```

15.5.1 Abstract structure-function data type

This type should hold all configuration data for a specific type of structure function. The base object is empty; the implementations will fill it.

```

<SF base: public>≡
    public :: sf_data_t

<SF base: types>≡
    type, abstract :: sf_data_t
    contains
    <SF base: sf data: TBP>
    end type sf_data_t

```

Output.

```

<SF base: sf data: TBP>≡
    procedure (sf_data_write), deferred :: write

<SF base: interfaces>≡
    abstract interface
        subroutine sf_data_write (data, unit, verbose)
            import
            class(sf_data_t), intent(in) :: data
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: verbose
        end subroutine sf_data_write
    end interface

```

Return true if this structure function is in generator mode. In that case, all parameters are free, otherwise bound. (We do not support mixed cases.) Default is: no generator.

```

<SF base: sf data: TBP>+≡

```

```

    procedure :: is_generator => sf_data_is_generator
  <SF base: procedures>+=
    function sf_data_is_generator (data) result (flag)
      class(sf_data_t), intent(in) :: data
      logical :: flag
      flag = .false.
    end function sf_data_is_generator

```

Return the number of input parameters that determine the structure function.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_get_int), deferred :: get_n_par
  <SF base: interfaces>+=
    abstract interface
      function sf_data_get_int (data) result (n)
        import
        class(sf_data_t), intent(in) :: data
        integer :: n
      end function sf_data_get_int
    end interface

```

Return the outgoing particle PDG codes for the current setup. The codes can be an array of particles, for each beam.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_get_pdg_out), deferred :: get_pdg_out
  <SF base: interfaces>+=
    abstract interface
      subroutine sf_data_get_pdg_out (data, pdg_out)
        import
        class(sf_data_t), intent(in) :: data
        type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
      end subroutine sf_data_get_pdg_out
    end interface

```

Allocate a matching structure function interaction object and properly initialize it.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_allocate_sf_int), deferred :: allocate_sf_int
  <SF base: interfaces>+=
    abstract interface
      subroutine sf_data_allocate_sf_int (data, sf_int)
        import
        class(sf_data_t), intent(in) :: data
        class(sf_int_t), intent(inout), allocatable :: sf_int
      end subroutine sf_data_allocate_sf_int
    end interface

```

Return the PDF set index, if applicable. We implement a default method which returns zero. The PDF (builtin and LHA) implementations will override this.

```

  <SF base: sf data: TBP>+=
    procedure :: get_pdf_set => sf_data_get_pdf_set

```

```

<SF base: procedures>+=
function sf_data_get_pdf_set (data) result (pdf_set)

  integer :: pdf_set
  pdf_set = 0
end function sf_data_get_pdf_set

```

15.5.2 Structure-function chain configuration

This is the data type that the `processes` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

```

<SF base: public>+=
public :: sf_config_t

<SF base: types>+=
type :: sf_config_t
  integer, dimension(:), allocatable :: i
  class(sf_data_t), allocatable :: data
contains
  <SF base: sf config: TBP>
end type sf_config_t

```

Output:

```

<SF base: sf config: TBP>=
procedure :: write => sf_config_write

<SF base: procedures>+=
subroutine sf_config_write (object, unit)
  class(sf_config_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  if (allocated (object%i)) then
    write (u, "(1x,A,2(1x,I0))") "Structure-function configuration: &
      &beam(s)", object%i
    if (allocated (object%data)) call object%data%write (u)
  else
    write (u, "(1x,A)") "Structure-function configuration: [undefined]"
  end if
end subroutine sf_config_write

```

Initialize.

```

<SF base: sf config: TBP>+=
procedure :: init => sf_config_init

<SF base: procedures>+=
subroutine sf_config_init (sf_config, i_beam, sf_data)
  class(sf_config_t), intent(out) :: sf_config
  integer, dimension(:), intent(in) :: i_beam
  class(sf_data_t), intent(in) :: sf_data

```

```

        allocate (sf_config%i (size (i_beam)), source = i_beam)
        allocate (sf_config%data, source = sf_data)
    end subroutine sf_config_init

```

Return the PDF set, if any.

```

⟨SF base: sf config: TBP⟩+≡
    procedure :: get_pdf_set => sf_config_get_pdf_set

⟨SF base: procedures⟩+≡
    function sf_config_get_pdf_set (sf_config) result (pdf_set)
        class(sf_config_t), intent(in) :: sf_config
        integer :: pdf_set
        pdf_set = sf_config%data%get_pdf_set ()
    end function sf_config_get_pdf_set

```

15.5.3 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

```

⟨SF base: public⟩+≡
    public :: sf_int_t

⟨SF base: types⟩+≡
    type, abstract, extends (interaction_t) :: sf_int_t
        integer :: status = SF_UNDEFINED
        real(default), dimension(:), allocatable :: mi2
        real(default), dimension(:), allocatable :: mr2
        real(default), dimension(:), allocatable :: mo2
        integer :: on_shell_mode = KEEP_ENERGY
        logical :: qmin_defined = .false.
        logical :: qmax_defined = .false.

```

```

    real(default), dimension(:), allocatable :: qmin
    real(default), dimension(:), allocatable :: qmax
    integer, dimension(:), allocatable :: beam_index
    integer, dimension(:), allocatable :: incoming
    integer, dimension(:), allocatable :: radiated
    integer, dimension(:), allocatable :: outgoing
    integer, dimension(:), allocatable :: par_index
    integer, dimension(:), allocatable :: par_primary
contains
  <SF base: sf_int: TBP>
end type sf_int_t

```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

```

<SF base: parameters>≡
  integer, parameter, public :: SF_UNDEFINED = 0
  integer, parameter, public :: SF_INITIAL = 1
  integer, parameter, public :: SF_DONE_LINKS = 2
  integer, parameter, public :: SF_FAILED_MASK = 3
  integer, parameter, public :: SF_DONE_MASK = 4
  integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
  integer, parameter, public :: SF_DONE_CONNECTIONS = 6
  integer, parameter, public :: SF_SEED_KINEMATICS = 10
  integer, parameter, public :: SF_FAILED_KINEMATICS = 11
  integer, parameter, public :: SF_DONE_KINEMATICS = 12
  integer, parameter, public :: SF_FAILED_EVALUATION = 13
  integer, parameter, public :: SF_EVALUATED = 20

```

Write a string version of the status code:

```

<SF base: procedures>+≡
  subroutine write_sf_status (status, u)
    integer, intent(in) :: status
    integer, intent(in) :: u
    select case (status)
    case (SF_UNDEFINED)
      write (u, "(1x,'[',A,']')") "undefined"
    case (SF_INITIAL)
      write (u, "(1x,'[',A,']')") "initialized"
    case (SF_DONE_LINKS)
      write (u, "(1x,'[',A,']')") "links set"
    case (SF_FAILED_MASK)
      write (u, "(1x,'[',A,']')") "mask mismatch"
    case (SF_DONE_MASK)
      write (u, "(1x,'[',A,']')") "mask set"
    case (SF_FAILED_CONNECTIONS)
      write (u, "(1x,'[',A,']')") "connections failed"
    case (SF_DONE_CONNECTIONS)
      write (u, "(1x,'[',A,']')") "connections set"
    case (SF_SEED_KINEMATICS)
      write (u, "(1x,'[',A,']')") "incoming momenta set"
    case (SF_FAILED_KINEMATICS)
      write (u, "(1x,'[',A,']')") "kinematics failed"

```

```

case (SF_DONE_KINEMATICS)
  write (u, "(1x,['',A,''])" "kinematics set"
case (SF_FAILED_EVALUATION)
  write (u, "(1x,['',A,''])" "evaluation failed"
case (SF_EVALUATED)
  write (u, "(1x,['',A,''])" "evaluated"
end select
end subroutine write_sf_status

```

Finalizer. Required because the base interaction needs a finalizer. We provide an implementation, which need not be overwritten if the implementation does not add finalizable subobjects.

```

<SF base: sf int: TBP>≡
  procedure :: final => sf_int_final
<SF base: procedures>+≡
  subroutine sf_int_final (object)
    class(sf_int_t), intent(inout) :: object
    call interaction_final (object%interaction_t)
  end subroutine sf_int_final

```

This is the basic output routine. Display status and interaction.

```

<SF base: sf int: TBP>+≡
  procedure :: base_write => sf_int_base_write
<SF base: procedures>+≡
  subroutine sf_int_base_write (object, unit, testflag)
    class(sf_int_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)", advance="no") "SF instance:"

    call interaction_write (object%interaction_t, u, testflag = testflag)
  end subroutine sf_int_base_write

```

The type string identifies the structure function class, and possibly more details about the structure function.

```

<SF base: sf int: TBP>+≡

```

```

    procedure (sf_int_type_string), deferred :: type_string
<SF base: interfaces>+≡
    abstract interface
        function sf_int_type_string (object) result (string)
            import
            class(sf_int_t), intent(in) :: object
            type(string_t) :: string
        end function sf_int_type_string
    end interface

```

Output of the concrete object. We should not forget to call the output routine for the base type.

```

<SF base: sf_int: TBP>+≡
    procedure (sf_int_write), deferred :: write
<SF base: interfaces>+≡
    abstract interface
        subroutine sf_int_write (object, unit, testflag)
            import
            class(sf_int_t), intent(in) :: object
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: testflag
        end subroutine sf_int_write
    end interface

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually required for non-collinear splitting.

```

<SF base: sf_int: TBP>+≡
    procedure :: base_init => sf_int_base_init
<SF base: procedures>+≡
    subroutine sf_int_base_init &

    subroutine sf_int_set_outgoing (sf_int, outgoing)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: outgoing
        allocate (sf_int%outgoing (size (outgoing)))
        sf_int%outgoing = outgoing
    end subroutine sf_int_set_outgoing

```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

```

<SF base: sf_int: TBP>+≡
    procedure (sf_int_init), deferred :: init

<SF base: interfaces>+≡
    abstract interface
        subroutine sf_int_init (sf_int, data)
            import

```

```

        class(sf_int_t), intent(out) :: sf_int
        class(sf_data_t), intent(in), target :: data
    end subroutine sf_int_init
end interface

```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

```

<SF base: sf_int: TBP>+≡
    procedure :: setup_constants => sf_int_setup_constants

<SF base: procedures>+≡
    subroutine sf_int_setup_constants (sf_int)
        class(sf_int_t), intent(inout) :: sf_int
    end subroutine sf_int_setup_constants

```

Set beam indices, i.e., the beam(s) on which this structure function applies.

```

<SF base: sf_int: TBP>+≡
    procedure :: set_beam_index => sf_int_set_beam_index

<SF base: procedures>+≡
    subroutine sf_int_set_beam_index (sf_int, beam_index)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: beam_index
        allocate (sf_int%beam_index (size (beam_index)))
        sf_int%beam_index = beam_index
    end subroutine sf_int_set_beam_index

```

Set parameter indices, indicating which MC input parameters are to be used for evaluating this structure function.

```

<SF base: sf_int: TBP>+≡
    procedure :: set_par_index => sf_int_set_par_index

<SF base: procedures>+≡
    subroutine sf_int_set_par_index (sf_int, par_index)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: par_index
        allocate (sf_int%par_index (size (par_index)))
        sf_int%par_index = par_index
    end subroutine sf_int_set_par_index

```

Initialize the structure-function kinematics, setting incoming momenta. We assume that array shapes match.

Three versions. The first version relies on the momenta being linked to another interaction. The second version sets the momenta explicitly. In the third version, we first compute momenta for the specified energies and store those.

```

<SF base: sf_int: TBP>+≡
    generic :: seed_kinematics => sf_int_receive_momenta
    generic :: seed_kinematics => sf_int_seed_momenta
    generic :: seed_kinematics => sf_int_seed_energies

```

```

procedure :: sf_int_receive_momenta
procedure :: sf_int_seed_momenta
procedure :: sf_int_seed_energies

<SF base: procedures>+=
subroutine sf_int_receive_momenta (sf_int)

end function sf_int_is_generator

```

Generate free parameters **r**. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value **x_free** is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

```

```

Complete the structure-function kinematics, derived from an input parameter (array) *r* between 0 and 1. The interaction momenta are calculated, and we return *x* (the momentum fraction), and *f* (the Jacobian factor for the map $r \rightarrow x$), if **map** is set.

If the **map** flag is unset, *r* and *x* values will coincide, and *f* will become unity. If it is set, the structure-function implementation chooses a convenient mapping from *r* to *x* with Jacobian *f*.

In the **inverse_kinematics** variant, we exchange the intent of **x** and **r**. The momenta are calculated only if the optional flag **set_momenta** is present and set.

Single splitting: compute momenta, given x input parameters. We assume that the incoming momentum is set. The status code is set to `SF_FAILED_KINEMATICS` if the x array does not correspond to a valid momentum configuration. Otherwise, it is updated to `SF_DONE_KINEMATICS`.

We force the outgoing particle on-shell. The on-shell projection is determined by the `on_shell_mode`. The radiated particle should already be on shell.

The inverse procedure: we compute the x array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

NOTE: We should also improve this in the sense of extracting both x and \bar{x} , where for the latter we may consult the beam remnant. The current implementation is not sensitive to small \bar{x} values.

```

15.5.6 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

(SF base: types)+≡

```

type :: sf_instance_t

type(enumerator_t) :: eval
real(default), dimension(:,:), allocatable :: r
real(default), dimension(:,:), allocatable :: rb
real(default), dimension(:), allocatable :: f
logical, dimension(:), allocatable :: m
real(default), dimension(:), allocatable :: x
end type sf_instance_t

```

15.5.7 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and

`n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

```

<SF base: public>+≡
    public :: sf_chain_t

<SF base: types>+≡

```

Initialize: setup beams. The `beam_data` target must remain valid for the lifetime of the chain, since we just establish a pointer. The structure-function configuration array is used to initialize the individual structure-function entries. The target attribute is needed because the `sf_int` entries establish pointers to the configuration data.

15.5.8 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the random-number generator. The `r` array results from applying global mappings. The `x` array results from applying structure-function local mappings. The `x` values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The `f` factor is the Jacobian that results from applying all mappings.

The `mapping` entry may store a global mapping that is applied to a combination of `x` values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the `p` array to the `r` array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

```

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the `p` etc. arrays.

The brute-force assignment of the `sf` component would be straightforward, but at least gfortran 4.6.3 would like a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained `interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time calling the proper defined assignment. Fur-

thermore, we allocate the parameter arrays for each structure function.

Manually select a channel.

```
<SF base: sf chain instance: TBP>+≡
  procedure :: select_channel => sf_chain_instance_select_channel

<SF base: procedures>+≡
  subroutine sf_chain_instance_select_channel (chain, channel)
    class(sf_chain_instance_t), intent(inout) :: chain
    integer, intent(in), optional :: channel
    if (present (channel)) then
      chain%selected_channel = channel
    else
      chain%selected_channel = 0
    end if
  end subroutine sf_chain_instance_select_channel
```

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the **channel** object are allocatable und thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

```
<SF base: sf chain instance: TBP>+≡
  procedure :: set_channel => sf_chain_instance_set_channel

<SF base: procedures>+≡
  subroutine sf_chain_instance_set_channel (chain, c, channel)

    end if
  end subroutine sf_chain_instance_set_channel
```

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

```

Exchange the quantum-number masks between the interactions in the chain, so we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the `setup_constants` method, which prepares constant data that depend on the matrix element structure.

    end if
    end if
    chain%status = SF_DONE_CONNECTIONS
end if
contains
<SF base: init evaluators: find outgoing particles>
end subroutine sf_chain_instance_init_evaluators

```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

```

<SF base: init evaluators: find outgoing particles>≡
subroutine find_outgoing_particles ()
    type(interaction_t), pointer :: int, int_next
    integer :: i, j, out_sf, out_i
    chain%out_eval = size (chain%sf)

    end do
end subroutine

```

```

        end do
        chain%out_eval_i(j) = out_i
    end do
end subroutine find_outgoing_particles

```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, we use up the MC input parameter array **p** to compute the radiated and outgoing momenta.

In the multi-channel case, **c_sel** is the channel which we use for computing the kinematics and the **x** values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the **r** array, and the Jacobian **f**.

We first apply any global mapping to transform the input **p** into the array **r**. This is then given to the structure functions which compute the final array **x** and Jacobian factors **f**, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the x parameters and reconstruct the momenta and the MC input parameters p . We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all x parameters, and then inverts mappings. See below `recover_kinematics`.

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the x and p parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

    <SF base: execute tests>
  end subroutine sf_base_test

```

15.5.11 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

```
<SF base: public>+=  
  public :: sf_test_data_t  
  
<SF base: test types>=  
  type, extends (sf_data_t) :: sf_test_data_t  
    class(model_data_t), pointer :: model => null ()  
    integer :: mode = 0  
    type(flavor_t) :: flv_in  
    type(flavor_t) :: flv_out  
    type(flavor_t) :: flv_rad  
    real(default) :: m = 0  
    logical :: collinear = .true.  
    real(default), dimension(:), allocatable :: qbounds  
  contains  
    <SF base: sf test data: TBP>  
  end type sf_test_data_t
```

Output.

```
<SF base: sf test data: TBP>=  
  procedure :: write => sf_test_data_write  
  
<SF base: procedures>+=  
  subroutine sf_test_data_write (data, unit, verbose)  
    class(sf_test_data_t), intent(in) :: data  
    integer, intent(in), optional :: unit  
    logical, intent(in), optional :: verbose  
    integer :: u  
    u = given_output_unit (unit)  
    write (u, "(1x,A)") "SF test data:"  
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())  
    write (u, "(3x,A)", advance="no") "incoming  = "  
    call flavor_write (data%flv_in, u); write (u, *)  
    write (u, "(3x,A)", advance="no") "outgoing  = "  
    call flavor_write (data%flv_out, u); write (u, *)  
    write (u, "(3x,A)", advance="no") "radiated  = "  
    call flavor_write (data%flv_rad, u); write (u, *)  
    write (u, "(3x,A," // FMT_19 // ")") "mass      = ", data%m  
    write (u, "(3x,A,L1)") "collinear = ", data%collinear  
    if (.not. data%collinear .and. allocated (data%qbounds)) then  
      write (u, "(3x,A," // FMT_19 // ")") "qmin      = ", data%qbounds(1)  
      write (u, "(3x,A," // FMT_19 // ")") "qmax      = ", data%qbounds(2)  
    end if  
  end subroutine sf_test_data_write
```

Initialization.

15.5.13 Test implementation: generator spectrum

A generator for two beams, no radiation (for simplicity).

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```
<SF base: test types>+≡
  type, extends (sf_data_t) :: sf_test_generator_data_t
    class(model_data_t), pointer :: model => null ()
    type(flavor_t) :: flv_in
    type(flavor_t) :: flv_out
    type(flavor_t) :: flv_rad
    real(default) :: m = 0
  contains
    <SF base: sf test generator data: TBP>
  end type sf_test_generator_data_t
```

Output.

```
<SF base: sf test generator data: TBP>≡
  procedure :: write => sf_test_generator_data_write

<SF base: procedures>+≡
  subroutine sf_test_generator_data_write (data, unit, verbose)

15.6.1 Physics

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (15.27)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of ϵ results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit $m^2 \ll s$ are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \quad (15.28)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \quad (15.29)$$

so the integration over the propagator $1/(t - m^2)$ yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \quad (15.30)$$

In $f_0(x)$, there is an integrable singularity at $x = 1$ which does not spoil the integration, but would lead to an unbounded f_{\max} . Therefore, we map this singularity like

$$x = 1 - (1 - x')^{1/\epsilon} \quad (15.31)$$

such that

$$\int dx f_0(x) = \int dx' \quad (15.32)$$

The structure function has three parameters: α , m_{in} of the incoming particle and s , the hard scale. Internally, we store the exponent ϵ which is the relevant parameter. (In conventional notation, $\epsilon = \beta/2$.) As defaults, we take the actual values of α (which is probably $\alpha(s)$), the actual mass m_{in} and the squared total c.m. energy s .

Including ϵ , ϵ^2 , and ϵ^3 corrections, the successive approximation of the ISR structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad (15.33)$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \quad (15.34)$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \quad (15.35)$$

$$\begin{aligned} f_3(x) = & g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \\ & - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \\ & - \frac{\epsilon^3}{48} \left((1+x) [6 \text{Li}_2(x) + 12 \ln^2(1-x) - 3\pi^2] + 6(x+5) \ln(1-x) \right. \\ & \quad \left. + \frac{1}{1-x} \left[\frac{3}{2}(1+8x+3x^2) \ln x + 12(1+x^2) \ln x \ln(1-x) \right. \right. \\ & \quad \left. \left. - \frac{1}{2}(1+7x^2) \ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \right) \end{aligned} \quad (15.36)$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \quad (15.37)$$

are given by

$$g_0(\epsilon) = 1 \quad (15.38)$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \quad (15.39)$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \quad (15.40)$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 + \frac{27 - 24\pi^2 + 128\zeta(3)}{384}\epsilon^3, \quad (15.41)$$

where, numerically

$$\zeta(3) = 1.20205690315959428539973816151\dots \quad (15.42)$$

Although one could calculate the function $g(\epsilon)$ exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx f_i(x) = 1 \quad \text{for all } i. \quad (15.43)$$

Effectively, the $O(\epsilon)$ correction reduces the low- x tail of the structure function by 50% while increasing the coefficient of the singularity by $O(\epsilon)$. Relative to this, the $O(\epsilon^2)$ correction slightly enhances $x > \frac{1}{2}$ compared to $x < \frac{1}{2}$. At $x = 0$, $f_2(x)$ introduces a logarithmic singularity which should be cut off at $x_0 = O(e^{-1/\epsilon})$: for lower x the perturbative series breaks down. The f_3 correction is slightly positive for low x values and negative near $x = 1$, where the Li₂ piece slightly softens the singularity at $x = 1$.

Instead of the definition for ϵ given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left(\ln \frac{s}{m^2} - 1 \right) \quad (15.44)$$

15.6.2 Implementation

In the concrete implementation, the zeroth order mapping (15.31) is implemented, and the Jacobian is equal to $f_i(x)/f_0(x)$. This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (15.45)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1 - x^2}{2(1 - x')} \quad (15.46)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 - \frac{1 - x^2}{2(1 - x')} \\ - \frac{(1 + 3x^2) \ln x + (1 - x)(4(1 + x) \ln(1 - x) + 5 + x)}{8(1 - x')} \epsilon \end{aligned} \quad (15.47)$$

For $x = 1$ (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (15.48)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (15.49)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \quad (15.50)$$

The last line in (15.47) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (15.51)$$

(Mathematica result), independent of ϵ . For x values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

15.6.3 The ISR data block

```

15.6.4 The ISR object

The `isr_t` data type is a $1 \rightarrow 2$ interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```

<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
    type(isr_data_t), pointer :: data => null ()
    real(default) :: x = 0
    real(default) :: xb= 0
  contains
    <SF isr: isr: TBP>
  end type isr_t

```

Type string: has to be here, but there is no string variable on which ISR depends. Hence, a dummy routine.

```

<SF isr: isr: TBP>≡
  procedure :: type_string => isr_type_string

```

```

<SF isr: procedures>+=

      end if
      call object%base_write (u, testflag)
    else
      write (u, "(1x,A)") "ISR data: [undefined]"
    end if
  end subroutine isr_write

```

15.6.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number \mathbf{r} to generate the momentum fraction \mathbf{x} and the function value \mathbf{f} . For numerical stability reasons, we also output \mathbf{xb} , which is $\bar{x} = 1 - x$.

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian \mathbf{f} and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian \mathbf{f} includes the value of the (zeroth-order) structure function, and strongly peaked.

```

<SF isr: isr: TBP>+=
  procedure :: complete_kinematics => isr_complete_kinematics

```

```

<SF isr: procedures>+≡
subroutine isr_complete_kinematics (sf_int, x, f, r, rb, map)
  class(isr_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), intent(out) :: f
  real(default), dimension(:), intent(in) :: r
  real(default), dimension(:), intent(in) :: rb
  logical, intent(in) :: map
  real(default) :: eps
  eps = sf_int%data%eps
  if (map) then
    call map_power_1 (sf_int%xb, f, rb(1), eps)
  else
    sf_int%xb = rb(1)
    if (rb(1) > 0) then
      f = 1
    else
      f = 0
    end if
  end if
  sf_int%x = 1 - sf_int%xb
  x(1) = sf_int%x
  if (size (x) == 3) x(2:3) = r(2:3)
  call sf_int%split_momentum (x, sf_int%xb)
  select case (sf_int%status)
  case (SF_FAILED_KINEMATICS)
    sf_int%x = 0
    sf_int%xb = 0
    f = 0
  end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the x array from the momentum configuration. In the specific case of ISR, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF isr: isr: TBP>+≡
  procedure :: recover_x => sf_isr_recover_x

<SF isr: procedures>+≡
subroutine sf_isr_recover_x (sf_int, x, x_free)
  class(isr_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), intent(inout), optional :: x_free
  call sf_int%base_recover_x (x, x_free)
  sf_int%x = x(1)
  sf_int%xb = 1 - x(1)
end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the x array and compute the “input” r values and the Jacobian f . After this, we can set momenta by the same formula as for normal kinematics.

For extracting x , we rely on the stored \bar{x} value, since the x value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

15.6.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With

mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

15.7.1 Physics

The EPA structure function for a photon inside an (elementary) particle p with energy E , mass m and charge q_p (e.g., electron) is given by ($\bar{x} \equiv 1 - x$)

$$\begin{aligned}
 f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} & \left[\left(\bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right. \\
 & \left. - \left(1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left(1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (15.52)
 \end{aligned}$$

If no explicit Q bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (15.53)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (15.54)$$

The second and third terms in (15.52) are negative definite (and subleading). Noting that $\bar{x} + x^2/2$ is bounded between $1/2$ and 1 , we derive that $f(x)$ is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (15.55)$$

where we allow for explicit Q bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (15.56)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4 [x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (15.57)$$

such that $x(0) = x_0$ and $x(1) = x_1$ and

$$\frac{dx}{dx'} = \left(\frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (15.58)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (15.59)$$

such that (15.56) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (15.60)$$

where x' is calculated from x via (15.57).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x (L - \log x) - \log x_0 (L - \log x_0)}{\log x_1 (L - \log x_1) - \log x_0 (L - \log x_0)}. \quad (15.61)$$

15.7.2 The EPA data block

The EPA parameters are: α , E_{\max} , m , Q_{\min} , and x_{\min} . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1} (L - \ln x_{0/1})$, the c.m. energy squared and the incoming particle mass.

15.7.3 The EPA object

The `epa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

15.7.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The x value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

```

Overriding the default method: we compute the \mathbf{x} array from the momentum configuration. In the specific case of EPA, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF epa: epa: TBP>+≡
  procedure :: recover_x => sf_epa_recover_x

<SF epa: procedures>+≡
  subroutine sf_epa_recover_x (sf_int, x, x_free)

    call sf_int%base_recover_x (x, x_free)
    sf_int%x = x(1)
    sf_int%xb = 1 - x(1)
  end subroutine sf_epa_recover_x

```

15.7.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for x , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

<SF epa: epa: TBP>+≡
  procedure :: apply => epa_apply

```

```

<SF epa: procedures>+≡

15.8.1 Physics

The EWA structure function for a Z or W inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal (\pm) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (15.62)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (15.63)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (15.64)$$

where $p_{\perp,\max}$ is the cutoff in transversal momentum, M is the vector-boson mass, v and a are the vector and axial-vector couplings, and $\bar{x} \equiv 1-x$. Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (15.65)$$

The vector and axial couplings for a fermion branching into a W are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (15.66)$$

For Z emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (15.67)$$

where $t_3 = \pm\frac{1}{2}$ is the fermion isospin, and q its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of v and a is irrelevant.

The EWA depends on the parameters g , $\sin^2\theta_w$, M_W , and M_Z . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a $1/x$ singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial x bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (15.68)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (15.69)$$

As a user parameter, we have the cutoff $p_{\perp,\max}$. The divergence $1/x$ also requires a x_0 cutoff; and for completeness we introduce a corresponding x_1 . Physically, the minimal sensible value of x is M^2/s , although the approximation loses its value already at higher x values.

15.8.2 The EWA data block

The EWA parameters are: $p_{T,\max}$, c_V , c_A , and m . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a W or a Z is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors $g/2 = e/2/\sin\theta_W$.

In principle, for EWA it would make sense to allow the user to also set the upper bound for x , x_{\max} , but we fix it to one here.

15.8.3 The EWA object

The `ewa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision: W/Z bosons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated, W/Z), where the W/Z initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the W/Z polarization. If we are having Z bosons, both up- and down-type fermions can participate. Otherwise, with a W^+ an up-type fermion is transferred to a down-type fermion, and the other way round.

15.8.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, the exponential mapping for the $1/x$ singularity discussed above is applied.

```

end subroutine ewa_inverse_kinematics

```

15.8.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for x , one for Q^2 , and two for the polar and azimuthal angles. Alternatively, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

15.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum $f(x)$, applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (15.70)$$

We want to compute the distribution of $E = \sqrt{\hat{s}} = \sqrt{xs}$, i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (15.71)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (15.72)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (15.73)$$

We implement this as a spectrum with a single parameter x . The parameters for the individual beams are computed as $x_i = \sqrt{x}$, so they are equal and the kinematics is always symmetric.

15.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and \sqrt{s} if it should be normalized to the total energy. In the latter case, the differential distribution $d\sigma/d\sqrt{\hat{s}}$ coincides with the partonic cross section $\hat{\sigma}$ as a function of $\sqrt{\hat{s}}$.

15.10 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of x values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

```

15.11.1 Physics

Beamstrahlung is applied before ISR. The CIRCE1 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the CIRCE1 parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1-x)^\gamma \quad (15.74)$$

for $x < 1 - \epsilon$ (resp. $x > \epsilon$ in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at $x = 1$ (resp. $x = 0$). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the `kirke` version of the `CIRCE1` subroutines, and is used here.

The parameter `circe1_eps` sets the peak mapping of the `CIRCE1` structure function. Its default value is 10^{-5} . The other parameters are the parameterization version and revision number, the accelerator type, and the \sqrt{s} value used by `CIRCE1`. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1_epsilon` which is taken from the `CIRCE1` internal data structure.

The \sqrt{s} value, if not explicitly set, is taken from the process data. Note that interpolating \sqrt{s} is not recommended; one should rather choose one of the distinct values known to `CIRCE1`.

15.11.2 The CIRCE1 data block

The `CIRCE1` parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter ϵ , \sqrt{s} and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the x values are actually discarded and a random number generator is used instead.

  end subroutine circe1_data_allocate_sf_int

```

15.11.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe1: types>+≡
  type, extends (circe1_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe1: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

15.11.4 The CIRCE1 object

This is a $2 \rightarrow 4$ interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

```

<SF circe1: types>+≡
  type, extends (sf_int_t) :: circe1_t
    type(circe1_data_t), pointer :: data => null ()
    real(default), dimension(2) :: x = 0

```

```

    real(default) :: f = 0
    logical, dimension(2) :: continuum = .true.
    logical, dimension(2) :: peak = .true.
    type(rng_obj_t) :: rng_obj
contains
  <SF circe1: circe1: TBP>
end type circe1_t

```

Type string: has to be here, but there is no string variable on which CIRCE1 depends. Hence, a dummy routine.

```

15.12.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

15.12.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

```

15.12.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe2: types>+=
  type, extends (circe2_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe2: procedures>+=
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

15.12.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a $2 \rightarrow 2$ interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is

nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

  end module hoppet_interface
```

15.14 Builtin PDF sets

For convenience in order not to depend on the external package LHAPDF, we ship some PDFs with WHIZARD.

15.14.1 The module

```
<sf_pdf_builtin.f90>≡  
<File header>  
  
module sf_pdf_builtin  
  
  <Use kinds>  
    use kinds, only: double  
  <Use strings>  
    use io_units  
    use format_defs, only: FMT_17  
    use unit_tests  
    use diagnostics  
    use os_interface  
    use physics_defs, only: PROTON, PHOTON, GLUON  
    use physics_defs, only: HADRON_REMNANT_SINGLET  
    use physics_defs, only: HADRON_REMNANT_TRIPLET  
    use physics_defs, only: HADRON_REMNANT_OCTET  
    use sm_qcd  
    use lorentz  
    use pdg_arrays  
    use model_data  
    use flavors  
    use colors  
    use quantum_numbers  
    use state_matrices  
    use polarizations  
    use interactions  
    use sf_aux  
    use sf_base  
    use pdf_builtin !NODEP!  
    use hoppet_interface  
  
  <Standard module head>  
  
  <SF pdf builtin: public>  
  
  <SF pdf builtin: types>  
  
  <SF pdf builtin: parameters>  
  
contains  
  
  <SF pdf builtin: procedures>  
  
  <SF pdf builtin: tests>  
  
end module sf_pdf_builtin
```

15.14.2 Codes for default PDF sets

```
<SF pdf builtin: parameters>≡  
  character(*), parameter :: PDF_BUILTIN_DEFAULT_PROTON = "CTEQ6L"  
  character(*), parameter :: PDF_BUILTIN_DEFAULT_PION   = "NONE"  
  character(*), parameter :: PDF_BUILTIN_DEFAULT_PHOTON = "MRST2004QEDp"
```

15.14.3 The PDF builtin data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

```
<SF pdf builtin: public>≡  
  public :: pdf_builtin_data_t  
  
<SF pdf builtin: types>≡  
  type, extends (sf_data_t) :: pdf_builtin_data_t

15.14.4 The PDF object

The PDF $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

15.14.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

(SF pdf builtin: pdf builtin: TBP)+≡

```

    procedure :: complete_kinematics => pdf_builtin_complete_kinematics

```

(SF pdf builtin: procedures)+≡

```

    subroutine pdf_builtin_complete_kinematics (sf_int, x, f, r, rb, map)

15.15.2 Codes for default PDF sets

The default PDF for protons set is chosen to be CTEQ6ll (LO fit with LO α_s).

<SF lhpdf: parameters>≡

```
character(*), parameter :: LHAPDF5_DEFAULT_PROTON = "cteq6ll.LHpdf"
character(*), parameter :: LHAPDF5_DEFAULT_PION   = "ABFKWPI.LHgrid"
character(*), parameter :: LHAPDF5_DEFAULT_PHOTON = "GSG960.LHgrid"
character(*), parameter :: LHAPDF6_DEFAULT_PROTON = "CT10"
```

15.15.3 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

<SF lhpdf: interfaces>≡

```
interface
  subroutine InitPDFsetM (set, file)
    integer, intent(in) :: set
    character(*), intent(in) :: file
  end subroutine InitPDFsetM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine InitPDFM (set, mem)
    integer, intent(in) :: set, mem
  end subroutine InitPDFM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine numberPDFM (set, n_members)
    integer, intent(in) :: set
    integer, intent(out) :: n_members
  end subroutine numberPDFM
end interface
```

<SF lhpdf: interfaces>+≡

```
interface
  subroutine evolvePDFM (set, x, q, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFM
end interface
```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine evolvePDFphotonM (set, x, q, ff, fphot)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q
    double precision, dimension(-6:6), intent(out) :: ff
    double precision, intent(out) :: fphot
  end subroutine evolvePDFphotonM
end interface

```

```

<SF lhpdf: interfaces>+≡
interface
  subroutine evolvePDFpM (set, x, q, s, scheme, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q, s
    integer, intent(in) :: scheme
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFpM
end interface

```

```

<SF lhpdf: interfaces>+≡

end interface

```

```

<SF lhpdf: interfaces>+=
  interface
    function has_photon () result(flag)
      logical :: flag
    end function has_photon
  end interface

```

15.15.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global object. We implement it as a private module variable. To access it from elsewhere, the caller has to create and initialize an object of type `lhpdf_status_t`, which acts as a proxy.

```

<SF lhpdf: types>=
  type :: lhpdf_global_status_t
    private
      logical, dimension(3) :: initialized = .false.
    end type lhpdf_global_status_t

<SF lhpdf: variables>=
  type(lhpdf_global_status_t) :: lhpdf_global_status

<SF lhpdf: procedures>=
  function lhpdf_global_status_is_initialized (set) result (flag)
    logical :: flag
    integer, intent(in), optional :: set
    if (present (set)) then
      select case (set)
        case (1:3);   flag = lhpdf_global_status%initialized(set)
        case default; flag = .false.
      end select
    else
      flag = any (lhpdf_global_status%initialized)
    end if
  end function lhpdf_global_status_is_initialized

<SF lhpdf: procedures>+=
  subroutine lhpdf_global_status_set_initialized (set)
    integer, intent(in) :: set
    lhpdf_global_status%initialized(set) = .true.
  end subroutine lhpdf_global_status_set_initialized

```

This is the only public procedure, it tells the system to forget about previous initialization, allowing for changing the chosen PDF set. Note that such a feature works only if the global program flow is serial, so no two distinct sets are accessed simultaneously. But this applies to LHAPDF anyway.

```

<SF lhpdf: public>=
  public :: lhpdf_global_reset

```

```

<SF lhpdf: procedures>+=
  subroutine lhpdf_global_reset ()
    lhpdf_global_status%initialized = .false.
  end subroutine lhpdf_global_reset

```

15.15.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an α_s formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf_builtin` is that there things are outsourced to a separate module (inc. `lhpdf_status` etc.).

```

<SF lhpdf: public>+=
  public :: lhpdf_initialize

<SF lhpdf: procedures>+=
  subroutine lhpdf_initialize (set, prefix, file, member, pdf, b_match)

15.15.6 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

```

<SF lhpdf: lhpdf: TBP>≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

<SF lhpdf: procedures>+≡
  subroutine lhpdf_complete_kinematics (sf_int, x, f, r, rb, map)

```

15.15.7 The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

```

15.15.8 The LHAPDF object

The `lhpdf_t` data type is a $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the x momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

<SF lhpdf: types>+≡
type, extends (sf_int_t) :: lhpdf_t
  type(lhpdf_data_t), pointer :: data => null ()
  real(default) :: x = 0
  real(default) :: q = 0
  real(default) :: s = 0

Chapter 16

Interface for Matrix Element Objects

These modules manage internal and, in particular, external matrix-element code.

prc_core We define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes. This abstract type supplements the `prc_core_def_t` type and related types in another module. Together, they provide a complete set of matrix-element handlers that are implemented in the concrete types below.

These are the implementations:

prc_template_me Implements matrix-element code without actual content (trivial value), but full-fledged interface. This can be used for injecting user-defined matrix-element code.

prc_omega Matrix elements calculated by `O'MEGA` are the default for WHIZARD. Here, we provide all necessary support.

16.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the `O'MEGA` matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

prc_core_def_t process and matrix-element configuration

prc_writer_t (optional) writing external matrix-element code

prc_driver_t accessing the matrix element (internal or external)

prc_core_t evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the **processes** module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the **processes** module.

```

<prc_core.f90>≡
  <File header>
  module prc_core

    <Use kinds>
    <Use strings>
    use io_units
    use diagnostics
    use os_interface
    use lorentz
    use model_data
    use model_testbed
    use interactions

    use process_constants
    use prc_core_def
    use process_libraries
    use sf_base

    <Standard module head>

    <Prc core: public>

    <Prc core: types>

    <Prc core: variables>

    <Prc core: interfaces>

    contains

    <Prc core: procedures>

  end module prc_core

```

16.1.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

```

<Prc core: public>≡
  public :: prc_core_t

```

```

<Prc core: types>≡
  type, abstract :: prc_core_t
    class(prc_core_def_t), pointer :: def => null ()
    logical :: data_known = .false.
    type(process_constants_t) :: data
    class(prc_core_driver_t), allocatable :: driver
    logical :: use_color_factors = .false.
    integer :: nc = 3
  contains
    <Prc core: process core: TBP>
  end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine prc_core_write
  end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: procedures>≡
  subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

```

```

<Prc core: procedures>+≡
function prc_core_has_matrix_element (object) result (flag)
  class(prc_core_t), intent(in) :: object
  logical :: flag
  flag = object%data%n_flg /= 0
end function prc_core_has_matrix_element

```

Return true if a MC dataset should be attached to this process component.
False if it shares the dataset with another component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_flag), deferred :: needs_mcset

```

```

<Prc core: interfaces>+≡
abstract interface
  function prc_core_get_flag (object) result (flag)
    import
    class(prc_core_t), intent(in) :: object
    logical :: flag
  end function prc_core_get_flag
end interface

```

Return an integer number

```

<Prc core: interfaces>+≡
abstract interface
  function prc_core_get_integer (object) result (i)
    import
    class(prc_core_t), intent(in) :: object
    integer :: i
  end function prc_core_get_integer
end interface

```

Return the number of distinct terms requested by this process component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_integer), deferred :: get_n_terms

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_is_allowed), deferred :: is_allowed

<Prc core: interfaces>+≡
abstract interface
  function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: i_term, f, h, c
    logical :: flag
  end function prc_core_is_allowed
end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: procedures>+≡
  subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that α_s is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the tmp workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: procedures>+≡
  function prc_core_get_alpha_s (object, tmp) result (alpha)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(in), allocatable :: tmp
    real(default) :: alpha
    alpha = -1
  end function prc_core_get_alpha_s

```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: allocate_workspace => prc_core_ignore_workspace

<Prc core: procedures>+≡
  subroutine prc_core_ignore_workspace (object, tmp)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_ignore_workspace

```

Initialize the structure-function instance that corresponds to a process component. In ordinary cases, this amounts to a straightforward copy of the given template, but the process core may also choose to modify the setup, and it may access its own workspace.

The `sf_chain_instance` is the object that we want to prepare. The `sf_chain` argument is a template for its structure. For the initialization, we also need the number of channels `n_channel`.

Note: crash with nagfor 5.3.1 if `sf_chain_instance` is declared `intent(out)`, as would be more appropriate.

```

<Prc core: process core: TBP>+≡
  procedure :: init_sf_chain => prc_core_init_sf_chain

<Prc core: procedures>+≡
  subroutine prc_core_init_sf_chain &
    (object, sf_chain_instance, sf_chain, n_channel, tmp)
    class(prc_core_t), intent(in) :: object
    type(sf_chain_instance_t), intent(inout), target :: sf_chain_instance
    type(sf_chain_t), intent(in), target :: sf_chain
    integer, intent(in) :: n_channel
    class(workspace_t), intent(inout), allocatable :: tmp
    call sf_chain_instance%init (sf_chain, n_channel)
  end subroutine prc_core_init_sf_chain

```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The `i_term` index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_hard_kinematics), deferred :: &
    compute_hard_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_hard_kinematics &
      (object, p_seed, i_term, int_hard, tmp)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_hard_kinematics
  end interface

```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_eff_kinematics), deferred :: &
    compute_eff_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_eff_kinematics &
      (object, i_term, int_hard, int_eff, tmp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_eff_kinematics

```

```
end interface
```

Recover the missing pieces. We know the incoming momenta of the `p_seed` array and the outgoing momenta of the `int_eff` interaction. We have to recover the outgoing momenta of `p_seed` and the incoming momenta of `int_eff`.

(The trivial case is that these are identical.)

Furthermore, if `int_hard` and `int_eff` are not aliased, we have to set the momenta there. In the trivial case, `int_eff` is a pointer to `int_hard`, so `int_hard` should not be touched at all.

```
<Prc core: process core: TBP>+≡
  procedure(prc_core_recover_kinematics), deferred :: &
    recover_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_recover_kinematics &
      (object, p_seed, int_hard, int_eff, tmp)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_recover_kinematics
end interface
```

The process core must implement this function. Here, `j` is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `tmp` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```
<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_compute_amplitude &
      (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    class(workspace_t), intent(inout), allocatable, optional :: tmp
    complex(default) :: amp
  end function prc_core_compute_amplitude
end interface
```

16.1.2 Storage for intermediate results

The abstract `workspace_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```
<Prc core: public>+≡
    public :: workspace_t

<Prc core: types>+≡
    type, abstract :: workspace_t
    contains
        procedure(workspace_write), deferred :: write
        procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
    end type workspace_t
```

For debugging, we should at least have an output routine.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_write (object, unit)
            import
            class(workspace_t), intent(in) :: object
            integer, intent(in), optional :: unit
        end subroutine workspace_write
    end interface
```

This is used during the NLO calculation, see there for more information.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_reset_new_kinematics (object)
            import
            class(workspace_t), intent(inout) :: object
        end subroutine workspace_reset_new_kinematics
    end interface
```

16.1.3 Helicity selection data

This is intended for use with O'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is 10^{10}) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

```
<Prc core: public>+≡
    public :: helicity_selection_t
```

```

<Prc core: types>+=
  type :: helicity_selection_t
    logical :: active = .false.
    real(default) :: threshold = 0
    integer :: cutoff = 0
    contains
    <Prc core: helicity selection: TBP>
  end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>=
  procedure :: write => helicity_selection_write

<Prc core: procedures>+=
  subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%active) then
      write (u, "(3x,A)") "Helicity selection data:"
      write (u, "(5x,A,ES17.10)") &
        "threshold =", object%threshold
      write (u, "(5x,A,I0)") &
        "cutoff    =", object%cutoff
    end if
  end subroutine helicity_selection_write

```

16.2 Template matrix elements

Here, we provide template matrix elements that are in structure very similar to O'MEGA matrix elements, but do not need its infrastructure. Per default, the matrix elements are flat, i.e. they have the constant value one. Analogous to the O'MEGA implementation, this section implements the interface to the templates (via the makefile) and the driver.

```

<prc_template_me.f90>=
  <File header>

  module prc_template_me

    use iso_c_binding !NODEP!
    use kinds
    use io_units
    <Use strings>
    use unit_tests
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use lorentz
    use flavors
    use sm_qcd

```

```

    use interactions
    use model_data
    use model_testbed

    use process_constants
    use prclib_interfaces
    use prc_core_def
    use particle_specifiers
    use process_libraries
    use prc_core

    <Standard module head>

    <Template matrix elements: public>

    <Template matrix elements: types>

    <Template matrix elements: interfaces>

    contains

    <Template matrix elements: procedures>

    <Template matrix elements: tests>

    end module prc_template_me

```

16.2.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

<Template matrix elements: public>≡
    public :: template_me_def_t

<Template matrix elements: types>≡
    type, extends (prc_core_def_t) :: template_me_def_t
    contains
    <Template matrix elements: template ME def: TBP>
    end type template_me_def_t

<Template matrix elements: template ME def: TBP>≡
    procedure, nopass :: type_string => template_me_def_type_string

<Template matrix elements: procedures>≡
    function template_me_def_type_string () result (string)
        type(string_t) :: string
        string = "template"
    end function template_me_def_type_string

```

Initialization: allocate the writer for the template matrix element. Also set any data for this process that the writer needs.

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: init => template_me_def_init

```

```

<Template matrix elements: procedures>+≡
  subroutine template_me_def_init &
    (object, model, prt_in, prt_out, unity)
    class(template_me_def_t), intent(out) :: object
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: unity
    allocate (template_me_writer_t :: object%writer)
    select type (writer => object%writer)
    type is (template_me_writer_t)
      call writer%init (model, prt_in, prt_out, unity)
    end select
  end subroutine template_me_def_init

```

Write/read process- and method-specific data.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: write => template_me_def_write

```

```

<Template matrix elements: procedures>+≡
  subroutine template_me_def_write (object, unit)
    class(template_me_def_t), intent(in) :: object
    integer, intent(in) :: unit
    select type (writer => object%writer)
    type is (template_me_writer_t)
      call writer%write (unit)
    end select
  end subroutine template_me_def_write

```

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: read => template_me_def_read

```

```

<Template matrix elements: procedures>+≡
  subroutine template_me_def_read (object, unit)
    class(template_me_def_t), intent(out) :: object
    integer, intent(in) :: unit
    call msg_bug &
      ("WHIZARD template process definition: input not supported (yet)")
  end subroutine template_me_def_read

```

Allocate the driver for template matrix elements.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: allocate_driver => template_me_def_allocate_driver

<Template matrix elements: procedures>+≡
  subroutine template_me_def_allocate_driver (object, driver, basename)
    class(template_me_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (template_me_driver_t :: driver)
  end subroutine template_me_def_allocate_driver

```

We need code:

```

<Template matrix elements: template ME def: TBP>+=
  procedure, nopass :: needs_code => template_me_def_needs_code

<Template matrix elements: procedures>+=
  function template_me_def_needs_code () result (flag)
    logical :: flag
    flag = .true.
  end function template_me_def_needs_code

```

These are the features that a template matrix element provides.

```

<Template matrix elements: template ME def: TBP>+=
  procedure, nopass :: get_features => template_me_def_get_features

<Template matrix elements: procedures>+=
  subroutine template_me_def_get_features (features)
    type(string_t), dimension(:), allocatable, intent(out) :: features
    allocate (features (6))
    features = [ &
      var_str ("init"), &
      var_str ("update_alpha_s"), &
      var_str ("is_allowed"), &
      var_str ("new_event"), &
      var_str ("get_amplitude")]
  end subroutine template_me_def_get_features

```

The interface of the specific features.

```

<Template matrix elements: interfaces>=
  abstract interface
    subroutine init_t (par) bind(C)
      import
      real(c_default_float), dimension(*), intent(in) :: par
    end subroutine init_t
  end interface

  abstract interface
    subroutine update_alpha_s_t (alpha_s) bind(C)
      import
      real(c_default_float), intent(in) :: alpha_s
    end subroutine update_alpha_s_t
  end interface

  abstract interface
    subroutine is_allowed_t (flv, hel, col, flag) bind(C)
      import
      integer(c_int), intent(in) :: flv, hel, col
      logical(c_bool), intent(out) :: flag
    end subroutine is_allowed_t
  end interface

  abstract interface
    subroutine new_event_t (p) bind(C)
      import
      real(c_default_float), dimension(0:3,*), intent(in) :: p

```

```

        end subroutine new_event_t
    end interface

    abstract interface
        subroutine get_amplitude_t (flv, hel, col, amp) bind(C)
            import
            integer(c_int), intent(in) :: flv, hel, col
            complex(c_default_complex), intent(out):: amp
        end subroutine get_amplitude_t
    end interface

```

Connect the template matrix element features with the process driver.

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: connect => template_me_def_connect

<Template matrix elements: procedures>+≡
    subroutine template_me_def_connect (def, lib_driver, i, proc_driver)
        class(template_me_def_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
        integer(c_int) :: pid, fid
        type(c_funptr) :: fptr
        select type (proc_driver)
            type is (template_me_driver_t)
                pid = i
                fid = 1
                call lib_driver%get_fptr (pid, fid, fptr)
                call c_f_procpointer (fptr, proc_driver%init)
                fid = 2
                call lib_driver%get_fptr (pid, fid, fptr)
                call c_f_procpointer (fptr, proc_driver%update_alpha_s)
                fid = 3
                call lib_driver%get_fptr (pid, fid, fptr)
                call c_f_procpointer (fptr, proc_driver%is_allowed)
                fid = 4
                call lib_driver%get_fptr (pid, fid, fptr)
                call c_f_procpointer (fptr, proc_driver%new_event)
                fid = 5
                call lib_driver%get_fptr (pid, fid, fptr)
                call c_f_procpointer (fptr, proc_driver%get_amplitude)
            end select
        end subroutine template_me_def_connect

```

16.2.2 The Template Matrix element writer

Unlike O'MEGA, the template matrix element is directly written by the main WHIZARD program, so there will be no entry in the makefile for calling an external program. The template matrix element writer is responsible for writing interfaces and wrappers.

```

<Template matrix elements: types>+≡
    type, extends (prc_writer_f_module_t) :: template_me_writer_t

```

```

class(model_data_t), pointer :: model => null ()
type(string_t) :: model_name
logical :: unity
type(string_t), dimension(:), allocatable :: prt_in
type(string_t), dimension(:), allocatable :: prt_out
integer :: n_in
integer :: n_out
integer :: n_tot
contains
  <Template matrix elements: template ME writer: TBP>
end type template_me_writer_t

```

The reported type is the same as for the `template_me_def_t` type.

```

<Template matrix elements: template ME writer: TBP>≡
  procedure, nopass :: type_name => template_me_writer_type_name
<Template matrix elements: procedures>+≡
  function template_me_writer_type_name () result (string)
    type(string_t) :: string
    string = "template"
  end function template_me_writer_type_name

```

Taking into account the prefix for template ME module names.

```

<Template matrix elements: template ME writer: TBP>+≡
  procedure, nopass :: get_module_name => template_me_writer_get_module_name
<Template matrix elements: procedures>+≡
  function template_me_writer_get_module_name (id) result (name)
    type(string_t) :: name
    type(string_t), intent(in) :: id
    name = "tpr_" // id
  end function template_me_writer_get_module_name

```

Output. This is called by `template_me_def_write`.

```

<Template matrix elements: template ME writer: TBP>+≡
  procedure :: write => template_me_writer_write
<Template matrix elements: procedures>+≡
  subroutine template_me_writer_write (object, unit)
    class(template_me_writer_t), intent(in) :: object
    integer, intent(in) :: unit
    integer :: i, j
    write (unit, "(5x,A,I0)") "# incoming part. = ", object%n_in
    write (unit, "(7x,A)", advance="no") &
      "      Initial state: "
    do i = 1, object%n_in - 1
      write (unit, "(1x,A)", advance="no") char (object%prt_in(i))
    end do
    write (unit, "(1x,A)") char (object%prt_in(object%n_in))
    write (unit, "(5x,A,I0)") "# outgoing part. = ", object%n_out
    write (unit, "(7x,A)", advance="no") &
      "      Final state:  "
    do j = 1, object%n_out - 1
      write (unit, "(1x,A)", advance="no") char (object%prt_out(i))
    end do
  end subroutine

```

```

end do
write (unit, "(1x,A)") char (object%prt_out(object%n_out))
write (unit, "(5x,A,I0)") "# part. (total) = ", object%n_tot
end subroutine template_me_writer_write

```

Initialize with process data.

```

<Template matrix elements: template ME writer: TBP>+≡
  procedure :: init => template_me_writer_init

<Template matrix elements: procedures>+≡
  subroutine template_me_writer_init (writer, model, &
    prt_in, prt_out, unity)
    class(template_me_writer_t), intent(out) :: writer
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: unity
    writer%model => model
    writer%model_name = model%get_name ()
    writer%n_in = size (prt_in)
    writer%n_out = size (prt_out)
    writer%n_tot = size (prt_in) + size (prt_out)
    allocate (writer%prt_in (size (prt_in)), source = prt_in)
    allocate (writer%prt_out (size (prt_out)), source = prt_out)
    writer%unity = unity
  end subroutine template_me_writer_init

```

The makefile is the driver file for the test matrix elements.

```

<Template matrix elements: template ME writer: TBP>+≡
  procedure :: write_makefile_code => template_me_write_makefile_code

<Template matrix elements: procedures>+≡
  subroutine template_me_write_makefile_code (writer, unit, id, os_data, testflag)
    class(template_me_writer_t), intent(in) :: writer

contains
  <Template matrix elements: template ME driver: TBP>
end type template_me_driver_t

```

The reported type is the same as for the `template_me_def_t` type.

```

<Template matrix elements: template ME driver: TBP>≡
  procedure, nopass :: type_name => template_me_driver_type_name

<Template matrix elements: procedures>+≡
  function template_me_driver_type_name () result (string)
    type(string_t) :: string
    string = "template"
  end function template_me_driver_type_name

```

16.2.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an template matrix element.

NOTE: For calling the `import_component` method, we must explicitly address the `process_def_t` parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments `prt_in` and `prt_out` become corrupted and cause a segfault.

```

<Template matrix elements: public>+≡
  public :: template_me_make_process_component

<Template matrix elements: procedures>+≡
  subroutine template_me_make_process_component (entry, component_index, &
    model, model_name, prt_in, prt_out, unity)
    class(process_def_entry_t), intent(inout) :: entry
    integer, intent(in) :: component_index
    type(string_t), intent(in) :: model_name
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out

    end select
    call entry%process_def_t%import_component (component_index, &
      n_out = size (prt_out), &
      prt_in = new_prt_spec (prt_in), &
      prt_out = new_prt_spec (prt_out), &
      method = var_str ("template"), &
      variant = def)
  end subroutine template_me_make_process_component

```

16.2.5 The prc_template_me_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`template_me_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`template_me_driver_t`).

```

<Template matrix elements: public>+≡
    public :: prc_template_me_t

<Template matrix elements: types>+≡
    type, extends (prc_core_t) :: prc_template_me_t
        real(default), dimension(:), allocatable :: par
    contains
        <Template matrix elements: prc template ME: TBP>
    end type prc_template_me_t

```

The workspace associated to a `prc_template_me_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Template matrix elements: types>+≡
    type, extends (workspace_t) :: template_me_state_t
        logical :: new_kinematics = .true.
        real(default) :: alpha_qcd = -1
    contains
        procedure :: write => template_me_state_write
        procedure :: reset_new_kinematics => template_me_state_reset_new_kinematics
    end type template_me_state_t

<Template matrix elements: procedures>+≡
    subroutine template_me_state_write (object, unit)
        class(template_me_state_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A,L1)") "Template ME state: new kinematics = ", &
            object%new_kinematics
    end subroutine template_me_state_write

<Template matrix elements: procedures>+≡
    subroutine template_me_state_reset_new_kinematics (object)
        class(template_me_state_t), intent(inout) :: object
    end subroutine template_me_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Template matrix elements: prc template ME: TBP>≡
    procedure :: allocate_workspace => prc_template_me_allocate_workspace

```

```

<Template matrix elements: procedures>+≡
subroutine prc_template_me_allocate_workspace (object, tmp)
  class(prc_template_me_t), intent(in) :: object
  class(workspace_t), intent(inout), allocatable :: tmp
  allocate (template_me_state_t :: tmp)
end subroutine prc_template_me_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters.

```

<Template matrix elements: prc template ME: TBP>+≡
procedure :: write => prc_template_me_write

<Template matrix elements: procedures>+≡
subroutine prc_template_me_write (object, unit)
  class(prc_template_me_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit)
  write (u, "(3x,A)", advance="no") "Template process core:"
  if (object%data_known) then
    write (u, "(1x,A)") char (object%data%id)
  else
    write (u, "(1x,A)") "[undefined]"
  end if
  if (allocated (object%par)) then
    write (u, "(3x,A)") "Parameter array:"
    do i = 1, size (object%par)
      write (u, "(5x,I0,1x,ES17.10)") i, object%par(i)
    end do
  end if
end subroutine prc_template_me_write

```

Temporarily store the parameter array inside the `prc_template_me` object, so we can use it later during the actual initialization.

```

<Template matrix elements: prc template ME: TBP>+≡
procedure :: set_parameters => prc_template_me_set_parameters

<Template matrix elements: procedures>+≡
subroutine prc_template_me_set_parameters (prc_template_me, model)
  class(prc_template_me_t), intent(inout) :: prc_template_me
  class(model_data_t), intent(in), target, optional :: model
  if (present (model)) then
    if (.not. allocated (prc_template_me%par)) &
      allocate (prc_template_me%par (model%get_n_real ()))
    call model%real_parameters_to_c_array (prc_template_me%par)
  end if
end subroutine prc_template_me_set_parameters

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

```

<Template matrix elements: prc template ME: TBP>+≡
  procedure :: init => prc_template_me_init

<Template matrix elements: procedures>+≡
  subroutine prc_template_me_init (object, def, lib, id, i_component)

    class(prc_template_me_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
    integer :: n_in
    n_in = interaction_get_n_in (int_eff)
    call interaction_set_momenta (int_eff, p_seed(1:n_in), outgoing = .false.)
    p_seed(n_in+1:) = interaction_get_momenta (int_eff, outgoing = .true.)
  end subroutine prc_template_me_recover_kinematics

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index `j` is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `tmp` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

```

<Template matrix elements: prc template ME: TBP>+=
  procedure :: compute_amplitude => prc_template_me_compute_amplitude

<Template matrix elements: procedures>+=
  function prc_template_me_compute_amplitude &
    (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)

    end if
end select
end function prc_template_me_compute_amplitude

```

We do not overwrite the `prc_core_t` routine for α_s .

16.2.6 Test

This is the master for calling self-test procedures. There is a separate test for testing O'MEGA diagram generation as this depends on a working analysis setup.

```

<Template matrix elements: public>+≡
    public :: prc_template_me_test

<Template matrix elements: tests>+≡
    subroutine prc_template_me_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Template matrix elements: execute tests>
end subroutine prc_template_me_test

```

Generate, compile and load a simple process matrix element

The process is $e^+e^- \rightarrow \mu^+\mu^-$ for vanishing masses and $e = 0.3$. We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to e^2 . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

<Template matrix elements: execute tests>≡
    call test (prc_template_me_1, "prc_template_me_1", &
        "build and load simple template process", &
        u, results)

16.3 O'MEGA Interface

The standard method for process computation with WHIZARD is the O'MEGA matrix element generator.

This section implements the interface to the code generator (via the makefile) and the driver for the features provided by the O'MEGA matrix element.

There are actually two different methods steered by this interface, the traditional one which delivers compiled Fortran code, while the O'MEGA virtual machine (OVM) produces bytecode with look-up tables.

`<prc_omega.f90>`≡
<File header>

16.3.3 Driver

```

<Omega interface: types>+≡
type, extends (prc_core_driver_t) :: omega_driver_t
  procedure(init_t), nopass, pointer :: &
    init => null ()
  procedure(update_alpha_s_t), nopass, pointer :: &
    update_alpha_s => null ()
  procedure(reset_helicity_selection_t), nopass, pointer :: &
    reset_helicity_selection => null ()
  procedure(is_allowed_t), nopass, pointer :: &
    is_allowed => null ()
  procedure(new_event_t), nopass, pointer :: &
    new_event => null ()
  procedure(get_amplitude_t), nopass, pointer :: &
    get_amplitude => null ()
contains
  <Omega interface: omega driver: TBP>
end type omega_driver_t

```

The reported type is the same as for the `omega_def_t` type.

```

<Omega interface: omega driver: TBP>≡
  procedure, nopass :: type_name => omega_driver_type_name
<Omega interface: procedures>+≡
  function omega_driver_type_name () result (string)
    type(string_t) :: string
    string = "omega"
  end function omega_driver_type_name

```

16.3.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an O'MEGA matrix element.

NOTE: For calling the `import_component` method, we must explicitly address the `process_def_t` parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments `prt_in` and `prt_out` become corrupted and cause a segfault.

```

<Omega interface: public>+≡

```

```

public :: omega_make_process_component
<Omega interface: procedures>+≡
  subroutine omega_make_process_component (entry, component_index, &
    model_name, prt_in, prt_out, restrictions, openmp_support, &
    report_progress, extra_options, diags, diags_color)
    class(process_def_entry_t), intent(inout) :: entry
    integer, intent(in) :: component_index
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    type(string_t), intent(in), optional :: restrictions
    logical, intent(in), optional :: openmp_support
    logical, intent(in), optional :: report_progress
    logical, intent(in), optional :: diags, diags_color
    type(string_t), intent(in), optional :: extra_options
    class(prc_core_def_t), allocatable :: def
    allocate (omega_omega_def_t :: def)
    select type (def)
    type is (omega_omega_def_t)
      call def%init (model_name, prt_in, prt_out, &
        restrictions, openmp_support, report_progress, &
        extra_options, diags, diags_color)
    end select
    call entry%process_def_t%import_component (component_index, &
      n_out = size (prt_out), &
      prt_in = new_prt_spec (prt_in), &
      prt_out = new_prt_spec (prt_out), &
      method = var_str ("omega"), &
      variant = def)
  end subroutine omega_make_process_component

```

16.3.5 The prc_omega_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`omega_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`omega_driver_t`).

```

<Omega interface: public>+≡
  public :: prc_omega_t
<Omega interface: types>+≡
  type, extends (prc_core_t) :: prc_omega_t
    real(default), dimension(:), allocatable :: par
    type(helicity_selection_t) :: helicity_selection
    type(qcd_t) :: qcd
  contains
    <Omega interface: prc omega: TBP>
  end type prc_omega_t

```

The workspace associated to a `prc_omega_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Omega interface: types>+≡
  type, extends (workspace_t) :: omega_state_t
    logical :: new_kinematics = .true.
    real(default) :: alpha_qcd = -1
  contains
    procedure :: write => omega_state_write
    procedure :: reset_new_kinematics => omega_state_reset_new_kinematics
  end type omega_state_t

```

```

<Omega interface: procedures>+≡
  subroutine omega_state_write (object, unit)
    class(omega_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A,L1)") "O'Mega state: new kinematics = ", &
      object%new_kinematics
  end subroutine omega_state_write

```

```

<Omega interface: procedures>+≡
  subroutine omega_state_reset_new_kinematics (object)
    class(omega_state_t), intent(inout) :: object
    object%new_kinematics = .true.
  end subroutine omega_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Omega interface: prc omega: TBP>≡
  procedure :: allocate_workspace => prc_omega_allocate_workspace

<Omega interface: procedures>+≡
  subroutine prc_omega_allocate_workspace (object, tmp)
    class(prc_omega_t), intent(in) :: object
    class(workspace_t), intent(inout), allocatable :: tmp
    allocate (omega_state_t :: tmp)
  end subroutine prc_omega_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters and the helicity selection data. (The latter are printed only if active.)

```

<Omega interface: prc omega: TBP>+≡
  procedure :: write => prc_omega_write

<Omega interface: procedures>+≡
  subroutine prc_omega_write (object, unit)
    class(prc_omega_t), intent(in) :: object
    integer, intent(in), optional :: unit

```

```

integer :: u, i
u = given_output_unit (unit)
write (u, "(3x,A)", advance="no") "0'Mega process core:"
if (object%data_known) then
  write (u, "(1x,A)") char (object%data%id)
else
  write (u, "(1x,A)") "[undefined]"
end if
if (allocated (object%par)) then
  write (u, "(3x,A)") "Parameter array:"
  do i = 1, size (object%par)
    write (u, "(5x,I0,1x,ES17.10)") i, object%par(i)
  end do
end if
call object%helicity_selection%write (u)
call object%qcd%write (u)
end subroutine prc_omega_write

```

Temporarily store the parameter array inside the `prc_omega` object, so we can use it later during the actual initialization. Also store threshold and cutoff for helicity selection.

```

<Omega interface: prc_omega: TBP>+≡
  procedure :: set_parameters => prc_omega_set_parameters

<Omega interface: procedures>+≡
  subroutine prc_omega_set_parameters (prc_omega, model, &
    helicity_selection, qcd, use_color_factors)
    class(prc_omega_t), intent(inout) :: prc_omega
    class(model_data_t), intent(in), target, optional :: model
    type(helicity_selection_t), intent(in), optional :: helicity_selection
    type(qcd_t), intent(in), optional :: qcd
    logical, intent(in), optional :: use_color_factors
    if (present (model)) then
      if (.not. allocated (prc_omega%par)) &
        allocate (prc_omega%par (model%get_n_real ()))
      call model%real_parameters_to_c_array (prc_omega%par)
    end if
    if (present (helicity_selection)) then
      prc_omega%helicity_selection = helicity_selection
    end if
    if (present (qcd)) then
      prc_omega%qcd = qcd
    end if
    if (present (use_color_factors)) then
      prc_omega%use_color_factors = use_color_factors
    end if
  end subroutine prc_omega_set_parameters

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated

driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

If requested, we initialize the helicity selection counter.

```

<Omega interface: prc omega: TBP>+≡
  procedure :: init => prc_omega_init

<Omega interface: procedures>+≡
  subroutine prc_omega_init (object, def, lib, id, i_component)
    class(prc_omega_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    call object%base_init (def, lib, id, i_component)
    call object%activate_parameters ()
  end subroutine prc_omega_init

```

Activate the stored parameters by transferring them to the external matrix element. Also reset the helicity selection, if requested.

```

<Omega interface: prc omega: TBP>+≡
  procedure :: activate_parameters => prc_omega_activate_parameters

<Omega interface: procedures>+≡
  subroutine prc_omega_activate_parameters (object)

```

Reset the helicity selection counters and start counting zero helicities. We assume that the `helicity_selection` object is allocated. Otherwise, reset and switch off helicity counting.

In the test routine, the driver is allocated but the driver methods are not. Therefore, guard against a disassociated method.

```

<Omega interface: prc omega: TBP>+=
  procedure :: reset_helicity_selection => prc_omega_reset_helicity_selection

<Omega interface: procedures>+=
  subroutine prc_omega_reset_helicity_selection (object)
    class(prc_omega_t), intent(inout) :: object
    select type (driver => object%driver)
    type is (omega_driver_t)
      if (associated (driver%reset_helicity_selection)) then
        if (object%helicity_selection%active) then
          call driver%reset_helicity_selection &
            (real (object%helicity_selection%threshold, &
              c_default_float), &
              int (object%helicity_selection%cutoff, c_int))
        else
          call driver%reset_helicity_selection &
            (0._c_default_float, 0_c_int)
        end if
      end if
    end select
  end subroutine prc_omega_reset_helicity_selection

```

```

        end if
    end select
end subroutine prc_omega_reset_helicity_selection

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index j is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `tmp` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

The `is_allowed` query is not redundant, since the status may change during the run if helicities are switched off.

```

    type(test_results_t), intent(inout) :: results
    <Omega interface: execute diags tests>
  end subroutine prc_omega_diags_test

```

Generate, compile and load a simple process matrix element

The process is $e^+e^- \rightarrow \mu^+\mu^-$ for vanishing masses and $e = 0.3$. We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to e^2 . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

<Omega interface: execute tests>≡

Check prc_omega_t wrapper and options

The process is $e^-e^+ \rightarrow e^-e^+$ for vanishing masses and $e = 0.3$. We build the library using the high-level procedure `omega_make_process_component` and the “black box” `prc_omega_t` object. Two variants with different settings for restrictions and OpenMP.

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

QCD coupling

The process is $u\bar{u} \rightarrow d\bar{d}$ for vanishing masses. We compute the amplitude for a fixed configuration once, then reset α_s , then compute again.

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

Chapter 17

Generic Event Handling

Event records allow the MC to communicate with the outside world. The event record should exhibit the observable contents of a physical event. We should be able to read and write events. The actual implementation of the event need not be defined yet, for that purpose.

We have the following basic modules:

event_base Abstract base type for event records. The base type contains a reference to a **particle_set_t** object as the event core, and it holds some data that we should always expect, such as the squared matrix element and event weight.

eio_data Transparent container for the metadata of an event sample.

eio_base Abstract base type for event-record input and output. The implementations of this base type represent specific event I/O formats.

These are the implementation modules:

eio_checkpoints Auxiliary output format. The only purpose is to provide screen diagnostics during event output.

eio_weights Print some event summary data, no details. The main use if for testing purposes.

hep_common Implements traditional HEP common blocks that are (still) used by some of the event I/O formats below.

hep_events Interface between the event record and the common blocks.

eio_ascii Collection of event output formats that write ASCII files.

eio_lhef LHEF for input and output.

eio_stdhep Support for the StdHEP format (binary, machine-independent).

eio_hepmc Support for the HepMC format (C++).

eio_lcio Support for the LCIO format (C++).

17.1 Generic Event Handling

We introduce events first in form of an abstract type, together with some utilities. Abstract events can be used by other modules, in particular event I/O, without introducing an explicit dependency on the event implementation.

(event_base.f90)≡

⟨File header⟩

`module event_base`

`use kinds`

⟨Use strings⟩

`use string_utils, only: lower_case`

`use diagnostics`

`use model_data`

`use particles`

⟨Standard module head⟩

⟨Event base: public⟩

⟨Event base: parameters⟩

⟨Event base: types⟩

⟨Event base: interfaces⟩

`contains`

⟨Event base: procedures⟩

`end module event_base`

17.1.1 generic event type

⟨Event base: public⟩≡

`public :: generic_event_t`

⟨Event base: types⟩≡

`type, abstract :: generic_event_t`

`private`

`logical :: particle_set_is_valid = .false.`

`type(particle_set_t), pointer :: particle_set => null ()`

`logical :: sqme_ref_known = .false.`

`real(default) :: sqme_ref = 0`

`logical :: sqme_prc_known = .false.`

`real(default) :: sqme_prc = 0`

`logical :: weight_ref_known = .false.`

`real(default) :: weight_ref = 0`

`logical :: weight_prc_known = .false.`

`real(default) :: weight_prc = 0`

`logical :: excess_prc_known = .false.`

`real(default) :: excess_prc = 0`

`integer :: n_alt = 0`

```

    logical :: sqme_alt_known = .false.
    real(default), dimension(:), allocatable :: sqme_alt
    logical :: weight_alt_known = .false.
    real(default), dimension(:), allocatable :: weight_alt
contains
  <Event base: generic event: TBP>
end type generic_event_t

```

17.1.2 Initialization

This determines the number of alternate weights and sqme values.

```

<Event base: generic event: TBP>≡
  procedure :: base_init => generic_event_init

<Event base: procedures>≡
  subroutine generic_event_init (event, n_alt)
    class(generic_event_t), intent(out) :: event
    integer, intent(in) :: n_alt
    event%n_alt = n_alt
    allocate (event%sqme_alt (n_alt))
    allocate (event%weight_alt (n_alt))
  end subroutine generic_event_init

```

17.1.3 Access particle set

The particle set is the core of the event. We allow access to it via a pointer, and we maintain the information whether the particle set is valid, i.e., has been filled with meaningful data.

```

<Event base: generic event: TBP>+≡
  procedure :: has_valid_particle_set => generic_event_has_valid_particle_set
  procedure :: accept_particle_set => generic_event_accept_particle_set
  procedure :: discard_particle_set => generic_event_discard_particle_set

<Event base: procedures>+≡
  function generic_event_has_valid_particle_set (event) result (flag)
    class(generic_event_t), intent(in) :: event
    logical :: flag
    flag = event%particle_set_is_valid
  end function generic_event_has_valid_particle_set

  subroutine generic_event_accept_particle_set (event)
    class(generic_event_t), intent(inout) :: event
    event%particle_set_is_valid = .true.
  end subroutine generic_event_accept_particle_set

  subroutine generic_event_discard_particle_set (event)
    class(generic_event_t), intent(inout) :: event
    event%particle_set_is_valid = .false.
  end subroutine generic_event_discard_particle_set

```

These procedures deal with the particle set directly. Return the pointer:

```

(Event base: generic event: TBP)+≡
    procedure :: get_particle_set_ptr => generic_event_get_particle_set_ptr

(Event base: procedures)+≡
    function generic_event_get_particle_set_ptr (event) result (ptr)
        class(generic_event_t), intent(in) :: event
        type(particle_set_t), pointer :: ptr
        ptr => event%particle_set
    end function generic_event_get_particle_set_ptr

```

Let it point to some existing particle set:

```

(Event base: generic event: TBP)+≡
    procedure :: link_particle_set => generic_event_link_particle_set

(Event base: procedures)+≡
    subroutine generic_event_link_particle_set (event, particle_set)
        class(generic_event_t), intent(inout) :: event
        type(particle_set_t), intent(in), target :: particle_set
        event%particle_set => particle_set
        call event%accept_particle_set ()
    end subroutine generic_event_link_particle_set

```

17.1.4 Access sqme and weight

There are several incarnations: the current value, a reference value, alternate values.

```

(Event base: generic event: TBP)+≡
    procedure :: sqme_prc_is_known => generic_event_sqme_prc_is_known
    procedure :: sqme_ref_is_known => generic_event_sqme_ref_is_known
    procedure :: sqme_alt_is_known => generic_event_sqme_alt_is_known
    procedure :: weight_prc_is_known => generic_event_weight_prc_is_known
    procedure :: weight_ref_is_known => generic_event_weight_ref_is_known
    procedure :: weight_alt_is_known => generic_event_weight_alt_is_known
    procedure :: excess_prc_is_known => generic_event_excess_prc_is_known

(Event base: procedures)+≡
    function generic_event_sqme_prc_is_known (event) result (flag)
        class(generic_event_t), intent(in) :: event
        logical :: flag
        flag = event%sqme_prc_known
    end function generic_event_sqme_prc_is_known

    function generic_event_sqme_ref_is_known (event) result (flag)
        class(generic_event_t), intent(in) :: event
        logical :: flag
        flag = event%sqme_ref_known
    end function generic_event_sqme_ref_is_known

    function generic_event_sqme_alt_is_known (event) result (flag)
        class(generic_event_t), intent(in) :: event
        logical :: flag
        flag = event%sqme_alt_known
    end function generic_event_sqme_alt_is_known

```

```

end function generic_event_sqme_alt_is_known

function generic_event_weight_prc_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%weight_prc_known
end function generic_event_weight_prc_is_known

```

17.1.5 Pure Virtual Methods

These procedures can only be implemented in the concrete implementation.

Output (verbose, depending on parameters).

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_write), deferred :: write

<Event base: interfaces>≡
    abstract interface
        subroutine generic_event_write (object, unit, &
            show_process, show_transforms, &
            show_decay, verbose, testflag)
        import
        class(generic_event_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: show_process
        logical, intent(in), optional :: show_transforms
        logical, intent(in), optional :: show_decay
        logical, intent(in), optional :: verbose
        logical, intent(in), optional :: testflag
        end subroutine generic_event_write
    end interface

```

Generate an event, based on a selector index `i_mci`, and optionally on an extra set of random numbers `r`. For the main bunch of random numbers that the generator needs, the event object should contain its own generator.

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_generate), deferred :: generate

<Event base: interfaces>+≡
    abstract interface
        subroutine generic_event_generate (event, i_mci, r)
        import
        class(generic_event_t), intent(inout) :: event
        integer, intent(in) :: i_mci
        real(default), dimension(:), intent(in), optional :: r
    end interface

```

```

        end subroutine generic_event_generate
    end interface

```

Alternative : inject a particle set that is supposed to represent the hard process.
How this determines the event, is dependent on the event structure, therefore
this is a deferred method.

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_set_hard_particle_set), deferred :: &
        set_hard_particle_set

<Event base: interfaces>+≡
    abstract interface
        subroutine generic_event_set_hard_particle_set (event, particle_set)
            import
            class(generic_event_t), intent(inout) :: event
            type(particle_set_t), intent(in) :: particle_set
        end subroutine generic_event_set_hard_particle_set
    end interface

```

Evaluate any expressions associated with the event. No argument needed.

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_handler), deferred :: evaluate_expressions

<Event base: interfaces>+≡
    abstract interface
        subroutine generic_event_handler (event)
            import
            class(generic_event_t), intent(inout) :: event
        end subroutine generic_event_handler
    end interface

```

Select internal parameters

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_select), deferred :: select

<Event base: interfaces>+≡
    abstract interface
        subroutine generic_event_select (event, i_mci, i_term, channel)
            import
            class(generic_event_t), intent(inout) :: event
            integer, intent(in) :: i_mci, i_term, channel
        end subroutine generic_event_select
    end interface

```

Return a pointer to the model for the currently active process.

```

<Event base: generic event: TBP>+≡
    procedure (generic_event_get_model_ptr), deferred :: get_model_ptr

<Event base: interfaces>+≡
    abstract interface
        function generic_event_get_model_ptr (event) result (model)
            import
            class(generic_event_t), intent(in) :: event

```

```

        class(model_data_t), pointer :: model
    end function generic_event_get_model_ptr
end interface

```

Return data used by external event formats.

```

(Event base: generic event: TBP)+≡
    procedure (generic_event_get_index), deferred :: get_index
    procedure (generic_event_get_fac_scale), deferred :: get_fac_scale
    procedure (generic_event_get_alpha_s), deferred :: get_alpha_s

(Event base: interfaces)+≡
    abstract interface
        function generic_event_get_index (event) result (index)
            import
            class(generic_event_t), intent(in) :: event
            integer :: index
        end function generic_event_get_index
    end interface

    abstract interface
        function generic_event_get_fac_scale (event) result (fac_scale)
            import
            class(generic_event_t), intent(in) :: event
            real(default) :: fac_scale
        end function generic_event_get_fac_scale
    end interface

    abstract interface
        function generic_event_get_alpha_s (event) result (alpha_s)
            import
            class(generic_event_t), intent(in) :: event
            real(default) :: alpha_s
        end function generic_event_get_alpha_s
    end interface

```

17.1.6 Utilities

Applying this, current event contents are marked as incomplete but are not deleted. In particular, the initialization is kept.

```

(Event base: generic event: TBP)+≡
    procedure :: reset => generic_event_reset
    procedure :: base_reset => generic_event_reset

(Event base: procedures)+≡
    subroutine generic_event_reset (event)
        class(generic_event_t), intent(inout) :: event
        call event%discard_particle_set ()
        event%sqme_ref_known = .false.
        event%sqme_prc_known = .false.
        event%sqme_alt_known = .false.
        event%weight_ref_known = .false.
        event%weight_prc_known = .false.
        event%weight_alt_known = .false.
    end subroutine

```

```

    event%excess_prc_known = .false.
end subroutine generic_event_reset

```

Pacify particle set.

```

<Event base: generic event: TBP>+≡
    procedure :: pacify_particle_set => generic_event_pacify_particle_set

<Event base: procedures>+≡
    subroutine generic_event_pacify_particle_set (event)
        class(generic_event_t), intent(inout) :: event
        if (event%has_valid_particle_set ()) call pacify (event%particle_set)
    end subroutine generic_event_pacify_particle_set

```

17.1.7 Event normalization

The parameters for event normalization. For unweighted events, NORM_UNIT is intended as default, while for weighted events, it is NORM_SIGMA.

Note: the unit test for this is in eio_data_2 below.

```

<Event base: parameters>≡
    integer, parameter, public :: NORM_UNDEFINED = 0
    integer, parameter, public :: NORM_UNIT = 1
    integer, parameter, public :: NORM_N_EVT = 2
    integer, parameter, public :: NORM_SIGMA = 3
    integer, parameter, public :: NORM_S_N = 4

```

These functions translate between the user representation and the internal one.

```

<Event base: public>+≡
    public :: event_normalization_mode
    public :: event_normalization_string

<Event base: procedures>+≡
    function event_normalization_mode (string, unweighted) result (mode)
        integer :: mode
        type(string_t), intent(in) :: string
        logical, intent(in) :: unweighted
        select case (lower_case (char (string)))

17.2 Event Sample Data

We define a simple and transparent container for (meta)data that are associated with an event sample.

```
<eio_data.f90>≡  
  <File header>  
  
  module eio_data  
  
    use kinds  
    use io_units  
    <Use strings>  
    use unit_tests  
    use diagnostics  
  
    use event_base  
  
    <Standard module head>  
  
    <EIO data: public>  
  
    <EIO data: types>  
  
    contains  
  
    <EIO data: procedures>  
  
    <EIO data: tests>  
  
  end module eio_data
```

17.2.1 Event Sample Data

These are data that apply to an event sample as a whole. They are given in an easily portable form (no fancy structure) and are used for initializing event formats.

There are two MD5 sums here. `md5sum_proc` depends only on the definition of the contributing processes. A sample with matching checksum can be rescanned with modified model parameters, beam structure etc, to recalculate observables. `md5sum_config` includes all relevant data. Rescanning a sample with matching checksum will produce identical observables. (A third checksum might be added which depends on the event sample itself. This is not needed, so far.)

If alternate weights are part of the event sample (`n_alt` nonzero), there is a configuration MD5 sum for each of them.

```
<EIO data: public>≡  
  public :: event_sample_data_t  
  
<EIO data: types>≡  
  type :: event_sample_data_t  
    character(32) :: md5sum_prc = ""  
    character(32) :: md5sum_cfg = ""  
    logical :: unweighted = .true.
```

```

logical :: negative_weights = .false.
integer :: norm_mode = NORM_UNDEFINED
integer :: n_beam = 0
integer, dimension(2) :: pdg_beam = 0
real(default), dimension(2) :: energy_beam = 0
integer :: n_proc = 0
integer :: n_evt = 0
integer :: split_n_evt = 0

17.3 Abstract I/O Handler

This module defines an abstract object for event I/O and the associated methods.

There are **output** and **input** methods which write or read a single event from/to the I/O stream, respectively. The I/O stream itself may be a file, a common block, or an externally linked structure, depending on the concrete implementation.

A **write** method prints the current content of the implementation-dependent event record in human-readable form.

The **init_in/init_out** and **final** prepare and finalize the I/O stream, respectively. There is also a **switch_inout** method which turns an input stream into an output stream where events can be appended.

Optionally, output files can be split in chunks of well-defined size. The **split_out** method takes care of this.

17.3.1 Type

We can assume that most implementations will need the file extension as a fixed string and, if they support file splitting, the current file index.

The fallback model is useful for implementations that are able to read unknown files which may contain hadrons etc., not in the current hard-interaction model.

```

<EIO base: public>≡
    public :: eio_t

<EIO base: types>≡
    type, abstract :: eio_t
        type(string_t) :: sample
        type(string_t) :: extension
        type(string_t) :: filename
        logical :: split = .false.
        integer :: split_n_evt = 0
        integer :: split_index = 0
        class(model_data_t), pointer :: fallback_model => null ()
    contains
        <EIO base: eio: TBP>
    end type eio_t

```

Write to screen. If possible, this should display the contents of the current event, i.e., the last one that was written or read.

```

<EIO base: eio: TBP>≡
    procedure (eio_write), deferred :: write

<EIO base: interfaces>≡
    abstract interface
        subroutine eio_write (object, unit)
            import
            class(eio_t), intent(in) :: object
            integer, intent(in), optional :: unit
        end subroutine eio_write
    end interface

```

Finalize. This should write/read footer data and close input/output channels.

```

(EIO base: eio: TBP)+≡
  procedure (eio_final), deferred :: final

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_final (object)
      import
      class(eio_t), intent(inout) :: object
    end subroutine eio_final
  end interface

```

Determine splitting parameters from the event sample data.

```

(EIO base: eio: TBP)+≡
  procedure :: set_splitting => eio_set_splitting

(EIO base: procedures)≡
  subroutine eio_set_splitting (eio, data)
    class(eio_t), intent(inout) :: eio
    type(event_sample_data_t), intent(in) :: data
    eio%split = data%split_n_evt > 0
    if (eio%split) then
      eio%split_n_evt = data%split_n_evt

      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
    end subroutine eio_init_out
  end interface

```

Initialize for input. We provide process names. This should open an event file if appropriate and read header data. The `md5sum` can be used to check the integrity of the configuration, it it provides a checksum to compare with. In case the extension has changed the extension is also given as an argument.

The `data` argument is `intent(inout)`: we may read part of it and keep other parts and/or check them against the data in the file.

```

(EIO base: eio: TBP)+≡
  procedure (eio_init_in), deferred :: init_in

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_init_in (eio, sample, data, success, extension)
      import
      class(eio_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(event_sample_data_t), intent(inout), optional :: data
      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
    end subroutine eio_init_in
  end interface

```

Re-initialize for output. This should change the status of any event file from input to output and position it for appending new events.

```

(EIO base: eio: TBP)+≡
  procedure (eio_switch_inout), deferred :: switch_inout

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_switch_inout (eio, success)
      import
      class(eio_t), intent(inout) :: eio
      logical, intent(out), optional :: success
    end subroutine eio_switch_inout
  end interface

```

This is similar: split the output, i.e., close the current file and open a new one. The default implementation does nothing. For the feature to work, an implementation must override this.

```

<EIO base: eio: TBP>+≡
  procedure :: split_out => eio_split_out

<EIO base: procedures>+≡
  subroutine eio_split_out (eio)
    class(eio_t), intent(inout) :: eio
  end subroutine eio_split_out

```

Output an event. All data can be taken from the **event** record. The index **i_prc** identifies the process among the processes that are contained in the current sample. The **reading** flag, if present, indicates that the event was read from file, not generated.

```

<EIO base: eio: TBP>+≡
  procedure (eio_output), deferred :: output

<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_output (eio, event, i_prc, reading, pacify)
      import
      class(eio_t), intent(inout) :: eio
      class(generic_event_t), intent(in), target :: event
      integer, intent(in) :: i_prc
      logical, intent(in), optional :: reading, pacify
    end subroutine eio_output
  end interface

```

Input an event. This should fill all event data that cannot be inferred from the associated process.

The input is broken down into two parts. First we read the **i_prc** index. So we know which process to expect in the subsequent event. If we have reached end of file, we also will know. Then, we read the event itself.

The parameter **iostat** is supposed to be set as the Fortran standard requires, negative for EOF and positive for error.

```

<EIO base: eio: TBP>+≡
  procedure (eio_input_i_prc), deferred :: input_i_prc
  procedure (eio_input_event), deferred :: input_event

<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_input_i_prc (eio, i_prc, iostat)
      import
      class(eio_t), intent(inout) :: eio
      integer, intent(out) :: i_prc
      integer, intent(out) :: iostat
    end subroutine eio_input_i_prc
  end interface

  abstract interface
    subroutine eio_input_event (eio, event, iostat)
      import

```

```

        class(eio_t), intent(inout) :: eio
        class(generic_event_t), intent(inout), target :: event
        integer, intent(out) :: iostat
    end subroutine eio_input_event
end interface

```

17.3.2 Unit tests

```

<EIO base: public>+≡
    public :: eio_base_test

<EIO base: tests>≡
    subroutine eio_base_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <EIO base: execute tests>
    end subroutine eio_base_test

```

The caller has to provide procedures that prepare and cleanup the test environment. They depend on modules that are not available here.

```

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_prepare_event (event, unweighted, n_alt)
            import
            class(generic_event_t), intent(inout), pointer :: event
            logical, intent(in), optional :: unweighted
            integer, intent(in), optional :: n_alt
        end subroutine eio_prepare_event
    end interface

    abstract interface
        subroutine eio_cleanup_event (event)
            import
            class(generic_event_t), intent(inout), pointer :: event
        end subroutine eio_cleanup_event
    end interface

```

We store pointers to the test-environment handlers as module variables. This allows us to call them from the test routines themselves, which don't allow for extra arguments.

```

<EIO base: public>+≡
    public :: eio_prepare_test, eio_cleanup_test

<EIO base: test types>≡
    procedure(eio_prepare_event), pointer :: eio_prepare_test => null ()
    procedure(eio_cleanup_event), pointer :: eio_cleanup_test => null ()

```

Similarly, for the fallback (hadron) model that some eio tests require:

```

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_prepare_model (model)

```

```

import
class(model_data_t), intent(inout), pointer :: model
end subroutine eio_prepare_model
end interface

abstract interface
subroutine eio_cleanup_model (model)
import
class(model_data_t), intent(inout), pointer :: model
end subroutine eio_cleanup_model
end interface

<EIO base: public>+=
public :: eio_prepare_fallback_model, eio_cleanup_fallback_model

<EIO base: test types>+=
procedure(eio_prepare_model), pointer :: eio_prepare_fallback_model => null ()
procedure(eio_cleanup_model), pointer :: eio_cleanup_fallback_model => null ()

```

Test type for event I/O

The contents simulate the contents of an external file. We have the `sample` string as the file name and the array of momenta `event_p` as the list of events. The second index is the event index. The `event_i` component is the pointer to the current event, `event_n` is the total number of stored events.

```

<EIO base: test types>+=
type, extends (eio_t) :: eio_test_t
integer :: event_n = 0
integer :: event_i = 0
integer :: i_prc = 0
type(vector4_t), dimension(:,,:), allocatable :: event_p
contains
<EIO base: eio test: TBP>
end type eio_test_t

```

Write to screen. Pretend that this is an actual event format.

```

<EIO base: eio test: TBP>=
procedure :: write => eio_test_write

<EIO base: procedures>+=
subroutine eio_test_write (object, unit)
class(eio_test_t), intent(in) :: object
integer, intent(in), optional :: unit
integer :: u, i
u = given_output_unit (unit)
write (u, "(1x,A)") "Test event stream"
if (object%event_i /= 0) then
write (u, "(1x,A,I0,A)") "Event #", object%event_i, ":"
do i = 1, size (object%event_p, 1)
call vector4_write (object%event_p(i, object%event_i), u)
end do
end if
end if

```

```
end subroutine eio_test_write
```

Finalizer. For the test case, we just reset the event count, but keep the stored “events”. For the real implementations, the events would be stored on an external medium, so we would delete the object contents.

```
<EIO base: eio test: TBP>+=
  procedure :: final => eio_test_final

<EIO base: procedures>+=
  subroutine eio_test_final (object)
    class(eio_test_t), intent(inout) :: object
    object%event_i = 0
  end subroutine eio_test_final
```

Initialization: We store the process IDs and the energy from the beam-data object. We also allocate the momenta (i.e., the simulated event record) for a fixed maximum size of 10 events, 2 momenta each. There is only a single process.

```
<EIO base: eio test: TBP>+=
  procedure :: init_out => eio_test_init_out

<EIO base: procedures>+=
  subroutine eio_test_init_out (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(in), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    eio%sample = sample
    eio%event_n = 0
    eio%event_i = 0
    allocate (eio%event_p (2, 10))
    if (present (success)) success = .true.
  end subroutine eio_test_init_out
```

Initialization for input. Nothing to do for the test type.

```
<EIO base: eio test: TBP>+=
  procedure :: init_in => eio_test_init_in

<EIO base: procedures>+=
  subroutine eio_test_init_in (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(inout), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    if (present (success)) success = .true.
  end subroutine eio_test_init_in
```

Switch from output to input. Again, nothing to do for the test type.

```
<EIO base: eio test: TBP>+=
  procedure :: switch_inout => eio_test_switch_inout
```

```

<EIO base: procedures>+≡
  subroutine eio_test_switch_inout (eio, success)
    class(eio_test_t), intent(inout) :: eio
    logical, intent(out), optional :: success
    if (present (success)) success = .true.
  end subroutine eio_test_switch_inout

```

Output. Increment the event counter and store the momenta of the current event.

```

<EIO base: eio test: TBP>+≡
  procedure :: output => eio_test_output

<EIO base: procedures>+≡
  subroutine eio_test_output (eio, event, i_prc, reading, pacify)
    class(eio_test_t), intent(inout) :: eio
    class(generic_event_t), intent(in), target :: event
    logical, intent(in), optional :: reading, pacify
    integer, intent(in) :: i_prc
    type(particle_set_t), pointer :: pset
    type(particle_t) :: prt
    eio%event_n = eio%event_n + 1
    eio%event_i = eio%event_n
    eio%i_prc = i_prc
    pset => event%get_particle_set_ptr ()
    prt = particle_set_get_particle (pset, 3)
    eio%event_p(1, eio%event_i) = particle_get_momentum (prt)
    prt = particle_set_get_particle (pset, 4)
    eio%event_p(2, eio%event_i) = particle_get_momentum (prt)
  end subroutine eio_test_output

```

Input. Increment the event counter and retrieve the momenta of the current event. For the test case, we do not actually modify the current event.

```

<EIO base: eio test: TBP>+≡
  procedure :: input_i_prc => eio_test_input_i_prc
  procedure :: input_event => eio_test_input_event

<EIO base: procedures>+≡
  subroutine eio_test_input_i_prc (eio, i_prc, iostat)
    class(eio_test_t), intent(inout) :: eio
    integer, intent(out) :: i_prc
    integer, intent(out) :: iostat

end subroutine eio_checkpoints_1

```

17.5 Event Weight Output

This is an output-only format. For each event, we print the indices that identify process, process part (MCI group), and term. As numerical information we print the squared matrix element (trace) and the event weight.

```

Output an event. Write first the event indices, then weight and two values of the squared matrix element: `sqme_ref` is the value stored in the event record, and `sqme_prc` is the one stored in the process instance. (They can differ: when recalculating, the former is read from file and the latter is the result of the new calculation.)

For the alternative entries, the `sqme` value is always obtained by a new calculation, and thus qualifies as `sqme_prc`.

17.7 HEP Common Blocks

Long ago, to transfer data between programs one had to set up a common block and link both programs as libraries to the main executable. The HEP community standardizes several of those common blocks.

The modern way of data exchange uses data files with standard formats. However, the LHEF standard data format derives from a common block (actually, two).

WHIZARD used to support those common blocks, and LHEF was implemented via writing/reading blocks. We still keep this convention, but intend to eliminate common blocks (or any other static storage) from the workflow in the future. This will gain flexibility towards concurrent running of program images.

We encapsulate everything here in a module. The module holds the variables which are part of the common block. To access the common block variables, we just have to `use` this module. (They are nevertheless in the common block, since external software may access it in this way.)

Note: This code is taken essentially unchanged from WHIZARD 2.1 and does not (yet) provide unit tests.

```

⟨HEP common: common blocks⟩

contains

⟨HEP common: procedures⟩

end module hep_common

17.7.1 Event characteristics

The maximal number of particles in an event record.

⟨HEP common: parameters⟩≡
integer, parameter, public :: MAXNUP = 500

The number of particles in this event.

⟨HEP common: variables⟩≡
integer, public :: NUP

The process ID for this event.

⟨HEP common: variables⟩+≡
integer, public :: IDPRUP

The weight of this event (± 1 for unweighted events).

⟨HEP common: variables⟩+≡
double precision, public :: XWGTUP

The factorization scale that is used for PDF calculation (-1 if undefined).

⟨HEP common: variables⟩+≡
double precision, public :: SCALUP

The QED and QCD couplings α used for this event (-1 if undefined).

⟨HEP common: variables⟩+≡
double precision, public :: AQEDUP
double precision, public :: AQCDUP

17.7.2 Particle characteristics

The PDG code:

⟨HEP common: variables⟩+≡
integer, dimension(MAXNUP) :: IDUP

The status code. Incoming: -1 , outgoing: $+1$. Intermediate t-channel propagator: -2 (currently not used by WHIZARD). Intermediate resonance whose mass should be preserved: 2 . Intermediate resonance for documentation: 3 (currently not used). Beam particles: -9 .

⟨HEP common: variables⟩+≡
integer, dimension(MAXNUP), public :: ISTUP

Index of first and last mother.

⟨HEP common: variables⟩+≡
integer, dimension(2,MAXNUP), public :: MOTHUP

Color line index of the color and anticolor entry for the particle. The standard recommends using large numbers; we start from MAXNUP+1.

⟨HEP common: variables⟩+≡
integer, dimension(2,MAXNUP), public :: ICOLUP

Momentum, energy, and invariant mass: (p_x, p_y, p_z, E, M) . For space-like particles, M is the negative square root of the absolute value of the invariant mass.

$\langle \text{HEP common: variables} \rangle + \equiv$
`double precision, dimension(5,MAXNUP), public :: PUP`

Invariant lifetime (distance) from production to decay in mm.

$\langle \text{HEP common: variables} \rangle + \equiv$
`double precision, dimension(MAXNUP), public :: VTIMUP`

Cosine of the angle between the spin-vector and a particle and the 3-momentum of its mother, given in the lab frame. If undefined/unpolarized: 9.

$\langle \text{HEP common: variables} \rangle + \equiv$
`double precision, dimension(MAXNUP), public :: SPINUP`

17.7.3 The HEPRUP common block

This common block is filled once per run.

Run characteristics

The maximal number of different processes.

$\langle \text{HEP common: parameters} \rangle + \equiv$
`integer, parameter, public :: MAXPUP = 100`

The beam PDG codes.

$\langle \text{HEP common: variables} \rangle + \equiv$
`integer, dimension(2), public :: IDBMUP`

The beam energies in GeV.

$\langle \text{HEP common: variables} \rangle + \equiv$
`double precision, dimension(2), public :: EBMUP`

The PDF group and set for the two beams. (Undefined: use -1 ; LHAPDF: use group = 0).

$\langle \text{HEP common: variables} \rangle + \equiv$
`integer, dimension(2), public :: PDFGUP`
`integer, dimension(2), public :: PDFSUP`

The (re)weighting model. 1: events are weighted, the shower generator (SHG) selects processes according to the maximum weight (in pb) and unweights events. 2: events are weighted, the SHG selects processes according to their cross section (in pb) and unweights events. 3: events are unweighted and simply run through the SHG. 4: events are weighted, and the SHG keeps the weight. Negative numbers: negative weights are allowed (and are reweighted to ± 1 by the SHG, if allowed).

WHIZARD only supports modes 3 and 4, as the SHG is not given control over process selection. This is consistent with writing events to file, for offline showering.

$\langle \text{HEP common: variables} \rangle + \equiv$
`integer, public :: IDWTUP`

The number of different processes.

$\langle \text{HEP common: variables} \rangle + \equiv$
`integer, public :: NPRUP`

Process characteristics

Cross section and error in pb. (Cross section is needed only for IDWTUP = 2, so here both values are given for informational purposes only.)

```
<HEP common: variables>+≡  
    double precision, dimension(MAXPUP), public :: XSECUP  
    double precision, dimension(MAXPUP), public :: XERRUP
```

Maximum weight, i.e., the maximum value that XWGTUP can take. Also unused for the supported weighting models. It is ± 1 for unweighted events.

```
<HEP common: variables>+≡  
    double precision, dimension(MAXPUP), public :: XMAXUP
```

Internal ID of the selected process, matches IDPRUP below.

```
<HEP common: variables>+≡  
    integer, dimension(MAXPUP), public :: LPRUP
```

The common block

```
<HEP common: common blocks>≡  
    common /HEPRUP/ &  
        IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP, &  
        XSECUP, XERRUP, XMAXUP, LPRUP  
    save /HEPRUP/
```

Fill the run characteristics of the common block. The initialization sets the beam properties, number of processes, and weighting model.

```
<HEP common: public>≡  
    public :: heprup_init  
  
<HEP common: procedures>≡  
    subroutine heprup_init &  
        (beam_pdg, beam_energy, n_processes, unweighted, negative_weights)  
        integer, dimension(2), intent(in) :: beam_pdg  
        real(default), dimension(2), intent(in) :: beam_energy  
        integer, intent(in) :: n_processes  
        logical, intent(in) :: unweighted  
        logical, intent(in) :: negative_weights  
        IDBMUP = beam_pdg  
        EBMUP = beam_energy  
        PDFGUP = -1  
        PDFSUP = -1  
        if (unweighted) then  
            IDWTUP = 3  
        else  
            IDWTUP = 4  
        end if  
        if (negative_weights) IDWTUP = - IDWTUP  
        NPRUP = n_processes  
    end subroutine heprup_init
```

Extract parameters from the common block. We leave it to the caller to specify which parameters it actually needs.

PDFGUP and PDFSUP are not extracted. IDWTUP=1,2 are not supported by WHIZARD, but correspond to weighted events.

```

<HEP common: public>+≡
  public :: heprup_get_run_parameters

<HEP common: procedures>+≡
  subroutine heprup_get_run_parameters &
    (beam_pdg, beam_energy, n_processes, unweighted, negative_weights)
    integer, dimension(2), intent(out), optional :: beam_pdg
    real(default), dimension(2), intent(out), optional :: beam_energy
    integer, intent(out), optional :: n_processes
    logical, intent(out), optional :: unweighted
    logical, intent(out), optional :: negative_weights
    if (present (beam_pdg)) beam_pdg = IDBMUP
    if (present (beam_energy)) beam_energy = EBMUP
    if (present (n_processes)) n_processes = NPRUP
    if (present (unweighted)) then
      select case (abs (IDWTUP))
        case (3)
          unweighted = .true.
        case (4)
          unweighted = .false.
        case (1,2) ! not supported by WHIZARD
          unweighted = .false.
        case default
          call msg_fatal ("HEPRUP: unsupported IDWTUP value")
      end select
    end if
    if (present (negative_weights)) then
      negative_weights = IDWTUP < 0
    end if
  end subroutine heprup_get_run_parameters

```

Specify PDF set info. Since we support only LHAPDF, the group entry is zero.

```

<HEP common: public>+≡
  public :: heprup_set_lhapdf_id

<HEP common: procedures>+≡
  subroutine heprup_set_lhapdf_id (i_beam, pdf_id)
    integer, intent(in) :: i_beam, pdf_id
    PDFGUP(i_beam) = 0
    PDFSUP(i_beam) = pdf_id
  end subroutine heprup_set_lhapdf_id

```

Fill the characteristics for a particular process. Only the process ID is mandatory. Note that WHIZARD computes cross sections in fb, so we have to rescale to pb. The maximum weight is meaningless for unweighted events.

```

<HEP common: public>+≡
  public :: heprup_set_process_parameters

```

```

        write (u, "(3x,A6,' = ',G12.5,1x,G12.5,8x,A)") "EBMUP ", EBMUP, &
            "Energy of beams in GeV"
        write (u, "(3x,A6,' = ',I9,3x,1x,I9,3x,8x,A)") "PDFGUP", PDFGUP, &
            "PDF author group [-1 = undefined]"
        write (u, "(3x,A6,' = ',I9,3x,1x,I9,3x,8x,A)") "PDFSUP", PDFSUP, &
            "PDF set ID [-1 = undefined]"
        write (u, "(3x,A6,' = ',I9,3x,1x,9x,3x,8x,A)") "IDWTUP", IDWTUP, &
            "LHA code for event weight mode"
        write (u, "(3x,A6,' = ',I9,3x,1x,9x,3x,8x,A)") "NPRUP ", NPRUP, &
            "Number of user subprocesses"
        do i = 1, NPRUP
            write (u, "(1x,A,I0)") "Subprocess #", i
            write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XSECUP", XSECUP(i), &
                "Cross section in pb"
            write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XERRUP", XERRUP(i), &
                "Cross section error in pb"
            write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XMAXUP", XMAXUP(i), &
                "Maximum event weight (cf. IDWTUP)"
            write (u, "(3x,A6,' = ',I9,3x,1x,12x,8x,A)") "LPRUP ", LPRUP(i), &
                "Subprocess ID"
        end do
    end subroutine heprup_write_verbose

```

17.7.5 Run parameter output (other formats)

This routine writes the initialization block according to the LHEF standard. It uses the current contents of the HEPRUP block.

```

<HEP common: public>+≡
    public :: heprup_write_lhef

```

```

<HEP common: procedures>+≡
subroutine heprup_write_lhef (unit)
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
    IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
  do i = 1, NPRUP
    write (u, "(3(1x,ES17.10),1x,I0)") &
      XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
  end do
end subroutine heprup_write_lhef

```

This routine is a complete dummy at the moment. It uses the current contents of the HEPRUP block. At the end, it should depend on certain input flags for the different ASCII event formats.

```

<HEP common: public>+≡
public :: heprup_write_ascii

<HEP common: procedures>+≡
subroutine heprup_write_ascii (unit)
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
    IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
  do i = 1, NPRUP
    write (u, "(3(1x,ES17.10),1x,I0)") &
      XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
  end do
end subroutine heprup_write_ascii

```

Run parameter input (LHEF)

In a LHEF file, the parameters are written in correct order on separate lines, but we should not count on the precise format. List-directed input should just work.

```

<HEP common: public>+≡
public :: heprup_read_lhef

<HEP common: procedures>+≡
subroutine heprup_read_lhef (u)
  integer, intent(in) :: u
  integer :: i
  read (u, *) &
    IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
  do i = 1, NPRUP
    read (u, *) &
      XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
  end do
end subroutine heprup_read_lhef

```

17.7.6 The HEPEUP common block

```
<HEP common: common blocks>+≡
common /HEPEUP/ &
    NUP, IDPRUP, XWGTUP, SCALUP, AQEDUP, AQCDUP, &
    IDUP, ISTUP, MOTHUP, ICOLUP, PUP, VTIMUP, SPINUP
save /HEPEUP/
```

Initialization

Fill the event characteristics of the common block. The initialization sets only the number of particles and initializes the rest with default values. The other routine sets the optional parameters.

```
<HEP common: public>+≡
public :: hepeup_init
public :: hepeup_set_event_parameters

<HEP common: procedures>+≡
subroutine hepeup_init (n_tot)
    integer, intent(in) :: n_tot
    NUP = n_tot
    IDPRUP = 0
    XWGTUP = 1
    SCALUP = -1
    AQEDUP = -1
    AQCDUP = -1
end subroutine hepeup_init

subroutine hepeup_set_event_parameters &
    (proc_id, weight, scale, alpha_qed, alpha_qcd)
    integer, intent(in), optional :: proc_id
    real(default), intent(in), optional :: weight, scale, alpha_qed, alpha_qcd
    if (present (proc_id)) IDPRUP = proc_id
    if (present (weight)) XWGTUP = weight
    if (present (scale)) SCALUP = scale
    if (present (alpha_qed)) AQEDUP = alpha_qed
    if (present (alpha_qcd)) AQCDUP = alpha_qcd
end subroutine hepeup_set_event_parameters
```

Extract event information. The caller determines the parameters.

```
<HEP common: public>+≡
public :: hepeup_get_event_parameters

<HEP common: procedures>+≡
subroutine hepeup_get_event_parameters &
    (proc_id, weight, scale, alpha_qed, alpha_qcd)
    integer, intent(out), optional :: proc_id
    real(default), intent(out), optional :: weight, scale, alpha_qed, alpha_qcd
    if (present (proc_id)) proc_id = IDPRUP
    if (present (weight)) weight = XWGTUP
    if (present (scale)) scale = SCALUP
    if (present (alpha_qed)) alpha_qed = AQEDUP
    if (present (alpha_qcd)) alpha_qcd = AQCDUP
```

```
end subroutine hepeup_get_event_parameters
```

Particle data

Below we need the particle status codes which are actually defined in the `subevents` module.

Set the entry for a specific particle. All parameters are set with the exception of lifetime and spin, where default values are stored.

```
<HEP common: public>+≡
public :: hepeup_set_particle

<HEP common: procedures>+≡
subroutine hepeup_set_particle (i, pdg, status, parent, col, p, m2)
  integer, intent(in) :: i
  integer, intent(in) :: pdg, status
  integer, dimension(:), intent(in) :: parent
  type(vector4_t), intent(in) :: p
  integer, dimension(2), intent(in) :: col
  real(default), intent(in) :: m2
  if (i > MAXNUP) then
    call msg_error (arr=[ &
      var_str ("Too many particles in HEPEUP common block. " // &
        "If this happened "), &
      var_str ("during event output, your events will be " // &
        "invalid; please consider "), &
      var_str ("switching to a modern event format like HEPMC. " // &
        "If you are not "), &
      var_str ("using an old, HEPEUP based format and " // &
        "nevertheless get this error,"), &
      var_str ("please notify the WHIZARD developers,") ])
    return
  end if
  IDUP(i) = pdg
  select case (status)
    case (PRT_BEAM);          ISTUP(i) = -9
    case (PRT_INCOMING);      ISTUP(i) = -1
    case (PRT_BEAM_REMNANT);  ISTUP(i) = 3
    case (PRT_OUTGOING);      ISTUP(i) = 1
    case (PRT_RESONANT);      ISTUP(i) = 2
    case (PRT_VIRTUAL);       ISTUP(i) = 3
    case default;             ISTUP(i) = 0
  end select
  select case (size (parent))
    case (0);      MOTHUP(:,i) = 0
    case (1);      MOTHUP(1,i) = parent(1); MOTHUP(2,i) = 0
    case default;  MOTHUP(:,i) = [ parent(1), parent(size (parent)) ]
  end select
  if (col(1) > 0) then
    ICOLUP(1,i) = 500 + col(1)
  else
    ICOLUP(1,i) = 0
  end if
  if (col(2) > 0) then
```

```

        ICOLUP(2,i) = 500 + col(2)
    else
        ICOLUP(2,i) = 0
    end if
    PUP(1:3,i) = vector3_get_components (space_part (p))
    PUP(4,i) = energy (p)
    PUP(5,i) = sign (sqrt (abs (m2)), m2)
    VTIMUP(i) = 0
    SPINUP(i) = 9
end subroutine hepeup_set_particle

```

Set the lifetime, actually $c\tau$ measured in mm, where τ is the invariant lifetime.

```

<HEP common: public>+≡
    public :: hepeup_set_particle_lifetime

<HEP common: procedures>+≡
    subroutine hepeup_set_particle_lifetime (i, lifetime)
        integer, intent(in) :: i
        real(default), intent(in) :: lifetime
        VTIMUP(i) = lifetime
    end subroutine hepeup_set_particle_lifetime

```

Set the particle spin entry. We need the cosine of the angle of the spin axis with respect to the three-momentum of the parent particle.

If the particle has a full polarization density matrix given, we need the particle momentum and polarization as well as the mother-particle momentum. The polarization is transformed into a spin vector (which is sensible only for spin-1/2 or massless particles), which then is transformed into the lab frame (by a rotation of the 3-axis to the particle momentum axis). Finally, we compute the scalar product of this vector with the mother-particle three-momentum.

This puts severe restrictions on the applicability of this definition, and Lorentz invariance is lost. Unfortunately, the Les Houches Accord requires this computation.

```

<HEP common: public>+≡
    public :: hepeup_set_particle_spin

<HEP common: interfaces>≡
    interface hepeup_set_particle_spin
        module procedure hepeup_set_particle_spin_pol
    end interface

<HEP common: procedures>+≡
    subroutine hepeup_set_particle_spin_pol (i, p, pol, p_mother)
        integer, intent(in) :: i
        type(vector4_t), intent(in) :: p
        type(polarization_t), intent(in) :: pol
        type(vector4_t), intent(in) :: p_mother
        type(vector3_t) :: s3, p3
        type(vector4_t) :: s4
        s3 = vector3_moving (polarization_get_axis (pol))
        p3 = space_part (p)
        s4 = rotation_to_2nd (3, p3) * vector4_moving (0._default, s3)
        SPINUP(i) = enclosed_angle_ct (s4, p_mother)
    end subroutine hepeup_set_particle_spin_pol

```

```
end subroutine hepeup_set_particle_spin_pol
```

Extract particle data. The caller decides which ones to retrieve.

Status codes: beam remnants share the status code with virtual particles. However, for the purpose of WHIZARD we should identify them. We use the PDG code for this.

```

17.7.7 The HEPEVT common block

For the LEP Monte Carlos, a standard common block has been proposed in AKV89. We strongly recommend its use. (The description is an abbreviated transcription of AKV89, Vol. 3, pp. 327-330).

NMXHEP is the maximum number of entries:

```
<HEP common: variables>+≡
integer, parameter :: NMXHEP = 4000
```

NEVHEP is normally the event number, but may take special values as follows:

0 the program does not keep track of event numbers. -1 a special initialization record. -2 a special final record.

```
<HEP common: variables>+≡
integer :: NEVHEP
```

NHEP holds the number of entries for this event.

```
<HEP common: variables>+≡
integer :: NHEP
```

The entry ISTHEP(N) gives the status code for the Nth entry, with the following semantics: 0 a null entry. 1 an existing entry, which has not decayed or fragmented. 2 a decayed or fragmented entry, which is retained for event history information. 3 documentation line. 4- 10 reserved for future standards. 11-200 at the disposal of each model builder. 201- at the disposal of users.

```
<HEP common: variables>+≡
integer, dimension(NMXHEP) :: ISTHEP
```

The Particle Data Group has proposed standard particle codes, which are to be stored in IDHEP(N).

```
<HEP common: variables>+≡
integer, dimension(NMXHEP) :: IDHEP
```

JMOHEP(1,N) points to the mother of the Nth entry, if any. It is set to zero for initial entries. JMOHEP(2,N) points to the second mother, if any.

```
<HEP common: variables>+≡
integer, dimension(2, NMXHEP) :: JMOHEP
```

JDAHEP(1,N) and JDAHEP(2,N) point to the first and last daughter of the Nth entry, if any. These are zero for entries which have not yet decayed. The other daughters are stored in between these two.

```
<HEP common: variables>+≡
integer, dimension(2, NMXHEP) :: JDAHEP
```

In PHEP we store the momentum of the particle, more specifically this means that PHEP(1,N), PHEP(2,N), and PHEP(3,N) contain the momentum in the x , y , and z direction (as defined by the machine people), measured in GeV/c. PHEP(4,N) contains the energy in GeV and PHEP(5,N) the mass in GeV/ c^2 . The latter may be negative for spacelike partons.

```
<HEP common: variables>+≡
    double precision, dimension(5, NMXHEP) :: PHEP
```

Finally VHEP is the place to store the position of the production vertex. VHEP(1,N), VHEP(2,N), and VHEP(3,N) contain the x , y , and z coordinate (as defined by the machine people), measured in mm. VHEP(4,N) contains the production time in mm/c.

```
<HEP common: variables>+≡
    double precision, dimension(4, NMXHEP) :: VHEP
```

As an amendment to the proposed standard common block HEPEVT, we also have a polarisation common block HEPSPN, as described in AKV89. SHEP(1,N), SHEP(2,N), and SHEP(3,N) give the x , y , and z component of the spinvector s of a fermion in the fermions restframe.

Furthermore, we add the polarization of the corresponding outgoing particles:

```
<HEP common: variables>+≡
    integer, dimension(NMXHEP) :: hepevt_pol
```

By convention, SHEP(4,N) is always 1. All this is taken from StdHep 4.06 manual and written using Fortran90 conventions.

```
<HEP common: common blocks>+≡
    common /HEPEVT/ &
        NEVHEP, NHEP, ISTHEP, IDHEP, &
        JMOHEP, JDAHEP, PHEP, VHEP
    save /HEPEVT/
```

Here we store HEPEVT parameters of the WHIZARD 1 realization which are not part of the HEPEVT common block.

```
<HEP common: variables>+≡
    integer :: hepevt_n_out, hepevt_n_remnants
```

```
<HEP common: variables>+≡
    double precision :: hepevt_weight, hepevt_function_value
    double precision :: hepevt_function_ratio
```

Filling HEPEVT: If the event count is not provided, set NEVHEP to zero. If the event count is -1 or -2, the record corresponds to initialization and finalization, and the event is irrelevant.

Note that the event count may be larger than 2^{31} (2 GEvents). In that case, cut off the upper bits since NEVHEP is probably limited to default integer.

```
<HEP common: public>+≡
    public :: hepevt_init
    public :: hepevt_set_event_parameters
```

<HEP common: procedures>+≡

```

subroutine hepevt_init (n_tot, n_out)
  integer, intent(in) :: n_tot, n_out
  NHEP                = n_tot
  NEVHEP              = 0
  hepevt_n_out        = n_out
  hepevt_n_remnants   = 0
  hepevt_weight        = 1
  hepevt_function_value = 0
  hepevt_function_ratio = 1
end subroutine hepevt_init

subroutine hepevt_set_event_parameters &
  (weight, function_value, function_ratio, i_evt)
  integer, intent(in), optional :: i_evt
  real(default), intent(in), optional :: weight, function_value, &
    function_ratio
  if (present (i_evt)) NEVHEP = i_evt
  if (present (weight)) hepevt_weight = weight
  if (present (function_value)) hepevt_function_value = &
    function_value
  if (present (function_ratio)) hepevt_function_ratio = &
    function_ratio
end subroutine hepevt_set_event_parameters

```

Set the entry for a specific particle. All parameters are set with the exception of lifetime and spin, where default values are stored.

<HEP common: public>+≡

        end do
    end subroutine hepeup_write_lha

```

```
end subroutine hepeup_write_lha
```

This routine writes event output according to the HEPEVT standard. It uses the current contents of the HEPEVT block and some additional parameters according to the standard in WHIZARD 1. For the long ASCII format, the value of the sample function (i.e. the product of squared matrix element, structure functions and phase space factor is printed out). The option of reweighting matrix elements with respect to some reference cross section is not implemented in WHIZARD 2 for this event format, therefore the second entry in the long ASCII format (the function ratio) is always one. The ATHENA format is an implementation of the HEPEVT format that is readable by the ATLAS ATHENA software framework. It is very similar to the WHIZARD 1 HEPEVT format, except that it contains an event counter, a particle counter inside the event, and has the HEPEVT ISTHEP status before the PDG code. The MOKKA format is a special ASCII format that contains the information to be parsed to the MOKKA LC fast simulation software.

17.7.11 Data Transfer: particle sets

The WHIZARD format for handling particle data in events is `particle_set_t`. We have to interface this to the common blocks.

We first create a new particle set that contains only the particles that are supported by the LHEF format. These are: beam, incoming, resonant, outgoing. We drop particles with unknown, virtual or beam-remnant status.

From this set we fill the common block. Event information such as process ID and weight is not transferred here; this has to be done by the caller. The spin information is set only if the particle has a unique mother, and if its polarization is fully defined.

```
(HEP common: public)+≡
    public :: hepeup_from_particle_set

(HEP common: procedures)+≡
    subroutine hepeup_from_particle_set (particle_set, keep_beams)
        type(particle_set_t), intent(in), target :: particle_set

        end do
        call particle_set_final (pset_hepevt)
    end subroutine hepeup_from_particle_set
```

Input. The particle set should be allocated properly, but we replace the particle contents.

If there are no beam particles in the event, we try to reconstruct beam particles and beam remnants. We assume for simplicity that the beam particles, if any, are the first two particles. If they are absent, the first two particles should

be the incoming partons.

```

<HEP common: public>+≡
    public :: hepeup_to_particle_set

    else
        call handle_beams (prt)
    end if
    call particle_set_replace (particle_set, prt)
end subroutine hepeup_to_particle_set

```

Beams and beam remnants require a special handling. WHIZARD's interactions are set up such that in the list of children of beam particles, the remnant comes before the interacting parton. To enforce this, we may have to reorder things.

The beam particles will always be the first two particles.

```

<HEP common: procedures>+≡
subroutine handle_beams (prt)
    type(particle_t), dimension(:), intent(inout) :: prt
    integer :: i
    integer, dimension(2) :: child
    do i = 1, 2
        select case (particle_get_status (prt(i)))
        case (PRT_BEAM)
            child = particle_get_children (prt(i))
            if (particle_get_status (prt(child(2)))) == PRT_BEAM_REMNANT) then
                call particle_set_children (prt(i), child([2,1]))
            end if
        end select
    end do
end subroutine handle_beams

```

The HEPEVT common block is quite similar, but does contain less information, e.g. no color flows (it was LEP time). The spin information is set only if the particle has a unique mother, and if its polarization is fully defined.

```

<HEP common: public>+≡

17.8 HEP Common and Events

This is a separate module that manages data exchange between the common blocks and `event_t` objects. We separate this from the previous module in order to avoid a circular module dependency. It also contains the functions necessary for communication between `hepmc_event_t` and `event_t` objects.

```

<hep_events.f90>≡
<File header>

module hep_events

    use kinds
    use io_units
    use diagnostics

    use model_data
    use particles
    use hep_common
    use hepmc_interface
    use event_base

<Standard module head>

<HEP events: public>

contains

<HEP events: procedures>

end module hep_events

```

17.8.1 Data Transfer: events

Fill the HEPEUP block, given a WHIZARD event object.

```

<HEP events: public>≡
    public :: hepeup_from_event

<HEP events: procedures>≡
    subroutine hepeup_from_event (event, keep_beams, process_index)
        class(generic_event_t), intent(in), target :: event
        logical, intent(in), optional :: keep_beams
    end subroutine

```

```

integer, intent(in), optional :: process_index
type(particle_set_t), pointer :: particle_set
real(default) :: scale, alpha_qcd
if (event%has_valid_particle_set ()) then
  particle_set => event%get_particle_set_ptr ()
  call hepeup_from_particle_set (particle_set, keep_beams)
  if (present (process_index)) &
    call hepeup_set_event_parameters (proc_id = process_index)
  scale = event%get_fac_scale ()
  if (scale /= 0) &
    call hepeup_set_event_parameters (scale = scale)
  alpha_qcd = event%get_alpha_s ()
  if (alpha_qcd /= 0) &
    call hepeup_set_event_parameters (alpha_qcd = alpha_qcd)
  if (event%weight_prc_is_known ()) then
    call hepeup_set_event_parameters (weight = event%get_weight_prc ())
  else
    call msg_bug ("HEPEUP: process weight is unknown")
  end if
else
  call msg_bug ("HEPEUP: event incomplete")
end if
end subroutine hepeup_from_event

```

Reverse.

Note: The current implementation sets the particle set of the hard process and is therefore not useful if the event on file is dressed. This should be reconsidered.

Note: setting of scale or alpha is not yet supported by the `event_t` object. Ticket #628.

```

<HEP events: public>+≡
  public :: hepeup_to_event

<HEP events: procedures>+≡
  subroutine hepeup_to_event &
    (event, fallback_model, process_index, recover_beams)

```

Initialize the tag objects. Some tags depend on the LHEF version. In particular, the tags that in LHEF 2.0 identify individual weights by name in each event block, in LHEF 3.0 are replaced by info tags in the init block and a single `weights` tag in the event block. The name attributes of those tags are specific for WHIZARD.

Input an event. Upon input of `i_prc`, we can just read in the whole HEPEUP common block. These data are known to come first. The `i_prc` value can be deduced from the IDPRUP value by a table lookup.

Reading the common block bypasses the `cstream` which accesses the input unit. This is consistent with the LHEF specification. After the common-block data have been swallowed, we can resume reading from stream.

We don't catch actual I/O errors. However, we return a negative value in `iostat` if we reached the terminating `</LesHouchesEvents>` tag.

Since we have already read the event information from file, this input routine can transfer the common-block contents to the event record. Also, we read any further information in the event record.

Since LHEF doesn't give this information, we must assume that the MCI group, term, and channel can all be safely set to 1. This works if there is only one MCI group and term. The channel doesn't matter for the matrix element.

```

17.9.5 Version-Specific Code: 1.0

In version 1.0, the init tag contains just HEPUP data. While a `cstream` is connected to the input unit, we bypass it temporarily for the purpose of reading the HEPUP contents. This is consistent with the LHEF standard.

This routine does not read the closing tag of the init block.

```

<EIO LHEF: eio_lhef: TBP>+≡
  procedure :: read_init_10 => eio_lhef_read_init_10

<EIO LHEF: procedures>+≡
  subroutine eio_lhef_read_init_10 (eio, data)

    type(event_sample_data_t), intent(out) :: data
    integer :: n_proc, i
    call heprup_read_lhef (eio%unit)
    call heprup_get_run_parameters (n_processes = n_proc)
    call data%init (n_proc)
    data%n_beam = 2
    call heprup_get_run_parameters ( &
      unweighted = data%unweighted, &

```

```

        negative_weights = data%negative_weights, &
        beam_pdg = data%pdg_beam, &
        beam_energy = data%energy_beam)
if (data%unweighted) then
    data%norm_mode = NORM_UNIT
else
    data%norm_mode = NORM_SIGMA
end if
do i = 1, n_proc
    call heprup_get_process_parameters (i, &
        process_id = data%proc_num_id(i), &
        cross_section = data%cross_section(i), &
        error = data%error(i))
end do
end subroutine eio_lhef_read_init_10

```

17.9.6 Version-Specific Code: 2.0

This is the init information for the 2.0 format, after the HEPUP data. We have the following tags:

- **generator** Generator name and version.
- **xsecinfo** Cross section and weights data. We have the total cross section and number of events (assuming that the event file is intact), but information on minimum and maximum weights is not available before the file is complete. We just write the mandatory tags. (Note that the default values of the other tags describe a uniform unit weight, but we can determine most values only after the sample is complete.)
- **cutsinfo** This optional tag is too specific to represent the possibilities of WHIZARD, so we skip it.
- **procinfo** This optional tag is useful for giving details of NLO calculations. Skipped.
- **mergetype** Optional, also not applicable.

```

<EIO LHEF: eio_lhef: TBP>+≡
    procedure :: write_init_20 => eio_lhef_write_init_20

<EIO LHEF: procedures>+≡
    subroutine eio_lhef_write_init_20 (eio, data)
        class(eio_lhef_t), intent(in) :: eio

17.9.8 Auxiliary

Create a string from a number. We use fixed format for the reals and variable format for integers.

```

<EIO LHEF: interfaces>≡
    interface str
        module procedure str_int, str_real
    end interface

<EIO LHEF: procedures>+≡
    function str_int (i) result (s)
        integer, intent(in) :: i
        type(string_t) :: s
        character(32) :: buffer
        write (buffer, "(I0)") i
        s = var_str (trim (buffer))
    end function str_int

    function str_real (x) result (s)
        real(default), intent(in) :: x
        type(string_t) :: s
        character(32) :: buffer
        write (buffer, "(ES17.10)") x
        s = var_str (trim (adjustl (buffer)))
    end function str_real

```

Auxiliary: Read real, integer, string value.

```

<EIO LHEF: procedures>+≡
    function read_rval (s) result (rval)
        type(string_t), intent(in) :: s
        real(default) :: rval
        character(80) :: buffer
        buffer = s
        read (buffer, *) rval
    end function read_rval

    function read_ival (s) result (ival)
        type(string_t), intent(in) :: s
        integer :: ival
        character(80) :: buffer
        buffer = s
        read (buffer, *) ival
    end function read_ival

```

17.9.9 Unit tests

```
<EIO LHEF: public>+≡
  public :: eio_lhef_test

<EIO LHEF: tests>≡
  subroutine eio_lhef_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
    <EIO LHEF: execute tests>
  end subroutine eio_lhef_test
```

Version 1.0 Output

We test the implementation of all I/O methods. We start with output according to version 1.0.

```
<EIO LHEF: execute tests>≡

17.10 STDHEP File Formats

Here, we implement the two existing STDHEP file formats, one based on the HEPUP/HEPEUP common blocks, the other based on the HEPEVT common block. The second one is actually the standard STDHEP format.

```
(eio_stdhep.f90)≡  
  <File header>  
  
  module eio_stdhep  
  
    use kinds  
    use io_units  
    <Use strings>  
    use unit_tests  
    use diagnostics  
  
    use lorentz  
    use model_data  
    use particles  
    use event_base  
    use hep_common  
    use hep_events  
    use eio_data  
    use eio_base  
  
    <Standard module head>  
  
    <EIO stdhep: public>  
  
    <EIO stdhep: types>  
  
    <EIO stdhep: variables>  
  
    contains  
  
    <EIO stdhep: procedures>  
  
    <EIO stdhep: tests>  
  
  end module eio_stdhep
```

17.10.1 Type

```
<EIO stdhep: public>≡  
  public :: eio_stdhep_t  
  
<EIO stdhep: types>≡  
  type, abstract, extends (eio_t) :: eio_stdhep_t  
    logical :: writing = .false.  
    logical :: reading = .false.  
    integer :: unit = 0  
    logical :: keep_beams = .false.  
    integer(i64) :: n_events_expected = 0  
  contains
```

```

    <EIO stdhep: eio stdhep: TBP>
end type eio_stdhep_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepevt_t

<EIO stdhep: types>+≡
    type, extends (eio_stdhep_t) :: eio_stdhep_hepevt_t
end type eio_stdhep_hepevt_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepeup_t

<EIO stdhep: types>+≡
    type, extends (eio_stdhep_t) :: eio_stdhep_hepeup_t
end type eio_stdhep_hepeup_t

```

17.10.2 Specific Methods

Set parameters that are specifically used with STDHEP file formats.

```

<EIO stdhep: eio stdhep: TBP>≡
    procedure :: set_parameters => eio_stdhep_set_parameters

<EIO stdhep: procedures>≡
    subroutine eio_stdhep_set_parameters (eio, keep_beams, extension)
        class(eio_stdhep_t), intent(inout) :: eio
        logical, intent(in), optional :: keep_beams
        type(string_t), intent(in), optional :: extension
        if (present (keep_beams)) eio%keep_beams = keep_beams
        if (present (extension)) then
            eio%extension = extension
        else
            select type (eio)
            type is (eio_stdhep_hepevt_t)
                eio%extension = "hep"
            type is (eio_stdhep_hepeup_t)
                eio%extension = "up.hep"
            end select
        end if
    end subroutine eio_stdhep_set_parameters

```

17.10.3 Common Methods

Output. This is not the actual event format, but a readable account of the current object status.

```

<EIO stdhep: eio stdhep: TBP>+≡
    procedure :: write => eio_stdhep_write

```

```

<EIO stdhep: procedures>+≡
subroutine eio_stdhep_write (object, unit)
  class(eio_stdhep_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "STDHEP event stream:"
  if (object%writing) then
    write (u, "(3x,A,A)") "Writing to file  = ", char (object%filename)
  else if (object%reading) then
    write (u, "(3x,A,A)") "Reading from file = ", char (object%filename)
  else
    write (u, "(3x,A)") "[closed]"
  end if
  write (u, "(3x,A,L1)") "Keep beams          = ", object%keep_beams
end subroutine eio_stdhep_write

```

Finalizer: close any open file.

```

<EIO stdhep: eio stdhep: TBP>+≡
procedure :: final => eio_stdhep_final

17.11 HepMC Output

The HepMC event record is standardized. It is an ASCII format. We try our best at using it for both input and output.

`<eio_hepmc.f90>`≡
<File header>

```

module eio_hepmc

    use kinds
    use io_units
    <Use strings>
    use unit_tests
    use diagnostics
    use os_interface
    use lorentz
    use model_data
    use particles
    use subevents
    use event_base
    use hep_events
    use eio_data
    use eio_base
    use hepmc_interface

    <Standard module head>

    <EIO HepMC: public>

    <EIO HepMC: types>

    <EIO HepMC: interfaces>

    contains

    <EIO HepMC: procedures>

    <EIO HepMC: tests>

end module eio_hepmc

```

17.11.1 Type

A type `hepmc_event` is introduced as container to store HepMC event data, particularly for splitting the reading into read out of the process index and the proper event data.

```

<EIO HepMC: public>≡
    public :: eio_hepmc_t

<EIO HepMC: types>≡
    type, extends (eio_t) :: eio_hepmc_t
        logical :: writing = .false.
        logical :: reading = .false.
        logical :: keep_beams = .false.
        logical :: recover_beams = .false.
        type(hepmc_iostream_t) :: iostream
        type(hepmc_event_t) :: hepmc_event
        integer, dimension(:), allocatable :: proc_num_id
    contains
    <EIO HepMC: eio hepmc: TBP>
end type eio_hepmc_t

```

17.11.2 Specific Methods

Set parameters that are specifically used with HepMC.

```

(EIO HepMC: eio hepmc: TBP)≡
  procedure :: set_parameters => eio_hepmc_set_parameters

(EIO HepMC: procedures)≡
  subroutine eio_hepmc_set_parameters (eio, keep_beams, &
    recover_beams, extension)
    class(eio_hepmc_t), intent(inout) :: eio
    logical, intent(in), optional :: keep_beams
    logical, intent(in), optional :: recover_beams
    type(string_t), intent(in), optional :: extension
    if (present (keep_beams)) eio%keep_beams = keep_beams

17.12.1 Type

A type `lcio_event` is introduced as container to store LCIO event data, particularly for splitting the reading into read out of the process index and the proper event data.

```
<EIO LCIO: public>≡
  public :: eio_lcio_t

<EIO LCIO: types>≡
  type, extends (eio_t) :: eio_lcio_t
    logical :: writing = .false.
    logical :: reading = .false.
    logical :: keep_beams = .false.
    logical :: recover_beams = .false.
    type(lcio_writer_t) :: lcio_writer
    type(lcio_run_header_t) :: lcio_run_hdr
    type(lcio_event_t) :: lcio_event
    integer, dimension(:), allocatable :: proc_num_id
  contains
    <EIO LCIO: eio lcio: TBP>
  end type eio_lcio_t
```

17.12.2 Specific Methods

Set parameters that are specifically used with LCIO.

```
<EIO LCIO: eio lcio: TBP>≡
  procedure :: set_parameters => eio_lcio_set_parameters

<EIO LCIO: procedures>≡
  subroutine eio_lcio_set_parameters (eio, keep_beams, &
    recover_beams, extension)
    class(eio_lcio_t), intent(inout) :: eio
    logical, intent(in), optional :: keep_beams
    logical, intent(in), optional :: recover_beams
    type(string_t), intent(in), optional :: extension
    if (present (keep_beams)) eio%keep_beams = keep_beams
    if (present (recover_beams)) eio%recover_beams = recover_beams

Chapter 18

Phase Space

The abstract representation of a type that parameterizes phase space, with methods for construction and evaluation.

phs_base Abstract phase-space representation.

A simple implementation:

phs_single Parameterize the phase space of a single particle, i.e., the solid angle. This is useful only for very restricted problems, but it avoids the complexity of a generic approach in those trivial cases.

The standard implementation is called *wood* phase space. It consists of several auxiliary modules and the actual implementation module.

mappings Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

phs_trees Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

phs_forests The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

cascades This module is a pseudo Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant

ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

phs_wood Make the functionality available in form of an implementation of the abstract phase-space type.

18.1 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

```
<phs_base.f90>≡  
<File header>  
  
module phs_base  
  
  <Use kinds>  
  <Use strings>  
  use io_units  
  use constants, only: TWOPI, TWOPI4  
  use format_defs, only: FMT_19  
  use unit_tests  
  use diagnostics  
  use md5  
  use physics_defs  
  use lorentz  
  use model_data  
  use flavors  
  use sf_mappings  
  use sf_base  
  use process_constants  
  
  <Standard module head>  
  
  <PHS base: public>  
  
  <PHS base: types>  
  
  <PHS base: interfaces>  
  
  <PHS base: test types>  
  
  contains  
  
  <PHS base: procedures>  
  
  <PHS base: tests>  
  
end module phs_base
```

18.1.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

```

<PHS base: public>≡
  public :: channel_prop_t

<PHS base: types>≡
  type, abstract :: channel_prop_t
  contains
    procedure (channel_prop_to_string), deferred :: to_string
    generic :: operator (==) => is_equal
    procedure (channel_eq), deferred :: is_equal
  end type channel_prop_t

<PHS base: interfaces>≡
  abstract interface
    function channel_prop_to_string (object) result (string)
      import
        class(channel_prop_t), intent(in) :: object
        type(string_t) :: string
      end function channel_prop_to_string
  end interface

<PHS base: interfaces>+≡
  abstract interface
    function channel_eq (prop1, prop2) result (flag)
      import
        class(channel_prop_t), intent(in) :: prop1, prop2
        logical :: flag
      end function channel_eq
  end interface

```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

```

<PHS base: public>+≡
  public :: resonance_t

<PHS base: types>+≡
  type, extends (channel_prop_t) :: resonance_t
    real(default) :: mass = 0
    real(default) :: width = 0
  contains
    procedure :: to_string => resonance_to_string
    procedure :: is_equal => resonance_is_equal
  end type resonance_t

```

Print mass and width.

```

<PHS base: procedures>≡
  function resonance_to_string (object) result (string)
    class(resonance_t), intent(in) :: object
    type(string_t) :: string
    character(32) :: buffer
    string = "resonant: m ="
    write (buffer, "(" // FMT_19 // ")") object%mass
    string = string // trim (buffer) // " GeV, w ="
    write (buffer, "(" // FMT_19 // ")") object%width
  end function resonance_to_string

```

```

    string = string // trim (buffer) // " GeV"
end function resonance_to_string

```

Equality.

```

(PHS base: procedures)+≡
function resonance_is_equal (prop1, prop2) result (flag)
  class(resonance_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (resonance_t)
    flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width
  class default
    flag = .false.
  end select
end function resonance_is_equal

```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

```

(PHS base: public)+≡
  public :: on_shell_t

(PHS base: types)+≡
  type, extends (channel_prop_t) :: on_shell_t
    real(default) :: mass = 0
  contains
    procedure :: to_string => on_shell_to_string
    procedure :: is_equal => on_shell_is_equal
  end type on_shell_t

```

Print mass and width.

```

(PHS base: procedures)+≡
function on_shell_to_string (object) result (string)
  class(on_shell_t), intent(in) :: object
  type(string_t) :: string
  character(32) :: buffer
  string = "on shell: m ="
  write (buffer, "(" // FMT_19 // ")") object%mass
  string = string // trim (buffer) // " GeV"
end function on_shell_to_string

```

Equality.

```

(PHS base: procedures)+≡
function on_shell_is_equal (prop1, prop2) result (flag)
  class(on_shell_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (on_shell_t)
    flag = prop1%mass == prop2%mass
  class default
    flag = .false.
  end select
end function on_shell_is_equal

```

```

        end select
    end function on_shell_is_equal

```

Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

```

<PHS base: types>+≡
    type :: phs_equivalence_t
        integer :: c = 0
        integer, dimension(:), allocatable :: perm
        integer, dimension(:), allocatable :: mode
    contains
        <PHS base: phs equivalence: TBP>
    end type phs_equivalence_t

```

The mapping modes are

```

<PHS base: types>+≡
    integer, parameter, public :: &
        EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3

```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the integrand can be assumed to be symmetric w.r.t. a reflection $x \rightarrow 1 - x$ of the corresponding integration variable.

These are the associated tags, for output:

```

<PHS base: types>+≡
    character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]

```

Write an equivalence.

```

<PHS base: phs equivalence: TBP>≡
    procedure :: write => phs_equivalence_write

<PHS base: procedures>+≡
    subroutine phs_equivalence_write (object, unit)
        class(phs_equivalence_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, j
        u = given_output_unit (unit)
        write (u, "(5x,'=',1x,I0,1x)", advance = "no") object%c
        if (allocated (object%perm)) then
            write (u, "(A)", advance = "no") "("
            do j = 1, size (object%perm)
                if (j > 1) write (u, "(1x)", advance = "no")
                write (u, "(I0,A1)", advance = "no") &
                    object%perm(j), TAG(object%mode(j))
            end do
            write (u, "(A)") ")"
        else
            write (u, "(A)")
        end if
    end subroutine

```

```
end subroutine phs_equivalence_write
```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

```
<PHS base: phs equivalence: TBP>+≡
  procedure :: init => phs_equivalence_init
<PHS base: procedures>+≡
  subroutine phs_equivalence_init (eq, n_dim)
    class(phs_equivalence_t), intent(out) :: eq
    integer, intent(in) :: n_dim
    allocate (eq%perm (n_dim), source = 0)
    allocate (eq%mode (n_dim), source = EQ_IDENTITY)
  end subroutine phs_equivalence_init
```

Channel objects

The channel entry holds (optionally) specific properties.

`sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

```
<PHS base: public>+≡
  public :: phs_channel_t
<PHS base: types>+≡
  type :: phs_channel_t
    class(channel_prop_t), allocatable :: prop
    integer :: sf_channel = 1
    type(phs_equivalence_t), dimension(:), allocatable :: eq
  contains
    <PHS base: phs channel: TBP>
  end type phs_channel_t
```

Output.

```
<PHS base: phs channel: TBP>≡
  procedure :: write => phs_channel_write
<PHS base: procedures>+≡
  subroutine phs_channel_write (object, unit)
    class(phs_channel_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(1x,I0)", advance="no") object%sf_channel
    if (allocated (object%prop)) then
      write (u, "(1x,A)") char (object%prop%to_string ())
    else
      write (u, *)
    end if
    if (allocated (object%eq)) then
      do j = 1, size (object%eq)
```

```

        call object%eq(j)%write (u)
    end do
end if
end subroutine phs_channel_write

```

Identify the channel with an s-channel resonance.

```

<PHS base: phs channel: TBP>+≡
    procedure :: set_resonant => channel_set_resonant

<PHS base: procedures>+≡
    subroutine channel_set_resonant (channel, mass, width)
        class(phs_channel_t), intent(inout) :: channel
        real(default), intent(in) :: mass, width
        allocate (resonance_t :: channel%prop)
        select type (prop => channel%prop)
            type is (resonance_t)
                prop%mass = mass
                prop%width = width
            end select
        end subroutine channel_set_resonant

```

Identify the channel with an on-shell particle.

```

<PHS base: phs channel: TBP>+≡
    procedure :: set_on_shell => channel_set_on_shell

<PHS base: procedures>+≡
    subroutine channel_set_on_shell (channel, mass)
        class(phs_channel_t), intent(inout) :: channel
        real(default), intent(in) :: mass
        allocate (on_shell_t :: channel%prop)
        select type (prop => channel%prop)
            type is (on_shell_t)
                prop%mass = mass
            end select
        end subroutine channel_set_on_shell

```

18.1.2 Property collection

We can set up a list of all distinct channel properties for a given set of channels.

```

<PHS base: public>+≡
    public :: phs_channel_collection_t

<PHS base: types>+≡
    type :: prop_entry_t
        integer :: i = 0
        class(channel_prop_t), allocatable :: prop
        type(prop_entry_t), pointer :: next => null ()
    end type prop_entry_t

    type :: phs_channel_collection_t
        integer :: n = 0
        type(prop_entry_t), pointer :: first => null ()

```

```

contains
  <PHS base: phs channel collection: TBP>≡
end type phs_channel_collection_t

```

Finalizer for the list.

```

<PHS base: phs channel collection: TBP>≡
  procedure :: final => phs_channel_collection_final

<PHS base: procedures>+≡
  subroutine phs_channel_collection_final (object)
    class(phs_channel_collection_t), intent(inout) :: object
    type(prop_entry_t), pointer :: entry
    do while (associated (object%first))
      entry => object%first
      object%first => entry%next
      deallocate (entry)
    end do
  end subroutine phs_channel_collection_final

```

Output.

Note: eliminating the `string` auxiliary triggers an ICE in gfortran 4.7.2.

```

<PHS base: phs channel collection: TBP>+≡
  procedure :: write => phs_channel_collection_write

<PHS base: procedures>+≡
  subroutine phs_channel_collection_write (object, unit)
    class(phs_channel_collection_t), intent(in) :: object

18.1.3 Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It doesn't depend on the QCD setup.)

```

<PHS base: public>+≡
  public :: phs_config_t

    integer :: u
    phs_config%md5sum_model_par = phs_config%model%get_parameters_md5sum ()
    phs_config%md5sum_phs_config = ""
    u = free_unit ()
    open (u, status = "scratch", action = "readwrite")
    call phs_config%write (u)
    rewind (u)
    phs_config%md5sum_phs_config = md5sum (u)
    close (u)
  end subroutine phs_config_compute_md5sum
```

Print an informative message after phase-space configuration.

```
<PHS base: phs config: TBP>+≡
  procedure (phs_startup_message), deferred :: startup_message
  procedure :: base_startup_message => phs_startup_message
<PHS base: procedures>+≡
  subroutine phs_startup_message (phs_config, unit)
    class(phs_config_t), intent(in) :: phs_config
    integer, intent(in), optional :: unit
    write (msg_buffer, "(A,3(1x,I0,1x,A))") &
      "Phase space:", &
      phs_config%n_channel, "channels,", &
      phs_config%n_par, "dimensions"
    call msg_message (unit = unit)
  end subroutine phs_startup_message
```

This procedure should be implemented such that the phase-space configuration object allocates a phase-space instance of matching type.

```
<PHS base: phs config: TBP>+≡
  procedure (phs_config_allocate_instance), nopass, deferred :: &
    allocate_instance
<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_config_allocate_instance (phs)
      import
      class(phs_t), intent(inout), pointer :: phs
    end subroutine phs_config_allocate_instance
  end interface
```

18.1.4 Extract data

Return the number of MC input parameters.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_par => phs_config_get_n_par

<PHS base: procedures>+≡
  function phs_config_get_n_par (phs_config) result (n)
    class(phs_config_t), intent(in) :: phs_config
    integer :: n
    n = phs_config%n_par
  end function phs_config_get_n_par
```

Return dimensions (parameter indices) for which the phase-space dimension is flat, so integration and event generation can be simplified.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_flat_dimensions => phs_config_get_flat_dimensions

<PHS base: procedures>+≡
  function phs_config_get_flat_dimensions (phs_config) result (dim_flat)
    class(phs_config_t), intent(in) :: phs_config
    integer, dimension(:), allocatable :: dim_flat
    if (allocated (phs_config%dim_flat)) then
      allocate (dim_flat (size (phs_config%dim_flat)))
      dim_flat = phs_config%dim_flat
    else
      allocate (dim_flat (0))
    end if
  end function phs_config_get_flat_dimensions
```

Return the number of phase-space channels.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_channel => phs_config_get_n_channel

<PHS base: procedures>+≡
  function phs_config_get_n_channel (phs_config) result (n)
    class(phs_config_t), intent(in) :: phs_config
    integer :: n
    n = phs_config%n_channel
  end function phs_config_get_n_channel
```

Return the structure-function channel that corresponds to the phase-space channel c. If the channel array is not allocated (which happens if there is no structure function), return zero.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_sf_channel => phs_config_get_sf_channel

<PHS base: procedures>+≡
  function phs_config_get_sf_channel (phs_config, c) result (c_sf)
    class(phs_config_t), intent(in) :: phs_config
    integer, intent(in) :: c
    integer :: c_sf
    if (allocated (phs_config%channel)) then
      c_sf = phs_config%channel(c)%sf_channel
    end if
  end function phs_config_get_sf_channel
```

```

    else
        c_sf = 0
    end if
end function phs_config_get_sf_channel

```

Return the mass(es) of the incoming particle(s). We take the first flavor combination in the array, assuming that masses must be degenerate among flavors.

```

<PHS base: phs config: TBP>+≡
    procedure :: get_masses_in => phs_config_get_masses_in

<PHS base: procedures>+≡
    subroutine phs_config_get_masses_in (phs_config, m)
        class(phs_config_t), intent(in) :: phs_config
        real(default), dimension(:), intent(out) :: m
        integer :: i
        do i = 1, phs_config%n_in
            m(i) = flavor_get_mass (phs_config%flv(i,1))
        end do
    end subroutine phs_config_get_masses_in

```

Return the MD5 sum of the configuration.

```

<PHS base: phs config: TBP>+≡
    procedure :: get_md5sum => phs_config_get_md5sum

<PHS base: procedures>+≡
    function phs_config_get_md5sum (phs_config) result (md5sum)
        class(phs_config_t), intent(in) :: phs_config
        character(32) :: md5sum
        md5sum = phs_config%md5sum_phs_config
    end function phs_config_get_md5sum

```

18.1.5 Phase-space point instance

The `phs_t` object holds the workspace for phase-space generation. In the base object, we have the MC input parameters `r` and the Jacobian factor `f`, for each channel, and the incoming and outgoing momenta.

Note: The `active_channel` array is not used yet, all elements are initialized with `.true..` It should be touched by the integrator if it decides to drop irrelevant channels.

```

<PHS base: public>+≡
    public :: phs_t

<PHS base: types>+≡
    type, abstract :: phs_t
        class(phs_config_t), pointer :: config => null ()
        logical :: r_defined = .false.
        integer :: selected_channel = 0
        logical, dimension(:), allocatable :: active_channel
        real(default), dimension(:,:), allocatable :: r
        real(default), dimension(:), allocatable :: f
        real(default), dimension(:), allocatable :: m_in
        real(default), dimension(:), allocatable :: m_out

```

```

    real(default) :: flux = 0
    real(default) :: volume = 0
    type(lorentz_transformation_t) :: lt_cm_to_lab
    logical :: p_defined = .false.
    real(default) :: sqrts_hat = 0
    type(vector4_t), dimension(:), allocatable :: p
    logical :: q_defined = .false.
    type(vector4_t), dimension(:), allocatable :: q
contains
  <PHS base: phs: TBP>
end type phs_t

```

Output. Since phase space may get complicated, we include a `verbose` option for the abstract `write` procedure.

```

<PHS base: phs: TBP>≡
  procedure (phs_write), deferred :: write
<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_write (object, unit, verbose)
      import

    end if
  end subroutine phs_base_select_channel

```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the z axis is the direction of the first beam, the second beam is along the negative z axis. The transformation from the c.m. to the lab frame is a rotation from the z axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

```

        real(default) :: f
        f = phs%flux * phs%volume
    end function phs_get_overall_factor

```

Compute flux factor. We do this during initialization (when the incoming momenta \mathbf{p} are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \quad (18.1)$$

2. For a $2 \rightarrow n$ scattering process with $n > 1$, the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \quad (18.2)$$

where for massless incoming particles, $\sqrt{\lambda} = s$.

3. For a $2 \rightarrow 1$ on-shell production process, the factor includes an extra $1/(2\pi)^3$ factor and a $1/m^2$ factor from the phase-space delta function $\delta(x_1 x_2 - m^2/s)$, which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \quad (18.3)$$

The delta function is handled by the structure-function parameterization.

```

      call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
    end if
    if (phs%q_defined) then
      call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
    end if
  end subroutine pacify_phs

```

18.1.7 Unit tests

```

<PHS base: public>+≡
  public :: phs_base_test

```

```

<PHS base: tests>≡
  subroutine phs_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <PHS base: execute tests>
  end subroutine phs_base_test

```

Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

```

<PHS base: public>+≡
  public :: init_test_process_data

<PHS base: tests>+≡
  subroutine init_test_process_data (id, data)
    type(process_constants_t), intent(out) :: data
    type(string_t), intent(in), optional :: id
    if (present (id)) then
      data%id = id
    else
      data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 2
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state = 25
  end subroutine init_test_process_data

```

This is the variant for a decay process.

```

<PHS base: public>+≡
  public :: init_test_decay_data

<PHS base: tests>+≡
  subroutine init_test_decay_data (id, data)
    type(process_constants_t), intent(out) :: data
    type(string_t), intent(in), optional :: id
    if (present (id)) then
      data%id = id
    else
      data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 1
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state(:,1) = [25, 6, -6]
  end subroutine init_test_decay_data

```

Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

```
<PHS base: public>+≡
    public :: phs_test_config_t
<PHS base: test types>≡
    type, extends (phs_config_t) :: phs_test_config_t

    class(phs_t), intent(inout), pointer :: phs
    allocate (phs_test_t :: phs)
  end subroutine phs_test_config_allocate_instance
```

Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates $\cos\theta$ and ϕ uniformly, in the other channel we map the r_1 parameter which belongs to $\cos\theta$.

We should store the mass parameter that we need.

```
<PHS base: public>+≡
  public :: phs_test_t
<PHS base: test types>+≡
  type, extends (phs_t) :: phs_test_t
    real(default) :: m = 0
    real(default), dimension(:), allocatable :: x
  contains
    <PHS base: phs test: TBP>
  end type phs_test_t
```

Output. The specific data are displayed only if `verbose` is set.

```
<PHS base: phs test: TBP>≡
  procedure :: write => phs_test_write
<PHS base: tests>+≡

Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters x_1 and x_2 :

$$\cos \theta = 1 - 2x_1, \quad \phi = 2\pi x_2 \quad (18.4)$$

We generate a rotation (Lorentz transformation) which rotates the positive z axis into this point on the unit sphere. This rotation is applied to the \mathbf{p} momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

```

<PHS base: public>+≡
  public :: compute_kinematics_solid_angle
<PHS base: tests>+≡
  subroutine compute_kinematics_solid_angle (p, q, x)
    type(vector4_t), dimension(2), intent(in) :: p
    type(vector4_t), dimension(2), intent(out) :: q
    real(default), dimension(2), intent(in) :: x
    real(default) :: ct, st, phi
    type(lorentz_transformation_t) :: rot
    integer :: i
    ct = 1 - 2*x(1)
    st = sqrt (1 - ct**2)
    phi = twopi * x(2)
    rot = rotation (phi, 3) * rotation (ct, st, 2)
    do i = 1, 2
      q(i) = rot * p(i)
    end do
  end subroutine compute_kinematics_solid_angle

```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from $q(1)$ alone. p is unused.

```

<PHS base: public>+≡
  public :: inverse_kinematics_solid_angle

18.2 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for $1 \rightarrow 2$ decays or for $2 \rightarrow 2$ scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic $2 \rightarrow 2$ situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

```

<PHS single: procedures>+≡
  subroutine phs_single_final (object)
    class(phs_single_t), intent(inout) :: object
  end subroutine phs_single_final

```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \quad (18.5)$$

For a decay with nonvanishing masses (m_3, m_4), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (18.6)$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (18.7)$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying \hat{s} .

```

<PHS single: phs single: TBP>+≡
  procedure :: init => phs_single_init

<PHS single: procedures>+≡
  subroutine phs_single_init (phs, phs_config)

18.3 Mappings

Mappings are objects that encode the transformation of the interval $(0,1)$ to a physical variable m^2 or $\cos\theta$ (and back), as it is used in the phase space parameterization. The mapping objects contain fixed parameters, the associated methods implement the mapping and inverse mapping operations, including the computation of the Jacobian (phase space factor).

```
< mappings.f90 >≡  
  <File header>  
  
  module mappings  
  
    <Use kinds>  
    use kinds, only: TC  
    <Use strings>  
    use io_units  
    use constants, only: pi  
    use format_defs, only: FMT_19  
    use diagnostics  
    use md5  
    use model_data  
    use flavors  
  
    <Standard module head>  
  
    <Mappings: public>  
  
    <Mappings: parameters>  
  
    <Mappings: types>  
  
    <Mappings: interfaces>  
  
    contains  
  
    <Mappings: procedures>  
  
  end module mappings
```

18.3.1 Default parameters

This type holds the default parameters, needed for setting the scale in cases where no mass parameter is available. The contents are public.

```
<Mappings: public>≡

  end function mapping_defaults_md5sum

```

18.3.2 The Mapping type

Each mapping has a type (e.g., s-channel, infrared), a binary code (redundant, but useful for debugging), and a reference particle. The flavor code of this particle is stored for bookkeeping reasons, what matters are the mass and width of this particle. Furthermore, depending on the type, various mapping parameters can be set and used.

The parameters **a1** to **a3** (for m^2 mappings) and **b1** to **b3** (for $\cos \theta$ mappings) are values that are stored once to speed up the calculation, if **variable_limits** is false. The exact meaning of these parameters depends on the mapping type. The limits are fixed if there is a fixed c.m. energy.

```

⟨Mappings: public⟩+≡
    public :: mapping_t

⟨Mappings: types⟩+≡
    type :: mapping_t
    private
        integer :: type = NO_MAPPING
        integer(TC) :: bincode
        type(flavor_t) :: flv
        real(default) :: mass = 0
        real(default) :: width = 0
        logical :: a_unknown = .true.
        real(default) :: a1 = 0
        real(default) :: a2 = 0
        real(default) :: a3 = 0
        logical :: b_unknown = .true.
        real(default) :: b1 = 0
        real(default) :: b2 = 0
        real(default) :: b3 = 0
        logical :: variable_limits = .true.
    end type mapping_t

```

The valid mapping types. The extra type STEP_MAPPING is used only internally.

```

⟨Mappings: parameters⟩≡

18.3.7 Mappings of the invariant mass

Inserting an x value between 0 and 1, we want to compute the corresponding invariant mass $m^2(x)$ and the jacobian, aka phase space factor $f(x)$. We also need the reverse operation.

In general, the phase space factor f is defined by

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx \frac{1}{s} \frac{dm^2}{dx} g(m^2(x)) = \int_0^1 dx f(x) g(x), \quad (18.8)$$

where thus

$$f(x) = \frac{1}{s} \frac{dm^2}{dx}. \quad (18.9)$$

With this mapping, a function of the form

$$g(m^2) = c \frac{dx(m^2)}{dm^2} \quad (18.10)$$

is mapped to a constant:

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx f(x) g(m^2(x)) = \int_0^1 dx \frac{c}{s}. \quad (18.11)$$

Here is the mapping routine. Input are the available energy squared s , the limits for m^2 , and the x value. Output are the m^2 value and the phase space factor f .

```

```

Trivial mapping

We simply map the boundaries of the interval (m_{\min}, m_{\max}) to $(0, 1)$:

$$m^2 = (1 - x)m_{\min}^2 + xm_{\max}^2; \quad (18.12)$$

the inverse is

$$x = \frac{m^2 - m_{\min}^2}{m_{\max}^2 - m_{\min}^2}. \quad (18.13)$$

Hence

$$f(x) = \frac{m_{\max}^2 - m_{\min}^2}{s}, \quad (18.14)$$

and we have, as required,

$$f(x) \frac{dx}{dm^2} = \frac{1}{s}. \quad (18.15)$$

We store the constant parameters the first time the mapping is called – or, if limits vary, recompute them each time.

```

⟨Constants for trivial msq mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a1 = 0
    map%a2 = msq_max - msq_min
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply trivial msq mapping⟩≡
  msq = (1-x) * msq_min + x * msq_max
  f = map%a3

⟨Apply inverse trivial msq mapping⟩≡
  if (map%a2 /= 0) then
    x = (msq - msq_min) / map%a2
  else
    x = 0
  end if
  f = map%a3

```

Resonance or step mapping does not make much sense if the resonance mass is outside the kinematical bounds. If this is the case, revert to `NO_MAPPING`. This is possible even if the kinematical bounds vary from event to event.

```

⟨Modify mapping type if necessary⟩≡
  select case (type)
  case (S_CHANNEL, STEP_MAPPING_E, STEP_MAPPING_H)
    msq0 = map%mass**2
    if (msq0 < msq_min .or. msq0 > msq_max) type = NO_MAPPING
  end select

```

Breit-Wigner mapping

A Breit-Wigner resonance with mass M and width Γ is flattened by the following mapping:

This mapping does not make much sense if the resonance mass is too low. If this is the case, revert to `NO_MAPPING`. There is a tricky point with this if the

mass is too high: `msq_max` is not a constant if structure functions are around. However, switching the type depending on the overall energy does not change the integral, it is just another branching point.

$$m^2 = M(M + t\Gamma), \quad (18.16)$$

where

$$t = \tan \left[(1-x) \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} + x \arctan \frac{m_{\max}^2 - M^2}{M\Gamma} \right]. \quad (18.17)$$

The inverse:

$$x = \frac{\arctan \frac{m^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}}{\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}} \quad (18.18)$$

The phase-space factor of this transformation is

$$f(x) = \frac{M\Gamma}{s} \left(\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} \right) (1 + t^2). \quad (18.19)$$

This maps any function proportional to

$$g(m^2) = \frac{M\Gamma}{(m^2 - M^2)^2 + M^2\Gamma^2} \quad (18.20)$$

to a constant times $1/s$.

```

⟨Constants for s-channel resonance mapping⟩≡

  f = map%a3 * (1 + tmp**2)

```

Mapping for massless splittings

This mapping accounts for approximately scale-invariant behavior where $\ln M^2$ is evenly distributed.

$$m^2 = m_{\min}^2 + M^2 (\exp(xL) - 1) \quad (18.21)$$

where

$$L = \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{M^2} + 1 \right). \quad (18.22)$$

The inverse:

$$x = \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) \quad (18.23)$$

The constant M is a characteristic scale. Above this scale ($m^2 - m_{\min}^2 \gg M^2$), this mapping behaves like $x \propto \ln m^2$, while below the scale it reverts to a linear mapping.

The phase-space factor is

$$f(x) = \frac{M^2}{s} \exp(xL) L. \quad (18.24)$$

A function proportional to

$$g(m^2) = \frac{1}{(m^2 - m_{\min}^2) + M^2} \quad (18.25)$$

is mapped to a constant, i.e., a simple pole near m_{\min} with a regulator mass M .

This type of mapping is useful for massless collinear and infrared singularities, where the scale is stored as the mass parameter. In the radiation case (IR radiation off massive particle), the heavy particle width is the characteristic scale.

```

⟨Constants for s-channel pole mapping⟩≡
    if (map%variable_limits .or. map%a_unknown) then
        if (type == RADIATION) then
            msq0 = map%width**2
        else

        map%a2 = log ((msq_max - msq_min) / msq0 + 1)
        map%a3 = map%a2 / s
        map%a_unknown = .false.
    end if

⟨Apply s-channel pole mapping⟩≡
    msq1 = map%a1 * exp (x * map%a2)
    msq = msq1 - map%a1 + msq_min
    f = map%a3 * msq1

⟨Apply inverse s-channel pole mapping⟩≡
    msq1 = msq - msq_min + map%a1
    x = log (msq1 / map%a1) / map%a2
    f = map%a3 * msq1

```

Mapping for t-channel poles

This is also approximately scale-invariant, and we use the same type of mapping as before. However, we map $1/x$ singularities at both ends of the interval; again, the mapping becomes linear when the distance is less than M^2 :

$$m^2 = \begin{cases} m_{\min}^2 + M^2 (\exp(xL) - 1) & \text{for } 0 < x < \frac{1}{2} \\ m_{\max}^2 - M^2 (\exp((1-x)L) - 1) & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (18.26)$$

where

$$L = 2 \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{2M^2} + 1 \right). \quad (18.27)$$

The inverse:

$$x = \begin{cases} \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1 - \frac{1}{L} \ln \left(\frac{m_{\max}^2 - m^2}{M^2} + 1 \right) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (18.28)$$

The phase-space factor is

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L. & \text{for } 0 < x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L. & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (18.29)$$

A (continuous) function proportional to

$$g(m^2) = \begin{cases} 1/(m^2 - m_{\min}^2) + M^2 & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1/((m_{\max}^2 - m^2) + M^2) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (18.30)$$

is mapped to a constant by this mapping, i.e., poles near both ends of the interval.

```

```

18.3.8 Step mapping

Step mapping is useful when the allowed range for a squared-mass variable is large, but only a fraction at the lower end is populated because the particle in question is an (off-shell) decay product of a narrow resonance. I.e., if the resonance was forced to be on-shell, the upper end of the range would be the resonance mass, minus the effective (real or resonance) mass of the particle(s) in the sibling branch of the decay.

The edge of this phase space section has a width which is determined by the width of the parent, plus the width of the sibling branch. (The widths might be added in quadrature, but this precision is probably not important.)

Fermi function

A possible mapping is derived from the Fermi function which has precisely this behavior. The Fermi function is given by

$$f(x) = \frac{1}{1 + \exp \frac{x-\mu}{\gamma}} \quad (18.31)$$

where x is taken as the invariant mass squared, μ is the invariant mass squared of the edge, and γ is the effective width which is given by the widths of the parent and the sibling branch. (Widths might be added in quadrature, but we do not require this level of precision.)

$$x = \frac{m^2 - m_{\min}^2}{\Delta m^2} \quad (18.32)$$

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (18.33)$$

$$\gamma = \frac{2m_{\max, \text{eff}}\Gamma}{\Delta m^2} \quad (18.34)$$

with

$$\Delta m^2 = m_{\max}^2 - m_{\min}^2 \quad (18.35)$$

m^2 is thus given by

$$m^2(x) = xm_{\max}^2 + (1 - x)m_{\min}^2 \quad (18.36)$$

For the mapping, we compute the integral $g(x)$ of the Fermi function, normalized such that $g(0) = 0$ and $g(1) = 1$. We introduce the abbreviations

$$\alpha = 1 - \gamma \ln \frac{1 + \beta e^{1/\gamma}}{1 + \beta} \quad (18.37)$$

$$\beta = e^{-\mu/\gamma} \quad (18.38)$$

and obtain

$$g(x) = \frac{1}{\alpha} \left(x - \gamma \ln \frac{1 + \beta e^{x/\gamma}}{1 + \beta} \right) \quad (18.39)$$

The actual mapping is the inverse function $h(y) = g^{-1}(y)$,

$$h(y) = -\gamma \ln \left(e^{-\alpha y/\gamma} (1 + \beta) - \beta \right) \quad (18.40)$$

The Jacobian is

$$\frac{dh}{dy} = \alpha \left(1 - e^{\alpha y/\gamma} \frac{\beta}{1 + \beta} \right)^{-1} \quad (18.41)$$

which is equal to $1/(dg/dx)$, namely

$$\frac{dg}{dx} = \frac{1}{\alpha} \frac{1}{1 + \beta e^{x/\gamma}} \quad (18.42)$$

The final result is

$$\int_{m_{\min}^2}^{m_{\max}^2} dm^2 F(m^2) = \Delta m^2 \int_0^1 dx F(m^2(x)) \quad (18.43)$$

$$= \Delta m^2 \int_0^1 dy F(m^2(h(y))) \frac{dh}{dy} \quad (18.44)$$

Here is the implementation. We fill `a1`, `a2`, `a3` with α, β, γ , respectively.

  f = map%a1 * tmp * (msq_max - msq_min) / s

```

Hyperbolic mapping

The Fermi function has the drawback that it decreases exponentially. It might be preferable to take a function with a power-law decrease, such that the high-mass region is not completely depopulated.

Here, we start with the actual mapping which we take as

$$h(y) = \frac{b}{a - y} - \frac{b}{a} + \mu y \quad (18.45)$$

with the abbreviation

$$a = \frac{1}{2} \left(1 + \sqrt{1 + \frac{4b}{1-\mu}} \right) \quad (18.46)$$

This is a hyperbola in the xy plane. The derivative is

$$\frac{dh}{dy} = \frac{b}{(a-y)^2} + \mu \quad (18.47)$$

The constants correspond to

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (18.48)$$

$$b = \frac{1}{\mu} \left(\frac{2m_{\max, \text{eff}} \Gamma}{\Delta m^2} \right)^2 \quad (18.49)$$

The inverse function is the solution of a quadratic equation,

$$g(x) = \frac{1}{2} \left[\left(a + \frac{x}{\mu} + \frac{b}{a\mu} \right) - \sqrt{\left(a - \frac{x}{\mu} \right)^2 + 2 \frac{b}{a\mu} \left(a + \frac{x}{\mu} \right) + \left(\frac{b}{a\mu} \right)^2} \right] \quad (18.50)$$

The constants $a_{1,2,3}$ are identified with a, b, μ .

```

                + tmp**2)) / 2
  f = (map%a2 / (map%a1 - x)**2 + map%a3) * (msq_max - msq_min) / s

```

18.3.9 Mappings of the polar angle

The other type of singularity, a simple pole just outside the integration region, can occur in the integration over $\cos \theta$. This applies to exchange of massless (or light) particles.

Double poles (Coulomb scattering) are also possible, but only in certain cases. These are also handled by the single-pole mapping.

The mapping is analogous to the previous m^2 pole mapping, but with a different normalization and notation of variables:

$$\frac{1}{2} \int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx \frac{d \cos \theta}{dx} g(\theta(x)) = \int_0^1 dx f(x) g(x), \quad (18.51)$$

where thus

$$f(x) = \frac{1}{2} \frac{d \cos \theta}{dx}. \quad (18.52)$$

With this mapping, a function of the form

$$g(\theta) = c \frac{dx(\cos \theta)}{d \cos \theta} \quad (18.53)$$

is mapped to a constant:

$$\int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx f(x) g(\theta(x)) = \int_0^1 dx c. \quad (18.54)$$

```

```

Trivial mapping

This is just the mapping of the interval $(-1, 1)$ to $(0, 1)$:

$$\cos \theta = -1 + 2x \quad (18.55)$$

and

$$f(x) = 1 \quad (18.56)$$

with the inverse

$$x = \frac{1 + \cos \theta}{2} \quad (18.57)$$

```

<Apply trivial ct mapping>≡
  tmp = 2 * (1-x)
  ct = 1 - tmp
  st = sqrt (tmp * (2-tmp))
  f = 1
<Apply inverse trivial ct mapping>≡
  x = (ct + 1) / 2
  f = 1

```

Pole mapping

As above for m^2 , we simultaneously map poles at both ends of the $\cos \theta$ interval. The formulae are completely analogous:

$$\cos \theta = \begin{cases} \frac{M^2}{s} [\exp(xL) - 1] - 1 & \text{for } x < \frac{1}{2} \\ -\frac{M^2}{s} [\exp((1-x)L) - 1] + 1 & \text{for } x \geq \frac{1}{2} \end{cases} \quad (18.58)$$

where

$$L = 2 \ln \frac{M^2 + s}{M^2}. \quad (18.59)$$

Inverse:

$$x = \begin{cases} \frac{1}{2L} \ln \frac{1 + \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta < 0 \\ 1 - \frac{1}{2L} \ln \frac{1 - \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta \geq 0 \end{cases} \quad (18.60)$$

The phase-space factor:

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L & \text{for } x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L & \text{for } x \geq \frac{1}{2} \end{cases} \quad (18.61)$$

```

<Constants for ct pole mapping>≡
  if (map%variable_limits .or. map%b_unknown) then

```

```

        map%b1 = map%mass**2 / s
        map%b2 = log ((map%b1 + 1) / map%b1)
        map%b3 = 0
        map%b_unknown = .false.

        x = 1 - log (ct1 / map%b1) / (2 * map%b2)
    end if
    f = ct1 * map%b2

```

18.4 Phase-space trees

The phase space evaluation is organized in terms of trees, where each branch corresponds to three integrations: m^2 , $\cos\theta$, and ϕ . The complete tree thus makes up a specific parameterization of the multidimensional phase-space integral. For the multi-channel integration, the phase-space tree is a single channel.

The trees imply mappings of formal Feynman tree graphs into arrays of integer numbers: Each branch, corresponding to a particular line in the graph, is assigned an integer code c (with kind value $\text{TC} = \text{tree code}$).

In this integer, each bit determines whether a particular external momentum flows through the line. The external branches therefore have codes 1, 2, 4, 8, ... An internal branch has those bits ORed corresponding to the momenta flowing through it. For example, a branch with momentum $p_1 + p_4$ has code $2^0 + 2^3 = 1 + 8 = 9$.

There is a two-fold ambiguity: Momentum conservation implies that the branch with code

$$c_0 = \sum_{i=1}^{n(\text{ext})} 2^{i-1} \quad (18.62)$$

i.e. the branch with momentum $p_1 + p_2 + \dots p_n$ has momentum zero, which is equivalent to tree code 0 by definition. Correspondingly,

$$c \quad \text{and} \quad c_0 - c = c \text{ XOR } c_0 \quad (18.63)$$

are equivalent. E.g., if there are five externals with codes $c = 1, 2, 4, 8, 16$, then $c = 9$ and $\bar{c} = 31 - 9 = 22$ are equivalent.

This ambiguity may be used to assign a direction to the line: If all momenta are understood as outgoing, $c = 9$ in the example above means $p_1 + p_4$, but $c = 22$ means $p_2 + p_3 + p_5 = -(p_1 + p_4)$.

Here we make use of the ambiguity in a slightly different way. First, the initial particles are singled out as those externals with the highest bits, the IN-bits. (Here: 8 and 16 for a $2 \rightarrow 3$ scattering process, 16 only for a $1 \rightarrow 4$ decay.) Then we invert those codes where all IN-bits are set. For a decay process this maps each tree of an equivalence class onto a unique representative (that one with the smallest integer codes). For a scattering process we proceed further:

The ambiguity remains in all branches where only one IN-bit is set, including the initial particles. If there are only externals with this property, we have an s -channel graph which we leave as it is. In all other cases, an internal with only one IN-bit is a t -channel line, which for phase space integration should be associated with one of the initial momenta as a reference axis. We take that one whose bit is set in the current tree code. (E.g., for branch $c = 9$ we use the initial particle $c = 8$ as reference axis, whereas for the same branch we would take $c = 16$ if it had been assigned $\bar{c} = 31 - 9 = 22$ as tree code.) Thus, different ways of coding the same t -channel graph imply different phase space parameterizations.

s -channel graphs have a unique parameterization. The same sets of parameterizations are used for t -channel graphs, except for the reference frames of their angular parts. We map each t -channel graph onto an s -channel graph as follows:

Working in ascending order, for each t -channel line (whose code has exactly one IN-bit set) the attached initial line is flipped upstream, while the outgoing

line is flipped downstream. (This works only if t -channel graphs are always parameterized beginning at their outer vertices, which we require as a restriction.) After all possible flips have been applied, we have an s -channel graph. We only have to remember the initial particle a vertex was originally attached to.

18.4.2 The phase-space tree type

Definition

In the concrete implementation, each branch c may have two *daughters* c_1 and c_2 such that $c_1 + c_2 = c$, a *sibling* c_s and a *mother* c_m such that $c + c_s = c_m$, and a *friend* which is kept during flips, such that it can indicate a fixed reference frame. Absent entries are set $c = 0$.

First, declare the branch type. There is some need to have this public. Give initializations for all components, so no `init` routine is necessary. The branch has some information about the associated coordinates and about connections.

```

(PHS trees: types)+≡
  type :: phs_branch_t
    private
    logical :: set = .false.
    logical :: inverted_decay = .false.
    logical :: inverted_axis = .false.
    integer(TC) :: mother = 0
    integer(TC) :: sibling = 0
    integer(TC) :: friend = 0
    integer(TC) :: origin = 0
    integer(TC), dimension(2) :: daughter = 0
    integer :: firstborn = 0
    logical :: has_children = .false.
    logical :: has_friend = .false.
    logical :: is_real = .false.
  end type phs_branch_t

```

The tree type: No initialization, this is done by `phs_tree_init`. In addition to the branch array which

The branches are collected in an array which holds all possible branches, of which only a few are set. After flips have been applied, the branch $c_M = \sum_{i=1}^{n(\text{fin})} 2^{i-1}$ must be there, indicating the mother of all decay products. In addition, we should check for consistency at the beginning.

`n_branches` is the number of those actually set. `n externals` defines the number of significant bit, and `mask` is a code where all bits are set. Analogous: `n_in` and `mask_in` for the incoming particles.

The mapping array contains the mappings associated to the branches (corresponding indices). The array `mass_sum` contains the sum of the real masses of the external final-state particles associated to the branch. During phase-space evaluation, this determines the boundaries.

```

(PHS trees: public)+≡
  public :: phs_tree_t

(PHS trees: types)+≡
  type :: phs_tree_t
    private
    integer :: n_branches, n externals, n_in, n_msq, n_angles
    integer(TC) :: n_branches_tot, n_branches_out
    integer(TC) :: mask, mask_in, mask_out
    type(phs_branch_t), dimension(:), allocatable :: branch
    type(mapping_t), dimension(:), allocatable :: mapping
    real(default), dimension(:), allocatable :: mass_sum
    real(default), dimension(:), allocatable :: effective_mass
    real(default), dimension(:), allocatable :: effective_width
    logical :: real_pbsp = .false.
    integer(TC) :: emitter = 0
    integer, dimension(:), allocatable :: momentum_link
  contains
    (PHS trees: phs tree: TBP)

```

```
end type phs_tree_t
```

The maximum number of external particles that can be represented is related to the bit size of the integer that stores binary codes. With the default integer of 32 bit on common machines, this is more than enough space. If TC is actually the default integer kind, there is no need to keep it separate, but doing so marks this as a special type of integer. So, just state that the maximum number is 32:

```
<Limits: public parameters>≡
integer, parameter, public :: MAX_EXTERNAL = 32
```

Constructor and destructor

Allocate memory for a phase-space tree with given number of externals and incoming. The number of allocated branches can easily become large, but appears manageable for realistic cases, e.g., for $n_{in}=2$ and $n_{out}=8$ we get $2^{10} - 1 = 1023$.

```
<PHS trees: public>+≡
public :: phs_tree_init
public :: phs_tree_final
```

Here we set the masks for incoming and for all externals.

```
<PHS trees: procedures>+≡

18.4.3 PHS tree setup

Transformation into an array of branch codes and back

Assume that the tree/array has been created before with the appropriate length and is empty.

```

<PHS trees: public>+≡
    public :: phs_tree_from_array

<PHS trees: procedures>+≡
    subroutine phs_tree_from_array (tree, a)
        type(phs_tree_t), intent(inout) :: tree

```

```

integer(TC), dimension(:), intent(in) :: a
integer :: i
integer(TC) :: k
<Set branches from array a>
<Set external branches if necessary>
<Check number of branches>
<Determine the connections>
contains
<Subroutine: set relatives>
end subroutine phs_tree_from_array

```

First, set all branches specified by the user. If all IN-bits are set, we invert the branch code.

```

<Set branches from array a>≡
do i=1, size(a)
  k = a(i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  tree%branch(k)%set = .true.
  tree%n_branches = tree%n_branches+1
end do

```

The external branches are understood, so set them now if not yet done. In all cases ensure that the representative with one bit set is used, except for decays where the in-particle is represented by all OUT-bits set instead.

```

<Set external branches if necessary>≡
do i=0, tree%n externals-1
  k = ibset(0,i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  if (tree%branch(ieor(tree%mask, k))%set) then
    tree%branch(ieor(tree%mask, k))%set = .false.
    tree%branch(k)%set = .true.
  else if (.not.tree%branch(k)%set) then
    tree%branch(k)%set = .true.
    tree%n_branches = tree%n_branches+1
  end if
end do

```

Now the number of branches set can be checked. Here we assume that the tree is binary. For three externals there are three branches in total, and for each additional external branch we get another internal one.

```

<Check number of branches>≡
if (tree%n_branches /= tree%n externals*2-3) then
  call phs_tree_write (tree)
  call msg_bug &
    & (" Wrong number of branches set in phase space tree")
end if

```

For all branches that are set, except for the externals, we try to find the daughter branches:

```

<Determine the connections>≡
do k=1, size (tree%branch)
  if (tree%branch(k)%set .and. tc_decay_level (k) /= 1) then
    call branch_set_relatives(k)
  end if
end do

```

To this end, we scan all codes less than the current code, whether we can find two branches which are set and which together give the current code. After that, the tree may still not be connected, but at least we know if a branch does not have daughters: This indicates some inconsistency.

The algorithm ensures that, at this stage, the first daughter has a smaller code value than the second one.

```

(Subroutine: set relatives)≡
subroutine branch_set_relatives (k)
  integer(TC), intent(in) :: k
  integer(TC) :: m,n
  do m=1, k-1
    if(iand(k,m)==m) then
      n = ieor(k,m)
      if ( tree%branch(m)%set .and. tree%branch(n)%set ) then
        tree%branch(k)%daughter(1) = m; tree%branch(k)%daughter(2) = n
        tree%branch(m)%mother      = k; tree%branch(n)%mother      = k
        tree%branch(m)%sibling      = n; tree%branch(n)%sibling      = m
        tree%branch(k)%has_children = .true.
        return
      end if
    end if
  end do
  call phs_tree_write (tree)
  call msg_bug &
    & (" Missing daughter branch(es) in phase space tree")
end subroutine branch_set_relatives

```

The inverse: this is trivial, fortunately.

Flip t -channel into s -channel

Flipping the tree is done upwards, beginning from the decay products. First we select a t -channel branch k : one which is set, which does have an IN-bit, and which is not an external particle.

Next, we determine the adjacent in-particle (called the 'friend' f here, since it will provide the reference axis for the angular integration). In addition, we look for the 'mother' and 'sibling' of this particle. If the latter field is empty, we select the (unique) other out-particle which has no mother, calling the internal subroutine `find_orphan`.

The flip is done as follows: We assume that the first daughter d is an s -channel line, which is true if the daughters are sorted. This will stay the first daughter. The second one is a t -channel line; it is exchanged with the 'sibling' s . The new line which replaces the branch k is just the sum of s and d . In addition, we have to rearrange the relatives of s and d , as well of f .

Finally, we flip 'sibling' and 'friend' and set the new s -channel branch n which replaces the t -channel branch k . After this is complete, we are ready to execute another flip.

[Although the friend is not needed for the final flip, since it would be an initial particle anyway, we need to know whether we have t - or u -channel.]

```

(PHS trees: public)+≡
public :: phs_tree_flip_t_to_s_channel

```

<PHS trees: procedures>+≡

```

subroutine phs_tree_flip_t_to_s_channel (tree)
  type(phs_tree_t), intent(inout) :: tree
  integer(TC) :: k, f, m, n, d, s
  if (tree%n_in == 2) then
    FLIP: do k=3, tree%mask-1
      if (.not. tree%branch(k)%set) cycle FLIP
      f = iand(k,tree%mask_in)
      if (f==0 .or. f==k) cycle FLIP
      m = tree%branch(k)%mother
      s = tree%branch(k)%sibling
      if (s==0) call find_orphan(s)
      d = tree%branch(k)%daughter(1)
      n = ior(d,s)
      tree%branch(k)%set = .false.
      tree%branch(n)%set = .true.
      tree%branch(n)%origin = k
      tree%branch(n)%daughter(1) = d; tree%branch(d)%mother = n
      tree%branch(n)%daughter(2) = s; tree%branch(s)%mother = n
      tree%branch(n)%has_children = .true.
      tree%branch(d)%sibling = s; tree%branch(s)%sibling = d
      tree%branch(n)%sibling = f; tree%branch(f)%sibling = n
      tree%branch(n)%mother = m
      tree%branch(f)%mother = m
      if (m/=0) then
        tree%branch(m)%daughter(1) = n
        tree%branch(m)%daughter(2) = f
      end if
      tree%branch(n)%friend = f
      tree%branch(n)%has_friend = .true.
      tree%branch(n)%firstborn = 2
    end do FLIP
  end if
contains
  subroutine find_orphan(s)
    integer(TC) :: s
    do s=1, tree%mask_out
      if (tree%branch(s)%set .and. tree%branch(s)%mother==0) return
    end do
    call phs_tree_write (tree)
    call msg_bug (" Can't flip phase space tree to channel")
  end subroutine find_orphan
end subroutine phs_tree_flip_t_to_s_channel

```

After the tree has been flipped, one may need to determine what has become of a particular *t*-channel branch. This function gives the bincode of the flipped tree. If the original bincode does not contain IN-bits, we leave it as it is.

<PHS trees: procedures>+≡

```

function tc_flipped (tree, kt) result (ks)
  type(phs_tree_t), intent(in) :: tree
  integer(TC), intent(in) :: kt
  integer(TC) :: ks
  if (iand (kt, tree%mask_in) == 0) then

```

```

        ks = kt
    else
        ks = tree%branch(iand (kt, tree%mask_out))%mother
    end if
end function tc_flipped

```

Scan a tree and make sure that the first daughter has always a smaller code than the second one. Furthermore, delete any **friend** entry in the root branch – this branching has the incoming particle direction as axis anyway. Keep track of reordering by updating **inverted_axis**, **inverted_decay** and **firstborn**.

```

        end subroutine branch_canonicalize
    end subroutine phs_tree_canonicalize

```

Mappings

Initialize a mapping for the current tree. This is done while reading from file, so the mapping parameters are read, but applied to the flipped tree. Thus, the size of the array of mappings is given by the number of outgoing particles only.

```

<PHS trees: public>+≡

```

```

    public :: phs_tree_init_mapping
<PHS trees: procedures>+≡
    subroutine phs_tree_init_mapping (tree, k, type, pdg, model)
        type(phs_tree_t), intent(inout) :: tree
        integer(TC), intent(in) :: k
        type(string_t), intent(in) :: type
        integer, intent(in) :: pdg
        class(model_data_t), intent(in), target :: model
        integer(TC) :: kk
        kk = tc_flipped (tree, k)
        call mapping_init (tree%mapping(kk), kk, type, pdg, model)
    end subroutine phs_tree_init_mapping

```

Set the physical parameters for the mapping, using a specific parameter set.
Also set the mass sum array.

```

<PHS trees: public>+≡
    public :: phs_tree_set_mapping_parameters
<PHS trees: procedures>+≡
    subroutine phs_tree_set_mapping_parameters &
        (tree, mapping_defaults, variable_limits)
        type(phs_tree_t), intent(inout) :: tree
        type(mapping_defaults_t), intent(in) :: mapping_defaults
        logical, intent(in) :: variable_limits
        integer(TC) :: k
        do k = 1, tree%n_branches_out
            call mapping_set_parameters &
                (tree%mapping(k), mapping_defaults, variable_limits)
        end do
    end subroutine phs_tree_set_mapping_parameters

```

Return the mapping for the sum of all outgoing particles. This should either be no mapping or a global s-channel mapping.

```

<PHS trees: public>+≡
    public :: phs_tree_assign_s_mapping
<PHS trees: procedures>+≡
    subroutine phs_tree_assign_s_mapping (tree, mapping)
        type(phs_tree_t), intent(in) :: tree
        type(mapping_t), intent(out) :: mapping
        mapping = tree%mapping(tree%mask_out)
    end subroutine phs_tree_assign_s_mapping

```

Kinematics

Fill the mass sum array, starting from the external particles and working down to the tree root. For each bincode k we scan the bits in k ; if only one is set, we take the physical mass of the corresponding external particle; if more than one is set, we sum up the two masses (which we know have already been set).

```

<PHS trees: public>+≡
    public :: phs_tree_set_mass_sum

```

```

<PHS trees: procedures>+≡
subroutine phs_tree_set_mass_sum (tree, flv)
  type(phs_tree_t), intent(inout) :: tree
  type(flavor_t), dimension(:), intent(in) :: flv
  integer(TC) :: k
  integer :: i
  tree%mass_sum = 0
  do k = 1, tree%n_branches_out
    do i = 0, size (flv) - 1
      if (btest(k,i)) then
        if (ibclr(k,i) == 0) then
          tree%mass_sum(k) = flavor_get_mass (flv(i+1))
        else
          tree%mass_sum(k) = &
            tree%mass_sum(ibclr(k,i)) + tree%mass_sum(ibset(0,i))
        end if
      end if
    end do
  end do
end subroutine phs_tree_set_mass_sum

```

Set the effective masses and widths. For each non-resonant branch in a tree, the effective mass is equal to the sum of the effective masses of the children (and analogous for the width). External particles have their real mass and width zero. For resonant branches, we insert mass and width from the corresponding mapping.

This routine has `phs_tree_set_mass_sum` and `phs_tree_set_mapping_parameters` as prerequisites.

```

<PHS trees: public>+≡
public :: phs_tree_set_effective_masses

<PHS trees: procedures>+≡
subroutine phs_tree_set_effective_masses (tree)
  type(phs_tree_t), intent(inout) :: tree
  tree%effective_mass = 0
  tree%effective_width = 0
  call set_masses_x (tree%mask_out)
contains
  recursive subroutine set_masses_x (k)
    integer(TC), intent(in) :: k

    if (tree%branch(k)%has_children) then
      k1 = tree%branch(k)%daughter(1)
      k2 = tree%branch(k)%daughter(2)
      call set_masses_x (k1)
      call set_masses_x (k2)
      if (mapping_is_s_channel (tree%mapping(k))) then
        tree%effective_mass(k) = mapping_get_mass (tree%mapping(k))
        tree%effective_width(k) = mapping_get_width (tree%mapping(k))
      else
        tree%effective_mass(k) = &
          tree%effective_mass(k1) + tree%effective_mass(k2)
      end if
    end if
  end subroutine set_masses_x

```

```

        tree%effective_width(k) = &
            tree%effective_width(k1) + tree%effective_width(k2)
    end if
else
    tree%effective_mass(k) = tree%mass_sum(k)
end if
end subroutine set_masses_x
end subroutine phs_tree_set_effective_masses

```

Define step mappings, recursively, for the decay products of all intermediate resonances. Step mappings account for the fact that a branch may originate from a resonance, which almost replaces the upper limit on the possible invariant mass. The step mapping implements a smooth cutoff that interpolates between the resonance and the real kinematic limit. The mapping width determines the sharpness of the cutoff.

Step mappings are inserted only for branches that are not mapped otherwise.

At each branch, we record the mass that is effectively available for phase space, by taking the previous limit and subtracting the effective mass of the sibling branch. Widths are added, not subtracted.

If we encounter a resonance decay, we discard the previous limit and replace it by the mass and width of the resonance, also subtracting the sibling branch.

Initially, the limit is zero, so it becomes negative at any branch. Only if there is a resonance, the limit becomes positive. Whenever the limit is positive, and the current branch decays, we activate a step mapping for the current branch.

As a result, step mappings are implemented for all internal lines that originate from an intermediate resonance decay.

The flag `variable_limits` applies to the ultimate limit from the available energy, not to the intermediate resonances whose masses are always fixed.

This routine requires `phs_tree_set_effective_masses`

end subroutine phs_tree_set_step_mappings

```

Structural comparison

This function allows to check whether one tree is the permutation of another one. The permutation is applied to the second tree in the argument list. We do not make up a temporary permuted tree, but compare the two trees directly. The branches are scanned recursively, where for each daughter we check the friend and the mapping as well. Once a discrepancy is found, the recursion is exited immediately.

```

Scan two decay trees and determine the correspondence of mass variables, i.e., the permutation that transfers the ordered list of mass variables belonging to the second tree into the first one. Mass variables are assigned beginning from

branches and ending at the root.

18.4.4 Phase-space evaluation

Phase-space volume

We compute the phase-space volume recursively, following the same path as for computing other kinematical variables. However, the volume depends just on $\sqrt{\hat{s}}$, not on the momentum configuration.

Note: counting branches, we may replace this by a simple formula.

```

<PHS trees: public>+≡
  public :: phs_tree_compute_volume

<PHS trees: procedures>+≡
  subroutine phs_tree_compute_volume (tree, sqrts, volume)
    type(phs_tree_t), intent(in) :: tree
    real(default), intent(in) :: sqrts
    real(default), intent(out) :: volume
    integer(TC) :: k
    k = tree%mask_out
    if (tree%branch(k)%has_children) then
      call compute_volume_x (tree%branch(k), k, volume, .true.)
    end if
  end subroutine

```

```

else
    volume = 1
end if
contains
recursive subroutine compute_volume_x (b, k, volume, initial)
    type(phs_branch_t), intent(in) :: b
    integer(TC), intent(in) :: k
    real(default), intent(out) :: volume
    logical, intent(in) :: initial
    integer(TC) :: k1, k2
    real(default) :: v1, v2
    k1 = b%daughter(1); k2 = b%daughter(2)
    if (tree%branch(k1)%has_children) then
        call compute_volume_x (tree%branch(k1), k1, v1, .false.)
    else
        v1 = 1
    end if
    if (tree%branch(k2)%has_children) then
        call compute_volume_x (tree%branch(k2), k2, v2, .false.)
    else
        v2 = 1
    end if
    if (initial) then
        volume = v1 * v2 / (4 * twopi5)
    else
        volume = v1 * v2 * sqrts**2 / (4 * twopi2)
    end if
end subroutine compute_volume_x
end subroutine phs_tree_compute_volume

```

Determine momenta

This is done in two steps: First the masses are determined. This step may fail, in which case `ok` is set to false. If successful, we generate angles and the actual momenta. The array `decay_p` serves for transferring the individual three-momenta of the daughter particles in their mother rest frame from the mass generation to the momentum generation step.

(PHS trees: public)+≡

```
public :: phs_tree_compute_momenta_from_x
```

(PHS trees: procedures)+≡

```

subroutine phs_tree_compute_momenta_from_x &
    (tree, prt, factor, volume, sqrts, x, ok)
    type(phs_tree_t), intent(inout) :: tree
    type(phs_prt_t), dimension(:), intent(inout) :: prt
    real(default), intent(out) :: factor, volume
    real(default), intent(in) :: sqrts
    real(default), dimension(:), intent(in) :: x
    logical, intent(out) :: ok
    real(default), dimension(tree%mask_out) :: decay_p
    integer :: n1, n2
    integer :: n_out
    if (tree%real_phsp) then

```

```

        n_out = tree%n_externals - tree%n_in - 1
        n1 = max (n_out-2, 0)
        n2 = n1 + max (2*n_out, 0)
    else
        n1 = tree%n_msq
        n2 = n1 + tree%n_angles
    end if
    call phs_tree_set_msq &
        (tree, prt, factor, volume, decay_p, sqrts, x(1:n1), ok)
    if (ok) call phs_tree_set_angles &
        (tree, prt, factor, decay_p, sqrts, x(n1+1:n2))
end subroutine phs_tree_compute_momenta_from_x

```

Mass generation is done recursively. The `ok` flag causes the filled tree to be discarded if set to `.false.` This happens if a three-momentum turns out to be imaginary, indicating impossible kinematics. The index `ix` tells us how far we have used up the input array `x`.

```

The heart of phase space generation: Now we have the invariant masses, let

us generate angles. At each branch, we take a Lorentz transformation and augment it by a boost to the current particle rest frame, and by rotations ϕ and θ around the z and y axis, respectively. This transformation is passed down to the daughter particles, if present.

18.5 The phase-space forest

Simply stated, a phase-space forest is a collection of phase-space trees. More precisely, a `phs_forest` object contains all parameterizations of phase space that `WHIZARD` will use for a single hard process, prepared in the form of `phs_tree` objects. This is suitable for evaluation by the `VAMP` integration package: each parameterization (tree) is a valid channel in the multi-channel adaptive integration, and each variable in a tree corresponds to an integration dimension, defined by an appropriate mapping of the $(0, 1)$ interval to the allowed range of the integration variable.

The trees are grouped in groves. The trees (integration channels) within a grove share a common weight, assuming that they are related by some approximate symmetry.

Trees/channels that are related by an exact symmetry are connected by an array of equivalences; each equivalence object holds the data that relate one channel to another.

The phase-space setup, i.e., the detailed structure of trees and forest, are read from a file. Therefore, this module also contains the syntax definition and the parser needed for interpreting this file.

```

18.5.1 Phase-space setup parameters

This transparent container holds the parameters that the algorithm needs for phase-space setup, with reasonable defaults.

The threshold mass (for considering a particle as effectively massless) is specified separately for s- and t-channel. The default is to treat W and Z bosons as massive in the s-channel, but as massless in the t-channel. The b -quark is treated always massless, the t -quark always massive.

<PHS forests: public>≡

public :: phs_parameters_t

    end function phs_parameters_ne
```

18.5.2 Equivalences

This type holds information about equivalences between phase-space trees. We make a linked list, where each node contains the two trees which are equivalent and the corresponding permutation of external particles. Two more arrays are to be filled: The permutation of mass variables and the permutation of angular variables, where the signature indicates a necessary exchange of daughter branches.

```
(PHS forests: types)+≡
  type :: equivalence_t
  private
  integer :: left, right
  type(permutation_t) :: perm
  type(permutation_t) :: msq_perm, angle_perm
  logical, dimension(:), allocatable :: angle_sig
  type(equivalence_t), pointer :: next => null ()
end type equivalence_t
```

```
(PHS forests: types)+≡
  type :: equivalence_list_t
  private
  integer :: length = 0
  type(equivalence_t), pointer :: first => null ()
  type(equivalence_t), pointer :: last => null ()
end type equivalence_list_t
```

Append an equivalence to the list

```
(PHS forests: procedures)+≡
  subroutine equivalence_list_add (eql, left, right, perm)
  type(equivalence_list_t), intent(inout) :: eql
  integer, intent(in) :: left, right
  type(permutation_t), intent(in) :: perm
  type(equivalence_t), pointer :: eq
  allocate (eq)
  eq%left = left
  eq%right = right
  eq%perm = perm
  if (associated (eql%last)) then
    eql%last%next => eq
  else
    eql%first => eq
  end if
  eql%last => eq
  eql%length = eql%length + 1
end subroutine equivalence_list_add
```

Delete the list contents. Has to be pure because it is called from an elemental subroutine.

```
(PHS forests: procedures)+≡
  pure subroutine equivalence_list_final (eql)
  type(equivalence_list_t), intent(inout) :: eql
  type(equivalence_t), pointer :: eq
```

```

do while (associated (eql%first))
  eq => eql%first
  eql%first => eql%first%next
  deallocate (eq)
end do
eql%last => null ()
eql%length = 0
end subroutine equivalence_list_final

```

Make a deep copy of the equivalence list. This allows for deep copies of groves and forests.

```

(PHS forests: interfaces)+≡
interface assignment(=)
  module procedure equivalence_list_assign
end interface

(PHS forests: procedures)+≡
subroutine equivalence_list_assign (eql_out, eql_in)
  type(equivalence_list_t), intent(out) :: eql_out
  type(equivalence_list_t), intent(in) :: eql_in

        end if
    end do
    write (u, *)
    if (associated (eq%next)) call equivalence_write_rec (eq%next, u)
end subroutine equivalence_write_rec
end subroutine equivalence_list_write

```

18.5.3 Groves

A grove is a group of trees (phase-space channels) that share a common weight in the integration. Within a grove, channels can be declared equivalent, so they also share their integration grids (up to symmetries). The grove contains a list of equivalences. The `tree_count_offset` is the total number of trees of the preceding groves; when the trees are counted per forest (integration channels), the offset has to be added to all tree indices.

```

<PHS forests: types>+≡
    type :: phs_grove_t
    private
    integer :: tree_count_offset
    type(phs_tree_t), dimension(:), allocatable :: tree
    type(equivalence_list_t) :: equivalence_list
end type phs_grove_t

```

Call `phs_tree_init` which is also elemental:

```

<PHS forests: procedures>+≡
    elemental subroutine phs_grove_init &
        (grove, n_trees, n_in, n_out, n_masses, n_angles)

```

```

    type(phs_grove_t), intent(inout) :: grove
    integer, intent(in) :: n_trees, n_in, n_out, n_masses, n_angles
    grove%tree_count_offset = 0
    allocate (grove%tree (n_trees))
    call phs_tree_init (grove%tree, n_in, n_out, n_masses, n_angles)
end subroutine phs_grove_init

```

The trees do not have pointer components, thus no call to `phs_tree_final`:

```

<PHS forests: procedures>+≡
    elemental subroutine phs_grove_final (grove)
        type(phs_grove_t), intent(inout) :: grove
        deallocate (grove%tree)
        call equivalence_list_final (grove%equivalence_list)
    end subroutine phs_grove_final

```

Deep copy.

```

<PHS forests: interfaces>+≡
    interface assignment(=)
        module procedure phs_grove_assign0
        module procedure phs_grove_assign1
    end interface

<PHS forests: procedures>+≡
    subroutine phs_grove_assign0 (grove_out, grove_in)
        type(phs_grove_t), intent(out) :: grove_out
        type(phs_grove_t), intent(in) :: grove_in
        grove_out%tree_count_offset = grove_in%tree_count_offset
        if (allocated (grove_in%tree)) then
            allocate (grove_out%tree (size (grove_in%tree)))
            grove_out%tree = grove_in%tree
        end if
        grove_out%equivalence_list = grove_in%equivalence_list
    end subroutine phs_grove_assign0

    subroutine phs_grove_assign1 (grove_out, grove_in)
        type(phs_grove_t), dimension(:), intent(out) :: grove_out
        type(phs_grove_t), dimension(:), intent(in) :: grove_in
        integer :: i
        do i = 1, size (grove_in)
            call phs_grove_assign0 (grove_out(i), grove_in(i))
        end do
    end subroutine phs_grove_assign1

```

Get the global (s-channel) mappings. Implemented as a subroutine which returns an array (slice).

```

<PHS forests: procedures>+≡
    subroutine phs_grove_assign_s_mappings (grove, mapping)
        type(phs_grove_t), intent(in) :: grove
        type(mapping_t), dimension(:), intent(out) :: mapping
        integer :: i
        if (size (mapping) == size (grove%tree)) then
            do i = 1, size (mapping)

```

```

        call phs_tree_assign_s_mapping (grove%tree(i), mapping(i))
    end do
else
    call msg_bug ("phs_grove_assign_s_mappings: array size mismatch")
end if
end subroutine phs_grove_assign_s_mappings

```

18.5.4 The forest type

This is a collection of trees and associated particles. In a given tree, each branch code corresponds to a particle in the `prt` array. Furthermore, we have an array of mass sums which is independent of the decay tree and of the particular event. The mappings directly correspond to the decay trees, and the decay groves collect the trees in classes. The permutation list consists of all permutations of outgoing particles that map the decay forest onto itself.

The particle codes `flv` (one for each external particle) are needed for determining masses and such. The trees and associated information are collected in the `grove` array, together with a lookup table that associates tree indices to groves. Finally, the `prt` array serves as workspace for phase-space evaluation.

The `prt_combination` is a list of index pairs, namely the particle momenta pairs that need to be combined in order to provide all momentum combinations that the phase-space trees need to know.

```

(PHS forests: public)+≡
    public :: phs_forest_t

(PHS forests: types)+≡
    type :: phs_forest_t
    private
        integer :: n_in, n_out, n_tot
        integer :: n_masses, n_angles, n_dimensions
        integer :: n_trees, n_equivalences
        type(flavor_t), dimension(:), allocatable :: flv
        type(phs_grove_t), dimension(:), allocatable :: grove
        integer, dimension(:), allocatable :: grove_lookup
        type(phs_prt_t), dimension(:), allocatable :: prt_in
        type(phs_prt_t), dimension(:), allocatable :: prt_out
        type(phs_prt_t), dimension(:), allocatable :: prt
        integer(TC), dimension(:,:), allocatable :: prt_combination
        type(mapping_t), dimension(:), allocatable :: s_mapping
    contains
        (PHS forests: phs forest: TBP)
    end type phs_forest_t

```

The initialization merely allocates memory. We have to know how many trees there are in each grove, so we can initialize everything. The number of groves is the size of the `n_tree` array.

In the `grove_lookup` table we store the grove index that belongs to each absolute tree index. The difference between the absolute index and the relative (to the grove) index is stored, for each grove, as `tree_count_offset`.

The particle array is allocated according to the total number of branches each tree has, but not filled.

```

18.5.7 Read the phase space setup from file

The phase space setup is stored in a file. The file may be generated by the `cascades` module below, or by other means. This file has to be read and parsed to create the PHS forest as the internal phase-space representation.

Create lexer and syntax:

```

(PHS forests: procedures)+≡
  subroutine define_phs_forest_syntax (ifile)
    type(ifile_t) :: ifile
    call ifile_append (ifile, "SEQ phase_space_list = process_phase_space*")
    call ifile_append (ifile, "SEQ process_phase_space = " &
      // "process_def process_header phase_space")
    call ifile_append (ifile, "SEQ process_def = process_process_list")
    call ifile_append (ifile, "KEY process")
    call ifile_append (ifile, "LIS process_list = process_tag*")
    call ifile_append (ifile, "IDE process_tag")
    call ifile_append (ifile, "SEQ process_header = " &

```

```

// "md5sum_process = md5sum " &
// "md5sum_model_par = md5sum " &
// "md5sum_phs_config = md5sum " &
// "sqrts = real " &
// "m_threshold_s = real " &
// "m_threshold_t = real " &
// "off_shell = integer " &
// "t_channel = integer " &
// "keep_nonresonant = logical")
call ifile_append (ifile, "KEY '='")
call ifile_append (ifile, "KEY md5sum_process")
call ifile_append (ifile, "KEY md5sum_model_par")
call ifile_append (ifile, "KEY md5sum_phs_config")
call ifile_append (ifile, "KEY sqrts")
call ifile_append (ifile, "KEY m_threshold_s")
call ifile_append (ifile, "KEY m_threshold_t")
call ifile_append (ifile, "KEY off_shell")
call ifile_append (ifile, "KEY t_channel")
call ifile_append (ifile, "KEY keep_nonresonant")
call ifile_append (ifile, "QUO md5sum = '""' ... '""'")
call ifile_append (ifile, "REA real")
call ifile_append (ifile, "INT integer")
call ifile_append (ifile, "IDE logical")
call ifile_append (ifile, "SEQ phase_space = grove_def+")
call ifile_append (ifile, "SEQ grove_def = grove tree_def+")
call ifile_append (ifile, "KEY grove")
call ifile_append (ifile, "SEQ tree_def = tree bincodes mapping*")
call ifile_append (ifile, "KEY tree")
call ifile_append (ifile, "SEQ bincodes = bincodes*")
call ifile_append (ifile, "INT bincodes")
call ifile_append (ifile, "SEQ mapping = map bincodes channel pdg")
call ifile_append (ifile, "KEY map")
call ifile_append (ifile, "ALT channel = &
    &s_channel | t_channel | u_channel | &
    &collinear | infrared | radiation | on_shell")
call ifile_append (ifile, "KEY s_channel")
! call ifile_append (ifile, "KEY t_channel")    !!! Key already exists
call ifile_append (ifile, "KEY u_channel")
call ifile_append (ifile, "KEY collinear")
call ifile_append (ifile, "KEY infrared")
call ifile_append (ifile, "KEY radiation")
call ifile_append (ifile, "KEY on_shell")
call ifile_append (ifile, "INT pdg")
end subroutine define_phs_forest_syntax

```

The model-file syntax and lexer are fixed, therefore stored as module variables:

```

<PHS forests: variables>≡
    type(syntax_t), target, save :: syntax_phs_forest

<PHS forests: public>+≡
    public :: syntax_phs_forest_init

<PHS forests: procedures>+≡
    subroutine syntax_phs_forest_init ()

```

```

    type(ifile_t) :: ifile
    call define_phs_forest_syntax (ifile)
    call syntax_init (syntax_phs_forest, ifile)
    call ifile_final (ifile)
end subroutine syntax_phs_forest_init

```

```

<PHS forests: procedures>+≡
subroutine lexer_init_phs_forest (lexer)
    type(lexer_t), intent(out) :: lexer
    call lexer_init (lexer, &
        comment_chars = "#!", &
        quote_chars = '"', &
        quote_match = '"', &
        single_chars = "'", &
        special_class = ["="] , &
        keyword_list = syntax_get_keyword_list_ptr (syntax_phs_forest))
end subroutine lexer_init_phs_forest

```

```

<PHS forests: public>+≡
public :: syntax_phs_forest_final

```

```

<PHS forests: procedures>+≡
subroutine syntax_phs_forest_final ()
    call syntax_final (syntax_phs_forest)
end subroutine syntax_phs_forest_final

```

```

<PHS forests: public>+≡
public :: syntax_phs_forest_write

```

```

<PHS forests: procedures>+≡
subroutine syntax_phs_forest_write (unit)
    integer, intent(in), optional :: unit
    call syntax_write (syntax_phs_forest, unit)
end subroutine syntax_phs_forest_write

```

The concrete parser and interpreter. Generate an input stream for the external `unit`, read the parse tree (with given `syntax` and `lexer`) from this stream, and transfer the contents of the parse tree to the PHS forest.

We look for the matching `process` tag, count groves and trees for initializing the forest, and fill the trees.

If the optional parameters are set, compare the parameters stored in the file to those. Set `match` true if everything agrees.

```

<PHS forests: public>+≡
public :: phs_forest_read

```

```

<PHS forests: interfaces>+≡
interface phs_forest_read
    module procedure phs_forest_read_file
    module procedure phs_forest_read_unit
    module procedure phs_forest_read_parse_tree
end interface

```

(PHS forests: procedures)+≡

```

18.5.8 Preparation

The trees that we read from file do not carry flavor information. This is set separately:

The flavor list must be unique for a unique set of masses; if a given particle can have different flavor, the mass must be degenerate, so we can choose one of the possible flavor combinations.

```
<PHS forests: public>+≡
  public :: phs_forest_set_flavors

<PHS forests: procedures>+≡
  subroutine phs_forest_set_flavors (forest, flv, reshuffle, flv_extra)

```

Once the parameter set is fixed, the masses and the widths of the particles are known and the `mass_sum` arrays as well as the mapping parameters can be computed. Note that order is important: we first compute the mass sums, then the ordinary mappings. The resonances obtained here determine the effective

masses, which in turn are used to implement step mappings for resonance decay products that are not mapped otherwise.

```

Generate the particle combination table. Scan all trees and merge their individual combination tables. At the end, valid entries are non-zero, and they indicate the indices of a pair of particles to be combined to a new particle. If a particle is accessible by more than one tree (this is usual), only keep the first possibility.

18.5.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

<PHS forests: procedures>+≡

```

```

18.5.12 Phase-space evaluation

Given one row of the x parameter array and the corresponding channel index, compute first all relevant momenta and then recover the remainder of the x array, the Jacobians `phs_factor`, and the phase-space volume.

The output argument `ok` indicates whether this was successful.

```

(PHS forests: public)+≡
public :: phs_forest_evaluate_selected_channel

(PHS forests: procedures)+≡
subroutine phs_forest_evaluate_selected_channel &
    (forest, channel, active, sqrts, x, phs_factor, volume, ok)
type(phs_forest_t), intent(inout) :: forest

18.6 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should generate one.

The idea is to construct all Feynman diagrams subject to certain constraints which eliminate everything that is probably irrelevant for the integration. These Feynman diagrams (cascades) are grouped in groves by finding equivalence classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the integration.

This module may eventually disappear and be replaced by CAML code. In particular, we need here a set of Feynman rules (vertices with particle codes, but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program only via the generated ASCII phase-space configuration file.

```

⟨cascades.f90⟩≡

18.6.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

⟨Mapping modes⟩≡

```
integer, parameter :: &  
  & EXTERNAL_PRT = -1, &  
  & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &  
  & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &  
  & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &  
  & ON_SHELL = 99
```

⟨Cascades: parameters⟩≡

⟨Mapping modes⟩

18.6.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascades has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a t -channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of t -channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

$\langle \text{Cascades: types} \rangle \equiv$

```

18.6.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry in the tree is set undefined because the cascade is not resonant. However, the flavor entry is set, so the cascade flavor is identified nevertheless.

(Cascades: procedures)+≡

```

subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos

```

```

real(default), intent(in) :: m_thr
call cascade_init (cascade, 1)
cascade%bincode = ibset (0_TC, pos-1)
cascade%flv = flv
cascade%pdg = abs (flavor_get_pdg (cascade%flv))
cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
cascade%m_min = flavor_get_mass (flv)
cascade%m_rea = cascade%m_min
if (cascade%m_rea >= m_thr) then
    cascade%m_eff = cascade%m_rea
end if
cascade%on_shell = .true.
cascade%multiplicity = 1
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_outgoing

```

The same for an incoming line:

```

<Cascades: procedures>+≡
subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%incoming = .true.
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flavor_anti (flv)
    cascade%pdg = abs (flavor_get_pdg (flv))
    cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
    cascade%m_min = flavor_get_mass (flv)
    cascade%m_rea = cascade%m_min
    if (cascade%m_rea >= m_thr) then
        cascade%m_eff = cascade%m_rea
    end if
    cascade%on_shell = .true.
    cascade%n_t_channel = 0
    cascade%n_off_shell = 0
    cascade%tree(1) = cascade%bincode
    cascade%tree_pdg(1) = cascade%pdg
    cascade%tree_mapping(1) = EXTERNAL_PRT
    cascade%tree_resonant(1) = .false.
end subroutine cascade_init_incoming

```

18.6.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

```

<Cascades: interfaces>≡
interface operator(.disjunct.)

```

```

    module procedure cascade_disjunct
end interface

```

```

<Cascades: procedures>+=
function cascade_disjunct (cascade1, cascade2) result (flag)
    logical :: flag
    type(cascade_t), intent(in) :: cascade1, cascade2
    flag = iand (cascade1%bincode, cascade2%bincode) == 0
end function cascade_disjunct

```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to i8 integers, and compute the hash code from this byte stream.

```

<Cascades: procedures>+=
subroutine cascade_assign_resonance_hash (cascade)
    type(cascade_t), intent(inout) :: cascade
    integer(i8), dimension(1) :: mold
    cascade%res_hash = hash (transfer &
        (concat (sort (pack (cascade%tree_pdg, &
            cascade%tree_resonant)), &
            sort (pack (cascade%tree_pdg, &
                cascade%tree_mapping == T_CHANNEL .or. &
                cascade%tree_mapping == U_CHANNEL))), &
        mold))
end subroutine cascade_assign_resonance_hash

```

18.6.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

```

<Cascades: types>+=
type :: cascade_p
    type(cascade_t), pointer :: cascade => null ()
    type(cascade_p), pointer :: next => null ()
end type cascade_p

```

Here is the bucket or hash entry type:

```

<Cascades: types>+=
type :: hash_entry_t
    integer(i32) :: hashval = 0
    integer(i8), dimension(:), allocatable :: key
    type(cascade_p), pointer :: first => null ()
    type(cascade_p), pointer :: last => null ()
end type hash_entry_t

```

Finalize: just deallocate the list; the contents are just pointers.

```

(Cascades: procedures)+≡
  subroutine hash_entry_final (hash_entry)
    type(hash_entry_t), intent(inout) :: hash_entry
    type(cascade_p), pointer :: current
    do while (associated (hash_entry%first))
      current => hash_entry%first
      hash_entry%first => current%next
      deallocate (current)
    end do
  end subroutine hash_entry_final

```

Output: concise format for debugging, just list cascade indices.

```

(Cascades: procedures)+≡
  subroutine hash_entry_write (hash_entry, unit)
    type(hash_entry_t), intent(in) :: hash_entry
    integer, intent(in), optional :: unit
    type(cascade_p), pointer :: current
    integer :: u, i
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(1x,A)", advance="no") "Entry:"
    do i = 1, size (hash_entry%key)
      write (u, "(1x,I0)", advance="no") hash_entry%key(i)
    end do
    write (u, "(1x,A)", advance="no") "->"
    current => hash_entry%first
    do while (associated (current))
      write (u, "(1x,I7)", advance="no") current%cascade%index
      current => current%next
    end do
    write (u, *)
  end subroutine hash_entry_write

```

This function adds a cascade pointer to the bucket. If ok is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

```

(Cascades: procedures)+≡
  subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(inout) :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out), optional :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    if (present (ok)) then
      call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
      if (.not. ok) return
    end if
    allocate (current)
    current%cascade => cascade
    if (associated (hash_entry%last)) then
      hash_entry%last%next => current
    end if
  end subroutine hash_entry_add_cascade_ptr

```

```

else
    hash_entry%first => current
end if
hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr

```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguished only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

```

<Cascades: procedures>+=
subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(in), target :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    integer, dimension(:), allocatable :: tree_pdg
    ok = .true.
    allocate (tree_pdg (size (cascade%tree_pdg)))
    if (cascade%complete) then
        where (cascade%tree_mapping == INFRARED .or. &
             cascade%tree_mapping == COLLINEAR .or. &
             cascade%tree_mapping == T_CHANNEL .or. &
             cascade%tree_mapping == U_CHANNEL)
            tree_pdg = 0
        elsewhere
            tree_pdg = cascade%tree_pdg
        end where
    else
        tree_pdg = cascade%tree_pdg
    end if
    current => hash_entry%first
    do while (associated (current))
        if (current%cascade%depth == cascade%depth) then
            if (all (current%cascade%tree == cascade%tree)) then
                if (all (current%cascade%tree_mapping == cascade%tree_mapping)) &
                    then
                    if (all (current%cascade%tree_pdg .match. tree_pdg)) then
                        if (present (cascade_ptr)) cascade_ptr => current%cascade
                        ok = .false.; return
                    end if
                end if
            end if
        end if
    end if
end if
end if

```

```

        current => current%next
    end do
    if (present (cascade_ptr)) cascade_ptr => cascade
end subroutine hash_entry_check_cascade

```

For PDG codes, we specify that the undefined code matches any code. This is already defined for flavor objects, but here we need it for the codes themselves.

```

<Cascades: interfaces>+≡
    interface operator(.match.)
        module procedure pdg_match
    end interface

<Cascades: procedures>+≡

                flag = pdg1 == pdg2
            end select
        end select
    end function pdg_match

```

18.6.6 The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a linked list. In addition to the usual **first** and **last** pointers, there is a **first_t** pointer which points to the first t-channel cascade (after all s-channel cascades), and a **first_k** pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated parameters where an additional pointer is stored for each cascade. The keys are made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

```

<Cascades: public>≡
    public :: cascade_set_t

<Cascades: types>+≡
    type :: cascade_set_t
        private
        class(model_data_t), pointer :: model
        integer :: n_in, n_out, n_tot
        type(flavor_t), dimension(:, :), allocatable :: flv
        integer :: depth_out, depth_tot
        real(default) :: sqrts = 0
        real(default) :: m_threshold_s = 0
        real(default) :: m_threshold_t = 0
    end type

```

```

integer :: off_shell = 0
integer :: t_channel = 0
logical :: keep_nonresonant
integer :: n_groves = 0
! The cascade list
type(cascade_t), pointer :: first => null ()
type(cascade_t), pointer :: last => null ()
type(cascade_t), pointer :: first_t => null ()
type(cascade_t), pointer :: first_k => null ()
! The hashtable
integer :: n_entries = 0
real :: fill_ratio = 0
integer :: n_entries_max = 0
integer(i32) :: mask = 0
logical :: fatal_beam_decay = .true.
type(hash_entry_t), dimension(:), allocatable :: entry
end type cascade_set_t

```

Return true if there are cascades which are active and complete, so the phase space file would be nonempty.

```

<Cascades: public>+≡
public :: cascade_set_is_valid

<Cascades: procedures>+≡
function cascade_set_is_valid (cascade_set) result (flag)
logical :: flag
type(cascade_set_t), intent(in) :: cascade_set
type(cascade_t), pointer :: cascade
flag = .false.
cascade => cascade_set%first_k
do while (associated (cascade))
    if (cascade%active .and. cascade%complete) then
        flag = .true.
        return
    end if
    cascade => cascade%next
end do
end function cascade_set_is_valid

```

The initializer sets up the hash table with some initial size guessed by looking at the number of external particles. We choose 256 for 3 external particles and a factor of 4 for each additional particle, limited at $2^{30}=1\text{G}$.

```

18.6.7 Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original, but the pointers are nullified. We do not care whether insertion was successful or not. The pointer argument, if present, is assigned to the input cascade, or to the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-copied and added to the cascade set before the current copy is added.

```

<Cascades: procedures>+=
recursive subroutine cascade_set_add_copy &
    (cascade_set, cascade_in, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in) :: cascade_in
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_t), pointer :: cascade
    logical :: ok
    allocate (cascade)
    cascade = cascade_in
    if (associated (cascade_in%daughter1)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter1, cascade%daughter1)
    if (associated (cascade_in%daughter2)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter2, cascade%daughter2)
    if (associated (cascade_in%mother)) call cascade_set_add_copy &
        (cascade_set, cascade_in%mother, cascade%mother)
    cascade%next => null ()
    call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    if (.not. ok) deallocate (cascade)
end subroutine cascade_set_add_copy

```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

```

<Cascades: procedures>+=
subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    integer(i8), dimension(1) :: mold
    call cascade_set_hash_insert &
        (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
    if (ok) call cascade_set_list_add (cascade_set, cascade)

```

```
end subroutine cascade_set_add
```

Add a new cascade to the list:

```
(Cascades: procedures) +=
  subroutine cascade_set_list_add (cascade_set, cascade)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    if (associated (cascade_set%last)) then
      cascade_set%last%next => cascade
    else
      cascade_set%first => cascade
    end if
    cascade_set%last => cascade
  end subroutine cascade_set_list_add
```

Add a cascade entry to the hash array:

```
(Cascades: procedures) +=
  subroutine cascade_set_hash_insert &
    (cascade_set, key, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    integer(i8), dimension(:), intent(in) :: key
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    integer(i32) :: h
    if (cascade_set%n_entries >= cascade_set%n_entries_max) &
      call cascade_set_hash_expand (cascade_set)
    h = hash (key)
    call cascade_set_hash_insert_rec &
      (cascade_set, h, h, key, cascade, ok, cascade_ptr)
  end subroutine cascade_set_hash_insert
```

Double the hashtable size when necessary:

```
(Cascades: procedures) +=
  subroutine cascade_set_hash_expand (cascade_set)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
    type(cascade_ptr), pointer :: current
    integer :: i, s
    allocate (table_tmp (0:cascade_set%mask))
    table_tmp = cascade_set%entry
    deallocate (cascade_set%entry)
    s = 2 * size (table_tmp)
    cascade_set%n_entries = 0
    cascade_set%n_entries_max = s * cascade_set%fill_ratio
    cascade_set%mask = s - 1
    allocate (cascade_set%entry (0:cascade_set%mask))
    do i = 0, ubound (table_tmp, 1)
      current => table_tmp(i)%first
      do while (associated (current))
        call cascade_set_hash_insert_rec &
          (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
```

```

        table_tmp(i)%key, current%cascade)
        current => current%next
    end do
end do
end subroutine cascade_set_hash_expand

```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If `ok` is present, before insertion we check whether the cascade is already stored, and return failure if yes.

(Cascades: procedures)+≡

```

recursive subroutine cascade_set_hash_insert_rec &
    (cascade_set, h, hashval, key, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout) :: cascade_set
    integer(i32), intent(in) :: h, hashval
    integer(i8), dimension(:), intent(in) :: key
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out), optional :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    integer(i32) :: i
    i = iand (h, cascade_set%mask)
    if (allocated (cascade_set%entry(i)%key)) then
        if (size (cascade_set%entry(i)%key) /= size (key)) then
            call cascade_set_hash_insert_rec &
                (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
        else if (any (cascade_set%entry(i)%key /= key)) then
            call cascade_set_hash_insert_rec &
                (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
        else
            call hash_entry_add_cascade_ptr &
                (cascade_set%entry(i), cascade, ok, cascade_ptr)
        end if
    else
        cascade_set%entry(i)%hashval = hashval
        allocate (cascade_set%entry(i)%key (size (key)))
        cascade_set%entry(i)%key = key
        call hash_entry_add_cascade_ptr &
            (cascade_set%entry(i), cascade, ok, cascade_ptr)
        cascade_set%n_entries = cascade_set%n_entries + 1
    end if
end subroutine cascade_set_hash_insert_rec

```

18.6.8 External particles

We want to initialize the cascade set with the outgoing particles. In case of multiple processes, initial cascades are prepared for all of them. The hash array check ensures that no particle appears more than once at the same place.

(Cascades: interfaces)+≡

```

interface cascade_set_add_outgoing
  module procedure cascade_set_add_outgoing1
  module procedure cascade_set_add_outgoing2
end interface

```

<Cascades: procedures>+≡

```

```

The incoming particles are added one at a time. Nevertheless, we may have several processes which are looped over. At the first opportunity, we set the pointer `first_t` in the cascade set which should point to the first t-channel cascade.

Return the indices of the first and last cascade generated.

18.6.9 Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

```
(Cascades: procedures) +=
  subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2
    logical, intent(in) :: s_channel
    integer, dimension(:), allocatable :: pdg3
    integer :: i, depth_max
    type(flavor_t) :: flv
    if (s_channel) then
      depth_max = cascade_set%depth_out
    else
      depth_max = cascade_set%depth_tot
    end if
    if (cascade1%depth + cascade2%depth < depth_max) then
      call cascade_set%model%match_vertex ( &
        flavor_get_pdg (cascade1%flv), &
        flavor_get_pdg (cascade2%flv), &
        pdg3)
      do i = 1, size (pdg3)
        call flavor_init (flv, pdg3(i), cascade_set%model)
        if (s_channel) then
          call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
        else
          call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
        end if
      end do
      deallocate (pdg3)
    end if
  end subroutine cascade_match_pair
```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

```
(Cascades: procedures) +=
  subroutine cascade_match_triplet &
    (cascade_set, cascade1, cascade2, cascade3, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
    logical, intent(in) :: s_channel
    integer :: depth_max
    depth_max = cascade_set%depth_tot
    if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
      if (cascade_set%model%check_vertex ( &
        flavor_get_pdg (cascade1%flv), &
```

```

        flavor_get_pdg (cascade2%flv), &
        flavor_get_pdg (cascade3%flv))) then
    call cascade_combine_keystone &
        (cascade_set, cascade1, cascade2, cascade3, s_channel)
    end if
end if
end subroutine cascade_match_triplet

```

18.6.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

```

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a $2 \rightarrow 1$ process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

  tree_tmp(pos(1)) = 0
end do
end subroutine tree_sort

```

18.6.12 Cascade set generation

These procedures loop over cascades and build up the cascade set. After each iteration of the innermost loop, we set a breakpoint.

s-channel: We use a nested scan to combine all cascades with all other cascades.

```

<Cascades: procedures>+=
subroutine cascade_set_generate_s (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  cascade1 => cascade_set%first
  LOOP1: do while (associated (cascade1))
    cascade2 => cascade_set%first
    LOOP2: do while (associated (cascade2))
      if (cascade2%index >= cascade1%index) exit LOOP2
      if (cascade1 .disjunct. cascade2) then
        call cascade_match_pair (cascade_set, cascade1, cascade2, .true.)
      end if
      call terminate_now_if_signal ()
      cascade2 => cascade2%next
    end do LOOP2
    cascade1 => cascade1%next
  end do LOOP1
end subroutine cascade_set_generate_s

```

The t-channel cascades are directed and have a seed (one of the incoming particles) and a target (the other one). We loop over all possible seeds and targets. Inside this, we loop over all t-channel cascades (*cascade1*) and s-channel cascades (*cascade2*) and try to combine them.

```

<Cascades: procedures>+=
subroutine cascade_set_generate_t (cascade_set, pos_seed, pos_target)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(in) :: pos_seed, pos_target

18.6.13 Groves

Before assigning groves, assign hashcodes to the resonance patterns, so they can easily be compared.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_resonance_hash (cascade_set)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), pointer :: cascade
    cascade => cascade_set%first_k
    do while (associated (cascade))
        call cascade_assign_resonance_hash (cascade)
        cascade => cascade%next
    end do
end subroutine cascade_set_assign_resonance_hash

```

After all cascades are recorded, we group the complete cascades in groves. A grove consists of cascades with identical multiplicity, number of resonances, log-enhanced, t-channel lines, and resonance flavors.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_groves (cascade_set)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), pointer :: cascade1, cascade2
    integer :: multiplicity
    integer :: n_resonances, n_log_enhanced, n_t_channel, n_off_shell
    integer :: res_hash
    integer :: grove
    grove = 0

    end if
  end if
  call terminate_now_if_signal ()
  cascade2 => cascade2%next
end do
end if
call terminate_now_if_signal ()
cascade1 => cascade1%next
end do
cascade_set%n_groves = grove
end subroutine cascade_set_assign_groves

```

18.6.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redundancies between flavor assignments.

```

<Cascades: public>+≡
  public :: cascade_set_generate

<Cascades: procedures>+≡

18.7 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and the `cascades` module for generating phase-space channels. As an extension of

the `phs_base` abstract type, the phase-space configuration and instance implement the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD. For trivial two-particle phase space, there is `phs_wood` as an alternative.)

```

<phs_wood.f90>≡
  <File header>

  module phs_wood

    <Use kinds>

18.7.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

```

<PHS wood: phs wood config: TBP>+≡
    procedure :: configure => phs_wood_config_configure

```

```

The MD5 sum of the forest is computed in addition to the MD5 sum of the configuration. The reason is that the forest may depend on a user-provided external file. On the other hand, this MD5 sum encodes all information that is relevant for further processing. Therefore, the `get_md5sum` method returns this result, once it is available.

```

<PHS wood: phs wood config: TBP>+≡

      phs%forest = phs_config%forest
    end select
  end subroutine phs_wood_init

```

18.7.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

```

Chapter 19

Multi-Channel Integration

The abstract representation of multi-channel Monte Carlo algorithms for integration and event generation.

Module `mci_base`: The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

`iterations` Container for defining integration call and pass settings.

`integration_results` This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

These are the implementations:

Module `mci_midpoint`: A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

Module `mci_vamp`: Interface for the VAMP package.

19.1 Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

```
<mci_base.f90>≡  
<File header>  
  
module mci_base  
  
    use kinds  
<Use strings>  
    use io_units  
    use format_utils, only: pac_fmt  
    use format_defs, only: FMT_14, FMT_17  
    use unit_tests  
    use diagnostics  
    use cputime  
    use phs_base  
    use rng_base  
  
<Standard module head>  
  
<MCI base: public>  
  
<MCI base: types>  
  
<MCI base: interfaces>  
  
<MCI base: test types>  
  
contains  
  
<MCI base: procedures>  
  
<MCI base: tests>  
  
end module mci_base
```

19.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as **rng**. It may or may not be used for integration. It will be used for

event generation.

```

    integer, intent(in) :: n_channel
    mci%n_dim = n_dim
    mci%n_channel = n_channel
  end subroutine mci_set_dimensions

```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions
<MCI base: interfaces>≡
  abstract interface
    subroutine mci_declare_flat_dimensions (mci, dim_flat)
      import
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_declare_flat_dimensions
  end interface

```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_equivalences), deferred :: declare_equivalences

```

```

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_equivalences (mci, channel, dim_offset)
      import
      class(mci_t), intent(inout) :: mci
      type(phas_channel_t), dimension(:), intent(in) :: channel
      integer, intent(in) :: dim_offset
    end subroutine mci_declare_equivalences
  end interface

```

Declare particular channels as chained together. The implementation may use this array for keeping their weights equal to each other, etc.

The chain array is an array sized by the number of channels. For each channel, there is an integer entry that indicates the corresponding chains. The total number of chains is the maximum value of this entry.

```

<MCI base: mci: TBP>+≡
  procedure :: declare_chains => mci_declare_chains

<MCI base: procedures>+≡
  subroutine mci_declare_chains (mci, chain)

    real(default), dimension(:,:), allocatable :: x_out
    real(default) :: val
    integer :: i, c
    allocate (x_in (mci%n_dim))
    allocate (f (mci%n_channel))
    allocate (x_out (mci%n_dim, mci%n_channel))
    do i = 1, n_calls
      c = mod (i, mci%n_channel) + 1
      call mci%rng%generate_array (x_in)
      call sampler%evaluate (c, x_in, val, x_out, f)
    end do
  end subroutine mci_sampler_test

```

Integrate: this depends on the implementation. We foresee a pacify flag to take care of small numerical noise on different platforms.

```

⟨MCI base: mci: TBP⟩+≡
  procedure (mci_integrate), deferred :: integrate

⟨MCI base: interfaces⟩+≡
  abstract interface
    subroutine mci_integrate (mci, instance, sampler, &
      n_it, n_calls, results, pacify)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      logical, intent(in), optional :: pacify
      class(mci_results_t), intent(inout), optional :: results
    end subroutine mci_integrate
  end interface

```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box **simulate** method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has **intent(inout)** for the **mci** passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the **mci** record.

```

<MCI base: mci: TBP>+≡
  procedure (mci_prepare_simulation), deferred :: prepare_simulation

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_prepare_simulation (mci)
      import
      class(mci_t), intent(inout) :: mci
    end subroutine mci_prepare_simulation
  end interface

```

The generated event will reside in in the **instance** object (overall results and weight) and in the **sampler** object (detailed data). In the real application, we can subsequently call methods of the **sampler** in order to further process the generated event.

The **target** attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

```

<MCI base: mci: TBP>+≡
  procedure (mci_generate), deferred :: generate_weighted_event
  procedure (mci_generate), deferred :: generate_unweighted_event

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_generate (mci, instance, sampler)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout), target :: instance
      class(mci_sampler_t), intent(inout), target :: sampler
    end subroutine mci_generate
  end interface

```

This is analogous, but we rebuild the event from the information stored in **state** instead of generating it.

Note: currently unused outside of tests, might be deleted later.

```

<MCI base: mci: TBP>+≡
  procedure (mci_rebuild), deferred :: rebuild_event

<MCI base: interfaces>+≡
  abstract interface

  end function mci_get_md5sum

```

19.1.2 MCI instance

The base type contains an array of channel weights. The value `mci_weight` is the combined MCI weight that corresponds to a particular sampling point.

For convenience, we also store the `x` and Jacobian values for this sampling point.

```

<MCI base: public>+≡
  public :: mci_instance_t

<MCI base: types>+≡
  type, abstract :: mci_instance_t
    logical :: valid = .false.
    real(default), dimension(:), allocatable :: w
    real(default), dimension(:), allocatable :: f
    real(default), dimension(:,:), allocatable :: x
    integer :: selected_channel = 0
    real(default) :: mci_weight = 0
    real(default) :: integrand = 0
  contains
    <MCI base: mci instance: TBP>
  end type mci_instance_t

```

Output: deferred

```

<MCI base: mci instance: TBP>≡
  procedure (mci_instance_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_instance_write (object, unit, pacify)
      import
      class(mci_instance_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: pacify
    end subroutine mci_instance_write
  end interface

```

A finalizer, just in case.

```

<MCI base: mci instance: TBP>+≡
  procedure (mci_instance_final), deferred :: final

```

```

<MCI base: interfaces> +=
  abstract interface
    subroutine mci_instance_final (object)
      import
      class(mci_instance_t), intent(inout) :: object
    end subroutine mci_instance_final
  end interface

```

Init: basic initializer for the arrays, otherwise deferred. Assigning the `mci` object is also deferred, because it depends on the concrete type.

The weights are initialized with an uniform normalized value.

```

<MCI base: mci instance: TBP> +=
  procedure (mci_instance_base_init), deferred :: init
  procedure :: base_init => mci_instance_base_init

<MCI base: procedures> +=
  subroutine mci_instance_base_init (mci_instance, mci)
    class(mci_instance_t), intent(out) :: mci_instance
    class(mci_t), intent(in), target :: mci
    allocate (mci_instance%w (mci%n_channel))
    allocate (mci_instance%f (mci%n_channel))
    allocate (mci_instance%x (mci%n_dim, mci%n_channel))
    if (size (mci_instance%w) /= 0) then
      mci_instance%w = 1._default / size (mci_instance%w)
    end if
    mci_instance%f = 0
    mci_instance%x = 0
  end subroutine mci_instance_base_init

```

Compute the overall weight factor for a configuration of x values and Jacobians f . The x values come in `n_channel` rows with `n_dim` entries each. The f factors constitute an array with `n_channel` entries.

We assume that the x and f arrays are already stored inside the MC instance. The result is also stored there.

```

<MCI base: mci instance: TBP> +=
  procedure (mci_instance_compute_weight), deferred :: compute_weight

<MCI base: interfaces> +=
  abstract interface
    subroutine mci_instance_compute_weight (mci, c)
      import
      class(mci_instance_t), intent(inout) :: mci
      integer, intent(in) :: c
    end subroutine mci_instance_compute_weight
  end interface

```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

```

<MCI base: mci instance: TBP> +=
  procedure (mci_instance_record_integrand), deferred :: record_integrand

```

```

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_instance_record_integrand (mci, integrand)
      import
      class(mci_instance_t), intent(inout) :: mci
      real(default), intent(in) :: integrand
    end subroutine mci_instance_record_integrand
  end interface

```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

```

<MCI base: mci instance: TBP>+≡
  procedure :: evaluate => mci_instance_evaluate

<MCI base: procedures>+≡
  subroutine mci_instance_evaluate (mci, sampler, c, x)

  function mci_instance_get_value (mci) result (value)
    class(mci_instance_t), intent(in) :: mci
    real(default) :: value
    if (mci%valid) then
      value = mci%integrand * mci%mci_weight
    else
      value = 0
    end if
  end function mci_instance_get_value

```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_event_weight => mci_instance_get_value

```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized in the same way as the event weight above (which for unweighted events becomes unity).

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure (mci_instance_get_event_excess), deferred :: get_event_excess

```

```

<MCI base: interfaces>+≡
  abstract interface
    function mci_instance_get_event_excess (mci) result (excess)
      import
        class(mci_instance_t), intent(in) :: mci
        real(default) :: excess
    end function mci_instance_get_event_excess
  end interface

```

19.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

```

<MCI base: public>+≡
  public :: mci_state_t

<MCI base: types>+≡
  type :: mci_state_t
    integer :: selected_channel = 0
    real(default), dimension(:), allocatable :: x_in
    real(default) :: val
  contains
    <MCI base: mci state: TBP>
  end type mci_state_t

```

Output:

```

<MCI base: mci state: TBP>≡
  procedure :: write => mci_state_write

<MCI base: procedures>+≡
  subroutine mci_state_write (object, unit)
    class(mci_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "MCI state:"
    write (u, "(3x,A,I0)") "Channel   = ", object%selected_channel
    write (u, "(3x,A,999(1x,F12.10))") "x (in)     =", object%x_in
    write (u, "(3x,A,ES19.12)") "Integrand = ", object%val
  end subroutine mci_state_write

```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

```

(MCI base: mci instance: TBP)+≡
  procedure :: store => mci_instance_store

(MCI base: procedures)+≡
  subroutine mci_instance_store (mci, state)
    class(mci_instance_t), intent(in) :: mci
    class(mci_state_t), intent(out) :: state
    state%selected_channel = mci%selected_channel
    allocate (state%x_in (size (mci%x, 1)))
    state%x_in = mci%x(:,mci%selected_channel)
    state%val = mci%integrand
  end subroutine mci_instance_store

```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

```

(MCI base: mci instance: TBP)+≡
  procedure :: recall => mci_instance_recall

(MCI base: procedures)+≡
  subroutine mci_instance_recall (mci, sampler, state)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    class(mci_state_t), intent(in) :: state
    if (size (state%x_in) == size (mci%x, 1) &
        .and. state%selected_channel <= size (mci%x, 2)) then
      call sampler%rebuild (state%selected_channel, &
        state%x_in, state%val, mci%x, mci%f)
      call mci%compute_weight (state%selected_channel)
      call mci%record_integrand (state%val)
    else
      call msg_fatal ("Recalling event: mismatch in channel or dimension")
    end if
  end subroutine mci_instance_recall

```

19.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of x MC parameter values, a the complete set of x values and associated Jacobian factors f for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

```

(MCI base: public)+≡
  public :: mci_sampler_t

```

```

<MCI base: types>+≡
  type, abstract :: mci_sampler_t
  contains
    <MCI base: mci_sampler: TBP>
  end type mci_sampler_t

```

Output, deferred to the implementation.

```

<MCI base: mci_sampler: TBP>≡
  procedure (mci_sampler_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_write (object, unit, testflag)
      import
      class(mci_sampler_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
    end subroutine mci_sampler_write
  end interface

```

The evaluation routine. Input is the channel index *c* and the one-dimensional parameter array *x_in*. Output are the integrand value *val*, the two-dimensional parameter array *x* and the Jacobian array *f*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_evaluate), deferred :: evaluate

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_evaluate
  end interface

```

Query the validity of the sampling point. Can be called after *evaluate*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_is_valid), deferred :: is_valid

<MCI base: interfaces>+≡
  abstract interface
    function mci_sampler_is_valid (sampler) result (valid)
      import
      class(mci_sampler_t), intent(in) :: sampler
      logical :: valid
    end function mci_sampler_is_valid
  end interface

```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_rebuild), deferred :: rebuild

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_rebuild
  end interface

```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_fetch), deferred :: fetch

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_fetch (sampler, val, x, f)
      import
      class(mci_sampler_t), intent(in) :: sampler
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_fetch
  end interface

```

19.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

```

<MCI base: public>+≡
  public :: mci_results_t

<MCI base: types>+≡
  type, abstract :: mci_results_t
    contains
    <MCI base: mci_results: TBP>
  end type mci_results_t

```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

```

<MCI base: mci_results: TBP>≡
  procedure (mci_results_write), deferred :: write
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_write (object, unit, verbose, suppress)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, suppress
    end subroutine mci_results_write
  end interface

```

This is the `record` method, which can be called directly from the integrator.

```

<MCI base: mci_results: TBP>+≡
  procedure (mci_results_record), deferred :: record
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_record (object, n_it, &
      n_calls, integral, error, efficiency, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      real(default), intent(in) :: integral
      real(default), intent(in) :: error
      real(default), intent(in) :: efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      logical, intent(in), optional :: suppress
    end subroutine mci_results_record
  end interface

```

19.1.6 Unit tests

```

<MCI base: public>+≡
  public :: mci_base_test
<MCI base: tests>≡
  subroutine mci_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <MCI base: execute tests>
  end subroutine mci_base_test

```

Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

```

<MCI base: public>+≡
    public :: mci_test_t

<MCI base: test types>≡
    type, extends (mci_t) :: mci_test_t
        integer :: divisions = 0
        integer :: tries = 0
        real(default) :: max_factor = 1
    contains
        procedure :: final => mci_test_final
        procedure :: write => mci_test_write
        procedure :: startup_message => mci_test_startup_message
        procedure :: declare_flat_dimensions => mci_test_ignore_flat_dimensions
        procedure :: declare_equivalences => mci_test_ignore_equivalences
        procedure :: set_divisions => mci_test_set_divisions

    call instance%recall (sampler, state)
  end select
end subroutine mci_test_rebuild_event

```

Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions g_i smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have n mappings of the unit hypercube

$$x = x(x^{(k)}) \quad \text{where } x = (x_1, \dots). \quad (19.1)$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \quad (19.2)$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \quad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \quad (19.3)$$

and weights

$$w_k \quad \text{with} \quad \sum_k w_k = 1 \quad (19.4)$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \quad (19.5)$$

which also satisfies

$$\int g(x) dx = 1. \quad (19.6)$$

The algorithm implements a resolution of unity as follows

$$\begin{aligned} 1 &= \int dx = \int \frac{g(x)}{g(x)} dx \\ &= \sum w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\ &= \sum w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x(x^{(k)}))} \end{aligned} \quad (19.7)$$

where each of the integrals in the sum is evaluated using the channel-specific variables $x^{(k)}$.

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$\begin{aligned} x(x^{(1)}) &= (x_1^{(1)}, x_2^{(1)}) \\ x(x^{(2)}) &= (x_1^{(2)2}, x_2^{(2)}) \end{aligned} \quad (19.8)$$

hence

$$f^{(1)} \equiv 1, \quad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \quad (19.9)$$

The probability functions are

$$g^{(1)} \equiv 1, \quad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \quad (19.10)$$

In the concrete implementation of the integrator instance we store values for the channel probabilities g_i and the accumulated probability g .

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

```

Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to $x_1 = x_1^{(2)2}$, so we have $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$.

For display purposes, we store the return values inside the object. This is not strictly necessary.

```

19.2 Iterations

This module defines a container for the list of iterations and calls, to be submitted to integration.

```

<iterations.f90>≡
  <File header>

  module iterations

    <Use strings>
    use io_units
    use unit_tests
    use diagnostics

    <Standard module head>

    <Iterations: public>

    <Iterations: types>

    contains

    <Iterations: procedures>

    <Iterations: tests>

  end module iterations

```

19.2.1 The iterations list

Each integration pass has a number of iterations and a number of calls per iteration. The last pass produces the end result; the previous passes are used for adaptation.

The flags `adapt_grid` and `adapt_weight` are used only if `custom_adaptation` is set. Otherwise, default settings are used that depend on the integration pass.

```

<Iterations: types>≡
  type :: iterations_spec_t
    private

```

```

        integer :: n_it = 0
        integer :: n_calls = 0
        logical :: custom_adaptation = .false.
        logical :: adapt_grids = .false.
        logical :: adapt_weights = .false.
    end type iterations_spec_t

```

We build up a list of iterations.

```

<Iterations: public>≡
    public :: iterations_list_t

<Iterations: types>+≡
    type :: iterations_list_t
    private
        integer :: n_pass = 0
        type(iterations_spec_t), dimension(:), allocatable :: pass
    contains
        <Iterations: iterations list: TBP>
    end type iterations_list_t

```

Initialize an iterations list. For each pass, we have to specify the number of iterations and calls. We may provide the adaption conventions explicitly, either as character codes or as logicals.

For passes where the adaptation conventions are not specified, we use the following default setting: adapt weights and grids for all passes except the last one.

```

<Iterations: iterations list: TBP>≡
    procedure :: init => iterations_list_init

<Iterations: procedures>≡
    subroutine iterations_list_init &
        (it_list, n_it, n_calls, adapt, adapt_code, adapt_grids, adapt_weights)
    class(iterations_list_t), intent(inout) :: it_list
    integer, dimension(:), intent(in) :: n_it, n_calls
    logical, dimension(:), intent(in), optional :: adapt
    type(string_t), dimension(:), intent(in), optional :: adapt_code
    logical, dimension(:), intent(in), optional :: adapt_grids, adapt_weights
    integer :: i
    it_list%n_pass = size (n_it)
    if (allocated (it_list%pass)) deallocate (it_list%pass)
    allocate (it_list%pass (it_list%n_pass))
    it_list%pass%n_it = n_it
    it_list%pass%n_calls = n_calls
    if (present (adapt)) then
        it_list%pass%custom_adaptation = adapt
        do i = 1, it_list%n_pass
            if (adapt(i)) then
                if (verify (adapt_code(i), "wg") /= 0) then
                    call msg_error ("iteration specification: " &
                        // "adaptation code letters must be 'w' or 'g'")
                end if
                it_list%pass(i)%adapt_grids = scan (adapt_code(i), "g") /= 0
                it_list%pass(i)%adapt_weights = scan (adapt_code(i), "w") /= 0
            end if
        end do
    end if

```

```

        end if
    end do
    else if (present (adapt_grids) .and. present (adapt_weights)) then
        it_list%pass%custom_adaptation = .true.
        it_list%pass%adapt_grids = adapt_grids
        it_list%pass%adapt_weights = adapt_weights

write (u, "(A)")
write (u, "(A)")  "* Test output end: iterations_2"

end subroutine iterations_2

```

19.3 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

```

<integration_results.f90>≡
module integration_results

  <Use kinds>
  <Use strings>
  use io_units
  use format_utils, only: mp_format, pac_fmt
  use format_defs, only: FMT_10, FMT_14
  use diagnostics
  use md5
  use os_interface
  use mci_base

  <Standard module head>

  <Integration results: public>

  <Integration results: parameters>

  <Integration results: types>

contains

  <Integration results: procedures>

```

```
end module integration_results
```

19.3.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of PRC_UNKNOWN.

<Integration results: types>≡

```
type :: integration_entry_t
  private
  integer :: process_type = PRC_UNKNOWN
  integer :: pass = 0
  integer :: it = 0
  integer :: n_it = 0
  integer :: n_calls = 0
  logical :: improved = .false.
  real(default) :: integral = 0
  real(default) :: error = 0
  real(default) :: efficiency = 0
  real(default) :: chi2 = 0
  real(default), dimension(:), allocatable :: chain_weights
end type integration_entry_t
```

The possible values of the type indicator:

<Integration results: parameters>≡

```
integer, parameter, public :: PRC_UNKNOWN = 0
integer, parameter, public :: PRC_DECAY = 1
integer, parameter, public :: PRC_SCATTERING = 2
```

Initialize with all relevant data

<Integration results: procedures>≡

```
subroutine integration_entry_init (entry, &
  process_type, pass, it, n_it, n_calls, improved, &
  integral, error, efficiency, chi2, chain_weights)
  type(integration_entry_t), intent(out) :: entry
  integer, intent(in) :: process_type, pass, it, n_it, n_calls
  logical, intent(in) :: improved
  real(default), intent(in) :: integral, error, efficiency
  real(default), intent(in), optional :: chi2
  real(default), dimension(:), intent(in), optional :: chain_weights
  entry%process_type = process_type
  entry%pass = pass
  entry%it = it
  entry%n_it = n_it
```

```

entry%n_calls = n_calls
entry%improved = improved
entry%integral = integral
entry%error = error
entry%efficiency = efficiency
if (present (chi2)) &
    entry%chi2 = chi2
if (present (chain_weights)) then
    allocate (entry%chain_weights (size (chain_weights)))
    entry%chain_weights = chain_weights
end if
end subroutine integration_entry_init

```

Access values, some of them computed on demand:

  flag = entry%improved
end function integration_entry_has_improved

elemental function integration_entry_get_n_groves (entry) result (n_groves)
  integer :: n_groves
  type(integration_entry_t), intent(in) :: entry
  if (allocated (entry%chain_weights)) then
    n_groves = size (entry%chain_weights, 1)
  else
    n_groves = 0
  end if
end function integration_entry_get_n_groves

```

Output. This writes the header line for the result account below:

```

<Integration results: procedures>+≡
  subroutine write_header (process_type, unit, logfile)
    integer, intent(in) :: process_type
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: logfile
    character(5) :: phys_unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    select case (process_type)
    case (PRC_DECAY);      phys_unit = "[GeV]"
    case (PRC_SCATTERING); phys_unit = "[fb] "
    case default
      phys_unit = ""
    end select
  end subroutine

```

```

end select
write (msg_buffer, "(A)") &
    "It      Calls  Integral" // phys_unit // &
    " Error" // phys_unit // &
    " Err[%]   Acc  Eff[%]   Chi2 N[It] |"
call msg_message (unit=u, logfile=logfile)
end subroutine write_header

```

This writes a separator for result display:

(Integration results: procedures)+≡

```

subroutine write_hline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("-", 77)) // "|"
    flush (u)
end subroutine write_hline

subroutine write_dline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("=", 77)) // "|"
    flush (u)
end subroutine write_dline

```

This writes the standard result account into one screen line. The verbose version uses multiple lines and prints the unabridged values. Dummy entries are not written.

        end do
        write (u, *)
    end if
end subroutine integration_entry_write_chain_weights

```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the χ^2 value.

All error distributions are assumed Gaussian, of course. The χ^2 value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

(Integration results: procedures)+≡

```

function compute_average (entry, pass) result (result)

```

19.3.2 Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily compute averages.

We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

```

<Integration results: public>≡
    public :: integration_results_t

<Integration results: types>+≡
    type, extends (mci_results_t) :: integration_results_t
        private
            integer :: process_type = PRC_UNKNOWN
            integer :: current_pass = 0
            integer :: n_pass = 0
            integer :: n_it = 0
            logical :: screen = .false.
            integer :: unit = 0
            real(default) :: error_threshold = 0
            type(integration_entry_t), dimension(:), allocatable :: entry
            type(integration_entry_t), dimension(:), allocatable :: average
        contains
            <Integration results: integration results: TBP>
        end type integration_results_t

```

The array is extended in chunks of 10 entries.

```

<Integration results: parameters>+≡
    integer, parameter :: RESULTS_CHUNK_SIZE = 10

```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

```

<Integration results: integration results: TBP>≡
    procedure :: init => integration_results_init

<Integration results: procedures>+≡
    subroutine integration_results_init (results, process_type)
        class(integration_results_t), intent(out) :: results
        integer, intent(in) :: process_type
        results%process_type = process_type
        results%n_pass = 0
        results%n_it = 0
        allocate (results%entry (RESULTS_CHUNK_SIZE))
        allocate (results%average (RESULTS_CHUNK_SIZE))
    end subroutine integration_results_init

```

Set additional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

```

<Integration results: integration results: TBP>+≡

```

```

    procedure :: set_error_threshold => integration_results_set_error_threshold
  <Integration results: procedures>+≡
    subroutine integration_results_set_error_threshold (results, error_threshold)
      class(integration_results_t), intent(inout) :: results
      real(default), intent(in) :: error_threshold
      results%error_threshold = error_threshold
    end subroutine integration_results_set_error_threshold

```

Output (ASCII format). The verbose format is used for writing the header in grid files.

```

end if
flush (u)
end subroutine integration_results_write

```

During integration, we do not want to print all results at once, but each intermediate result as soon as we get it. Thus, the previous procedure is chopped in pieces. First piece: store the output unit and a flag whether we want to print to standard output as well. Then write the header if the results are still empty, i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

19.4 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order h^2 , where h is the bin width. Given that $h = N^{-1/d}$, where d is the integration dimension and N is the total number of sampling points, we get a relative error of order $N^{-2/d}$. This is superior to MC integration if $d < 4$, and equivalent if $d = 4$. It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

```

19.4.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This

is required for event generation.

```

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can `fetch` results.

```

<MCI midpoint: test types>≡
  type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
  contains
    <MCI midpoint: test sampler 1: TBP>
  end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI midpoint: test sampler 1: TBP>≡
  procedure :: write => test_sampler_1_write

<MCI midpoint: procedures>+≡
  subroutine test_sampler_1_write (object, unit, testflag)

19.5 VAMP interface

The standard method for integration is **VAMP**: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic **VAMP** algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

```

Update a pass object, given a reference. The parameters must match, except for the `n_it` entry. The number of complete iterations must be less or equal to the reference, and the number of complete iterations in the reference must be no larger than `n_it`. Where results are present in both passes, they must match. Where results are present in the reference only, the pass is updated accordingly.

Update the MCI record (i.e., the integration passes) by reading from input stream. The stream should contain a `write` output from a previous run. We first check the MD5 sum of the configuration parameters. If that matches, we proceed directly to the stored integration passes. If successful, we may continue to read the file; the position will be after a blank line that must follow the MCI

record.

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

Prepare an event generation pass. Should be called before a sequence of events is generated, then we should call the corresponding finalizer.

The pass-specific data of the previous integration pass are retained, but we reset the number of iterations and calls to zero. The latter now counts the number of events (calls to the sampling function, actually).

19.5.5 Sampler as Workspace

In the full setup, the sampling function requires the process instance object as workspace. We implement this by (i) implementing the process instance as a type extension of the abstract `sampler_t` object used by the MCI implementation and (ii) providing such an object as an extra argument to the sampling function that VAMP can call. To minimize cross-package dependencies, we use an abstract type `vamp_workspace` that VAMP declares and extend this by including a pointer to the `sampler` and `instance` objects. In the body of the sampling function, we dereference this pointer and can then work with the contents.

```

<MCI vamp: types>+=
  type, extends (vamp_data_t) :: mci_workspace_t
    class(mci_sampler_t), pointer :: sampler => null ()
    class(mci_vamp_instance_t), pointer :: instance => null ()
  end type mci_workspace_t

```

19.5.6 Integrator instance

The history entries should point to the corresponding history entry in the `pass_t` object. If there is none, we may allocate a local history, which is then just transient.

```

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set `reshape` if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together

with the MCI instance object.

```

Integration: sample the VAMP grids. The number of calls etc. are already stored inside the grids. We provide the random-number generator, the sampling function, and a link to the workspace object, which happens to contain a pointer to the sampler object. The sampler object thus becomes the workspace of the sampling function.

Note: in the current implementation, the random-number generator must be the TAO generator. This explicit dependence should be removed from the VAMP implementation.

19.5.7 Sampling function

The VAMP sampling function has a well-defined interface which we have to implement. The `data` argument allows us to pass pointers to the `sampler` and `instance` objects, so we can access configuration data and fill point-dependent contents within these objects.

The `weights` and `channel` argument must be present in the call.

Note: we would normally declare the `instance` pointer with the concrete type, or just use the `data` component directly. Unfortunately, gfortran 4.6 forgets the inherited base-type methods in that case.

Note: this is the place where we must look for external signals, i.e., interrupt from the OS. We would like to raise a VAMP exception which is then caught by

vamp_sample_grids as the caller, so it dumps its current state and returns (with the signal still pending). WHIZARD will then terminate gracefully. Of course, VAMP should be able to resume from the dump.

In the current implementation, we handle the exception in place and terminate immediately. The incomplete current integration pass is lost.

```

(MCI vamp: procedures)+≡
function vamp_sampling_function &
  (xi, data, weights, channel, grids) result (f)
  real(default) :: f
  real(default), dimension(:), intent(in) :: xi
  class(vamp_data_t), intent(in) :: data
  real(default), dimension(:), intent(in), optional :: weights
  integer, intent(in), optional :: channel
  type(vamp_grid), dimension(:), intent(in), optional :: grids
  type(exception) :: exc
  class(mci_instance_t), pointer :: instance
  logical :: verbose
  character(*), parameter :: FN = "WHIZARD sampling function"
  select type (data)
  type is (mci_workspace_t)
    instance => data%instance
    select type (instance)
    class is (mci_vamp_instance_t)
      instance%calls = instance%calls + 1
      verbose = instance%mci%verbose
    end select
    call instance%evaluate (data%sampler, channel, xi)
    if (signal_is_pending ()) then
      call raise_exception (exc, EXC_FATAL, FN, "signal received")
      call handle_vamp_exception (exc, verbose)
      call terminate_now_if_signal ()
    end if
    f = instance%get_value ()
  end select
end function vamp_sampling_function

```

This is supposed to be the mapping between integration channels. The VAMP event generating procedures technically require it, but it is meaningless in our setup where all transformations happen inside the sampler object. So, this implementation is trivial:

```

(MCI vamp: procedures)+≡
pure function phi_trivial (xi, channel_dummy) result (x)
  real(default), dimension(:), intent(in) :: xi
  integer, intent(in) :: channel_dummy
  real(default), dimension(size(xi)) :: x
  x = xi
end function phi_trivial

```

19.5.8 Integrator instance: evaluation

Here, we compute the multi-channel reweighting factor for the current channel, that accounts for the Jacobians of the transformations from/to all other channels.

The computation of the VAMP probabilities may consume considerable time, therefore we enable parallel evaluation. (Collecting the contributions to `mci%g` is a reduction, which we should also implement via OpenMP.)

```
(MCI vamp: mci vamp instance: TBP)+≡
  procedure :: compute_weight => mci_vamp_instance_compute_weight

(MCI vamp: procedures)+≡
  subroutine mci_vamp_instance_compute_weight (mci, c)
    class(mci_vamp_instance_t), intent(inout) :: mci
    integer, intent(in) :: c
    integer :: i
    mci%selected_channel = c
    !$OMP PARALLEL PRIVATE(i) SHARED(mci)
    !$OMP DO
    do i = 1, mci%mci%n_channel
      if (mci%w(i) /= 0) then
        mci%gi(i) = vamp_probability (mci%grids%grids(i), mci%x(:,i))
      else
        mci%gi(i) = 0
      end if
    end do
    !$OMP END DO
    !$OMP END PARALLEL
    mci%g = 0
    if (mci%gi(c) /= 0) then

        if (mci%w(i) /= 0 .and. mci%f(i) /= 0) then
          mci%g = mci%g + mci%w(i) * mci%gi(i) / mci%f(i)
        end if
      end do
    end if
    if (mci%g /= 0) then
      mci%mci_weight = mci%gi(c) / mci%g
    else
      mci%mci_weight = 0
    end if
  end subroutine mci_vamp_instance_compute_weight
```

Record the integrand.

```
(MCI vamp: mci vamp instance: TBP)+≡
  procedure :: record_integrand => mci_vamp_instance_record_integrand

(MCI vamp: procedures)+≡
  subroutine mci_vamp_instance_record_integrand (mci, integrand)
    class(mci_vamp_instance_t), intent(inout) :: mci
    real(default), intent(in) :: integrand
    mci%integrand = integrand
  end subroutine mci_vamp_instance_record_integrand
```

Get the event weight. The default routine returns the same value that we would use for integration. This is correct if we select the integration channel according to the channel weight. `vamp_next_event` does differently, so we should rather rely on the weight that VAMP returns. This is the value stored in `vamp_weight`. We override the default TBP accordingly.

```

(MCI vamp: mci vamp instance: TBP)+≡
  procedure :: get_event_weight => mci_vamp_instance_get_event_weight
  procedure :: get_event_excess => mci_vamp_instance_get_event_excess

(MCI vamp: procedures)+≡
  function mci_vamp_instance_get_event_weight (mci) result (value)
    class(mci_vamp_instance_t), intent(in) :: mci

  end function mci_vamp_instance_get_event_excess

```

19.5.9 VAMP exceptions

A VAMP routine may have raised an exception. Turn this into a WHIZARD error message.

An external signal could raise a fatal exception, but this should be delayed and handled by the correct termination routine.

```

(MCI vamp: procedures)+≡
  subroutine handle_vamp_exception (exc, verbose)
    type(exception), intent(in) :: exc
    logical, intent(in) :: verbose
    integer :: exc_level
    if (verbose) then
      exc_level = EXC_INFO
    else
      exc_level = EXC_ERROR
    end if
    if (exc%level >= exc_level) then
      write (msg_buffer, "(A,':',1x,A)") trim (exc%origin), trim (exc%message)
      select case (exc%level)
        case (EXC_INFO); call msg_message ()
        case (EXC_WARN); call msg_warning ()
        case (EXC_ERROR); call msg_error ()
      end select
    end if
  end subroutine handle_vamp_exception

```

```

        case (EXC_FATAL)
            if (signal_is_pending ()) then
                call msg_message ()
            else
                call msg_fatal ()
            end if
        end select
    end if
end subroutine handle_vamp_exception

```

19.5.10 Unit tests

```

        type(test_results_t), intent(inout) :: results
    <MCI vamp: execute tests>
    end subroutine mci_vamp_test

```

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is $11x^{10}$, also with integral 1.

```

<MCI vamp: test types>≡
    type, extends (mci_sampler_t) :: test_sampler_1_t
        real(default), dimension(:), allocatable :: x
        real(default) :: val
        integer :: mode = 1
    contains
        <MCI vamp: test sampler 1: TBP>
    end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI vamp: test sampler 1: TBP>≡
    procedure :: write => test_sampler_1_write

<MCI vamp: tests>+≡
    subroutine test_sampler_1_write (object, unit, testflag)

Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \quad (19.11)$$

where

$$x = u^v \quad u = xy \quad (19.12)$$

$$y = u^{(1-v)} \quad v = \frac{1}{2} \left(1 + \frac{\log(x/y)}{\log xy} \right) \quad (19.13)$$

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates x and y , while the second term is peaked along the diagonal $x = y$.

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \quad (19.14)$$

```

Two-channel, one dimension test sampler

This sampler implements the function

$$f(x, y) = a * 5x^4 + b * 5(1 - x)^4 \quad (19.15)$$

Each term contributes 1 to the integral, multiplied by a or b , respectively. The first term is peaked at $x = 1$, the second one at $x = 0$.

We implement the two mappings

$$x = u^{1/5} \quad \text{and} \quad x = 1 - v^{1/5}, \quad (19.16)$$

with Jacobians

$$\frac{\partial(x)}{\partial(u)} = u^{-4/5}/5 \quad \text{and} \quad v^{-4/5}/5, \quad (19.17)$$

respectively. The first mapping concentrates points near $x = 1$, the second one near $x = 0$.

Chapter 20

Parton shower and interface to hadronization

This is the code for the WHIZARD QCD parton shower for final state radiation (FSR) and initial state radiation (ISR) as well as the interface to the PYTHIA module for showering and hadronization.

20.1 Basics of the shower

```
<shower_base.f90>≡  
<File header>  
  
module shower_base  
  
  <Use kinds>  
  use constants  
  use diagnostics  
  use rng_base  
  use physics_defs  
  use sm_physics, only: running_as_lam  
  
  <Standard module head>  
  
  <Shower base: public>  
  
  <Shower base: parameters>  
  
  contains  
  
  <Shower base: procedures>  
  
end module shower_base
```

20.1.1 PDF Parameters

The shower has to know about the PDF set used for the parent process, if any. We support the following:

```

<Shower base: parameters>+=
  integer, parameter, public :: STRF_NONE = 0
  integer, parameter, public :: STRF_LHAPDF6 = 1
  integer, parameter, public :: STRF_LHAPDF5 = 2
  integer, parameter, public :: STRF_PDF_BUILTIN = 3

```

20.1.2 Additional parameters

D_PRINT decides whether to print out additional information while ASSERT does additional sanity checks that should be disabled for production.

```

<Shower base: parameters>+=
  logical, parameter, public :: D_PRINT = .false.
  logical, parameter, public :: ASSERT = .false.

```

These parameters are the cut-off scale t_{cut} , given in GeV^2 (PARJ(82)), the cut-off scale for the P_t^2 -ordered shower in GeV^2 , and the two shower parameters PARP(72) and PARP(61), respectively.

```

<Shower base: parameters>+=
  real(default), public :: D_Min_t = one
  real(default), public :: D_min_scale = 0.5_default
  real(default), public :: D_Lambda_fsr = 0.29_default
  real(default), public :: D_Lambda_isr = 0.29_default

```

The parameter MSTJ(45) gives the maximum number of flavours in gluon decay to quarks:

```

<Shower base: parameters>+=
  integer, public :: D_Nf = 5

```

These two parameters decide whether to use constant or running α_s in the form of the function $D_{\alpha_s}(t)$ for the FSR and ISR (MSTJ(44), MSTP(64)), respectively. The next is the parameter PARU(111), which sets the value for constant α_s , and the flag whether to use P_t -ordered ISR.

```

<Shower base: parameters>+=
  logical, public :: D_running_alpha_s_fsr = .true.
  logical, public :: D_running_alpha_s_isr = .true.
  real(default), public :: D_constalpha_s = 0.20_default
  logical, public :: alpha_s_fudged = .true.
  logical, public :: isr_pt_ordered = .false.

```

Treating either u and d , or all quarks except t as massless:

```

<Shower base: parameters>+=
  logical, public :: treat_light_quarks_massless = .true.
  logical, public :: treat_duscb_quarks_massless = .false.

```

The width and the cutoff of the Gaussian primordial k_t distribution, PARP(91) and PARP(93), in GeV :

```

<Shower base: parameters>+=
  real(default), public :: primordial_kt_width = 1.5_default
  real(default), public :: primordial_kt_cutoff = five

```

Temporary parameters for the P_t -ordered shower:

```

<Shower base: parameters>+=
  real(default), public :: scalefactor1 = 0.02_default
  real(default), public :: scalefactor2 = 0.02_default

```

```

        else
            alpha_s = D_constalpha_s
        end if
    end function D_alpha_s_fsr

```

Mass and mass squared selection functions. All masses are in GeV. Light quarks are assumed to be ordered, $m_1 < m_2 < m_3 \dots$, and they get current masses, not elementary ones. Mesons and baryons other than proton and neutron are needed as beam-remnants. Particles with PDG number zero are taken massless, as well as proper beam remnants and any other particles.

    ⟨Shower partons: public⟩

    ⟨Shower partons: types⟩

    contains

    ⟨Shower partons: procedures⟩

    end module shower_partons

```

20.2.1 The basic type definitions

The type `parton_t` defines a parton for the shower. The `x` value of the parton is only needed for spacelike showers. The pointer `initial` is only needed for partons in initial showers, it points to the hadron the parton is coming from. An auxiliary value for the P_t -ordered ISR is `aux_pt`. Then, there are two auxiliary entries for the clustering of CKKW pseudo weights and CKKW matching, `ckkwlabel` and `ckkwscale`.

```

⟨Shower partons: public⟩≡
  public :: parton_t

```

```

<Shower partons: types>≡
  type :: parton_t
    integer :: nr = 0
    integer :: type = 0
    type(vector4_t) :: momentum = vector4_null

    type :: shower_interaction_pointer_t
        type(shower_interaction_t), pointer :: i => null ()
    end type shower_interaction_pointer_t

```

The main type of `shower_core`: It contains many parameter of the shower, namely `maxz_isr` (PARP(66)), the minimal energy of the emitted timelike parton in the ISR `minenergy_timelike` (PARP(65)), the factor for the first scale, as well as the factor by which the integral in the Sudakov factor is suppressed for the respective first scale in ISR. Higher values here correspond to higher starting scales. Also, there is a flag whether ISR is angular ordered (MSTP(62)). The flag corresponding to MSTP(63) sets emitted timelike partons in the spacelike shower on shell.

```

  end subroutine shower_add_interaction_2ton

```

In this routine, y and y_{\min} are the jet measures, w and w_{\max} are weights, s is the kinematic energy squared of the interaction. The flag `isr_is_possible` checks whether the initial parton is set, lepton-hadron collisions are not implemented (yet). As a workaround: as WHIZARD can treat partons as massless, there might be partons with $E < m$: if such a parton is found, quarks will be treated massless.

!C      KTCLUS: written by Mike Seymour, July 1992.
!C      Last modified November 2000.
!C      Please send comments or suggestions to Mike.Seymour@rl.ac.uk
!C
!C      This is a general-purpose kt clustering package.
!C      It can handle ee, ep and pp collisions.
!C      It is loosely based on the program of Siggi Bethke.
!C
!C      The time taken (on a 10MIP machine) is (0.2microsec)*N**3
!C      where N is the number of particles.
!C      Over 90 percent of this time is used in subroutine KTPMIN, which
!C      simply finds the minimum member of a one-dimensional array.
!C      It is well worth thinking about optimization: on the SPARCstation
!C      a factor of two increase was obtained simply by increasing the
!C      optimization level from its default value.
!C
!C      The approach is to separate the different stages of analysis.
!C      KTCLUS does all the clustering and records a merging history.

```

```

!C      It returns a simple list of the y values at which each merging
!C      occurred. Then the following routines can be called to give extra
!C      information on the most recently analysed event.
!C      KTCLUR is identical but includes an R parameter, see below.
!C      KTYCUT gives the number of jets at each given YCUT value.
!C      KTYSUB gives the number of sub-jets at each given YCUT value.
!C      KTBEAM gives same info as KTCLUS but only for merges with the beam
!C      KTJOIN gives same info as KTCLUS but for merges of sub-jets.
!C      KTRECO reconstructs the jet momenta at a given value of YCUT.
!C      It also gives information on which jets at scale YCUT belong to
!C      which macro-jets at scale YMAC, for studying sub-jet properties.
!C      KTINCL reconstructs the jet momenta according to the inclusive jet
!C      definition of Ellis and Soper.
!C      KTISUB, KTIJOI and KTIREC are like KTYSUB, KTJOIN and KTRECO,
!C      except that they only apply to one inclusive jet at a time,
!C      with the pt of that jet automatically used for ECUT.
!C      KTWICH gives a list of which particles ended up in which jets.
!C      KTWCHS gives the same thing, but only for subjets.
!C      Note that the numbering of jets used by these two routines is
!C      guaranteed to be the same as that used by KTRECO.
!C
!C      The collision type and analysis type are indicated by the first
!C      argument of KTCLUS. IMODE=<TYPE><ANGLE><MONO><RECOM> where
!C      TYPE:  1=>ee, 2=>ep with p in -z direction, 3=>pe, 4=>pp
!C      ANGLE: 1=>angular kt def., 2=>DeltaR, 3=>f(DeltaEta,DeltaPhi)
!C              where f() $=2(\cosh(\eta)-\cos(\phi))$  is the QCD emission metric
!C      MONO:  1=>derive relative pseudoparticle angles from jets
!C              2=>monotonic definitions of relative angles
!C      RECOM: 1=>E recombination scheme, 2=>pt scheme, 3=>pt**2 scheme
!C
!C      There are also abbreviated forms for the most common combinations:
!C      IMODE=1 => E scheme in e+e-                (=1111)
!C              2 => E scheme in ep                  (=2111)
!C              3 => E scheme in pe                  (=3111)
!C              4 => E scheme in pp                  (=4111)
!C              5 => covariant E scheme in pp        (=4211)
!C              6 => covariant pt-scheme in pp       (=4212)
!C              7 => covariant monotonic pt**2-scheme in pp (=4223)
!C
!C      KTRECO no longer needs to reconstruct the momenta according to the
!C      same recombination scheme in which they were clustered. Its first
!C      argument gives the scheme, taking the same values as RECOM above.
!C
!C      Note that unlike previous versions, all variables which hold y
!C      values have been named in a consistent way:
!C      Y() is the output scale at which jets were merged,
!C      YCUT is the input scale at which jets should be counted, and
!C      jet-momenta reconstructed etc,
!C      YMAC is the input macro-jet scale, used in determining whether
!C      or not each jet is a sub-jet.
!C      The original scheme defined in our papers is equivalent to always
!C      setting YMAC=1.
!C      Whenever a YCUT or YMAC variable is used, it is rounded down
!C      infinitesimally, so that for example, setting YCUT=Y(2) refers

```

```

!C      to the scale where the event is 2-jet, even if rounding errors
!C      have shifted its value slightly.
!C
!C      An R parameter can be used in hadron-hadron collisions by
!C      calling KTCLUR instead of KTCLUS. This is as suggested by
!C      Ellis and Soper, but implemented slightly differently,
!C      as in M.H. Seymour, LU TP 94/2 (submitted to Nucl. Phys. B.).
!C      R**2 multiplies the single Kt everywhere it is used.
!C      Calling KTCLUR with R=1 is identical to calling KTCLUS.
!C      R plays a similar role to the jet radius in a cone-type algorithm,
!C      but is scaled up by about 40% (ie R=0.7 in a cone algorithm is
!C      similar to this algorithm with R=1).
!C      Note that R.EQ.1 must be used for the e+e- and ep versions,
!C      and is strongly recommended for the hadron-hadron version.
!C      However, R values smaller than 1 have been found to be useful for
!C      certain applications, particularly the mass reconstruction of
!C      highly-boosted colour-singlets such as high-pt hadronic Ws,
!C      as in M.H. Seymour, LU TP 93/8 (to appear in Z. Phys. C.).
!C      Situations in which R<1 is useful are likely to also be those in
!C      which the inclusive reconstruction method is more useful.
!C
!C      Also included is a set of routines for doing Lorentz boosts:
!C      KTLBST finds the boost matrix to/from the cm frame of a 4-vector
!C      KTRROT finds the rotation matrix from one vector to another
!C      KTMUL multiplies together two matrices
!C      KTMUL multiplies a vector by a matrix
!C      KTNVT inverts a transformation matrix (nb NOT a general 4 by 4)
!C      KTFRAM boosts a list of vectors between two arbitrary frames
!C      KTBREI boosts a list of vectors between the lab and Breit frames
!C      KTHADR boosts a list of vectors between the lab and hadronic cmf
!C      The last two need the momenta in the +z direction of the lepton
!C      and hadron beams, and the 4-momentum of the outgoing lepton.
!C
!C      The main reference is:
!C      S. Catani, Yu.L. Dokshitzer, M.H. Seymour and B.R. Webber,
!C      Nucl.Phys.B406(1993)187.
!C      The ep version was proposed in:
!C      S. Catani, Yu.L. Dokshitzer and B.R. Webber,
!C      Phys.Lett.285B(1992)291.
!C      The inclusive reconstruction method was proposed in:
!C      S.D. Ellis and D.E. Soper,
!C      Phys.Rev.D48(1993)3160.

CKKW (pseudo) weights

The type `ckkw_pseudo_shower_weights_t` gives the (relative) weights for different clusterings of the final particles, as given in Eq. (2.7) of hep-ph/0503281v1. Each particle has a binary labelling (power of 2) (first particle = 1, second particle = 2, third particle = 4, ...). Each recombination therefore corresponds to an integer, that is not a power of 2. For multiple subsequent recombinations, no different weights for different sequences of clustering are stored. It is assumed that the weight of a multiply recombined state is a combination of the states with one fewer recombination and that these states' contributions are proportional to their weights. For a $2- > n$ event, the weights array thus has the size $2^{(2+n)-1}$. The `weights_by_type` array gives the weights depending on the type of the particle, the first index is the same as for weights, the second index gives the type of the new mother particle:

- 0: uncolored (γ , Z , W , Higgs)
- 1: colored (quark)
- 2: gluon
- 3: squark
- 4: gluino

`alphaS` gives the value for α_s used in the generation of the matrix element. This is needed for the reweighting using the values for a running α_s at the scales of the clusterings.

Chapter 21

Multiple Interactions (MPI) Code

This is the code for the `WHIZARD` module for multiple interactions (MPI) in hadron collisions. It also provides the interleaved shower with together with the shower module.

21.1 Basic types

This file contains the module `multi_basic` which is included by all other modules of the MPI code. It's main purpose is serialization and deserialization, but it also contains some bitmodel parameters and some minor definitions common to all modules and types.

Serialization is implemented in three layers:

1. **I/O layer:** streamfile access and exact, retrievable and compiler independent representation of all intrinsic types
2. **Marking layer:** storing/restoring pointer association and better human readability
3. **Derived type layer:** abstract type as parent for all serializable derived types

The I/O Layer The I/O layer is implemented by `page_ring_t` and its type bound procedures. We chose not to use the standard formatted sequential I/O for several reasons:

- Sequential I/O is line orientated, but serialization is not.
- Formatted I/O of floating point numbers is inexact. There were problems in reading numbers like `1+epsilon(1)` or `huge(1)` including arithmetic exceptions and wrong results.
- Formatted reading is slow. This does matter, when you read files of $\mathcal{O}(100)$ MB.

`page_ring_t` is a ring buffer of default kind characters holding a region of the addressed file. All read and write procedures use the ring buffer, not the file. `page_ring` automatically reads more characters from the file when needed and writes and discards parts of the ring buffer when not any longer needed.

Marking layer Marking is done by `marking_t` and its type bound procedures. Files written by `marking_t` are regular XML files, so you can use your favorite XML editor to examine or edit serialized contents. The main purpose of this layer is to recover the type of polymorphic entities and to restore association of pointers, but it also assigns names to all contents, so it is much easier to read generated files.

Type recovery is done by a reference list. You must push a representative object to this reference list for each type that might get resolved before starting deserialization. `marker_t` will care for comparing these representatives to the contents of the files.

Association restoration is done by a heap list. It is technically equal to the reference list, but holds all targets that have been processed so far. Generation of this list is handled by `marking_t`, so you don't have to care for this aspect at all. Up to the present it is not possible to restore association, when a non-pointer target is serialized after its associated pointer is serialized. There is no trivial solution and this case does not appear here, so we will not take care of this.

Derived type layer Each instance that shall become serialized must extend `ser_class_t`. Essential for type recovery is the virtual type bound procedure `get_type`. Each non-virtual type shall override `get_type` and return the actual name of its type in lower-case letters. Each type which adds new, non-redundant components shall override `write_to_marker` and `read_from_marker`. These type-bound procedures define, what contents get serialized. While the marker cares about tagging the type and association of the instance, every instance still has to define what to serialize. The rule is to mark the begin of its contents, then its parents procedure, then mark all non-redundant components, then mark the end of its contents. Finally, each serializable type shall override `print_to_unit`. This procedure is called for an arbitrary human-readable output. It is quite similar to `write_to_ring`, but without strict format and ignoring machine-readability.

`ser_class_t` has strictly speaking two layers. `write_to_marker` and `read_from_marker` are only for internal usage. Serialization and deserialization are triggered by the TBPs `serialize` and `deserialize`. These procedures take care of initialization and finalization of the marker. A serializable type should override these procedures to push a representative of itself and any other references to the reference list of its marker before (de)serialization and to pop them from the list afterwards.

```
<multi_base.f90>≡
