is part of the library, there is a separate library entry (`process_library_entry_t`). The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The `status` indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status `STAT_LOADED` is accessible for computing matrix elements.

The `def` pointer identifies the corresponding process definition. The process component within that definition is identified by the `i_component` index.

The `i_external` index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The `driver` component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

```
<Process libraries: types>+≡
type :: process_library_entry_t
  private
  integer :: status = STAT_UNKNOWN
  type(process_def_t), pointer :: def => null ()
  integer :: i_component = 0
  integer :: i_external = 0
  class(prc_core_driver_t), allocatable :: driver
contains
<Process libraries: process library entry: TBP>
end type process_library_entry_t
```

Here are the available status codes. An entry starts with `UNKNOWN` status. Once the association with a valid process definition is established, the status becomes `CONFIGURED`. If matrix element source code is to be generated by the system or provided from elsewhere, `CODE_GENERATED` indicates that this is done. The `COMPILED` status is next, it also applies to processes which are accessed as pre-compiled binaries. Finally, the library is linked and process pointers are set; this is marked as `LOADED`.

For a process library, the initial status is `OPEN`, since process definitions may be added. After configuration, the process content is fixed and the status becomes `CONFIGURED`. The further states are as above, always referring to the lowest status among the process entries.

```
<Process libraries: parameters>≡
integer, parameter :: STAT_UNKNOWN = 0
integer, parameter :: STAT_OPEN = 1
integer, parameter :: STAT_CONFIGURED = 2
integer, parameter :: STAT_SOURCE = 3
integer, parameter :: STAT_COMPILED = 4
integer, parameter :: STAT_LINKED = 5
integer, parameter :: STAT_ACTIVE = 6
```

These are the associated code letters, for output:

```
<Process libraries: parameters>+≡
character, dimension(0:6), parameter :: STATUS_LETTER = &
  ["?", "o", "f", "s", "c", "l", "a"]
```

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

```

(Process libraries: process library entry: TBP)+≡
  procedure :: to_string => process_library_entry_to_string

(Process libraries: procedures)+≡
  function process_library_entry_to_string (object) result (string)
    type(string_t) :: string
    class(process_library_entry_t), intent(in) :: object
    character(32) :: buffer
    string = "[" // STATUS_LETTER(object%status) // "]"
    select case (object%status)
    case (STAT_UNKNOWN)
    case default
      if (associated (object%def)) then
        write (buffer, "(IO)") object%i_component
        string = string // " " // object%def%id // "." // trim (buffer)
      end if
      if (object%i_external /= 0) then
        write (buffer, "(IO)") object%i_external
        string = string // " = ext:" // trim (buffer)
      else
        string = string // " = int"
      end if
      if (allocated (object%driver)) then
        string = string // " (" // object%driver%type_name () // ")"
      end if
    end select
  end function process_library_entry_to_string

```

Initialize with data. Used for the unit tests.

```

(Process libraries: process library entry: TBP)+≡
  procedure :: init => process_library_entry_init

(Process libraries: procedures)+≡
  subroutine process_library_entry_init (object, &
    status, def, i_component, i_external)
    class(process_library_entry_t), intent(out) :: object
    integer, intent(in) :: status
    type(process_def_t), target, intent(in) :: def
    integer, intent(in) :: i_component
    integer, intent(in) :: i_external
    object%status = status
    object%def => def
    object%i_component = i_component
    object%i_external = i_external
  end subroutine process_library_entry_init

```

Assign pointers for all process-specific features. We have to combine the method from the `core_def` specification, the assigned pointers within the library driver, the index within that driver, and the process driver which should receive the links.

```

(Process libraries: process library entry: TBP)+≡

```

```

    procedure :: connect => process_library_entry_connect
<Process libraries: procedures>+≡
    subroutine process_library_entry_connect (entry, lib_driver, i)
        class(process_library_entry_t), intent(inout) :: entry
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        call entry%def%initial(entry%i_component)%connect &
            (lib_driver, i, entry%driver)
    end subroutine process_library_entry_connect

```

The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The `entry` array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The `driver` object is needed only if `external` is true. This object handles all interactions with external matrix-element code.

The `md5sum` summarizes the complete `process_def_list_t` base object. It can be used to check if the library configuration has changed.

```

<Process libraries: public>+≡
    public :: process_library_t
<Process libraries: types>+≡
    type, extends (process_def_list_t) :: process_library_t
        private
        type(string_t) :: basename
        integer :: n_entries = 0
        logical :: external = .false.
        integer :: status = STAT_UNKNOWN
        logical :: static = .false.
        logical :: driver_exists = .false.
        logical :: makefile_exists = .false.
        type(process_library_entry_t), dimension(:), allocatable :: entry
        class(prclib_driver_t), allocatable :: driver
        character(32) :: md5sum = ""
    contains
        <Process libraries: process library: TBP>
    end type process_library_t

```

For the output, we write first the metadata and the DL access record, then the library entries in short form, and finally the process definition list which is the base object.

Don't write the MD5 sum since this is used to generate it.

```

<Process libraries: process library: TBP>≡
    procedure :: write => process_library_write

```

<Process libraries: procedures>+≡

```

The initializer defines just the basename. We may now add process definitions to the library.

```

<Process libraries: process library: TBP>+=
    procedure :: init => process_library_init
<Process libraries: procedures>+=
    subroutine process_library_init (lib, basename)
        class(process_library_t), intent(out) :: lib
        type(string_t), intent(in) :: basename
        lib%basename = basename
        lib%status = STAT_OPEN
        call msg_message ("Process library '" // char (basename) &
            // "': initialized")
    end subroutine process_library_init

```

This alternative initializer declares the library as static. We should now add process definitions to the library, but all external process code exists already. We need the driver object, and we should check the defined processes against the stored ones.

```

<Process libraries: process library: TBP>+=
    procedure :: init_static => process_library_init_static
<Process libraries: procedures>+=
    subroutine process_library_init_static (lib, basename)
        class(process_library_t), intent(out) :: lib
        type(string_t), intent(in) :: basename
        lib%basename = basename
        lib%status = STAT_OPEN
        lib%static = .true.
        call msg_message ("Static process library '" // char (basename) &
            // "': initialized")
    end subroutine process_library_init_static

```

The `configure` procedure scans the allocated entries in the process definition list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of process components and the number of components which need external code. This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry for each external matrix element.

NOTE: Currently we handle only `initial` process components; `extra` components are ignored.

```

<Process libraries: process library: TBP>+=
    procedure :: configure => process_library_configure

```

(Process libraries: procedures)+≡

end if
end subroutine process_library_write_driver

```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

(Process libraries: process library: TBP)+≡

end if
end subroutine process_library_update_status

```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status `STAT_CONFIGURED`, which then advance to `STAT_SOURCE`. If, for a particular process, the status is already advanced, we do not remove previous files, so `make` will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh `make`.

Finally, if any source code has been generated, we need a driver file.

```

```

14.4.6 Test

This is the master for calling self-test procedures.

```

<Process libraries: public>+≡
    public :: process_libraries_test

<Process libraries: tests>≡
    subroutine process_libraries_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Process libraries: execute tests>
    end subroutine process_libraries_test

```

Empty process list

Test 1: Write an empty process list.

```

<Process libraries: execute tests>≡

```

```

    call test (process_libraries_1, "process_libraries_1", &
              "empty process list", &
              u, results)
<Process libraries: tests>+≡
subroutine process_libraries_1 (u)
  integer, intent(in) :: u
  type(process_def_list_t) :: process_def_list

  write (u, "(A)")  "* Test output: process_libraries_1"
  write (u, "(A)")  "* Purpose: Display an empty process definition list"
  write (u, "(A)")

  call process_def_list%write (u)

  write (u, "(A)")
  write (u, "(A)")  "* Test output end: process_libraries_1"
end subroutine process_libraries_1

```

Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

```

<Process libraries: test declarations>≡
type, extends (prc_core_def_t) :: prcdef_2_t
  integer :: data = 0
  logical :: file = .false.
contains
  <Process libraries: prcdef 2: TBP>
end type prcdef_2_t

```

The process variant is named 'test'.

```

<Process libraries: prcdef 2: TBP>≡
  procedure, nopass :: type_string => prcdef_2_type_string
<Process libraries: tests>+≡
function prcdef_2_type_string () result (string)
  type(string_t) :: string
  string = "test"
end function prcdef_2_type_string

```

Write the contents (the integer value).

```

<Process libraries: prcdef 2: TBP>+≡
  procedure :: write => prcdef_2_write
<Process libraries: tests>+≡
subroutine prcdef_2_write (object, unit)
  class(prcdef_2_t), intent(in) :: object
  integer, intent(in) :: unit

```

```

        write (unit, "(3x,A,I0)") "Test data          = ", object%data
    end subroutine prcdef_2_write

```

Recover the integer value.

```

<Process libraries: prcdef 2: TBP>+≡
    procedure :: read => prcdef_2_read

<Process libraries: tests>+≡
    subroutine prcdef_2_read (object, unit)
        class(prcdef_2_t), intent(out) :: object
        integer, intent(in) :: unit
        character(80) :: buffer
        read (unit, "(A)") buffer
        call strip_prefix (buffer)
        read (buffer, *) object%data
    end subroutine prcdef_2_read

```

No external procedures.

```

<Process libraries: prcdef 2: TBP>+≡
    procedure, nopass :: get_features => prcdef_2_get_features

<Process libraries: tests>+≡
    subroutine prcdef_2_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (0))
    end subroutine prcdef_2_get_features

```

No code generated.

```

<Process libraries: prcdef 2: TBP>+≡
    procedure :: generate_code => prcdef_2_generate_code

<Process libraries: tests>+≡
    subroutine prcdef_2_generate_code (object, &
        basename, model_name, prt_in, prt_out)
        class(prcdef_2_t), intent(in) :: object
        type(string_t), intent(in) :: basename
        type(string_t), intent(in) :: model_name
        type(string_t), dimension(:), intent(in) :: prt_in
        type(string_t), dimension(:), intent(in) :: prt_out
    end subroutine prcdef_2_generate_code

```

Allocate the driver with the appropriate type.

```

<Process libraries: prcdef 2: TBP>+≡
    procedure :: allocate_driver => prcdef_2_allocate_driver

<Process libraries: tests>+≡
    subroutine prcdef_2_allocate_driver (object, driver, basename)
        class(prcdef_2_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (prctest_2_t :: driver)
    end subroutine prcdef_2_allocate_driver

```

Nothing to connect.

```
<Process libraries: prcdef 2: TBP>+≡  
  procedure :: connect => prcdef_2_connect  
  
<Process libraries: tests>+≡  
  subroutine prcdef_2_connect (def, lib_driver, i, proc_driver)  
    class(prcdef_2_t), intent(in) :: def  
    class(prclib_driver_t), intent(in) :: lib_driver  
    integer, intent(in) :: i  
    class(prc_core_driver_t), intent(inout) :: proc_driver  
  end subroutine prcdef_2_connect
```

The associated driver type.

```
<Process libraries: types>+≡  
  type, extends (process_driver_internal_t) :: prctest_2_t  
  contains  
    <Process libraries: prctest 2: TBP>  
  end type prctest_2_t
```

Return the type name.

```
<Process libraries: prctest 2: TBP>≡  
  procedure, nopass :: type_name => prctest_2_type_name  
  
<Process libraries: procedures>+≡  
  function prctest_2_type_name () result (type)  
    type(string_t) :: type  
    type = "test"  
  end function prctest_2_type_name
```

This should fill constant process data. We do not check those here, however, therefore nothing done.

```
<Process libraries: prctest 2: TBP>+≡  
  procedure :: fill_constants => prctest_2_fill_constants  
  
<Process libraries: procedures>+≡  
  subroutine prctest_2_fill_constants (driver, data)  
    class(prctest_2_t), intent(in) :: driver  
    type(process_constants_t), intent(out) :: data  
  end subroutine prctest_2_fill_constants
```

Here is the actual test.

For reading, we need a list of templates, i.e., an array containing allocated objects for all available process variants. This is the purpose of `process_core_templates`. Here, we have only a single template for the 'test' variant.

```
<Process libraries: execute tests>+≡  
  call test (process_libraries_2, "process_libraries_2", &  
    "process definition list", &  
    u, results)
```

```

(Process libraries: tests)+≡
subroutine process_libraries_2 (u)

Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

```

<Process libraries: test declarations>+≡
    type, extends (prc_core_def_t) :: prcdef_5_t
    contains
    <Process libraries: prcdef 5: TBP>
end type prcdef_5_t

```

The process variant is named `test_file`.

```

<Process libraries: prcdef 5: TBP>≡
    procedure, nopass :: type_string => prcdef_5_type_string

<Process libraries: tests>+≡
    function prcdef_5_type_string () result (string)
        type(string_t) :: string
        string = "test_file"
    end function prcdef_5_type_string

```

We reuse the writer `test_writer_4` from the previous module.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: init => prcdef_5_init

<Process libraries: tests>+≡
    subroutine prcdef_5_init (object)
        class(prcdef_5_t), intent(out) :: object
        allocate (test_writer_4_t :: object%writer)
    end subroutine prcdef_5_init

```

Nothing to write.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: write => prcdef_5_write

<Process libraries: tests>+≡
    subroutine prcdef_5_write (object, unit)
        class(prcdef_5_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_5_write

```

Nothing to read.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: read => prcdef_5_read

```

```

<Process libraries: tests>+≡
  subroutine prcdef_5_read (object, unit)
    class(prcdef_5_t), intent(out) :: object
    integer, intent(in) :: unit
  end subroutine prcdef_5_read

```

Allocate the driver with the appropriate type.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: allocate_driver => prcdef_5_allocate_driver

<Process libraries: tests>+≡
  subroutine prcdef_5_allocate_driver (object, driver, basename)
    class(prcdef_5_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (prctest_5_t :: driver)
  end subroutine prcdef_5_allocate_driver

```

This time we need code:

```

<Process libraries: prcdef 5: TBP>+≡
  procedure, nopass :: needs_code => prcdef_5_needs_code

<Process libraries: tests>+≡
  function prcdef_5_needs_code () result (flag)
    logical :: flag
    flag = .true.
  end function prcdef_5_needs_code

```

For the test case, we implement a single feature proc1.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure, nopass :: get_features => prcdef_5_get_features

<Process libraries: tests>+≡
  subroutine prcdef_5_get_features (features)
    type(string_t), dimension(:), allocatable, intent(out) :: features
    allocate (features (1))
    features = [ var_str ("proc1") ]
  end subroutine prcdef_5_get_features

```

Nothing to connect.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: connect => prcdef_5_connect

<Process libraries: tests>+≡
  subroutine prcdef_5_connect (def, lib_driver, i, proc_driver)
    class(prcdef_5_t), intent(in) :: def
    class(prclib_driver_t), intent(in) :: lib_driver
    integer, intent(in) :: i
    class(prc_core_driver_t), intent(inout) :: proc_driver

```

14.5 Process Library Stacks

For storing and handling multiple libraries, we define process library stacks. These are ordinary stacks where new entries are pushed onto the top.

```

⟨prclib_stacks.f90⟩≡
  ⟨File header⟩

  module prclib_stacks

    ⟨Use strings⟩
    ⟨Use file utils⟩
    use unit_tests
    use os_interface
    use models

    use process_libraries

    ⟨Standard module head⟩

    ⟨Prclib stacks: public⟩

    ⟨Prclib stacks: types⟩

    contains

    ⟨Prclib stacks: procedures⟩

    ⟨Prclib stacks: tests⟩

  end module prclib_stacks

```

14.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

```
<Prclib stacks: public>≡
    public :: prclib_entry_t

<Prclib stacks: types>≡
    type, extends (process_library_t) :: prclib_entry_t
        type(prclib_entry_t), pointer :: next => null ()
    end type prclib_entry_t
```

14.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

```
<Prclib stacks: public>+≡
    public :: prclib_stack_t

<Prclib stacks: types>+≡
    type :: prclib_stack_t
        integer :: n = 0
        type(prclib_entry_t), pointer :: first => null ()
    contains
        <Prclib stacks: prclib stack: TBP>
    end type prclib_stack_t
```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

```
<Prclib stacks: prclib stack: TBP>≡
    procedure :: final => prclib_stack_final

<Prclib stacks: procedures>≡
    subroutine prclib_stack_final (object)
        class(prclib_stack_t), intent(inout) :: object
        type(prclib_entry_t), pointer :: lib
        do while (associated (object%first))
            lib => object%first
            object%first => lib%next
            call lib%final ()
            deallocate (lib)
        end do
        object%n = 0
    end subroutine prclib_stack_final
```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

```
<Prclib stacks: prclib stack: TBP>+≡
    procedure :: write => prclib_stack_write
```

```

<Prclib stacks: procedures>+≡
subroutine prclib_stack_write (object, unit, libpath)
  class(prclib_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: libpath
  type(prclib_entry_t), pointer :: lib
  integer :: u
  u = output_unit (unit)
  call write_separator_double (u)
  select case (object%n)
  case (0)
    write (u, "(1x,A)") "Process library stack: [empty]"
  case default
    write (u, "(1x,A)") "Process library stack:"
    lib => object%first
    do while (associated (lib))
      call write_separator (u)
      call lib%write (u, libpath)
      lib => lib%next
    end do
  end select
  call write_separator_double (u)
end subroutine prclib_stack_write

```

14.5.3 Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the library entry is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

<Prclib stacks: prclib stack: TBP>+≡
procedure :: push => prclib_stack_push

<Prclib stacks: procedures>+≡
subroutine prclib_stack_push (stack, lib)
  class(prclib_stack_t), intent(inout) :: stack
  type(prclib_entry_t), intent(inout), pointer :: lib
  lib%next => stack%first
  stack%first => lib
  lib => null ()
  stack%n = stack%n + 1
end subroutine prclib_stack_push

```

14.5.4 Accessing Contents

Return a pointer to the topmost stack element. The result type is just the bare `process_library_t`. There is no `target` attribute required since the stack elements are allocated via pointers.

```

<Prclib stacks: prclib stack: TBP>+≡
procedure :: get_first_ptr => prclib_stack_get_first_ptr

```

```

<Prclib stacks: procedures>+≡
function prclib_stack_get_first_ptr (stack) result (ptr)
  class(prclib_stack_t), intent(in) :: stack
  type(process_library_t), pointer :: ptr
  ptr => stack%first%process_library_t
end function prclib_stack_get_first_ptr

```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: get_names => prclib_stack_get_names
<Prclib stacks: procedures>+≡
subroutine prclib_stack_get_names (stack, libname)
  class(prclib_stack_t), intent(in) :: stack
  type(string_t), dimension(:), allocatable, intent(out) :: libname
  type(prclib_entry_t), pointer :: lib
  integer :: i
  allocate (libname (stack%n))
  i = stack%n
  lib => stack%first
  do while (associated (lib))
    libname(i) = lib%get_name ()
    i = i - 1
    lib => lib%next
  end do
end subroutine prclib_stack_get_names

```

Return a pointer to the library with given name.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: get_library_ptr => prclib_stack_get_library_ptr
<Prclib stacks: procedures>+≡
function prclib_stack_get_library_ptr (stack, libname) result (ptr)
  class(prclib_stack_t), intent(in) :: stack
  type(string_t), intent(in) :: libname
  type(process_library_t), pointer :: ptr
  type(prclib_entry_t), pointer :: current
  current => stack%first
  do while (associated (current))
    if (current%get_name () == libname) then
      ptr => current%process_library_t
      return
    end if
    current => current%next
  end do
  ptr => null ()
end function prclib_stack_get_library_ptr

```

14.5.5 Unit tests

```

<Prclib stacks: public>+≡

```

```

public :: prclib_stacks_test
<Prclib stacks: tests>≡
  subroutine prclib_stacks_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <Prclib stacks: execute tests>
  end subroutine prclib_stacks_test

```

Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

```

<Prclib stacks: execute tests>≡
  call test (prclib_stacks_1, "prclib_stacks_1", &
    "write an empty process library stack", &
    u, results)
<Prclib stacks: tests>+≡
  subroutine prclib_stacks_1 (u)
    integer, intent(in) :: u
    type(prclib_stack_t) :: stack

    write (u, "(A)")  "* Test output: prclib_stacks_1"
    write (u, "(A)")  "* Purpose: display an empty process library stack"
    write (u, "(A)")

    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: prclib_stacks_1"

  end subroutine prclib_stacks_1

```

Fill a process library stack

Fill a process library stack with two (identical) processes.

```

<Prclib stacks: execute tests>+≡
  call test (prclib_stacks_2, "prclib_stacks_2", &
    "fill a process library stack", &
    u, results)
<Prclib stacks: tests>+≡
  subroutine prclib_stacks_2 (u)
    integer, intent(in) :: u
    type(prclib_stack_t) :: stack
    type(prclib_entry_t), pointer :: lib

    write (u, "(A)")  "* Test output: prclib_stacks_2"
    write (u, "(A)")  "* Purpose: fill a process library stack"
    write (u, "(A)")

    write (u, "(A)")  "* Initialize two (empty) libraries &

```

```

        &and push them on the stack"
write (u, "(A)")

allocate (lib)
call lib%init (var_str ("lib1"))
call stack%push (lib)

allocate (lib)
call lib%init (var_str ("lib2"))
call stack%push (lib)

call stack%write (u)

write (u, "(A)")
write (u, "(A)")  "* Cleanup"

call stack%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: prclib_stacks_2"

end subroutine prclib_stacks_2

```

14.6 Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements with the simplest possible structure.

This matrix element generator can only generate a single scattering process and a single decay process. The scattering process is a quartic interaction of a massless, neutral and colorless scalar s with unit coupling results in a trivial $2 \rightarrow 2$ scattering process. The matrix element is implemented internally, so we do not need the machinery of external process libraries. The decay process is a decay of s into a pair of colored fermions f .

```

<prc_test.f90>≡
<File header>

module prc_test

    use iso_c_binding !NODEP!
    use kinds !NODEP!
    <Use strings>
    use unit_tests
    use os_interface

    use process_constants
    use prclib_interfaces
    use prc_core_def
    use particle_specifiers
    use process_libraries

    <Standard module head>

```

```

    <Test ME: public>

    <Test ME: types>

    contains

    <Test ME: procedures>

    <Test ME: tests>

end module prc_test

```

14.6.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

<Test ME: public>≡
    public :: prc_test_def_t

<Test ME: types>≡
    type, extends (prc_core_def_t) :: prc_test_def_t
        type(string_t) :: model_name
        type(string_t), dimension(:), allocatable :: prt_in
        type(string_t), dimension(:), allocatable :: prt_out
    contains
        <Test ME: test me def: TBP>
    end type prc_test_def_t

<Test ME: test me def: TBP>≡
    procedure, nopass :: type_string => prc_test_def_type_string

<Test ME: procedures>≡
    function prc_test_def_type_string () result (string)
        type(string_t) :: string
        string = "test_me"
    end function prc_test_def_type_string

```

There is no 'feature' here since there is no external code.

```

<Test ME: test me def: TBP>+≡
    procedure, nopass :: get_features => prc_test_def_get_features

<Test ME: procedures>+≡
    subroutine prc_test_def_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (0))
    end subroutine prc_test_def_get_features

```

Initialization: set some data (not really useful).

```

<Test ME: test me def: TBP>+≡
    procedure :: init => prc_test_def_init

```

```

<Test ME: procedures>+≡
  subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
    class(prc_test_def_t), intent(out) :: object
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    object%model_name = model_name
    allocate (object%prt_in (size (prt_in)))
    object%prt_in = prt_in
    allocate (object%prt_out (size (prt_out)))
    object%prt_out = prt_out
  end subroutine prc_test_def_init

```

Write/read process- and method-specific data. (No-op)

```

<Test ME: test me def: TBP>+≡
  procedure :: write => prc_test_def_write

<Test ME: procedures>+≡
  subroutine prc_test_def_write (object, unit)
    class(prc_test_def_t), intent(in) :: object
    integer, intent(in) :: unit
  end subroutine prc_test_def_write

```

```

<Test ME: test me def: TBP>+≡
  procedure :: read => prc_test_def_read

<Test ME: procedures>+≡
  subroutine prc_test_def_read (object, unit)
    class(prc_test_def_t), intent(out) :: object
    integer, intent(in) :: unit
  end subroutine prc_test_def_read

```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition.

```

<Test ME: test me def: TBP>+≡
  procedure :: allocate_driver => prc_test_def_allocate_driver

<Test ME: procedures>+≡
  subroutine prc_test_def_allocate_driver (object, driver, basename)
    class(prc_test_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (prc_test_t :: driver)
    select type (driver)
    type is (prc_test_t)
      driver%id = basename
      driver%model_name = object%model_name
      select case (size (object%prt_in))
      case (1); driver%scattering = .false.
      case (2); driver%scattering = .true.
      end select
    end select
  end subroutine

```

```
end subroutine prc_test_def_allocate_driver
```

Nothing to connect. This subroutine will not be called.

```
<Test ME: test me def: TBP>+≡
  procedure :: connect => prc_test_def_connect

<Test ME: procedures>+≡
  subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
    class(prc_test_def_t), intent(in) :: def
    class(prclib_driver_t), intent(in) :: lib_driver
    integer, intent(in) :: i
    class(prc_core_driver_t), intent(inout) :: proc_driver
  end subroutine prc_test_def_connect
```

14.6.2 Driver

```
<Test ME: public>+≡
  public :: prc_test_t

<Test ME: types>+≡
  type, extends (process_driver_internal_t) :: prc_test_t
    type(string_t) :: id
    type(string_t) :: model_name
    logical :: scattering = .true.
  contains
    <Test ME: test me driver: TBP>
  end type prc_test_t
```

In contrast to generic matrix-element implementations, we can hard-wire the amplitude method as a type-bound procedure.

```
<Test ME: test me driver: TBP>≡
  procedure, nopass :: get_amplitude => prc_test_get_amplitude

<Test ME: procedures>+≡
  function prc_test_get_amplitude (p) result (amp)
    complex(default) :: amp
    real(default), dimension(:,:), intent(in) :: p
    amp = 1
  end function prc_test_get_amplitude
```

The reported type is the same as for the `prc_test_def_t` type.

```
<Test ME: test me driver: TBP>+≡
  procedure, nopass :: type_name => prc_test_type_name

<Test ME: procedures>+≡
  function prc_test_type_name () result (string)
    type(string_t) :: string
    string = "test_me"
  end function prc_test_type_name
```

Fill process constants.

```
<Test ME: test me driver: TBP>+≡
  procedure :: fill_constants => prc_test_fill_constants
```

```

<Test ME: procedures>+=
subroutine prc_test_fill_constants (driver, data)
  class(prc_test_t), intent(in) :: driver
  type(process_constants_t), intent(out) :: data
  data%id = driver%id

```

14.6.3 Shortcut

Since this module is there for testing purposes, we set up a subroutine that does all the work at once: create a library with the two processes (scattering and decay), configure and load, and set up the driver.

```
<Test ME: public>+≡
    public :: prc_test_create_library

<Test ME: procedures>+≡
    subroutine prc_test_create_library &
        (libname, lib, scattering, decay, procname1, procname2)
        type(string_t), intent(in) :: libname
        type(process_library_t), intent(out) :: lib
        logical, intent(in), optional :: scattering, decay
        type(string_t), intent(in), optional :: procname1, procname2
        type(string_t) :: model_name, procname
        type(string_t), dimension(:), allocatable :: prt_in, prt_out
        class(prc_core_def_t), allocatable :: def
        type(process_def_entry_t), pointer :: entry
        type(os_data_t) :: os_data
        logical :: sca, dec
        sca = .true.; if (present (scattering)) sca = scattering
        dec = .false.; if (present (decay)) dec = decay

        call os_data_init (os_data)
        call lib%init (libname)
        model_name = "Test"

        if (sca) then
            if (present (procname1)) then
                procname = procname1
            else
                procname = libname
            end if
            allocate (prt_in (2), prt_out (2))
            prt_in = [var_str ("s"), var_str ("s")]
            prt_out = [var_str ("s"), var_str ("s")]
            allocate (prc_test_def_t :: def)
            select type (def)
            type is (prc_test_def_t)

    call lib%append (entry)
end if

call lib%configure (os_data)
call lib%load (os_data)
end subroutine prc_test_create_library

```

14.6.4 Test

This is the master for calling self-test procedures.

```

<Test ME: public>+≡
    public :: prc_test_test

<Test ME: tests>≡
    subroutine prc_test_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Test ME: execute tests>
    end subroutine prc_test_test

```

Generate and load the scattering process

The process is $ss \rightarrow ss$, where s is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

```

<Test ME: execute tests>≡

Chapter 15

Integration and Process Objects

This is the central part of the WHIZARD package. It provides the functionality for evaluating structure functions, kinematics and matrix elements, integration and event generation. It combines the various parts that deal with those tasks individually and organizes the data transfer between them.

integration_results This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

prc_core Here, we define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes.

parton_states A `parton_state_t` object represents an elementary partonic interaction. There are two versions: one for the isolated elementary process, one for the elementary process convoluted with the structure-function chain. The parton state is an effective state. It needs not coincide with the seed-kinematics state which is used in evaluating phase space.

processes Here, all pieces are combined for the purpose of evaluating the elementary processes. The whole algorithm is coded in terms of abstract data types as defined in the appropriate modules: `prc_core` for matrix-element evaluation, `prc_core_def` for the associated configuration and driver, `sf_base` for beams and structure-functions, `phs_base` for phase space, and `mci_base` for integration and event generation.

process_stacks Process stacks collect process objects.

15.1 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

```

<integration_results.f90>≡
  module integration_results

    use limits, only: FMT_12, FMT_14, GML_MIN_RANGE_RATIO !NODEP!
    use limits, only: INTEGRATION_ERROR_TOLERANCE !NODEP!
    <Use kinds>
    <Use strings>
    <Use file utils>
    use diagnostics !NODEP!
    use md5
    use os_interface
    use mci_base

    <Standard module head>

    <Integration results: public>

    <Integration results: parameters>

    <Integration results: types>

    contains

    <Integration results: procedures>

  end module integration_results

```

15.1.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of `PRC_UNKNOWN`.

```

<Integration results: types>≡
  type :: integration_entry_t
    private
    integer :: process_type = PRC_UNKNOWN
    integer :: pass = 0
    integer :: it = 0
    integer :: n_it = 0
    integer :: n_calls = 0
    logical :: improved = .false.
    real(default) :: integral = 0

```

```

    real(default) :: error = 0
    real(default) :: efficiency = 0
    real(default) :: chi2 = 0
    real(default), dimension(:), allocatable :: chain_weights
end type integration_entry_t

```

The possible values of the type indicator:

```

<Integration results: parameters>≡
integer, parameter, public :: PRC_UNKNOWN = 0
integer, parameter, public :: PRC_DECAY = 1
integer, parameter, public :: PRC_SCATTERING = 2

```

Initialize with all relevant data

```

<Integration results: procedures>≡
subroutine integration_entry_init (entry, &
    process_type, pass, it, n_it, n_calls, improved, &
    integral, error, efficiency, chi2, chain_weights)
type(integration_entry_t), intent(out) :: entry
integer, intent(in) :: process_type, pass, it, n_it, n_calls
logical, intent(in) :: improved
real(default), intent(in) :: integral, error, efficiency
real(default), intent(in), optional :: chi2
real(default), dimension(:), intent(in), optional :: chain_weights
entry%process_type = process_type
entry%pass = pass
entry%it = it
entry%n_it = n_it
entry%n_calls = n_calls
entry%improved = improved
entry%integral = integral
entry%error = error
entry%efficiency = efficiency
if (present (chi2)) &
    entry%chi2 = chi2
if (present (chain_weights)) then
    allocate (entry%chain_weights (size (chain_weights)))
    entry%chain_weights = chain_weights
end if
end subroutine integration_entry_init

```

Access values, some of them computed on demand:

```

<Integration results: procedures>+≡
elemental function integration_entry_get_pass (entry) result (n)
integer :: n
type(integration_entry_t), intent(in) :: entry
n = entry%pass
end function integration_entry_get_pass

elemental function integration_entry_get_n_calls (entry) result (n)
integer :: n
type(integration_entry_t), intent(in) :: entry
n = entry%n_calls

```

```

end function integration_entry_get_n_calls

elemental function integration_entry_get_integral (entry) result (int)
    real(default) :: int
    type(integration_entry_t), intent(in) :: entry
    int = entry%integral
end function integration_entry_get_integral

elemental function integration_entry_get_error (entry) result (err)
    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    err = entry%error
end function integration_entry_get_error

elemental function integration_entry_get_relative_error (entry) result (err)
    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    if (entry%integral /= 0) then
        err = entry%error / entry%integral
    else
        err = 0
    end if
end function integration_entry_get_relative_error

elemental function integration_entry_get_accuracy (entry) result (acc)
    real(default) :: acc
    type(integration_entry_t), intent(in) :: entry
    acc = accuracy (entry%integral, entry%error, entry%n_calls)
end function integration_entry_get_accuracy

elemental function accuracy (integral, error, n_calls) result (acc)
    real(default) :: acc
    real(default), intent(in) :: integral, error
    integer, intent(in) :: n_calls
    if (integral /= 0) then
        acc = error / integral * sqrt (real (n_calls, default))
    else
        acc = 0
    end if
end function accuracy

elemental function integration_entry_get_efficiency (entry) result (eff)
    real(default) :: eff
    type(integration_entry_t), intent(in) :: entry
    eff = entry%efficiency
end function integration_entry_get_efficiency

elemental function integration_entry_get_chi2 (entry) result (chi2)
    real(default) :: chi2
    type(integration_entry_t), intent(in) :: entry
    chi2 = entry%chi2
end function integration_entry_get_chi2

elemental function integration_entry_has_improved (entry) result (flag)

```

```

logical :: flag
type(integration_entry_t), intent(in) :: entry
flag = entry%improved
end function integration_entry_has_improved

elemental function integration_entry_get_n_groves (entry) result (n_groves)
integer :: n_groves
type(integration_entry_t), intent(in) :: entry
if (allocated (entry%chain_weights)) then
    n_groves = size (entry%chain_weights, 1)
else
    n_groves = 0
end if
end function integration_entry_get_n_groves

```

Output. This writes the header line for the result account below:

```

<Integration results: procedures>+≡
subroutine write_header (process_type, unit, logfile)
integer, intent(in) :: process_type
integer, intent(in), optional :: unit
logical, intent(in), optional :: logfile
character(5) :: phys_unit
integer :: u
u = output_unit (unit); if (u < 0) return
select case (process_type)
case (PRC_DECAY);      phys_unit = "[GeV]"
case (PRC_SCATTERING); phys_unit = "[fb] "
case default
    phys_unit = ""
end select
write (msg_buffer, "(A)") &
    "It      Calls Integral" // phys_unit // &
    " Error" // phys_unit // &
    " Err[%]  Acc Eff[%]  Chi2 N[It] |"
call msg_message (unit=u, logfile=logfile)
end subroutine write_header

```

This writes a separator for result display:

```

<Integration results: procedures>+≡
subroutine write_hline (unit)
integer, intent(in), optional :: unit
integer :: u
u = output_unit (unit); if (u < 0) return
write (u, "(A)")  "|" // (repeat("-", 77)) // "|"
flush (u)
end subroutine write_hline

subroutine write_dline (unit)
integer, intent(in), optional :: unit
integer :: u
u = output_unit (unit); if (u < 0) return
write (u, "(A)")  "|" // (repeat("=", 77)) // "|"
flush (u)

```

```
end subroutine write_dline
```

This writes the standard result account into one screen line. The verbose version uses multiple lines and prints the unabridged values. Dummy entries are not written.

(Integration results: procedures)+≡

```
subroutine integration_entry_write (entry, unit, verbose, suppress)

        do i = 1, size (entry%chain_weights)
            write (u, "(1x,I3)", advance="no") nint (entry%chain_weights(i) * 100)

```

```

        end do
        write (u, *)
    end if
end subroutine integration_entry_write_chain_weights

```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the χ^2 value.

All error distributions are assumed Gaussian, of course. The χ^2 value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

(Integration results: procedures)+≡

```

function compute_average (entry, pass) result (result)
    type(integration_entry_t) :: result
    type(integration_entry_t), dimension(:), intent(in) :: entry
    integer, intent(in) :: pass

    exit
  end if
end do
end function compute_average

```

15.1.2 Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily compute averages.

We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

```

<Integration results: public>≡
  public :: integration_results_t

<Integration results: types>+≡
  type, extends (mci_results_t) :: integration_results_t
  private
  integer :: process_type = PRC_UNKNOWN
  integer :: current_pass = 0
  integer :: n_pass = 0
  integer :: n_it = 0
  logical :: screen = .false.
  integer :: unit = 0
  real(default) :: error_threshold = 0
  type(integration_entry_t), dimension(:), allocatable :: entry
  type(integration_entry_t), dimension(:), allocatable :: average
contains

```

```

    <Integration results: integration results: TBP>
end type integration_results_t

```

The array is extended in chunks of 10 entries.

```

<Integration results: parameters>+≡
    integer, parameter :: RESULTS_CHUNK_SIZE = 10

```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

```

<Integration results: integration results: TBP>≡
    procedure :: init => integration_results_init

<Integration results: procedures>+≡
    subroutine integration_results_init (results, process_type)
        class(integration_results_t), intent(out) :: results
        integer, intent(in) :: process_type
        results%process_type = process_type
        results%n_pass = 0
        results%n_it = 0
        allocate (results%entry (RESULTS_CHUNK_SIZE))
        allocate (results%average (RESULTS_CHUNK_SIZE))
    end subroutine integration_results_init

```

Set additional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

```

<Integration results: integration results: TBP>+≡
    procedure :: set_error_threshold => integration_results_set_error_threshold

<Integration results: procedures>+≡
    subroutine integration_results_set_error_threshold (results, error_threshold)
        class(integration_results_t), intent(inout) :: results
        real(default), intent(in) :: error_threshold
        results%error_threshold = error_threshold
    end subroutine integration_results_set_error_threshold

```

Output (ASCII format). The `verbose` format is used for writing the header in grid files.

```

<Integration results: integration results: TBP>+≡
    procedure :: write => integration_results_write

<Integration results: procedures>+≡
    subroutine integration_results_write (object, unit, verbose, suppress)
        class(integration_results_t), intent(in) :: object
        integer, intent(in), optional :: unit

  end do
  write (u, *) "end(integration_pass)"
end if
write (u, *) "end(integration_results)"
end if
flush (u)
end subroutine integration_results_write

```

During integration, we do not want to print all results at once, but each intermediate result as soon as we get it. Thus, the previous procedure is chopped in pieces. First piece: store the output unit and a flag whether we want to print to standard output as well. Then write the header if the results are still empty,

i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

```

```

15.1.3 Access results

Return true if the results object has entries.

```

<Integration results: integration results: TBP>+≡
procedure :: exist => integration_results_exist

<Integration results: procedures>+≡
function integration_results_exist (results) result (flag)
  logical :: flag
  class(integration_results_t), intent(in) :: results
  flag = results%n_pass > 0
end function integration_results_exist

```

Retrieve information from the results record. If `last` is set and true, take the last iteration. If `it` is set instead, take this iteration. If `pass` is set, take this average. If none is set, take the final average.

If the result would be invalid, the entry is not assigned. Due to default initialization, this returns a null entry.

(Integration results: integration results: TBP)+≡

```
procedure :: get_entry => results_get_entry
```

15.2 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the O’MEGA matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

prc_core_def_t process and matrix-element configuration

prc_writer_t (optional) writing external matrix-element code

prc_driver_t accessing the matrix element (internal or external)

prc_core_t evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the **processes** module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the `processes` module.

```

<prc_core.f90>≡
  <File header>
  module prc_core

    <Use kinds>
    <Use strings>
    <Use file utils>
    use diagnostics !NODEP!
    use lorentz !NODEP!
    use interactions

    use sf_base
    use process_constants
    use mci_base

    use prc_core_def
    use process_libraries

    <Standard module head>

    <Prc core: public>

    <Prc core: types>

    <Prc core: interfaces>

    contains

    <Prc core: procedures>

  end module prc_core

```

15.2.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

```

<Prc core: public>≡
  public :: prc_core_t

<Prc core: types>≡
  type, abstract :: prc_core_t
    class(prc_core_def_t), pointer :: def => null ()
    logical :: data_known = .false.
    type(process_constants_t) :: data
    class(prc_core_driver_t), allocatable :: driver
    logical :: use_color_factors = .false.
    integer :: nc = 3
  contains
    <Prc core: process core: TBP>
  end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine prc_core_write
  end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: procedures>≡
  subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

<Prc core: procedures>+≡
  function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object
    logical :: flag
    flag = object%data%n_flv /= 0
  end function prc_core_has_matrix_element

```

Return true if a MC dataset should be attached to this process component. False if it shares the dataset with another component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_flag), deferred :: needs_mcset

```

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_flag (object) result (flag)
      import
        class(prc_core_t), intent(in) :: object
        logical :: flag
    end function prc_core_get_flag
  end interface

```

Return an integer number

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_integer (object) result (i)
      import
        class(prc_core_t), intent(in) :: object
        integer :: i
    end function prc_core_get_integer
  end interface

```

Return the number of distinct terms requested by this process component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_integer), deferred :: get_n_terms

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_is_allowed), deferred :: is_allowed

```

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
      import
        class(prc_core_t), intent(in) :: object
        integer, intent(in) :: i_term, f, h, c
        logical :: flag
    end function prc_core_is_allowed
  end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: procedures>+≡
  subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that α_s is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the `tmp` workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: procedures>+≡
  function prc_core_get_alpha_s (object, tmp) result (alpha)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(in), allocatable :: tmp
    real(default) :: alpha
    alpha = -1
  end function prc_core_get_alpha_s

```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: allocate_workspace => prc_core_ignore_workspace

<Prc core: procedures>+≡
  subroutine prc_core_ignore_workspace (object, tmp)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_ignore_workspace

```

Initialize the structure-function instance that corresponds to a process component. In ordinary cases, this amounts to a straightforward copy of the given template, but the process core may also choose to modify the setup, and it may access its own workspace.

The `sf_chain_instance` is the object that we want to prepare. The `sf_chain` argument is a template for its structure. For the initialization, we also need the number of channels `n_channel`.

Note: crash with nagfor 5.3.1 if `sf_chain_instance` is declared `intent(out)`, as would be more appropriate.

```

<Prc core: process core: TBP>+≡
  procedure :: init_sf_chain => prc_core_init_sf_chain

<Prc core: procedures>+≡
  subroutine prc_core_init_sf_chain &
    (object, sf_chain_instance, sf_chain, n_channel, tmp)
    class(prc_core_t), intent(in) :: object
    type(sf_chain_instance_t), intent(inout), target :: sf_chain_instance
    type(sf_chain_t), intent(in), target :: sf_chain
    integer, intent(in) :: n_channel
    class(workspace_t), intent(inout), allocatable :: tmp
    call sf_chain_instance%init (sf_chain, n_channel)
  end subroutine prc_core_init_sf_chain

```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The `i_term` index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_hard_kinematics), deferred :: &
    compute_hard_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_hard_kinematics &
      (object, p_seed, i_term, int_hard, tmp)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_hard_kinematics
end interface

```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_eff_kinematics), deferred :: &
    compute_eff_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_eff_kinematics &
      (object, i_term, int_hard, int_eff, tmp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_eff_kinematics
end interface

```

Recover the missing pieces. We know the incoming momenta of the `p_seed` array and the outgoing momenta of the `int_eff` interaction. We have to recover the outgoing momenta of `p_seed` and the incoming momenta of `int_eff`.

(The trivial case is that these are identical.)

Furthermore, if `int_hard` and `int_eff` are not aliased, we have to set the momenta there. In the trivial case, `int_eff` is a pointer to `int_hard`, so `int_hard` should not be touched at all.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_recover_kinematics), deferred :: &
    recover_kinematics

```

```

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_recover_kinematics &
      (object, p_seed, int_hard, int_eff, tmp)
    import
      class(prc_core_t), intent(in) :: object
      type(vector4_t), dimension(:), intent(inout) :: p_seed
      type(interaction_t), intent(inout) :: int_hard
      type(interaction_t), intent(inout) :: int_eff
      class(workspace_t), intent(inout), allocatable :: tmp
    end subroutine prc_core_recover_kinematics
  end interface

```

The process core must implement this function. Here, *j* is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The *tmp* (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_compute_amplitude &
      (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
    import
      class(prc_core_t), intent(in) :: object
      integer, intent(in) :: j
      type(vector4_t), dimension(:), intent(in) :: p
      integer, intent(in) :: f, h, c
      real(default), intent(in) :: fac_scale, ren_scale
      class(workspace_t), intent(inout), allocatable, optional :: tmp
      complex(default) :: amp
    end function prc_core_compute_amplitude
  end interface

```

15.2.2 Storage for intermediate results

The abstract *workspace_t* type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```

<Prc core: public>+≡
  public :: workspace_t

<Prc core: types>+≡
  type, abstract :: workspace_t
  contains
    procedure(workspace_write), deferred :: write
  end type workspace_t

```

For debugging, we should at least have an output routine.

```

<Prc core: interfaces>+≡
  abstract interface
    subroutine workspace_write (object, unit)
      import
      class(workspace_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine workspace_write
  end interface

```

15.2.3 Helicity selection data

This is intended for use with O'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than **threshold** (a value which multiplies **epsilon**, to be compared with the average of the current amplitude, default is 10^{10}) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero **cutoff** times.

```

<Prc core: public>+≡
  public :: helicity_selection_t

<Prc core: types>+≡
  type :: helicity_selection_t
    logical :: active = .false.
    real(default) :: threshold = 0
    integer :: cutoff = 0
  contains
    <Prc core: helicity selection: TBP>
  end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>≡
  procedure :: write => helicity_selection_write

<Prc core: procedures>+≡
  subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = output_unit (unit)
    if (object%active) then
      write (u, "(3x,A)") "Helicity selection data:"
      write (u, "(5x,A,ES17.10)") &
        "threshold =", object%threshold
      write (u, "(5x,A,I0)") &
        "cutoff    = ", object%cutoff
    end if
  end subroutine helicity_selection_write

```

15.3 Process observables

We define an abstract `subevt_expr_t` object as an extension of the `subevt_t` type. The object contains a local variable list, variable instances (as targets for pointers in the variable list), and evaluation trees. The evaluation trees reference both the variables and the `subevt`.

There are two instances of the abstract type: one for process instances, one for physical events. Both have a common logical expression `selection` which determines whether the object passes user-defined cuts.

The intention is that we fill the `subevt_t` base object and compute the variables once we have evaluated a kinematical phase space point (or a complete event). We then evaluate the expressions and can use the results in further calculations.

The `process_expr_t` extension contains furthermore scale and weight expressions. The `event_expr_t` extension contains a reweighting-factor expression and a logical expression for event analysis. In practice, we will link the variable list of the `event_obs` object to the variable list of the currently active `process_obs` object, such that the process variables are available to both objects. Event variables are meaningful only for physical events.

```
<subevt_expr.f90>≡

    end if
  end subroutine subevt_expr_setup_selection

```

15.3.3 Evaluation

Reset to initial state, i.e., mark the subevt as invalid.

```

<Subevt expr: subevt expr: TBP>+≡
  procedure :: reset => subevt_expr_reset
  procedure :: base_reset => subevt_expr_reset

<Subevt expr: procedures>+≡
  subroutine subevt_expr_reset (expr)
    class(subevt_expr_t), intent(inout) :: expr
    expr%subevt_filled = .false.
  end subroutine subevt_expr_reset

```

Evaluate the selection expression and return the result. There is also a deferred version: this should evaluate the remaining expressions if the event has passed.

```

<Subevt expr: subevt expr: TBP>+≡
  procedure :: base_evaluate => subevt_expr_evaluate

<Subevt expr: procedures>+≡
  subroutine subevt_expr_evaluate (expr, passed)
    class(subevt_expr_t), intent(inout) :: expr
    logical, intent(out) :: passed
    if (expr%has_selection) then
      call eval_tree_evaluate (expr%selection)
    end if
  end subroutine subevt_expr_evaluate

```

```

        if (eval_tree_result_is_known (expr%selection)) then
            passed = eval_tree_get_log (expr%selection)
        else
            call msg_error ("Evaluate selection expression: result undefined")
            passed = .false.
        end if
    else
        passed = .true.
    end if
end subroutine subevt_expr_evaluate

```

15.3.4 Implementation for partonic events

      expr%has_weight = .true.
    end if
  end subroutine parton_expr_setup_weight

```

Filling the partonic state consists of two parts. The first routine prepares the subevt without assigning momenta. It takes the particles from an `interaction_t`. It needs the indices and flavors for the beam, incoming, and outgoing particles.

We can assume that the particle content of the subevt does not change.

Therefore, we set the event variables `n_in`, `n_out`, `n_tot` already in this initialization step.

```

(Subvt expr: parton expr: TBP)+≡
  procedure :: setup_subvt => parton_expr_setup_subvt

(Subvt expr: procedures)+≡
  subroutine parton_expr_setup_subvt (expr, int, &
    i_beam, i_in, i_out, f_beam, f_in, f_out)
    class(parton_expr_t), intent(inout) :: expr

15.3.5 Implementation for full events

This implementation contains the expressions that we can evaluate for the full event. It also contains data that pertain to the event, suitable for communication with external event formats. These data simultaneously serve as pointer targets for the variable lists hidden in the expressions (eval trees).

Squared matrix element and weight values: when reading events from file, the `ref` value is the number in the file, while the `prc` value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of `alt` values is copied from an array of alternative event records. These values should represent calculated values.

```

<Subvt expr: public>+≡
  public :: event_expr_t

<Subvt expr: types>+≡

15.4 Parton states

A `parton_state_t` object contains the effective kinematics and dynamics of an elementary partonic interaction, with or without the beam/structure function state included. The type is abstract and has two distinct extensions. The `isolated_state_t` extension describes the isolated elementary interaction where the `int_eff` subobject contains the complex transition amplitude, exclusive in all quantum numbers. The particle content and kinematics describe the effective partonic state. The `connected_state_t` extension contains the partonic `subevt` and the expressions for cuts and scales which use it.

In the isolated state, the effective partonic interaction may either be identical to the hard interaction, in which case it is just a pointer to the latter. Or it may involve a rearrangement of partons, in which case we allocate it explicitly and flag this by `int_is_allocated`.

The `trace` evaluator contains the absolute square of the effective transition amplitude matrix, summed over final states. It is also summed over initial states, depending on the the beam setup allows. The result is used for integration.

The `matrix` evaluator is the counterpart of `trace` which is kept exclusive in all observable quantum numbers. The `flows` evaluator is furthermore exclusive in colors, but neglecting all color interference. The `matrix` and `flows` evaluators are filled only for sampling points that become part of physical events.

Note: It would be natural to make the evaluators allocatable. However, this causes memory corruption in gfortran 4.6.3. The extra `has_XXX` flags indicate whether evaluators are active, instead.

This module contains no unit tests. The tests are covered by the `processes` module below.

  end module parton_states

```

15.4.1 Abstract base type

The common part are the evaluators, one for the trace (summed over all quantum numbers), one for the transition matrix (summed only over unobservable quantum numbers), and one for the flow distribution (transition matrix without interferences, exclusive in color flow).

```

<Parton states: types>≡
  type, abstract :: parton_state_t
    logical :: has_trace = .false.
    logical :: has_matrix = .false.

```

```

    logical :: has_flows = .false.
    type(evaluator_t) :: trace
    type(evaluator_t) :: matrix
    type(evaluator_t) :: flows
contains
  ⟨Parton states: parton state: TBP⟩
end type parton_state_t

```

The `isolated_state_t` extension contains the `sf_chain_eff` object and the (hard) effective interaction `int_eff`, separately, both implemented as a pointer. The evaluators (trace, matrix, flows) apply to the hard interaction only.

If the effective interaction differs from the hard interaction, the pointer is allocated explicitly. Analogously for `sf_chain_eff`.

```

⟨Parton states: public⟩≡
  public :: isolated_state_t

⟨Parton states: types⟩+≡
  type, extends (parton_state_t) :: isolated_state_t
    logical :: sf_chain_is_allocated = .false.
    type(sf_chain_instance_t), pointer :: sf_chain_eff => null ()
    logical :: int_is_allocated = .false.
    type(interaction_t), pointer :: int_eff => null ()
contains
  ⟨Parton states: isolated state: TBP⟩
end type isolated_state_t

```

The `connected_state_t` extension contains all data that enable the evaluation of observables for the effective connected state. The evaluators connect the (effective) structure-function chain and hard interaction that were kept separate in the `isolated_state_t`.

The `flows_sf` evaluator is an extended copy of the structure-function

The `expr` subobject consists of the `subevt`, a simple event record, expressions for cuts etc. which refer to this record, and a `var_list` which contains event-specific variables, linked to the process variable list. Variables used within the expressions are looked up in `var_list`.

```

⟨Parton states: types⟩+≡
  public :: connected_state_t

⟨Parton states: types⟩+≡
  type, extends (parton_state_t) :: connected_state_t
    logical :: has_flows_sf = .false.
    type(evaluator_t) :: flows_sf
    logical :: has_expr = .false.
    type(parton_expr_t) :: expr
contains
  ⟨Parton states: connected state: TBP⟩
end type connected_state_t

```

Output: each evaluator is written only when it is active. The `sf_chain` is only written if it is explicitly allocated.

```

⟨Parton states: parton state: TBP⟩≡
  procedure :: write => parton_state_write

```

    end subroutine parton_state_final

```

15.4.2 Common Initialization

Initialize the isolated parton state. In this version, the effective structure-function chain `sf_chain_eff` and the effective interaction `int_eff` both are trivial pointers to the seed structure-function chain and to the hard interaction, respectively.

```

⟨Parton states: isolated state: TBP⟩≡
    procedure :: init => isolated_state_init_pointers

```

```

(Parton states: procedures)+≡
  subroutine isolated_state_init_pointers (state, sf_chain, int)
    class(isolated_state_t), intent(out) :: state
    type(sf_chain_instance_t), intent(in), target :: sf_chain
    type(interaction_t), intent(in), target :: int
    state%sf_chain_eff => sf_chain
    state%int_eff => int
  end subroutine isolated_state_init_pointers

```

15.4.3 Evaluator initialization: isolated state

Create an evaluator for the trace of the squared transition matrix. The trace goes over all outgoing quantum numbers. Whether we trace over incoming quantum numbers other than color, depends on the given `qn_mask_in`.

There are two options: explicitly computing the color factor table (`use_cf` false; `nc` defined), or taking the color factor table from the hard matrix element data.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_trace => isolated_state_setup_square_trace
(Parton states: procedures)+≡
  subroutine isolated_state_setup_square_trace (state, core, qn_mask_in, &
    col)
    class(isolated_state_t), intent(inout), target :: state
    class(prc_core_t), intent(in) :: core
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask_in
    integer, dimension(:), intent(in) :: col
    type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
    associate (data => core%data)
      allocate (qn_mask (data%n_in + data%n_out))
      qn_mask(:data%n_in) = &
        new_quantum_numbers_mask (.false., .true., .false.) &
        .or. qn_mask_in
      qn_mask(data%n_in+1:) = &
        new_quantum_numbers_mask (.true., .true., .true.)
      if (core%use_color_factors) then
        call evaluator_init_square (state%trace, &
          state%int_eff, qn_mask, &
          data%cf_index, data%color_factors, col, nc=core%nc)
      else
        call evaluator_init_square (state%trace, &
          state%int_eff, qn_mask, nc=core%nc)
      end if
    end associate
    state%has_trace = .true.
  end subroutine isolated_state_setup_square_trace

```

Setup the evaluator for the transition matrix, exclusive in helicities where this is requested.

For all unstable final-state particles we keep polarization according to the applicable decay options. If the process is a decay itself, this applies also to the initial state.

For all polarized final-state particles, we keep polarization including off-diagonal entries. We drop helicity completely for unpolarized final-state particles.

For the initial state, if the particle has not been handled yet, we apply the provided `qn_mask_in` which communicates the beam properties.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_matrix => isolated_state_setup_square_matrix
(Parton states: procedures)+≡
  subroutine isolated_state_setup_square_matrix &
    (state, core, model, qn_mask_in, col)

  end subroutine isolated_state_setup_square_flows

```

15.4.4 Evaluator initialization: connected state

Setup a trace evaluator as a product of two evaluators (incoming state, effective interaction). In the result, all quantum numbers are summed over.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`.

```

(Parton states: connected state: TBP)+≡
  procedure :: setup_connected_trace => connected_state_setup_connected_trace

(Parton states: procedures)+≡
  subroutine connected_state_setup_connected_trace (state, isolated, int)
    class(connected_state_t), intent(inout), target :: state
    type(isolated_state_t), intent(in), target :: isolated
    type(interaction_t), intent(in), optional, target :: int

```

```

type(quantum_numbers_mask_t) :: mask
type(interaction_t), pointer :: src_int
mask = new_quantum_numbers_mask (.true., .true., .true.)
if (present (int)) then
    src_int => int
else
    src_int => isolated%sf_chain_eff%get_out_int_ptr ()
end if
call evaluator_init_product &
    (state%trace, src_int, isolated%trace, mask, mask)
state%has_trace = .true.
end subroutine connected_state_setup_connected_trace

```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interaction). In the intermediate state, color and helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

```

<Parton states: connected state: TBP>+≡
    procedure :: setup_connected_matrix => connected_state_setup_connected_matrix

<Parton states: procedures>+≡
    subroutine connected_state_setup_connected_matrix (state, isolated, int)
        class(connected_state_t), intent(inout), target :: state
        type(isolated_state_t), intent(in), target :: isolated
        type(interaction_t), intent(in), optional, target :: int
        type(quantum_numbers_mask_t) :: mask
        type(interaction_t), pointer :: src_int
        mask = new_quantum_numbers_mask (.false., .true., .true.)
        if (present (int)) then
            src_int => int
        else
            src_int => isolated%sf_chain_eff%get_out_int_ptr ()
        end if
        call evaluator_init_product &
            (state%matrix, src_int, isolated%matrix, mask)
        state%has_matrix = .true.
    end subroutine connected_state_setup_connected_matrix

```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interaction). In the intermediate state, only helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`, after creating an intermediate interaction that includes a correlated color state. We assume that for a caller-provided `int`, this is not necessary.

```

<Parton states: connected state: TBP>+≡
    procedure :: setup_connected_flows => connected_state_setup_connected_flows

<Parton states: procedures>+≡
    subroutine connected_state_setup_connected_flows (state, isolated, int)
        class(connected_state_t), intent(inout), target :: state
        type(isolated_state_t), intent(in), target :: isolated
        type(interaction_t), intent(in), optional, target :: int

```

```

type(quantum_numbers_mask_t) :: mask
type(interaction_t), pointer :: src_int
mask = new_quantum_numbers_mask (.false., .false., .true.)
if (present (int)) then
    src_int => int
else
    src_int => isolated%sf_chain_eff%get_out_int_ptr ()

    state%has_flows_sf = .true.
    src_int => evaluator_get_int_ptr (state%flows_sf)
end if
call evaluator_init_product &
    (state%flows, src_int, isolated%flows, mask)
state%has_flows = .true.
end subroutine connected_state_setup_connected_flows

```

15.4.5 Cuts and expressions

Set up the `subevt` that corresponds to the connected interaction. The index arrays refer to the interaction.

We assign the particles as follows: the beam particles are the first two (decay process: one) entries in the trace evaluator. The incoming partons are identified by their link to the outgoing partons of the structure-function chain. The outgoing partons are those of the trace evaluator, which include radiated partons during the structure-function chain.

```

(Parton states: connected state: TBP)+≡
    procedure :: setup_subevt => connected_state_setup_subevt

(Parton states: procedures)+≡
    subroutine connected_state_setup_subevt (state, sf_chain, f_beam, f_in, f_out)
        class(connected_state_t), intent(inout), target :: state

        call state%expr%setup_scales (pn_scale, pn_fac_scale, pn_ren_scale)
        call state%expr%setup_weight (pn_weight)
    end subroutine connected_state_setup_expressions

```

Reset the expression object: invalidate the subvt.

```

(Parton states: connected state: TBP)+≡
    procedure :: reset_expressions => connected_state_reset_expressions

(Parton states: procedures)+≡
    subroutine connected_state_reset_expressions (state)
        class(connect_state_t), intent(inout) :: state
        if (state%has_expr) call state%expr%reset ()
    end subroutine connected_state_reset_expressions

```

15.4.6 Evaluation

Transfer momenta to the trace evaluator and fill the `subvt` with this effective kinematics, if applicable.

Note: we may want to apply a boost for the subevt.

```

(Parton states: parton state: TBP)+≡
  procedure :: receive_kinematics => parton_state_receive_kinematics

(Parton states: procedures)+≡
  subroutine parton_state_receive_kinematics (state)
    class(parton_state_t), intent(inout), target :: state
    type(interaction_t), pointer :: int
    if (state%has_trace) then
      call evaluator_receive_momenta (state%trace)
      select type (state)
        class is (connected_state_t)
          if (state%has_expr) then
            int => evaluator_get_int_ptr (state%trace)
            call state%expr%fill_subevt (int)
          end if
        end select
      end if
    end subroutine parton_state_receive_kinematics

```

Recover kinematics: We assume that the trace evaluator is filled with momenta. Send those momenta back to the sources, then fill the variables and subevent as above.

The incoming momenta of the connected state are not connected to the isolated state but to the beam interaction. Therefore, the incoming momenta within the isolated state do not become defined, yet. Instead, we reconstruct the beam (and ISR) momentum configuration.

```

(Parton states: parton state: TBP)+≡
  procedure :: send_kinematics => parton_state_send_kinematics

(Parton states: procedures)+≡
  subroutine parton_state_send_kinematics (state)
    class(parton_state_t), intent(inout), target :: state
    type(interaction_t), pointer :: int
    if (state%has_trace) then
      call evaluator_send_momenta (state%trace)
      select type (state)
        class is (connected_state_t)
          int => evaluator_get_int_ptr (state%trace)
          call state%expr%fill_subevt (int)
        end select
      end if
    end subroutine parton_state_send_kinematics

```

Evaluate the expressions. The routine evaluates first the cut expression. If the event passes, it evaluates the other expressions. Where no expressions are defined, default values are inserted.

```

(Parton states: connected state: TBP)+≡
  procedure :: evaluate_expressions => connected_state_evaluate_expressions

(Parton states: procedures)+≡
  subroutine connected_state_evaluate_expressions (state, passed, &
    scale, fac_scale, ren_scale, weight)

```

```

class(connected_state_t), intent(inout) :: state
logical, intent(out) :: passed
real(default), intent(out) :: scale, fac_scale, ren_scale, weight
if (state%has_expr) then
    call state%expr%evaluate (passed, scale, fac_scale, ren_scale, weight)
end if
end subroutine connected_state_evaluate_expressions

```

Evaluate the structure-function chain, if it is allocated explicitly. The argument is the factorization scale.

If the chain is merely a pointer, the chain should already be evaluated at this point.

```

(Parton states: isolated state: TBP)+≡
    procedure :: evaluate_sf_chain => isolated_state_evaluate_sf_chain

(Parton states: procedures)+≡
    subroutine isolated_state_evaluate_sf_chain (state, fac_scale)

(Parton states: procedures)+≡
  function parton_state_get_trace_int_ptr (state) result (ptr)
    class(parton_state_t), intent(in), target :: state
    type(interaction_t), pointer :: ptr
    if (state%has_trace) then
      ptr => evaluator_get_int_ptr (state%trace)
    else
      ptr => null ()
    end if
  end function parton_state_get_trace_int_ptr

  function parton_state_get_matrix_int_ptr (state) result (ptr)
    class(parton_state_t), intent(in), target :: state
    type(interaction_t), pointer :: ptr
    if (state%has_matrix) then
      ptr => evaluator_get_int_ptr (state%matrix)
    else
      ptr => null ()
    end if
  end function parton_state_get_matrix_int_ptr

  function parton_state_get_flows_int_ptr (state) result (ptr)

```

```

class(parton_state_t), intent(in), target :: state
type(interaction_t), pointer :: ptr
if (state%has_flows) then
    ptr => evaluator_get_int_ptr (state%flows)
else
    ptr => null ()
end if
end function parton_state_get_flows_int_ptr

```

Return the indices of the beam particles and the outgoing particles within the trace (and thus, matrix and flows) evaluator, respectively.

(Parton states: connected state: TBP)+≡

```

procedure :: get_beam_index => connected_state_get_beam_index
procedure :: get_in_index => connected_state_get_in_index

```

(Parton states: procedures)+≡

```

subroutine connected_state_get_beam_index (state, i_beam)
    class(connected_state_t), intent(in) :: state
    integer, dimension(:), intent(out) :: i_beam
    call state%expr%get_beam_index (i_beam)
end subroutine connected_state_get_beam_index

subroutine connected_state_get_in_index (state, i_in)
    class(connected_state_t), intent(in) :: state
    integer, dimension(:), intent(out) :: i_in
    call state%expr%get_in_index (i_in)
end subroutine connected_state_get_in_index

```

15.5 Complete Elementary Processes

This module combines hard interactions, phase space, and (for scatterings) structure functions and interfaces them to the integration module.

The process object implements the combination of a fixed beam and structure-function setup with a number of elementary processes. The latter are called process components. The process object represents an entity which is supposedly observable. It should be meaningful to talk about the cross section of a process.

The individual components of a process are, technically, processes themselves, but they may have unphysical cross sections which have to be added for a physical result. Process components may be exclusive tree-level elementary processes, dipole subtraction term, loop corrections, etc.

The beam and structure function setup is common to all process components. Thus, there is only one instance of this part.

The process may be a scattering process or a decay process. In the latter case, there are no structure functions, and the beam setup consists of a single particle. Otherwise, the two classes are treated on the same footing.

Once a sampling point has been chosen, a process determines a set of partons with a correlated density matrix of quantum numbers. In general, each sampling point will generate, for each process component, one or more distinct parton

configurations. This is the **computed** state. The computed state is the subject of the multi-channel integration algorithm.

For NLO computations, it is necessary to project the computed states onto another set of parton configurations (e.g., by recombining certain pairs). This is the **observed** state. When computing partonic observables, the information is taken from the observed state.

For the purpose of event generation, we will later select one parton configuration from the observed state and collapse the correlated quantum state. This configuration is then dressed by applying parton shower, decays and hadronization. The decay chain, in particular, combines a scattering process with possible subsequent decay processes on the parton level, which are full-fledged process objects themselves.

15.5.1 The Process Object

A process object is the workspace for creating process instances for event generation. After initialization, its contents are filled by integration passes which shape the integration grids and compute cross sections. Processes are set up initially from user-level configuration data. After calculating integrals and thus developing integration grid data, the program may use a process object or a copy of it for the purpose of generating events

The process object consists of several subobjects with their specific purposes. The corresponding types are defined below. (Technically, the subobject type definitions have to come before the process type definition, but with NOWEB

magic we reverse this order here.)

The **type** determines whether we are considering a decay or a scattering process.

The **meta** object describes the process and its environment. All contents become fixed when the object is initialized.

The **config** object holds physical and technical configuration data that have been obtained during process initialization, and which are common to all process components.

The individual process components are configured in the **component** objects. These objects contain more configuration parameters and workspace, as needed for the specific process variant.

The **term** objects describe parton configurations which are technically used as phase-space points. Each process component may split into several terms with distinct kinematics and particle content. Furthermore, each term may project on a different physical state, e.g., by particle recombination. The **term** object provides the framework for this projection, for applying cuts, weight, and thus completing the process calculation.

The **beam_config** object describes the incoming particles, either the decay mother or the scattering beams. It also contains the structure-function information.

The **mci_entry** objects configure a MC input parameter set and integrator, each. The number of parameters depends on the process component and on the beam and structure-function setup.

```

<Processes: public>≡
    public :: process_t
<Processes: process type>≡
    type :: process_t
    private
    type(process_metadata_t) :: &
        meta

Process setup

Initialize a process. We need a process library, the name of the process, and a run ID.

```

(Processes: process: TBP) +=
  procedure :: init => process_init

(Processes: procedures) +=
  subroutine process_init &
    (process, proc_id, run_id, lib, os_data, qcd, rng_factory, model_list)
    class(process_t), intent(out) :: process
    type(string_t), intent(in) :: proc_id
    type(string_t), intent(in) :: run_id
    type(process_library_t), intent(in), target :: lib
    type(os_data_t), intent(in) :: os_data
    type(qcd_t), intent(in) :: qcd
    class(rng_factory_t), intent(inout), allocatable :: rng_factory
    type(model_list_t), intent(inout) :: model_list
    if (.not. lib%is_active ()) then
      call msg_bug ("Process init: inactive library not handled yet")
    end if
    if (.not. lib%contains (proc_id)) then
      call msg_fatal ("Process library doesn't contain process '" &
        // char (proc_id) // "'")
      return
    end if
    associate (meta => process%meta)
      call meta%init (proc_id, run_id, lib)
      call process%config%init (meta, os_data, qcd, rng_factory, model_list)
    end associate
  end subroutine process_init

```

```

        allocate (process%component (meta%n_components))
    end associate
end subroutine process_init

```

Store a snapshot of a variable list. We link this snapshot to the current model instance and use it to update the model parameters in this instance. After update, synchronize the var list, i.e., fetch any new values of derived parameters.

```

<Processes: process: TBP>+=
    procedure :: set_var_list => process_set_var_list

<Processes: procedures>+=
    subroutine process_set_var_list (process, var_list)
        class(process_t), intent(inout) :: process

        call process%term(k+j)%init (k+j, i, j, core, model)
      end do
    end associate
  end associate
  k = k + n_entry(i)
end do
process%config%n_terms = n_tot
end subroutine process_setup_terms

```

Initialize the beam setup. This is the trivial version where the incoming state of the matrix element coincides with the initial state of the process. For a scattering process, we need the c.m. energy, all other variables are set to their default values (no polarization, lab frame and c.m. frame coincide, etc.)

We assume that all components consistently describe a scattering process, i.e., two incoming particles.

Note: The current layout of the `beam_data_t` record requires that the flavor for each beam is unique. For processes with multiple flavors in the initial state, one has to set up beams explicitly. This restriction could be removed by extending the code in the `beams` module.

```

(Processes: process: TBP) +=
  procedure :: setup_beams_sqrts => process_setup_beams_sqrts

(Processes: procedures) +=
  subroutine process_setup_beams_sqrts (process, sqrts, beam_structure)
    class(process_t), intent(inout) :: process

```

Notify the user about beam setup.

```

<Processes: process: TBP>+≡
  procedure :: beams_startup_message => process_beams_startup_message

<Processes: procedures>+≡
  subroutine process_beams_startup_message (process, unit, beam_structure)
    class(process_t), intent(in) :: process
    integer, intent(in), optional :: unit
    type(beam_structure_t), intent(in), optional :: beam_structure
    call process%beam_config%startup_message (unit, beam_structure)
  end subroutine process_beams_startup_message

```

We complete the kinematics configuration after the beam setup, but before we configure the chain of structure functions. The reason is that we need the total energy `sqrts` for the kinematics, but the structure-function setup requires the number of channels, which depends on the kinematics configuration. For instance, the kinematics module may return the need for parameterizing an s-channel resonance.

```

<Processes: process: TBP>+≡
  procedure :: configure_phs => process_configure_phs

```

```

(Processes: procedures) +=
  subroutine process_configure_phs (process, rebuild, ignore_mismatch)
    class(process_t), intent(inout) :: process
    logical, intent(in), optional :: rebuild
    logical, intent(in), optional :: ignore_mismatch
    real(default) :: sqrts
    integer :: i
    sqrts = process%get_sqrts ()
    do i = 1, process%meta%n_components
      associate (component => process%component(i))
        if (component%active) then
          call component%configure_phs &
            (sqrts, process%beam_config, rebuild, ignore_mismatch)
        end if
      end associate
    end do
  end subroutine process_configure_phs

```

Insert the structure-function configuration data. First allocate the storage, then insert data one by one. The third procedure declares a mapping (of the MC input parameters) for a specific channel and structure-function combination.

We take the number of channels from the corresponding entry in the `config_data` section.

Otherwise, these are simple wrapper routines. The extra level in the call tree may allow for simple addressing of multiple concurrent beam configurations, not implemented currently.

If we do not want structure functions, we simply do not call those procedures.

```

(Processes: process: TBP) +=
  procedure :: init_sf_chain => process_init_sf_chain

          end if
        end if
      end do
    end subroutine process_setup_mci

```

```

        end associate
    end do
    do i_mci = 1, size (process%mci_entry)
        call process%mci_entry(i_mci)%set_parameters (process%meta%var_list)
    end do
end subroutine process_setup_mci

```

Set cuts. This is a parse node, namely the right-hand side of the `cut` assignment. When creating an instance, we compile this into an evaluation tree. The parse node may be null.

```

(Processes: process: TBP) +=
    procedure :: set_cuts => process_set_cuts

(Processes: procedures) +=
    subroutine process_set_cuts (process, pn_cuts)
        class(process_t), intent(inout) :: process
        type(parse_node_t), intent(in), pointer :: pn_cuts
        process%config%pn_cuts => pn_cuts
    end subroutine process_set_cuts

```

Analogously for the other expressions.

```

(Processes: process: TBP) +=
    procedure :: set_scale => process_set_scale
    procedure :: set_fac_scale => process_set_fac_scale
    procedure :: set_ren_scale => process_set_ren_scale
    procedure :: set_weight => process_set_weight

(Processes: procedures) +=
    subroutine process_set_scale (process, pn_scale)
        class(process_t), intent(inout) :: process
        type(parse_node_t), intent(in), pointer :: pn_scale
        process%config%pn_scale => pn_scale
    end subroutine process_set_scale

    subroutine process_set_fac_scale (process, pn_fac_scale)
        class(process_t), intent(inout) :: process
        type(parse_node_t), intent(in), pointer :: pn_fac_scale
        process%config%pn_fac_scale => pn_fac_scale
    end subroutine process_set_fac_scale

    subroutine process_set_ren_scale (process, pn_ren_scale)
        class(process_t), intent(inout) :: process
        type(parse_node_t), intent(in), pointer :: pn_ren_scale
        process%config%pn_ren_scale => pn_ren_scale
    end subroutine process_set_ren_scale

    subroutine process_set_weight (process, pn_weight)
        class(process_t), intent(inout) :: process
        type(parse_node_t), intent(in), pointer :: pn_weight
        process%config%pn_weight => pn_weight
    end subroutine process_set_weight

```

MD5 sum

The MD5 sum of the process object should reflect the state completely, including integration results. It is used for checking the integrity of event files. This global checksum includes checksums for the various parts. In particular, the MCI object receives a checksum that includes the configuration of all configuration parts relevant for an individual integration. This checksum is used for checking the integrity of integration grids.

We do not need MD5 sums for the process terms, since these are generated from the component definitions.

```
<Processes: process: TBP>+≡
  procedure :: compute_md5sum => process_compute_md5sum

<Processes: procedures>+≡
  subroutine process_compute_md5sum (process)
    class(process_t), intent(inout) :: process
    integer :: i
    call process%config%compute_md5sum ()
    do i = 1, process%config%n_components
      associate (component => process%component(i))
        if (component%active) then
          call component%compute_md5sum ()
        end if
      end associate
    end do
    call process%beam_config%compute_md5sum ()
    do i = 1, process%config%n_mci
      call process%mci_entry(i)%compute_md5sum &
        (process%config, process%component, process%beam_config)
    end do
  end subroutine process_compute_md5sum
```

Integration and event generation

The sampler test should just evaluate the squared matrix element `n_calls` times, discarding the results, and return. This can be done before integration, e.g., for timing estimates.

```
<Processes: process: TBP>+≡
  procedure :: sampler_test => process_sampler_test

<Processes: procedures>+≡
  subroutine process_sampler_test (process, instance, i_mci, n_calls)
    class(process_t), intent(inout) :: process
    type(process_instance_t), intent(inout), target :: instance
    integer, intent(in) :: i_mci
    integer, intent(in) :: n_calls
    call process%mci_entry(i_mci)%sampler_test (instance, n_calls)
  end subroutine process_sampler_test
```

Integrate the process, using a previously initialized process instance. We select one of the available MCI integrators by its index `i_mci` and thus integrate

over (structure functions and) phase space for the associated (group of) process component(s).

The finalizer should be called after all integration passes have been completed. It will, for instance, write a summary of the integration results.

`integrate_dummy` does a “dummy” integration in the sense that nothing is done but just empty integration results appended.

```

(Processes: process: TBP)+≡
  procedure :: integrate => process_integrate
  procedure :: final_integration => process_final_integration
  procedure :: integrate_dummy => process_integrate_dummy

(Processes: procedures)+≡
  subroutine process_integrate (process, instance, i_mci, n_it, n_calls, &
    adapt_grids, adapt_weights, final, pacify)
    class(process_t), intent(inout) :: process
    type(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_mci
    integer, intent(in) :: n_it
    integer, intent(in) :: n_calls
    logical, intent(in), optional :: adapt_grids
    logical, intent(in), optional :: adapt_weights
    logical, intent(in), optional :: final, pacify
    call process%mci_entry(i_mci)%integrate (instance, n_it, n_calls, &
      adapt_grids, adapt_weights, final, pacify)
  end subroutine process_integrate

  subroutine process_final_integration (process, i_mci)
    class(process_t), intent(inout) :: process

        (process%component(i_component)%core, unit)
    end if
  end do
end subroutine process_write_state_summary

```

Prepare event generation for the specified MCI entry. This implies, in particular, checking the phase-space file.

```

<Processes: process: TBP>+≡
    procedure :: prepare_simulation => process_prepare_simulation

<Processes: procedures>+≡
    subroutine process_prepare_simulation (process, i_mci)
        class(process_t), intent(inout) :: process
        integer, intent(in) :: i_mci
        call process%mci_entry(i_mci)%prepare_simulation ()
    end subroutine process_prepare_simulation

```

Generate a weighted event. We select one of the available MCI integrators by its index `i_mci` and thus generate an event for the associated (group of) process component(s). The arguments exactly correspond to the initializer and finalizer above.

The resulting event is stored in the `process_instance` object, which also holds the workspace of the integrator.

Note: The `process` object is declared `intent(inout)` because it contains the random-number state, which changes for each event. Otherwise, all volatile data are inside the `instance` object.

```

<Processes: process: TBP>+≡
    procedure :: generate_weighted_event => process_generate_weighted_event
    procedure :: generate_unweighted_event => process_generate_unweighted_event

<Processes: procedures>+≡
    subroutine process_generate_weighted_event (process, instance, i_mci)
        class(process_t), intent(inout) :: process
        type(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_mci
        call process%mci_entry(i_mci)%generate_weighted_event (instance)
    end subroutine process_generate_weighted_event

    subroutine process_generate_unweighted_event (process, instance, i_mci)
        class(process_t), intent(inout) :: process
        type(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_mci
        call process%mci_entry(i_mci)%generate_unweighted_event (instance)
    end subroutine process_generate_unweighted_event

```

This replaces the event generation methods for the situation that the process instance object has been filled by other means (i.e., reading and/or recalculating its contents). We just have to fill in missing MCI data, especially the event weight.

```

<Processes: process: TBP>+≡
    procedure :: recover_event => process_recover_event

<Processes: procedures>+≡
    subroutine process_recover_event (process, instance, i_term)
        class(process_t), intent(inout) :: process
        type(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_term
        call process%mci_entry(instance%i_mci)%recover_event (instance, i_term)
    end subroutine process_recover_event

```

```
end subroutine process_recover_event
```

Retrieve process data

Tell whether integral (and error) are known.

```
(Processes: process: TBP)+≡

    class(process_t), intent(in) :: process
    character(32) :: md5sum
    md5sum = process%config%md5sum
  end function process_get_md5sum_cfg
```

15.5.2 Metadata

This information describes the process and its environment. It is fixed upon initialization.

The `id` string is the name of the process object, as given by the user. The matrix element generator will use this string for naming Fortran procedures and types, so it should qualify as a Fortran name.

The `num_id` is meaningful if nonzero. It is used for communication with external programs or file standards which do not support string IDs.

The `run_id` string distinguishes among several runs for the same process. It identifies process instances with respect to adapted integration grids and similar run-specific data. The run ID is kept when copying processes for creating instances, however, so it does not distinguish event samples.

The `var_list` is a snapshot of the variable list, taken at the point where the process was initialized.

The `lib` pointer accesses the process library where the process definition and the process driver are located.

The `lib_index` is the index of entry in the process library that corresponds to the current process.

The `component_id` array identifies the individual process components.

The `component_description` is an array of human-readable strings that characterize the process components, for instance `a, b => c, d`.

The `active` mask array marks those components which are active. The others are skipped.

```

15.5.3 Generic Configuration Data

This information concerns physical and technical properties of the process. It is fixed upon initialization, using data from the process specification and the variable list.

The number **n_in** is the number of incoming beam particles, simultaneously the number of incoming partons, 1 for a decay and 2 for a scattering process. (The number of outgoing partons may depend on the process component.)

The number **n_components** is the number of components that constitute the current process.

The number **n_terms** is the number of distinct contributions to the scattering matrix that constitute the current process. Each component may generate several terms.

The number **n_mci** is the number of independent MC integration configurations that this process uses. Distinct process components that share a MCI configuration may be combined pointwise. (Nevertheless, a given MC variable set may correspond to several “nearby” kinematical configurations.) This is also

the number of distinct sampling-function results that this process can generate. Process components that use distinct variable sets are added only once after an integration pass has completed.

The `model` pointer identifies the physics model and its parameters. This is a pointer to an external object.

The `rng_factory` component spawns independent random-number generators for use in integration, event generation, and event postprocessing.

Various `parse_node_t` objects are taken from the SINDARIN input. They encode expressions for evaluating cuts and scales. The workspaces for evaluating those expressions are set up in the `effective_state` subobjects. Note that these are really pointers, so the actual nodes are not stored inside the process object.

The `md5sum` is taken and used to verify the process configuration when re-reading data from file.

```

end if
end subroutine process_config_data_write

```

Initialize. We use information from the process metadata and from the process library, given the process ID. We also store the currently active OS data set.

Using the model name that the library gives us, we try to load the model here. Reading from the global model library, we are sure that we are looking at the model associated to the process, not the selected one at the user level. However, when the mode names are the same, the models will be identical.

Instead of storing a model pointer, we create an instance which contains the current values of model parameters. The captured values are now disconnected from user-level changes and will stay for the lifetime of the process object. Allocating the model via a pointer guarantees the `target` attribute.

The RNG factory object is imported by moving the allocation.

```

<Processes: process config data: TBP>+=
    procedure :: init => process_config_data_init

<Processes: procedures>+=
    subroutine process_config_data_init &
        (config, meta, os_data, qcd, rng_factory, model_list)

      config%md5sum = md5sum (u)
      close (u)
    end if
  end subroutine process_config_data_compute_md5sum

```

15.5.4 Beam configuration

The object **data** holds all details about the initial beam configuration. The allocatable array **sf** holds the structure-function configuration blocks. There are **n_strfun** entries in the structure-function chain (not counting the initial beam object). We maintain **n_channel** independent parameterizations of this chain. If this is greater than zero, we need a multi-channel sampling algorithm, where for each point one channel is selected to generate kinematics.

The number of parameters that are required for generating a structure-function chain is **n_sfpar**.

The flag **azimuthal_dependence** tells whether the process setup is symmetric about the beam axis in the c.m. system. This implies that there is no transversal beam polarization. The flag **lab_is_cm_frame** is obvious.

```

(Processes: process part types)+≡

```

```

type :: process_beam_config_t
private

    end subroutine process_counter_record

```

15.5.5 Multi-channel integration

The `process_mci_entry_t` block contains, for each process component that is integrated independently, the configuration data for its MC input parameters. Each input parameter set is handled by a `mci_t` integrator.

The MC input parameter set is broken down into the parameters required by the structure-function chain and the parameters required by the phase space of the elementary process.

The MD5 sum collects all information about the associated processes that may affect the integration. It does not contain the MCI object itself or integration results.

MC integration is organized in passes. Each pass may consist of several iterations, and for each iteration there is a number of calls. We store explicitly the values that apply to the current pass. Previous values are archived in the **results** object.

The **counter** receives the counter statistics from the associated process instance, for diagnostics.

The **results** object records results, broken down in passes and iterations.

```

<Processes: process part types>+≡
  type :: process_mci_entry_t
    integer :: i_mci = 0
    integer, dimension(:), allocatable :: i_component

    end if
  end subroutine process_mci_entry_compute_md5sum

```

Test the MCI sampler by calling it a given number of time, discarding the results. The instance should be initialized.

The `mci_entry` is intent(inout) because the integrator contains the random-number state.

```

(Processes: process mci entry: TBP)+≡
  procedure :: sampler_test => process_mci_entry_sampler_test

(Processes: procedures)+≡
  subroutine process_mci_entry_sampler_test (mci_entry, instance, n_calls)
    class(process_mci_entry_t), intent(inout) :: mci_entry
    type(process_instance_t), intent(inout), target :: instance
    integer, intent(in) :: n_calls
    call instance%choose_mci (mci_entry%i_mci)
    call instance%reset_counter ()
    call mci_entry%mci%sampler_test (instance, n_calls)
    mci_entry%counter = instance%get_counter ()
  end subroutine process_mci_entry_sampler_test

```

Integrate. The instance should be initialized.

The `integrate` method counts as an integration pass; the pass count is increased by one. We transfer the pass parameters (number of iterations and number of calls) to the actual integration routine.

The `mci_entry` is `intent(inout)` because the integrator contains the random-number state.

Note: The results are written to screen and to logfile. This behavior is hardcoded.

```

(Processes: process mci entry: TBP)+≡
  procedure :: integrate => process_mci_entry_integrate
  procedure :: final_integration => process_mci_entry_final_integration

Generate an event. The instance should be initialized, otherwise event generation is directed by the mci integrator subobject. The integrator instance is contained in a `mci_work` subobject of the process instance, which simultaneously serves as the sampler object. (We avoid the anti-aliasing rules if we assume that the sampling itself does not involve the integrator instance contained in the process instance.)

Regarding weighted events, we only take events which are valid, which means that they have valid kinematics and have passed cuts. Therefore, we have a rejection loop. For unweighted events, the unweighting routine should already take care of this.

15.5.6 Process Components

A process component is an individual contribution to a process (scattering or decay) which needs not be physical. The sum over all components should be physical.

The `index` identifies this component within its parent process.

The actual process component is stored in the `core` subobject. We use a polymorphic subobject instead of an extension of `process_component_t`, because the individual entries in the array of process components can have different types. In short, `process_component_t` is a wrapper for the actual process variants.

If the `active` flag is false, we should skip this component. This happens if the associated process has vanishing matrix element.

The index array `i_term` points to the individual terms generated by this component. The indices refer to the parent process.

The index `i_mci` is the index of the MC integrator and parameter set which are associated to this process component.

```

<Processes: process part types>+=
  type :: process_component_t
    private
      type(process_component_def_t), pointer :: config => null ()
      integer :: index = 0
      class(prc_core_t), allocatable :: core
      logical :: active = .false.
      class(mci_t), allocatable :: mci_template
      integer, dimension(:), allocatable :: i_term
      integer :: i_mci = 0
      class(phs_config_t), allocatable :: phs_config
      character(32) :: md5sum_phs = ""
    contains
      <Processes: process component: TBP>
    end type process_component_t

```

Finalizer. The MCI template may (potentially) need a finalizer. The process configuration finalizer may include closing an open scratch file.

```

<Processes: process component: TBP>=
  procedure :: final => process_component_final

15.5.7 Process terms

For straightforward tree-level calculations, each process component corresponds to a unique elementary interaction. However, in the case of NLO calculations with subtraction terms, a process component may split into several separate contributions to the scattering, which are qualified by interactions with distinct kinematics and particle content. We represent their configuration as `process_term_t` objects, the actual instances will be introduced below as `term_instance_t`. In any case, the process term contains an elementary interaction with a definite quantum-number and momentum content.

The index `i_term_global` identifies the term relative to the process.

The index `i_component` identifies the process component which generates this term, relative to the parent process.

The index `i_term` identifies the term relative to the process component (not the process).

The `data` subobject holds all process constants.

The number of allowed flavor/helicity/color combinations is stored as `n_allowed`. This is the total number of independent entries in the density matrix. For each combination, the index of the flavor, helicity, and color state is stored in the arrays `flv`, `hel`, and `col`, respectively.

The flag `rearrange` is true if we need to rearrange the particles of the hard interaction, to obtain the effective parton state.

The interaction `int` holds the quantum state for the (resolved) hard interaction, the parent-child relations of the particles, and their momenta. The

momenta are not filled yet; this is postponed to copies of `int` which go into the process instances.

If recombination is in effect, we should allocate `int_eff` to describe the rearranged partonic state.

```

<Processes: process part types>+≡
  type :: process_term_t
    integer :: i_term_global = 0
    integer :: i_component = 0
    integer :: i_term = 0
    integer :: n_allowed = 0
    type(process_constants_t) :: data
    real(default) :: alpha_s = 0
    integer, dimension(:), allocatable :: flv, hel, col
    logical :: rearrange = .false.
    type(interaction_t) :: int
    type(interaction_t), pointer :: int_eff => null ()
  contains
    <Processes: process term: TBP>
  end type process_term_t

```

For the output, we skip the process constants and the tables of allowed quantum numbers. Those can also be read off from the interaction object.

```

<Processes: process term: TBP>≡
  procedure :: write => process_term_write

<Processes: procedures>+≡
  subroutine process_term_write (term, unit)

  if (term%rearrange) then
    call interaction_final (term%i_term_eff)
    deallocate (term%i_term_eff)
  end if
end subroutine process_term_final

```

Initialize the term. We copy the process constants from the `core` object and set up the `int` hard interaction accordingly.

The `alpha_s` value is useful for writing external event records. This is the constant value which may be overridden by a event-specific running value. If the model does not contain the strong coupling, the value is zero.

The `rearrange` part is commented out; this or something equivalent could become relevant for NLO algorithms.

```

<Processes: process term: TBP>+≡

!   if (term%rearrange) then
!     call term%setup_effective_interaction (core, term%int, term%int_eff)
!   end if
  end subroutine process_term_init

```

We fetch the process constants which determine the quantum numbers and use those to create the interaction. The interaction contains incoming and outgoing particles, no virtuals. The incoming particles are parents of the outgoing ones.

Keeping previous WHIZARD conventions, we invert the color assignment (but not flavor or helicity) for the incoming particles. When the color-flow square matrix is evaluated, this inversion is done again, so in the color-flow sequence we get the color assignments of the matrix element.

```

15.5.8 Default Iterations

If the user does not specify the passes and iterations for integration, we should be able to give reasonable defaults. These depend on the process, therefore we implement the following procedures as methods of the process object. The algorithm is not very sophisticated yet, it may be improved by looking at the process in more detail.

We investigate only the first process component, assuming that it characterizes the complexity of the process reasonable well.

The number of passes is limited to two: one for adaption, one for integration.

(Processes: process: TBP)+≡

```

    procedure :: get_n_pass_default => process_get_n_pass_default
    procedure :: adapt_grids_default => process_adapt_grids_default
    procedure :: adapt_weights_default => process_adapt_weights_default

```

(Processes: procedures)+≡

```

    function process_get_n_pass_default (process) result (n_pass)
        class(process_t), intent(in) :: process

```

```

integer :: n_pass
integer :: n_eff
type(process_component_def_t), pointer :: config
config => process%component(1)%config
n_eff = config%get_n_tot () - 2
select case (n_eff)
case (1)
    n_pass = 1
case default
    n_pass = 2
end select
end function process_get_n_pass_default

```

15.5.10 Compute an amplitude

Each process variant should allow for computing an amplitude value directly, without generating a process instance.

The process component is selected by the index *i*. The term within the process component is selected by *j*. The momentum combination is transferred as the array *p*. The function sets the specific quantum state via the indices of a flavor *f*, helicity *h*, and color *c* combination. Each index refers to the list of flavor, helicity, and color states, respectively, as stored in the process data.

Optionally, we may set factorization and renormalization scale. If unset, the partonic c.m. energy is inserted.

The function checks arguments for validity. For invalid arguments (quantum states), we return zero.

```

<Processes: process: TBP>+≡
  procedure :: compute_amplitude => process_compute_amplitude

```

```

<Processes: procedures>+≡

15.5.11 Process instances

Kinematics instance

In this data type we combine all objects (instances) necessary for generating (or recovering) a kinematical configuration. The components work together as an implementation of multi-channel phase space.

sf_chain is an instance of the structure-function chain. It is used both for generating kinematics and, after the proper scale has been determined, evaluating the structure function entries.

phs is an instance of the phase space for the elementary process.

The array **f** contains the products of the Jacobians that originate from parameter mappings in the structure-function chain or in the phase space. We allocate this explicitly if either **sf_chain** or **phs** are explicitly allocated, otherwise we can take over a pointer.

All components are implemented as pointers to (anonymous) targets. For each component, there is a flag that tells whether this component is to be regarded as a proper component ('owned' by the object) or as a pointer.

(Processes: types)+≡

```

type :: kinematics_t
  integer :: n_in = 0
  integer :: n_channel = 0
  integer :: selected_channel = 0
  type(sf_chain_instance_t), pointer :: sf_chain => null ()
  class(phs_t), pointer :: phs => null ()
  real(default), dimension(:), pointer :: f => null ()
  real(default) :: phs_factor
  logical :: sf_chain_allocated = .false.
  logical :: phs_allocated = .false.
  logical :: f_allocated = .false.
contains
  (Processes: kinematics: TBP)
end type kinematics_t

```

Output. Show only those components which are marked as owned.

```

<Processes: kinematics: TBP>≡
  procedure :: write => kinematics_write

<Processes: procedures>+≡
  subroutine kinematics_write (object, unit)

  do c = 1, k%n_channel
    c_sf = k%phs%config%get_sf_channel (c)
    k%f(c) = k%sf_chain%get_f (c_sf) * k%phs%get_f (c)
  end do
end subroutine kinematics_compute_other_channels

```

Just fetch the outgoing momenta of the `sf_chain` subobject, which become the incoming (seed) momenta of the hard interaction.

This is a stripped down-version of the above which we use when recovering kinematics. Momenta are known, but no MC parameters yet.

(We do not use the `get_out_momenta` method of the chain, since this relies on the structure-function interactions, which are not necessary filled here. We do rely on the momenta of the last evaluator in the chain, however.)

```

<Processes: kinematics: TBP>+≡
procedure :: get_incoming_momenta => kinematics_get_incoming_momenta

```

```

<Processes: procedures>+≡
subroutine kinematics_get_incoming_momenta (k, p)
  class(kinematics_t), intent(in) :: k
  type(vector4_t), dimension(:), intent(out) :: p
  type(interaction_t), pointer :: int
  integer :: i
  int => k%sf_chain%get_out_int_ptr ()
  do i = 1, k%n_in
    p(i) = interaction_get_momentum (int, k%sf_chain%get_out_i (i))
  end do
end subroutine kinematics_get_incoming_momenta

```

This inverts the remainder of the above `compute` method. We know the momenta and recover the rest, as far as needed. If we select a channel, we can complete the inversion and reconstruct the MC parameter set.

```

<Processes: kinematics: TBP>+≡
procedure :: recover_mcpair => kinematics_recover_mcpair

    case (SF_DONE_KINEMATICS)

```

```

        call k%sf_chain%evaluate (fac_scale)
    end select
end subroutine kinematics_evaluate_sf_chain

```

Recover beam momenta, i.e., return the beam momenta stored in the current `sf_chain` to their source. This is a side effect.

```

<Processes: kinematics: TBP>+≡
    procedure :: return_beam_momenta => kinematics_return_beam_momenta
<Processes: procedures>+≡
    subroutine kinematics_return_beam_momenta (k)
        class(kinematics_t), intent(in) :: k
        call k%sf_chain%return_beam_momenta ()
    end subroutine kinematics_return_beam_momenta

```

Process component instance

The actual calculation of a sampling point is done from here.

The `config` pointer accesses the corresponding configuration in the `process` object.

The `active` flag indicates that we are currently computing this component, together with all other components that share the same MC parameter set. Inactive components are using a different MC parameter set and are not in use for this sampling point.

The `k_seed` subobject contains the kinematics (structure-function chain, phase space, etc.) that implements the ‘seed’ configuration of momenta. This version of the process kinematics is accessed by the MCI setup.

`p_seed` is the array of momenta that we compute from the MC input parameters, via the `k_seed` subobject. Depending on the process variant, these may or may not coincide with the momenta that enter the process terms associated to this component.

The `tmp` object can be used for storing intermediate results. Its precise type and contents depend on the process variant.

```

<Processes: types>+≡
    type :: component_instance_t
        type(process_component_t), pointer :: config => null ()
        logical :: active = .false.
        type(kinematics_t) :: k_seed
        type(vector4_t), dimension(:), allocatable :: p_seed
        logical :: sqme_known = .false.
        real(default) :: sqme = 0
        class(workspace_t), allocatable :: tmp
    contains
    <Processes: component instance: TBP>
end type component_instance_t

```

In the header, fetch the component index from the configuration record. `process_component_t` configuration block.

We write the `sf_chain` subobject only upon request, since its instances appear elsewhere.

```

<Processes: component instance: TBP>≡

```

```

          end if
          call core%compute_hard_kinematics &
            (component%p_seed, i, term(i)%int_hard, component%tmp)
        end do
      end associate
    end associate
  end subroutine component_instance_compute_hard_kinematics

```

Here, we invert this. We fetch the incoming momenta which reside in the appropriate `sf_chain` object, stored within the `k_seed` subobject. On the other hand, we have the outgoing momenta of the effective interaction. We rely on the process core to compute the remaining seed momenta and to fill the momenta within the hard interaction. (The latter is trivial if hard and effective interaction coincide.)

After this is done, the incoming momenta in the trace evaluator that corresponds to the hard (effective) interaction, are still left undefined. We remedy this by calling `receive_kinematics` once.

```

<Processes: component instance: TBP>+≡
  procedure :: recover_seed_kinematics => &

```

```

        component_instance_recover_seed_kinematics

  end do
end associate
component%sqme_known = .true.
end subroutine component_instance_evaluate_sqme

```

Term instance

A `term_instance_t` object contains all data that describe a term. Each process component consists of one or more distinct terms which may differ in kinematics, but whose squared transition matrices have to be added pointwise.

The `active` flag is set when this term is connected to an active process component. Inactive terms are skipped for kinematics and evaluation.

The `k_term` object is the instance of the kinematics setup (structure-function chain, phase space, etc.) that applies specifically to this term. In ordinary cases, it consists of straight pointers to the seed kinematics.

The `amp` array stores the amplitude values when we get them from evaluating the associated matrix-element code.

The `int_hard` interaction describes the elementary hard process. It receives the momenta and the amplitude entries for each sampling point.

The `isolated` object holds the effective parton state for the elementary interaction. The amplitude entries are computed from `int_hard`.

The `connected` evaluator set convolutes this scattering matrix with the beam (and possibly structure-function) density matrix.

The `checked` flag is set once we have applied cuts on this term. The result of this is stored in the `passed` flag. Once the term has passed cuts, we calculate the various scale and weight expressions.

        call term%isolated%final ()
        call interaction_final (term%int_hard)
    end subroutine term_instance_final

```

For initialization, we make use of defined assignment for the `interaction_t` type. This creates a deep copy.

The hard interaction (incoming momenta) is linked to the structure function instance. In the isolated state, we either set pointers to both, or we create modified copies (`rearrange`) as effective structure-function chain and interaction, respectively.

Finally, we set up the `subevt` component that will be used for evaluating observables, collecting particles from the trace evaluator in the effective connected state. Their quantum numbers must be determined by following back source links and set explicitly, since they are already eliminated in that trace.

The `rearrange` parts are still commented out; they could become relevant for a NLO algorithm.

```

(Processes: procedures)+≡
  subroutine term_instance_reset (term)
    class(term_instance_t), intent(inout) :: term
    call term%connected%reset_expressions ()
    term%active = .false.
  end subroutine term_instance_reset

```

Complete the kinematics computation for the effective parton states.

We assume that the `compute_hard_kinematics` method of the process component instance has already been called, so the `int_hard` contains the correct

hard kinematics. The duty of this procedure is first to compute the effective kinematics and store this in the `int_eff` effective interaction inside the `isolated` parton state. The effective kinematics may differ from the kinematics in the hard interaction. It may involve parton recombination or parton splitting. The `rearrange_partons` method is responsible for this part.

We may also call a method to compute the effective structure-function chain at this point. This is not implemented yet.

In the simple case that no rearrangement is necessary, as indicated by the `rearrange` flag, the effective interaction is a pointer to the hard interaction, and we can skip the rearrangement method. Similarly for the effective structure-function chain. (If we have an algorithm that uses rearrangement, it should evaluate `k_term` explicitly.)

The final step of kinematics setup is to transfer the effective kinematics to the evaluators and to the `subevt`.

```

(Processes: term instance: TBP)+≡
  procedure :: compute_eff_kinematics => &
    term_instance_compute_eff_kinematics

(Processes: procedures)+≡
  subroutine term_instance_compute_eff_kinematics (term, component)
    class(term_instance_t), intent(inout) :: term
    type(component_instance_t), dimension(:), intent(inout) :: component
    integer :: i_component, i_term
    term%checked = .false.
    term%passed = .false.
    if (term%config%rearrange) then
      ! should evaluate k_term first if allocated separately, not impl. yet
      i_component = term%config%i_component
      i_term = term%config%i_term
      associate (core => component(i_component)%config%core)
        call core%compute_eff_kinematics &
          (i_term, term%int_hard, term%isolated%int_eff, &
            component(i_component)%tmp)
      end associate
    end if
    call term%isolated%receive_kinematics ()
    call term%connected%receive_kinematics ()
  end subroutine term_instance_compute_eff_kinematics

```

Inverse. Reconstruct the connected state from the momenta in the trace evaluator (which we assume to be set), then reconstruct the isolated state as far as possible. The second part finalizes the momentum configuration, using the incoming seed momenta

```

(Processes: term instance: TBP)+≡
  procedure :: recover_hard_kinematics => &
    term_instance_recover_hard_kinematics

(Processes: procedures)+≡
  subroutine term_instance_recover_hard_kinematics (term, component)
    class(term_instance_t), intent(inout) :: term
    type(component_instance_t), dimension(:), intent(inout) :: component
    term%checked = .false.
    term%passed = .false.

```

```

    call term%connected%send_kinematics ()
    call term%isolated%send_kinematics ()
end subroutine term_instance_recover_hard_kinematics

```

Check the term whether it passes cuts and, if successful, evaluate scales and weights. The factorization scale is also given to the term kinematics, enabling structure-function evaluation.

```

<Processes: term instance: TBP>+=
  procedure :: evaluate_expressions => &
    term_instance_evaluate_expressions

<Processes: procedures>+=
  subroutine term_instance_evaluate_expressions (term)
    class(term_instance_t), intent(inout) :: term
    call term%connected%evaluate_expressions (term%passed, &
      term%scale, term%fac_scale, term%ren_scale, term%weight)
    term%checked = .true.
  end subroutine term_instance_evaluate_expressions

```

Evaluate the trace: first evaluate the hard interaction, then the trace evaluator. We use the `evaluate_interaction` method of the process component which generated this term. The `subevt` and cut expressions are not yet filled.

The `component` argument is `intent(inout)` because the `compute_amplitude` method may modify the `tmp` workspace object.

```

<Processes: term instance: TBP>+=
  procedure :: evaluate_interaction => term_instance_evaluate_interaction

<Processes: procedures>+=
  subroutine term_instance_evaluate_interaction (term, component)
    class(term_instance_t), intent(inout) :: term
    type(component_instance_t), dimension(:), intent(inout) :: component
    integer :: i_component, i_term, i
    i_component = term%config%i_component
    i_term = term%config%i_term
    term%p_hard = interaction_get_momenta (term%int_hard)
    associate (core => component(i_component)%config%core)
      do i = 1, term%config%n_allowed
        term%amp(i) = core%compute_amplitude (i_term, term%p_hard, &
          term%config%flv(i), term%config%hel(i), term%config%col(i), &
          term%fac_scale, term%ren_scale, &
          component(i_component)%tmp)
      end do
      call interaction_set_matrix_element (term%int_hard, term%amp)
    end associate
  end subroutine term_instance_evaluate_interaction

```

Evaluate the trace. First evaluate the structure-function chain (i.e., the density matrix of the incoming partons). Do this twice, in case the `sf-chain` instances within `k_term` and `isolated` differ. Next, evaluate the hard interaction, then compute the convolution with the initial state.

```

<Processes: term instance: TBP>+=
  procedure :: evaluate_trace => term_instance_evaluate_trace

```

```

<Processes: procedures>+≡
  subroutine term_instance_evaluate_trace (term)
    class(term_instance_t), intent(inout) :: term
    call term%k_term%evaluate_sf_chain (term%fac_scale)
    call term%isolated%evaluate_sf_chain (term%fac_scale)
    call term%isolated%evaluate_trace ()
    call term%connected%evaluate_trace ()
  end subroutine term_instance_evaluate_trace

```

Evaluate the extra data that we need for processing the object as a physical event.

```

<Processes: term instance: TBP>+≡
  procedure :: evaluate_event_data => term_instance_evaluate_event_data

<Processes: procedures>+≡
  subroutine term_instance_evaluate_event_data (term)
    class(term_instance_t), intent(inout) :: term
    call term%isolated%evaluate_event_data ()
    call term%connected%evaluate_event_data ()
  end subroutine term_instance_evaluate_event_data

```

Return data that might be useful for external processing. The factorization scale:

```

<Processes: term instance: TBP>+≡
  procedure :: get_fac_scale => term_instance_get_fac_scale

<Processes: procedures>+≡
  function term_instance_get_fac_scale (term) result (fac_scale)
    class(term_instance_t), intent(in) :: term
    real(default) :: fac_scale
    fac_scale = term%fac_scale
  end function term_instance_get_fac_scale

```

We take the strong coupling from the process core. The value is calculated when a new event is requested, so we should call it only after the event has been evaluated. If it is not available there (a negative number is returned), we take the value stored in the term configuration, which should be determined by the model. If the model does not provide a value, the result is zero.

```

<Processes: term instance: TBP>+≡
  procedure :: get_alpha_s => term_instance_get_alpha_s

<Processes: procedures>+≡
  function term_instance_get_alpha_s (term, component) result (alpha_s)
    class(term_instance_t), intent(in) :: term
    type(component_instance_t), dimension(:), intent(in) :: component
    real(default) :: alpha_s
    integer :: i_component
    i_component = term%config%i_component
    associate (core => component(i_component)%config%core)
      alpha_s = core%get_alpha_s (component(i_component)%tmp)
    end associate
    if (alpha_s < 0) alpha_s = term%config%alpha_s
  end function term_instance_get_alpha_s

```

MC parameter set and MCI instance

For each process component that is associated with a multi-channel integration (MCI) object, the `mci_work_t` object contains the currently active parameter set. It also holds the implementation of the `mci_instance_t` that the integrator needs for doing its work.

```

<Processes: types>+≡
  type :: mci_work_t
    type(process_mci_entry_t), pointer :: config => null ()
    real(default), dimension(:), allocatable :: x
    class(mci_instance_t), pointer :: mci => null ()
    type(process_counter_t) :: counter
  contains
    <Processes: mci work: TBP>
  end type mci_work_t

```

First write configuration data, then the current values.

```

<Processes: mci work: TBP>≡
  procedure :: write => mci_work_write

<Processes: procedures>+≡
  subroutine mci_work_write (mci_work, unit, testflag)

```

The process instance

A process instance contains all process data that depend on the sampling point and thus change often. In essence, it is an event record at the elementary (parton) level. We do not call it such, to avoid confusion with the actual event records. If decays are involved, the latter are compositions of several elementary processes (i.e., their instances).

We implement the process instance as an extension of the `mci_sampler_t` that we need for computing integrals and generate events.

The base type contains: the `integrand`, the `selected_channel`, the two-dimensional array `x` of parameters, and the one-dimensional array `f` of Jacobians. These subobjects are public and used for communicating with the multi-channel integrator.

The `process` pointer accesses the process of which this record is an instance. It is required whenever the calculation needs invariant configuration data, therefore the process should stay in memory for the whole lifetime of its instances.

The `evaluation_status` code is used to check the current status. In particular, failure at various stages is recorded there.

The `count` object records process evaluations, broken down according to status.

The `sqme` value is the single real number that results from evaluating and tracing the kinematics and matrix elements. This is the number that is handed over to an integration routine.

The `weight` value is the event weight. It is defined when an event has been generated from the process instance, either weighted or unweighted. The value is the `sqme` value times Jacobian weights from the integration, or unity, respectively.

The `i_mci` index chooses a subset of components that are associated with a common parameter set and integrator, i.e., that are added coherently.

The `sf_chain` subobject is a realization of the beam and structure-function configuration in the `process` object. It is not used for calculation directly

but serves as the template for the sf-chain instances that are contained in the **component** objects.

The **component** subobjects determine the state of each component.

The **term** subobjects are workspace for evaluating kinematics, matrix elements, cuts etc.

The **mci_work** subobject contains the array of real input parameters (random numbers) that generates the kinematical point. It also contains the workspace for the MC integrators. The active entry of the **mci_work** array is selected by the **i_mci** index above.

```

<Processes: public>+=
  public :: process_instance_t

<Processes: types>+=
  type, extends (mci_sampler_t) :: process_instance_t
    type(process_t), pointer :: process => null ()
    integer :: evaluation_status = STAT_UNDEFINED

        end do
    end if
end associate
end do
end associate
instance%evaluation_status = STAT_ACTIVATED
end subroutine process_instance_activate

```

Initialization connects the instance with a process. All initial information is transferred from the process object. The process object contains templates for the interaction subobjects (beam and term), but no evaluators. The initialization routine creates evaluators for the matrix element trace, other evaluators are left untouched.

The **instance** object must have the **target** attribute (also in any caller) since the initialization routine assigns various pointers to subobject of **instance**.

(Processes: process instance: TBP)+≡

```

    procedure :: init => process_instance_init

```

(Processes: procedures)+≡

```

subroutine process_instance_init (instance, process)

    end associate
end if
end associate
end do
instance%evaluation_status = STAT_INITIAL
end subroutine process_instance_init

```

Subroutine of the initialization above: initialize the beam and structure-function chain template. We establish pointers to the configuration data, so `beam_config` must have a `target` attribute.

The resulting chain is not used directly for calculation. It will acquire instances which are stored in the process-component instance objects.

```

<Processes: process instance: TBP>+≡
    procedure :: setup_sf_chain => process_instance_setup_sf_chain

<Processes: procedures>+≡
    subroutine process_instance_setup_sf_chain (instance, config)
        class(process_instance_t), intent(inout) :: instance
        type(process_beam_config_t), intent(in), target :: config
        integer :: n_strfun
        n_strfun = config%n_strfun
        if (n_strfun /= 0) then
            call instance%sf_chain%init (config%data, config%sf)
        else
            call instance%sf_chain%init (config%data)
        end if
        if (config%sf_trace) then
            call instance%sf_chain%setup_tracing (config%sf_trace_file)
        end if
    end subroutine process_instance_setup_sf_chain

```

This initialization routine should be called only for process instances which we intend as a source for physical events. It initializes the evaluators in the parton states of the terms. They describe the (semi-)exclusive transition matrix and the distribution of color flow for the partonic process, convoluted with the beam and structure-function chain.

If the model is not provided explicitly, we may use the model instance that belongs to the process. However, an explicit model allows us to override particle settings.

```

<Processes: process instance: TBP>+≡
    procedure :: setup_event_data => process_instance_setup_event_data

<Processes: procedures>+≡
    subroutine process_instance_setup_event_data (instance, model)
        class(process_instance_t), intent(inout), target :: instance
        type(model_t), intent(in), optional, target :: model
        type(model_t), pointer :: current_model
        integer :: i, i_component
        if (present (model)) then
            current_model => model
        else
            current_model => instance%process%config%model
        end if
    end subroutine process_instance_setup_event_data

```

```

end if
do i = 1, size (instance%term)
  associate (term => instance%term(i))
    if (associated (term%config)) then
      i_component = term%config%i_component
      associate (component => instance%process%component(i_component))
        call term%setup_event_data (component%core, current_model)
      end associate
    end if
  end associate
end do
end subroutine process_instance_setup_event_data

```

Choose a MC parameter set and the corresponding integrator.

The choice persists beyond calls of the `reset` method above. This method is automatically called here.

```

<Processes: process instance: TBP>+≡
  procedure :: choose_mci => process_instance_choose_mci

<Processes: procedures>+≡
  subroutine process_instance_choose_mci (instance, i_mci)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_mci
    instance%i_mci = i_mci
    call instance%reset ()
  end subroutine process_instance_choose_mci

```

Explicitly set a MC parameter set. Works only if we are in initial state. We assume that the length of the parameter set is correct.

After setting the parameters, activate the components and terms that correspond to the chosen MC parameter set.

```

<Processes: process instance: TBP>+≡
  procedure :: set_mcpair => process_instance_set_mcpair

<Processes: procedures>+≡
  subroutine process_instance_set_mcpair (instance, x)
    class(process_instance_t), intent(inout) :: instance
    real(default), dimension(:), intent(in) :: x
    if (instance%evaluation_status == STAT_INITIAL) then
      associate (mci_work => instance%mci_work(instance%i_mci))
        call mci_work%set (x)
      end associate
      call instance%activate ()
    end if
  end subroutine process_instance_set_mcpair

```

Receive the beam momentum/momenta from a source interaction. This applies to a cascade decay process instance, where the ‘beam’ momentum varies event by event.

The master beam momentum array is contained in the main structure function chain subobject `sf_chain`. The sf-chain instance that reside in the components will take their beam momenta from there.

The procedure transforms the instance status into STAT_BEAM_MOMENTA. For process instance with fixed beam, this intermediate status is skipped.

```

<Processes: process instance: TBP>+≡
  procedure :: receive_beam_momenta => process_instance_receive_beam_momenta

<Processes: procedures>+≡
  subroutine process_instance_receive_beam_momenta (instance)
    class(process_instance_t), intent(inout) :: instance
    if (instance%evaluation_status >= STAT_INITIAL) then
      call instance%sf_chain%receive_beam_momenta ()
      instance%evaluation_status = STAT_BEAM_MOMENTA
    end if
  end subroutine process_instance_receive_beam_momenta

```

Set the beam momentum/momenta explicitly. Otherwise, analogous to the previous procedure.

```

<Processes: process instance: TBP>+≡
  procedure :: set_beam_momenta => process_instance_set_beam_momenta

<Processes: procedures>+≡
  subroutine process_instance_set_beam_momenta (instance, p)
    class(process_instance_t), intent(inout) :: instance
    type(vector4_t), dimension(:), intent(in) :: p
    if (instance%evaluation_status >= STAT_INITIAL) then
      call instance%sf_chain%set_beam_momenta (p)
      instance%evaluation_status = STAT_BEAM_MOMENTA
    end if
  end subroutine process_instance_set_beam_momenta

```

Recover the initial beam momenta (those in the sf_chain component), given a valid (recovered) sf_chain_instance in one of the active components. We need to do this only if the lab frame is not the c.m. frame, otherwise those beams would be fixed anyway.

```

<Processes: process instance: TBP>+≡
  procedure :: recover_beam_momenta => process_instance_recover_beam_momenta

<Processes: procedures>+≡
  subroutine process_instance_recover_beam_momenta (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    integer :: i
    if (.not. instance%process%beam_config%lab_is_cm_frame) then
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        i = instance%term(i_term)%config%i_component
        call instance%component(i)%return_beam_momenta ()
      end if
    end if
  end subroutine process_instance_recover_beam_momenta

```

Explicitly choose MC integration channel. We assume here that the channel count is identical for all active components.

```

<Processes: process instance: TBP>+≡
  procedure :: select_channel => process_instance_select_channel

```

```

<Processes: procedures>+≡
  subroutine process_instance_select_channel (instance, channel)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: channel
    instance%selected_channel = channel
  end subroutine process_instance_select_channel

```

First step of process evaluation: set up seed kinematics. That is, for each active process component, compute a momentum array from the MC input parameters.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

```

<Processes: process instance: TBP>+≡
  procedure :: compute_seed_kinematics => &
    process_instance_compute_seed_kinematics

<Processes: procedures>+≡
  subroutine process_instance_compute_seed_kinematics (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: channel, skip_component, i
    logical :: success
    channel = instance%selected_channel
    if (channel == 0) then
      call msg_bug ("Compute seed kinematics: undefined integration channel")
    end if
    if (present (skip_term)) then
      skip_component = instance%term(skip_term)%config%i_component
    else
      skip_component = 0
    end if
    if (instance%evaluation_status >= STAT_ACTIVATED) then
      success = .true.
      do i = 1, size (instance%component)
        if (i == skip_component) cycle
        if (instance%component(i)%active) then
          call instance%component(i)%compute_seed_kinematics &
            (instance%mc_i_work(instance%i_mci), channel, success)
          if (.not. success) exit
        end if
      end do
      if (success) then
        instance%evaluation_status = STAT_SEED_KINEMATICS
      else
        instance%evaluation_status = STAT_FAILED_KINEMATICS
      end if
    end if
  end subroutine process_instance_compute_seed_kinematics

```

Inverse: recover missing parts of the kinematics from the momentum configuration, which we know for a single term and component. Given a channel, reconstruct the MC parameter set.

```

<Processes: process instance: TBP>+≡

```

```

    procedure :: recover_mcpair => process_instance_recover_mcpair
  <Processes: procedures>+≡
    subroutine process_instance_recover_mcpair (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: channel
      integer :: i
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        channel = instance%selected_channel
        if (channel == 0) then
          call msg_bug ("Recover MC parameters: undefined integration channel")
        end if
        i = instance%term(i_term)%config%i_component
        call instance%component(i)%recover_mcpair &
          (instance%mc_work(instance%i_mci), channel)
      end if
    end subroutine process_instance_recover_mcpair

```

Second step of process evaluation: compute all momenta, for all active components, from the seed kinematics.

```

  <Processes: process instance: TBP>+≡
    procedure :: compute_hard_kinematics => &
      process_instance_compute_hard_kinematics
  <Processes: procedures>+≡
    subroutine process_instance_compute_hard_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: i
      if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
        do i = 1, size (instance%component)
          if (instance%component(i)%active) then
            call instance%component(i)% &
              compute_hard_kinematics (instance%term, skip_term)
          end if
        end do
        instance%evaluation_status = STAT_HARD_KINEMATICS
      end if
    end subroutine process_instance_compute_hard_kinematics

```

Inverse: recover seed kinematics. We know the beam momentum configuration and the outgoing momenta of the effective interaction, for one specific term.

```

  <Processes: process instance: TBP>+≡
    procedure :: recover_seed_kinematics => &
      process_instance_recover_seed_kinematics
  <Processes: procedures>+≡
    subroutine process_instance_recover_seed_kinematics (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        associate (i_component => instance%term(i_term)%config%i_component)
          call instance%component(i_component)% &

```

```

        recover_seed_kinematics (instance%term(i_term))
    end associate
end if
end subroutine process_instance_recover_seed_kinematics

```

Third step of process evaluation: compute the effective momentum configurations, for all active terms, from the hard kinematics.

```

<Processes: process instance: TBP>+≡
    procedure :: compute_eff_kinematics => &
        process_instance_compute_eff_kinematics
<Processes: procedures>+≡
    subroutine process_instance_compute_eff_kinematics (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: i
    if (instance%evaluation_status >= STAT_HARD_KINEMATICS) then
        do i = 1, size (instance%term)
            if (present (skip_term)) then
                if (i == skip_term) cycle
            end if
            if (instance%term(i)%active) then
                call instance%term(i)% &
                    compute_eff_kinematics (instance%component)
            end if
        end do
        instance%evaluation_status = STAT_EFF_KINEMATICS
    end if
end subroutine process_instance_compute_eff_kinematics

```

Inverse: recover the hard kinematics from effective kinematics for one term, then compute effective kinematics for the other terms.

```

<Processes: process instance: TBP>+≡
    procedure :: recover_hard_kinematics => &
        process_instance_recover_hard_kinematics
<Processes: procedures>+≡
    subroutine process_instance_recover_hard_kinematics (instance, i_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_term
    integer :: i
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        call instance%term(i_term)%recover_hard_kinematics (instance%component)
        do i = 1, size (instance%term)
            if (i /= i_term) then
                if (instance%term(i)%active) then
                    call instance%term(i)% &
                        compute_eff_kinematics (instance%component)
                end if
            end if
        end do
        instance%evaluation_status = STAT_EFF_KINEMATICS
    end if
end subroutine process_instance_recover_hard_kinematics

```

Fourth step of process evaluation: check cuts for all terms. Where successful, compute any scales and weights. Otherwise, deactivate the term. If any of the terms has passed, set the state to STAT_PASSED_CUTS.

```

(Processes: process instance: TBP)+≡
  procedure :: evaluate_expressions => &
    process_instance_evaluate_expressions

(Processes: procedures)+≡
  subroutine process_instance_evaluate_expressions (instance)
    class(process_instance_t), intent(inout) :: instance
    integer :: i
    if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
      do i = 1, size (instance%term)
        if (instance%term(i)%active) then
          call instance%term(i)%evaluate_expressions ()
        end if
      end do
      if (any (instance%term%passed)) then
        instance%evaluation_status = STAT_PASSED_CUTS
      else
        instance%evaluation_status = STAT_FAILED_CUTS
      end if
    end if
  end subroutine process_instance_evaluate_expressions

```

Fifth step of process evaluation: fill the parameters for the non-selected channels, that have not been used for seeding. We should do this after evaluating cuts, since we may save some expensive calculations if the phase space point fails the cuts.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

```

(Processes: process instance: TBP)+≡
  procedure :: compute_other_channels => &
    process_instance_compute_other_channels

(Processes: procedures)+≡
  subroutine process_instance_compute_other_channels (instance, skip_term)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in), optional :: skip_term
    integer :: channel, skip_component, i
    channel = instance%selected_channel
    if (channel == 0) then
      call msg_bug ("Compute other channels: undefined integration channel")
    end if
    if (present (skip_term)) then
      skip_component = instance%term(skip_term)%config%i_component
    else
      skip_component = 0
    end if
    if (instance%evaluation_status >= STAT_PASSED_CUTS) then
      do i = 1, size (instance%component)

```

```

        if (i == skip_component) cycle
        if (instance%component(i)%active) then
            call instance%component(i)%compute_other_channels &
                (instance%mci_work(instance%i_mci), channel)
        end if
    end do
end if
end subroutine process_instance_compute_other_channels

```

Sixth step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

```

<Processes: process instance: TBP>+≡
    procedure :: evaluate_trace => process_instance_evaluate_trace

<Processes: procedures>+≡
    subroutine process_instance_evaluate_trace (instance)
        class(process_instance_t), intent(inout) :: instance
        integer :: i
        if (instance%evaluation_status >= STAT_PASSED_CUTS) then
            do i = 1, size (instance%term)
                associate (term => instance%term(i))
                    if (term%active .and. term%passed) then
                        call term%evaluate_interaction (instance%component)
                        call term%evaluate_trace ()
                    end if
                end associate
            end do
            instance%sqme = 0
            do i = 1, size (instance%component)
                associate (component => instance%component(i))
                    if (component%active) then
                        call component%evaluate_sqme (instance%term)
                        instance%sqme = instance%sqme + component%sqme
                    end if
                end associate
            end do
            instance%evaluation_status = STAT_EVALUATED_TRACE
        else
            ! failed kinematics, failed cuts: set sqme to zero
            instance%sqme = 0
        end if
    end subroutine process_instance_evaluate_trace

```

Final step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

If **weight** is provided, we already know the kinematical event weight (the MCI weight which depends on the kinematics sampling algorithm, but not on the matrix element), so we do not need to take it from the MCI record.

```

<Processes: process instance: TBP>+≡
    procedure :: evaluate_event_data => process_instance_evaluate_event_data

```

```

<Processes: procedures>+≡
subroutine process_instance_evaluate_event_data (instance, weight)
  class(process_instance_t), intent(inout) :: instance
  real(default), intent(in), optional :: weight
  integer :: i
  if (instance%evaluation_status >= STAT_EVALUATED_TRACE) then
    do i = 1, size (instance%term)
      associate (term => instance%term(i))
        if (term%active .and. term%passed) then
          call term%evaluate_event_data ()
        end if
      end associate
    end do
    if (present (weight)) then
      instance%weight = weight
    else
      instance%weight = &
        instance%mc_i_work(instance%i_mci)%mc_i%get_event_weight ()
      instance%excess = &
        instance%mc_i_work(instance%i_mci)%mc_i%get_event_excess ()
    end if
    instance%evaluation_status = STAT_EVENT_COMPLETE
  else
    ! failed kinematics etc.: set weight to zero
    instance%weight = 0
  end if
end subroutine process_instance_evaluate_event_data

```

For unweighted event generation, we should reset the reported event weight to unity (signed) or zero. The latter case is appropriate for an event which failed for whatever reason.

```

<Processes: process instance: TBP>+≡
  procedure :: normalize_weight => process_instance_normalize_weight

<Processes: procedures>+≡
subroutine process_instance_normalize_weight (instance)
  class(process_instance_t), intent(inout) :: instance
  if (instance%weight /= 0) then
    instance%weight = sign (1._default, instance%weight)
  end if
end subroutine process_instance_normalize_weight

```

This is a convenience routine that performs the computations of the steps 1 to 5 in a single step. The arguments are the input for `set_mcp`. After this, the evaluation status should be either `STAT_FAILED_KINEMATICS`, `STAT_FAILED_CUTS` or `STAT_EVALUATED_TRACE`.

Before calling this, we should call `choose_mci`.

```

<Processes: process instance: TBP>+≡
  procedure :: evaluate_sqme => process_instance_evaluate_sqme

<Processes: procedures>+≡
subroutine process_instance_evaluate_sqme (instance, channel, x)
  class(process_instance_t), intent(inout) :: instance

```

```

integer, intent(in) :: channel
real(default), dimension(:), intent(in) :: x
call instance%reset ()
call instance%set_mcpair (x)
call instance%select_channel (channel)
call instance%compute_seed_kinematics ()
call instance%compute_hard_kinematics ()
call instance%compute_eff_kinematics ()
call instance%evaluate_expressions ()
call instance%compute_other_channels ()
call instance%evaluate_trace ()
end subroutine process_instance_evaluate_sqme

```

This is the inverse. Assuming that the final trace evaluator contains a valid momentum configuration, recover kinematics and recalculate the matrix elements and their trace.

To be precise, we first recover kinematics for the given term and associated component, then recalculate from that all other terms and active components. The `channel` is not really required to obtain the matrix element, but it allows us to reconstruct the exact MC parameter set that corresponds to the given phase space point.

Before calling this, we should call `choose_mci`.

```

(Processes: process instance: TBP)+≡
  procedure :: recover => process_instance_recover

(Processes: procedures)+≡
  subroutine process_instance_recover (instance, channel, i_term, update_sqme)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: channel
    integer, intent(in) :: i_term
    logical, intent(in) :: update_sqme
    call instance%activate ()
    instance%evaluation_status = STAT_EFF_KINEMATICS
    call instance%recover_hard_kinematics (i_term)
    call instance%recover_seed_kinematics (i_term)
    call instance%select_channel (channel)
    call instance%recover_mcpair (i_term)
    call instance%recover_beam_momenta (i_term)
    call instance%compute_seed_kinematics (i_term)
    call instance%compute_hard_kinematics (i_term)
    call instance%compute_eff_kinematics (i_term)
    call instance%compute_other_channels (i_term)
    call instance%evaluate_expressions ()
    if (update_sqme) call instance%evaluate_trace ()
  end subroutine process_instance_recover

```

The `evaluate` method is required by the `sampler_t` base type of which the process instance is an extension.

The requirement is that after the process instance is evaluated, the integrand, the selected channel, the x array, and the f Jacobian array are exposed by the `sampler_t` object.

```

(Processes: process instance: TBP)+≡
  procedure :: evaluate => process_instance_evaluate

```

```

<Processes: procedures>+≡
subroutine process_instance_evaluate (sampler, c, x_in, val, x, f)
  class(process_instance_t), intent(inout) :: sampler
  integer, intent(in) :: c
  real(default), dimension(:), intent(in) :: x_in
  real(default), intent(out) :: val
  real(default), dimension(:,:), intent(out) :: x
  real(default), dimension(:), intent(out) :: f
  call sampler%evaluate_sqme (c, x_in)
  if (sampler%is_valid ()) call sampler%fetch (val, x, f)
  call sampler%record_call ()
end subroutine process_instance_evaluate

```

The phase-space point is valid if the event has valid kinematics and has passed the cuts.

```

<Processes: process instance: TBP>+≡
  procedure :: is_valid => process_instance_is_valid

<Processes: procedures>+≡
function process_instance_is_valid (sampler) result (valid)
  class(process_instance_t), intent(in) :: sampler
  logical :: valid
  valid = sampler%evaluation_status >= STAT_PASSED_CUTS
end function process_instance_is_valid

```

The `rebuild` method should rebuild the kinematics section out of the `x_in` parameter set. The integrand value `val` should not be computed, but is provided as input.

```

<Processes: process instance: TBP>+≡
  procedure :: rebuild => process_instance_rebuild

<Processes: procedures>+≡
subroutine process_instance_rebuild (sampler, c, x_in, val, x, f)
  class(process_instance_t), intent(inout) :: sampler
  integer, intent(in) :: c
  real(default), dimension(:), intent(in) :: x_in
  real(default), intent(in) :: val
  real(default), dimension(:,:), intent(out) :: x
  real(default), dimension(:), intent(out) :: f
  call msg_bug ("process_instance_rebuild not implemented yet")
  x = 0
  f = 0
end subroutine process_instance_rebuild

```

This is another method required by the `sampler_t` base type: fetch the data that are relevant for the MCI record.

```

<Processes: process instance: TBP>+≡
  procedure :: fetch => process_instance_fetch

<Processes: procedures>+≡
subroutine process_instance_fetch (sampler, val, x, f)
  class(process_instance_t), intent(in) :: sampler
  real(default), intent(out) :: val

```

```

real(default), dimension(:,:), intent(out) :: x
real(default), dimension(:), intent(out) :: f
integer :: i, cc
integer :: n_channel
val = 0
FIND_COMPONENT: do i = 1, size (sampler%component)
  associate (component => sampler%component(i))
    if (component%active) then
      associate (k => component%k_seed)
        n_channel = k%n_channel
        do cc = 1, n_channel
          call k%get_mcpair (cc, x(:,cc))
        end do
        f = k%f
        val = sampler%sqme * k%phs_factor
      end associate
    end if
  end associate
end do FIND_COMPONENT
end subroutine process_instance_fetch

```

Initialize and finalize event generation for the specified MCI entry.

```

<Processes: process instance: TBP>+≡
  procedure :: init_simulation => process_instance_init_simulation
  procedure :: final_simulation => process_instance_final_simulation

<Processes: procedures>+≡
  subroutine process_instance_init_simulation (instance, i_mci, safety_factor)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_mci
    real(default), intent(in), optional :: safety_factor
    call instance%mci_work(i_mci)%init_simulation (safety_factor)
  end subroutine process_instance_init_simulation

  subroutine process_instance_final_simulation (instance, i_mci)
    class(process_instance_t), intent(inout) :: instance
    integer, intent(in) :: i_mci
    call instance%mci_work(i_mci)%final_simulation ()
  end subroutine process_instance_final_simulation

```

15.5.12 Accessing the process instance

Once the seed kinematics is complete, we can retrieve the MC input parameters for all channels, not just the seed channel.

Note: We choose the first active component. This makes sense only if the seed kinematics is identical for all active components.

```

<Processes: process instance: TBP>+≡
  procedure :: get_mcpair => process_instance_get_mcpair

<Processes: procedures>+≡
  subroutine process_instance_get_mcpair (instance, channel, x)

```

```

class(process_instance_t), intent(inout) :: instance
integer, intent(in) :: channel
real(default), dimension(:), intent(out) :: x
integer :: i
if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
  do i = 1, size (instance%component)
    if (instance%component(i)%active) then
      call instance%component(i)%k_seed%get_mcpair (channel, x)
      return
    end if
  end do
  call msg_bug ("Process instance: get_mcpair: no active channels")
else
  call msg_bug ("Process instance: get_mcpair: no seed kinematics")
end if
end subroutine process_instance_get_mcpair

```

Return true if the `sqrme` value is known. This also implies that the event is kinematically valid and has passed all cuts.

```

<Processes: process instance: TBP>+≡
  procedure :: has_evaluated_trace => process_instance_has_evaluated_trace

<Processes: procedures>+≡
  function process_instance_has_evaluated_trace (instance) result (flag)
    class(process_instance_t), intent(in) :: instance
    logical :: flag
    flag = instance%evaluation_status >= STAT_EVALUATED_TRACE
  end function process_instance_has_evaluated_trace

```

Return true if the event is complete. In particular, the event must be kinematically valid, passed all cuts, and the event data have been computed.

```

<Processes: process instance: TBP>+≡
  procedure :: is_complete_event => process_instance_is_complete_event

<Processes: procedures>+≡
  function process_instance_is_complete_event (instance) result (flag)
    class(process_instance_t), intent(in) :: instance
    logical :: flag
    flag = instance%evaluation_status >= STAT_EVENT_COMPLETE
  end function process_instance_is_complete_event

```

Select a term for the process instance which is to provide the event record.

Note: this should be done using random numbers and applying probabilities for the various terms and components that belong to the selected MCI group. The current implementation simply selects the first term for the first active component.

```

<Processes: process instance: TBP>+≡
  procedure :: select_i_term => process_instance_select_i_term

<Processes: procedures>+≡
  subroutine process_instance_select_i_term (instance, i_term)
    class(process_instance_t), intent(in) :: instance
    integer, intent(out) :: i_term

```

```

integer :: i_mci, i_component
i_mci = instance%i_mci
i_component = instance%process%mc_entry(i_mci)%i_component(1)
i_term = instance%process%component(i_component)%i_term(1)
end subroutine process_instance_select_i_term

```

Return pointer to the master beam interaction.

```

(Processes: process instance: TBP)+≡
  procedure :: get_beam_int_ptr => process_instance_get_beam_int_ptr

(Processes: procedures)+≡
  function process_instance_get_beam_int_ptr (instance) result (ptr)

    counter = process_instance%mci_work(process_instance%i_mci)%get_counter ()
  end function process_instance_get_counter

```

15.5.13 Particle sets

Here we provide two procedures that convert the process instance from/to a particle set. The conversion applies to the trace evaluator which has no quantum-number information, thus it involves only the momenta and the parent-child relations. We keep virtual particles.

Nevertheless, it is possible to reconstruct the complete structure from a particle set. The reconstruction implies a re-evaluation of the structure function and matrix-element codes.

The *i_term* index is needed for both input and output, to select among different active trace evaluators.

In both cases, the *instance* object must be properly initialized.

```

(Processes: process instance: TBP)+≡
  procedure :: get_trace => process_instance_get_trace
  procedure :: set_trace => process_instance_set_trace

(Processes: procedures)+≡
  subroutine process_instance_get_trace (instance, pset, i_term)
    class(process_instance_t), intent(in), target :: instance
    type(particle_set_t), intent(out) :: pset
    integer, intent(in) :: i_term
    type(interaction_t), pointer :: int
    logical :: ok
    int => instance%get_trace_int_ptr (i_term)
    call particle_set_init (pset, ok, int, int, FM_IGNORE_HELICITY, &
      [0._default, 0._default], .false., .true.)
  end subroutine process_instance_get_trace

```

```

subroutine process_instance_set_trace (instance, pset, i_term, recover_beams)
  class(process_instance_t), intent(inout), target :: instance
  type(particle_set_t), intent(in) :: pset
  integer, intent(in) :: i_term
  logical, intent(in), optional :: recover_beams
  type(interaction_t), pointer :: int
  integer :: n_in
  int => instance%get_trace_int_ptr (i_term)
  n_in = instance%process%get_n_in ()
  call particle_set_fill_interaction (pset, int, n_in, recover_beams)
end subroutine process_instance_set_trace

```

The `pacify` subroutine has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. We do this in some unit tests. Here, we apply this to the phase space subobject of the process instance.

```

<Processes: public>+≡
  public :: pacify

<Processes: interfaces>≡
  interface pacify
    module procedure pacify_process_instance
  end interface pacify

<Processes: procedures>+≡
  subroutine pacify_process_instance (instance)
    type(process_instance_t), intent(inout) :: instance
    integer :: i
    do i = 1, size (instance%component)
      call pacify (instance%component(i)%k_seed%phs)
    end do
  end subroutine pacify_process_instance

```

15.5.14 Unit tests

```

<Processes: public>+≡
  public :: processes_test

<Processes: tests>≡
  subroutine processes_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <Processes: execute tests>
  end subroutine processes_test

```

Test process type

For the following tests, we define a simple implementation of the abstract `prc_core_t`, designed such as to complement the `prc_test_t` process definition type.

Note that it is not given that the actual process is defined as `prc_test_t` type. We enforce this by calling `prc_test_create_library`. The driver component in the process core will then become of type `prc_test_t`.

```

<Processes: public>+≡
    public :: test_t

<Processes: test types>≡
    type, extends (prc_core_t) :: test_t
    contains
        procedure :: write => test_write
        procedure :: needs_mcset => test_needs_mcset
        procedure :: get_n_terms => test_get_n_terms
        procedure :: is_allowed => test_is_allowed
        procedure :: compute_hard_kinematics => test_compute_hard_kinematics
        procedure :: compute_eff_kinematics => test_compute_eff_kinematics
        procedure :: recover_kinematics => test_recover_kinematics
        procedure :: compute_amplitude => test_compute_amplitude
    end type test_t

<Processes: tests>+≡
    subroutine test_write (object, unit)
        class(test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = output_unit (unit)
        write (u, "(3x,A)") "test type implementing prc_test"
    end subroutine test_write

```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

```

<Processes: tests>+≡
    function test_needs_mcset (object) result (flag)
        class(test_t), intent(in) :: object
        logical :: flag
        flag = .true.
    end function test_needs_mcset

    function test_get_n_terms (object) result (n)
        class(test_t), intent(in) :: object
        integer :: n
        n = 1
    end function test_get_n_terms

    function test_is_allowed (object, i_term, f, h, c) result (flag)
        class(test_t), intent(in) :: object
        integer, intent(in) :: i_term, f, h, c
        logical :: flag
        flag = .true.
    end function test_is_allowed

```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

```

<Processes: tests>+≡

```

```

subroutine test_compute_hard_kinematics &
  (object, p_seed, i_term, int_hard, tmp)
  class(test_t), intent(in) :: object
  type(vector4_t), dimension(:), intent(in) :: p_seed
  integer, intent(in) :: i_term
  type(interaction_t), intent(inout) :: int_hard
  class(workspace_t), intent(inout), allocatable :: tmp
  call interaction_set_momenta (int_hard, p_seed)
end subroutine test_compute_hard_kinematics

```

This procedure is not called for `test_t`, just a placeholder.

(Processes: tests)+≡

```

subroutine test_compute_eff_kinematics &
  (object, i_term, int_hard, int_eff, tmp)
  class(test_t), intent(in) :: object
  integer, intent(in) :: i_term
  type(interaction_t), intent(in) :: int_hard
  type(interaction_t), intent(inout) :: int_eff
  class(workspace_t), intent(inout), allocatable :: tmp
end subroutine test_compute_eff_kinematics

```

Transfer the incoming momenta of `p_seed` directly to the effective interaction, and vice versa for the outgoing momenta.

`int_hard` is left untouched since `int_eff` is an alias (via pointer) to it.

(Processes: tests)+≡

```

subroutine test_recover_kinematics &
  (object, p_seed, int_hard, int_eff, tmp)
  class(test_t), intent(in) :: object
  type(vector4_t), dimension(:), intent(inout) :: p_seed
  type(interaction_t), intent(inout) :: int_hard
  type(interaction_t), intent(inout) :: int_eff
  class(workspace_t), intent(inout), allocatable :: tmp
  integer :: n_in
  n_in = interaction_get_n_in (int_eff)
  call interaction_set_momenta (int_eff, p_seed(1:n_in), outgoing = .false.)
  p_seed(n_in+1:) = interaction_get_momenta (int_eff, outgoing = .true.)
end subroutine test_recover_kinematics

```

Compute the amplitude. The driver ignores all quantum numbers and, in fact, returns a constant. Nevertheless, we properly transfer the momentum vectors.

(Processes: tests)+≡

```

function test_compute_amplitude &
  (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
  class(test_t), intent(in) :: object
  integer, intent(in) :: j
  type(vector4_t), dimension(:), intent(in) :: p
  integer, intent(in) :: f, h, c
  real(default), intent(in) :: fac_scale, ren_scale
  class(workspace_t), intent(inout), allocatable, optional :: tmp
  complex(default) :: amp
  real(default), dimension(:,:), allocatable :: parray
  integer :: i, n_tot

```

```

select type (driver => object%driver)
type is (prc_test_t)
  if (driver%scattering) then
    n_tot = 4
  else
    n_tot = 3
  end if
  allocate (parray (0:3,n_tot))
  forall (i = 1:n_tot) parray(:,i) = vector4_get_components (p(i))
  amp = driver%get_amplitude (parray)
end select
end function test_compute_amplitude

```

Write an empty process object

The most trivial test is to write an uninitialized process object.

```

<Processes: execute tests>≡
  call test (processes_1, "processes_1", &
    "write an empty process object", &
    u, results)

<Processes: tests>+≡
  subroutine processes_1 (u)
    integer, intent(in) :: u
    type(process_t) :: process

    write (u, "(A)")  "* Test output: processes_1"
    write (u, "(A)")  "* Purpose: display an empty process object"
    write (u, "(A)")

    call process%write (.false., u)

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: processes_1"

  end subroutine processes_1

```

Initialize a process object

Initialize a process and display it.

```

<Processes: execute tests>+≡
  call test (processes_2, "processes_2", &
    "initialize a simple process object", &
    u, results)

<Processes: tests>+≡

Evaluating a process with structure function

Configure structure functions (single-channel) in a process object, create an instance, compute kinematics and evaluate.

Note the order of operations when setting up structure functions and phase space. The beams are first, they determine the `sqrts` value. We can also set up the chain of structure functions. We then configure the phase space. From this, we can obtain information about special configurations (resonances, etc.), which we need for allocating the possible structure-function channels (parameterizations and mappings). Finally, we match phase-space channels onto structure-function channels.

In the current example, this matching is trivial; we only have one structure-function channel.

```

Complete events

For the purpose of simplifying further tests, we implement a convenience routine that initializes a process and prepares a single event. This is a wrapup of the test `processes_10`.

```

<Processes: public>+≡
    public :: prepare_test_process

<Processes: procedures>+≡
    subroutine prepare_test_process (process, process_instance, model_list)
        type(process_t), intent(out), target :: process
        type(process_instance_t), intent(out), target :: process_instance
        type(model_list_t), intent(inout) :: model_list
        type(process_library_t), target :: lib
        type(string_t) :: libname

```

```

type(string_t) :: procname
type(string_t) :: run_id
type(os_data_t) :: os_data
type(qcd_t) :: qcd
class(rng_factory_t), allocatable :: rng_factory
class(prc_core_t), allocatable :: core_template
class(mci_t), allocatable :: mci_template
class(phs_config_t), allocatable :: phs_config_template
real(default) :: sqrts
libname = "processes_test"
procname = libname
run_id = "run_test"
call os_data_init (os_data)
allocate (rng_test_factory_t :: rng_factory)
call prc_test_create_library (libname, lib)
call reset_interaction_counter ()
call process%init &
    (procname, run_id, lib, os_data, qcd, rng_factory, model_list)
allocate (test_t :: core_template)
allocate (mci_test_t :: mci_template)
select type (mci_template)
type is (mci_test_t); call mci_template%set_divisions (100)
end select
allocate (phs_test_config_t :: phs_config_template)
call process%init_component &
    (1, core_template, mci_template, phs_config_template)
sqrts = 1000
call process%setup_beams_sqrts (sqrts)
call process%configure_phs ()
call process%setup_mci ()
call process%setup_terms ()
call process_instance%init (process)
select type (mci => process%mci_entry(1)%mci)
type is (mci_test_t)
    ! This ensures that the next 'random' numbers are 0.3, 0.5, 0.7
    call mci%rng%init (3)
    ! Include the constant PHS factor in the stored maximum of the integrand
    call mci%set_max_factor (conv * twopi4 &
        / (2 * sqrt (lambda (sqrts **2, 125._default**2, 125._default**2))))
end select
end subroutine prepare_test_process

```

Here we do the cleanup of the process and process instance emitted by the previous routine.

```

<Processes: public>+≡
    public :: cleanup_test_process

<Processes: procedures>+≡
    subroutine cleanup_test_process (process, process_instance)

15.6 Process Stacks

For storing and handling multiple processes, we define process stacks. These are ordinary stacks where new process entries are pushed onto the top. We allow for multiple entries with identical process ID, but distinct run ID.

The implementation is essentially identical to the `prclib_stacks` module above. Unfortunately, Fortran supports no generic programming, so we do not make use of this fact.

When searching for a specific process ID, we will get (a pointer to) the top-most process entry with that ID on the stack, which was entered last. Usually, this is the best version of the process (in terms of integral, etc.) Thus the stack terminology makes sense.

```
<process_stacks.f90>≡  
  <File header>  
  
  module process_stacks  
  
    <Use strings>  
    <Use file utils>  
    use diagnostics !NODEP!  
    use unit_tests  
    use os_interface  
    use sm_qcd  
    use variables  
    use models  
    use rng_base  
  
    use process_libraries  
    use prc_test  
    use processes  
  
    <Standard module head>  
  
    <Process stacks: public>  
  
    <Process stacks: types>  
  
    contains  
  
    <Process stacks: procedures>  
  
    <Process stacks: tests>  
  
  end module process_stacks
```

15.6.1 The process entry type

A process entry is a process object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, processes should be prepared as process entry objects.

```

<Process stacks: public>≡
    public :: process_entry_t

<Process stacks: types>≡
    type, extends (process_t) :: process_entry_t
        type(process_entry_t), pointer :: next => null ()
    end type process_entry_t

```

15.6.2 The process stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

The `var_list` component stores process-specific results, so they can be retrieved as (pseudo) variables.

```

<Process stacks: public>+≡
    public :: process_stack_t

<Process stacks: types>+≡
    type :: process_stack_t
        integer :: n = 0
        type(process_entry_t), pointer :: first => null ()
        type(var_list_t), pointer :: var_list => null ()
    contains
        <Process stacks: process stack: TBP>
    end type process_stack_t

```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

```

<Process stacks: process stack: TBP>≡
    procedure :: final => process_stack_final

<Process stacks: procedures>≡
    subroutine process_stack_final (object)
        class(process_stack_t), intent(inout) :: object
        type(process_entry_t), pointer :: process
        if (associated (object%var_list)) then
            call var_list_final (object%var_list)
            deallocate (object%var_list)
        end if
        do while (associated (object%first))
            process => object%first
            object%first => process%next
            call process%final ()
            deallocate (process)
        end do
        object%n = 0
    end subroutine process_stack_final

```

Output. The processes on the stack will be ordered LIFO, i.e., backwards.

```

<Process stacks: process stack: TBP>+≡
    procedure :: write => process_stack_write

```

```

<Process stacks: procedures>+≡
subroutine process_stack_write (object, unit, pacify)
  class(process_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: pacify
  type(process_entry_t), pointer :: process
  integer :: u
  u = output_unit (unit)
  call write_separator_double (u)
  select case (object%n)
  case (0)
    write (u, "(1x,A)") "Process stack: [empty]"
    call write_separator_double (u)
  case default
    write (u, "(1x,A)") "Process stack:"
    process => object%first
    do while (associated (process))
      call process%write (.false., u, pacify = pacify)
      process => process%next
    end do
  end select
end subroutine process_stack_write

```

The variable list is printed by a separate routine, since it should be linked to the global variable list, anyway.

```

<Process stacks: process stack: TBP>+≡
procedure :: write_var_list => process_stack_write_var_list

<Process stacks: procedures>+≡
subroutine process_stack_write_var_list (object, unit)
  class(process_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  if (associated (object%var_list)) then
    call var_list_write (object%var_list, unit)
  end if
end subroutine process_stack_write_var_list

```

Short output.

```

<Process stacks: process stack: TBP>+≡
procedure :: show => process_stack_show

<Process stacks: procedures>+≡
subroutine process_stack_show (object, unit)
  class(process_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  type(process_entry_t), pointer :: process
  integer :: u
  u = output_unit (unit)
  select case (object%n)
  case (0)
  case default
    process => object%first
    do while (associated (process))
      call process%show (u, verbose=.false.)
    end do
  end select
end subroutine process_stack_show

```

```

        process => process%next
    end do
end select
end subroutine process_stack_show

```

15.6.3 Push

We take a process pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the process is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

(Process stacks: process stack: TBP)+≡
    procedure :: push => process_stack_push

(Process stacks: procedures)+≡
    subroutine process_stack_push (stack, process)
        class(process_stack_t), intent(inout) :: stack
        type(process_entry_t), intent(inout), pointer :: process
        process%next => stack%first
        stack%first => process
        process => null ()
        stack%n = stack%n + 1
    end subroutine process_stack_push

```

Initialize the process variable list and link it to a global variable list.

```

(Process stacks: process stack: TBP)+≡
    procedure :: init_var_list => process_stack_init_var_list

(Process stacks: procedures)+≡
    subroutine process_stack_init_var_list (stack, var_list)
        class(process_stack_t), intent(inout) :: stack
        type(var_list_t), intent(inout), optional :: var_list
        allocate (stack%var_list)
        if (present (var_list)) call var_list_link (var_list, stack%var_list)
    end subroutine process_stack_init_var_list

```

Initialize process variables for a given process ID, without setting values.

```

(Process stacks: process stack: TBP)+≡
    procedure :: init_result_vars => process_stack_init_result_vars

(Process stacks: procedures)+≡
    subroutine process_stack_init_result_vars (stack, id)
        class(process_stack_t), intent(inout) :: stack
        type(string_t), intent(in) :: id
        call var_list_init_num_id (stack%var_list, id)
        call var_list_init_process_results (stack%var_list, id)
    end subroutine process_stack_init_result_vars

```

Fill process variables with values. This is executed after the integration pass.

Note: We set only integral and error. With multiple MCI records possible, the results for `n_calls`, `chi2` etc. are not necessarily unique. (We might set the efficiency, though.)

```

end subroutine process_stacks_3
```

Chapter 16

Parton shower and interface to hadronization

This is the code for the WHIZARD QCD parton shower for final state radiation (FSR) and initial state radiation (ISR) as well as the interface to the PYTHIA module for showering and hadronization.

<Version>≡
2.2.0

```
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
! This file has been stripped of most comments.  For documentation, refer
! to the source 'shower.nw'
```

We are strict with our names:

```
<Standard module head>≡
  implicit none
  private
```

This is the way to invoke the kinds module (not contained in this source)

```
<Use kinds>≡
  use kinds, only: default !NODEP!
```

And we make heavy use of variable-length strings

```
<Use strings>≡
  use iso_varying_string, string_t => varying_string !NODEP!
```

16.1 Basics of the shower

```
<shower_base.f90>≡
  <File header>

  module shower_base

    <Use kinds>
    use constants !NODEP!
    use tao_random_numbers !NODEP!

    <Standard module head>

    <Shower base: public>

    <Shower base: parameters>

    <Shower base: interfaces>

    contains

    <Shower base: procedures>

    end module shower_base
```

16.1.1 PDF Interface of the shower

```
<Shower base: public>≡
  public :: shower_pdf

<Shower base: interfaces>≡
  interface
    subroutine shower_pdf (set, x, q, ff)
      integer, intent(in) :: set
      double precision, intent(in) :: x, q
      double precision, dimension(-6:6), intent(out) :: ff
    end subroutine shower_pdf
```

```
end interface
```

16.1.2 Parameters

This decides whether to print out additional information.

```
<Shower base: parameters>≡
    logical, parameter, public :: D_print = .false.
```

These parameters are the cut-off scale t_{cut} , given in GeV^2 (PARJ(82)), the cut-off scale for the P_t^2 -ordered shower in GeV^2 , and the two shower parameters PARP(72) and PARP(61), respectively.

```
<Shower base: parameters>+≡
    real(default), public :: D_Min_t = one
    real(default), public :: D_min_scale = 0.5_default
    real(default), public :: D_Lambda_fsr = 0.29_default
    real(default), public :: D_Lambda_isr = 0.29_default
```

The parameter MSTJ(45) gives the maximum number of flavours in gluon decay to quarks:

```
<Shower base: parameters>+≡
    integer, public :: D_Nf = 5
```

These two parameters decide whether to use constant or running α_s in the form of the function $D.\alpha_s(t)$ for the FSR and ISR (MSTJ(44), MSTP(64)), respectively. The next is the parameter PARU(111), which sets the value for constant α_s , and the flag whether to use P_t -ordered ISR.

```
<Shower base: parameters>+≡
    logical, public :: D_running_alpha_s_fsr = .true.
    logical, public :: D_running_alpha_s_isr = .true.
    real(default), public :: D_constalpha_s = 0.20_default
    logical, public :: isr_pt_ordered = .false.
```

This flag sets emitted timelike partons in the spacelike shower on shell, true corresponds to MSTP(63) = 0.

```
<Shower base: parameters>+≡
    logical, public :: isr_only_onshell_emitted_partons = .true.
```

Flag whether ISR is angular ordered (MSTP(62)).

```
<Shower base: parameters>+≡
    logical, public :: isr_angular_ordered = .true.
```

Treating either u and d , or all quarks except t as massless:

```
<Shower base: parameters>+≡
    logical, public :: treat_light_quarks_massless = .true.
    logical, public :: treat_duscb_quarks_massless = .false.
```

The width and the cutoff of the Gaussian primordial k_t distribution, PARP(91) and PARP(93), in GeV :

```
<Shower base: parameters>+≡
    real(default), public :: primordial_kt_width = 1.5_default
    real(default), public :: primordial_kt_cutoff = five
```

The parameter `PARP(66)`, the minimal energy of the emitted timelike parton in the ISR (`PARP(65)`), the factor for the first scale, as well as the factor by which the integral in the Sudakov factor is suppressed for the respective first scale in ISR. Higher values here correspond to higher starting scales.

```

<Shower base: parameters>+≡
  real(default), public :: maxz_isr = 0.999_default
  real(default), public :: minenergy_timelike = one
  real(default), public :: tscalefactor_isr = one
  real(default), public :: first_integral_suppression_factor = one

```

Temporary parameters for the P_t -ordered shower:

```

<Shower base: parameters>+≡
  real(default), public :: scalefactor1 = 0.02_default
  real(default), public :: scalefactor2 = 0.02_default

```

Then, there are the variables for the PDF functions:

```

<Shower base: parameters>+≡
  integer, public :: shower_pdf_set = 0

```

And the PDF function itself, as a procedure pointer:

```

<Shower base: parameters>+≡
  procedure(shower_pdf), pointer, public :: shower_pdf_func

```

```

<Shower base: procedures>≡
  subroutine randomseed (seed)
    integer, intent(in), optional :: seed
    integer :: clock

    if (present (seed)) then
      clock = seed
    else
      call system_clock (count = clock)
    end if
    call tao_random_seed (clock)
  end subroutine randomseed

```

```

<Shower base: public>+≡
  public :: D_alpha_s_isr
  public :: D_alpha_s_fsr

```

```

<Shower base: procedures>+≡
  function D_alpha_s_isr (tin) result(alpha_s)
    real(default), intent(in) :: tin
    real(default) :: b, t
    real(default) :: alpha_s

    !   arbitrary lower cut off for scale
    !   t = MAX(max(one * D_Min_t, 1.1_default * D_Lambda_isr**2), ABS(tin))
    t = max (max (0.1_default * D_Min_t, &
      1.1_default * D_Lambda_isr**2), abs(tin))

    if (D_running_alpha_s_isr) then
      b = (33._default - two * number_of_flavors(t)) / (12._default * pi)
      alpha_s = one / (b * log(t / (D_Lambda_isr**2)))
    end if
  end function D_alpha_s_isr

```

```

        else
            alpha_s = D_constalpha_s
        end if
    end function D_alpha_s_isr

function D_alpha_s_fsr (tin) result(alpha_s)
    real(default), intent(in) :: tin
    real(default) :: b, t
    real(default) :: alpha_s

!    arbitrary lower cut off for scale
!    t= max( max (one * D_Min_t, 1.1_default * D_Lambda**2), ABS(tin))
    t = max (max (0.1_default * D_Min_t, &
        1.1_default * D_Lambda_fsr**2), abs(tin))

    if (D_running_alpha_s_fsr) then
        b = (33._default - two * number_of_flavors(t)) / (12._default * pi)
        alpha_s = one / (b * log(t / (D_Lambda_fsr**2)))
    else
        alpha_s = D_constalpha_s
    end if
end function D_alpha_s_fsr

```

Mass and mass squared selection functions. All masses are in GeV. Light quarks are assumed to be ordered, $m_1 < m_2 < m_3 \dots$, and they get current masses, not elementary ones. Mesons and baryons other than proton and neutron are needed as beam-remnants. Particles with PDG number zero are taken massless, as well as proper beam remnants and any other particles.

16.2.1 The basic type defintions

The type `parton_t` defines a parton for the shower. The `x` value of the parton is only needed for spacelike showers. The pointer `initial` is only needed for partons in initial showers, it points to the hadron the parton is coming from. An auxiliary value for the P_t -ordered ISR is `aux_pt`. Then, there are two auxiliary entries for the clustering of CKKW pseudo weights and CKKW matching, `ckkwlabel` and `ckkwscale`.

<Shower partons: public>≡

public :: parton_t

<Shower partons: types>≡

```
type :: parton_t
  integer :: nr = 0
  integer :: type = 0
  type(vector4_t) :: momentum = vector4_null
  real(default) :: t = zero

From the whole ISR algorithm all functionality has been moved to `shower_core.f90`. Only `maxzz` remains here, because more than one module needs to access it.

<Shower partons: public>+≡

```

    public :: maxzz
    <Shower partons: procedures>+≡
    function maxzz (shat, s) result (maxz)
        real(default), intent(in) :: shat,s
        real(default) :: maxz
        maxz= min (maxz_isr, one - (two * minenergy_timelike * sqrt(shat)) / s)
    end function maxzz

```

16.3 Main shower module

```

    <shower_core.f90>≡
    <File header>

    module shower_core

    <Use kinds>
    use constants !NODEP!
    use limits !NODEP!
    use lorentz !NODEP!
    use diagnostics !NODEP!
    use file_utils !NODEP!
    use tao_random_numbers !NODEP!
    use shower_base
    use shower_partons
    use ckkw_pseudo_weights

    <Standard module head>

    <Shower core: public>

    <Shower core: parameters>

    <Shower core: types>

    contains

    <Shower core: procedures>

    end module shower_core

    <Shower core: public>≡
    public :: shower_interaction_t

    <Shower core: types>≡
    type :: shower_interaction_t
        type(parton_pointer_t), dimension(:), allocatable :: partons
    end type shower_interaction_t

    type :: shower_interaction_pointer_t
        type(shower_interaction_t), pointer :: i => null ()
    end type shower_interaction_pointer_t

```

The main type of `shower_core`:

```

<Shower core: public>+≡
    public :: shower_t

<Shower core: types>+≡
    type :: shower_t
        type(shower_interaction_pointer_t), dimension(:), allocatable :: &
            interactions
        type(parton_pointer_t), dimension(:), allocatable :: partons
        integer :: next_free_nr
        integer :: next_color_nr
        logical :: valid
    contains
        <Shower core: shower: TBP>
    end type shower_t

```

The parameters of the shower module:

```

<Shower core: parameters>≡
    ! real(default), parameter :: alphasmax = one
    ! real(default), parameter :: xpdfmax = 10._default
    real(default), save :: alphasxpdfmax = 12._default

<Shower core: shower: TBP>≡
    procedure :: add_interaction_2ton => shower_add_interaction_2ton

<Shower core: procedures>≡
    subroutine shower_add_interaction_2ton (shower, partons)
        class(shower_t), intent(inout) :: shower
        type(parton_pointer_t), intent(in), dimension(:), allocatable :: partons
        type(ckkw_pseudo_shower_weights_t) :: ckkw_pseudo_weights
        call shower%add_interaction_2ton_CKKW (partons, ckkw_pseudo_weights)
    end subroutine shower_add_interaction_2ton

```

In this routine, `y` and `ymin` are the jet measures, `w` and `wmax` are weights, `s` is the kinematic energy squared of the interaction. The flag `isr_is_possible` checks whether the initial parton is set, lepton-hadron collisions are not implemented (yet). As a workaround: as WHIZARD can treat partons as massless, there might be partons with $E < m$: if such a parton is found, quarks will be treated massless.

```
