### Momentum splitting: massless parton

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds, we arrive at an exact number  $t = -0.36$  for the given input values.

```

## 15.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of  $x_1, x_2, \dots$  as parameters for the beams, we generate one parameter that is equal, or related to, the product  $x_1 x_2 \dots$  (so it directly corresponds to  $\sqrt{s}$ ). The other parameters describe the distribution of energy (loss) between beams and radiations.

```

⟨sf_mappings.f90⟩≡
  ⟨File header⟩

  module sf_mappings

    ⟨Use kinds⟩
    use kinds, only: double
    use io_units
    use constants, only: pi, zero, one
    use unit_tests, only: vanishes
    use diagnostics

    ⟨Standard module head⟩

    ⟨SF mappings: public⟩

    ⟨SF mappings: parameters⟩

    ⟨SF mappings: types⟩

    ⟨SF mappings: interfaces⟩

    contains

    ⟨SF mappings: procedures⟩

  end module sf_mappings

```

### 15.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

```

⟨SF mappings: public⟩≡
  public :: sf_mapping_t

```

```

<SF mappings: types>≡
  type, abstract :: sf_mapping_t
    integer, dimension(:), allocatable :: i
    contains
    <SF mappings: sf mapping: TBP>
  end type sf_mapping_t

```

The output routine is deferred:

```

<SF mappings: sf mapping: TBP>≡
  procedure (sf_mapping_write), deferred :: write
<SF mappings: interfaces>≡
  abstract interface
    subroutine sf_mapping_write (object, unit)
      import
      class(sf_mapping_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine sf_mapping_write
  end interface

```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: base_init => sf_mapping_base_init
<SF mappings: procedures>≡
  subroutine sf_mapping_base_init (mapping, n_par)
    class(sf_mapping_t), intent(out) :: mapping
    integer, intent(in) :: n_par
    allocate (mapping%i (n_par))
    mapping%i = 0
  end subroutine sf_mapping_base_init

```

Set an index value.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: set_index => sf_mapping_set_index
<SF mappings: procedures>+≡
  subroutine sf_mapping_set_index (mapping, j, i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j, i
    mapping%i(j) = i
  end subroutine sf_mapping_set_index

```

Return the dimensionality, i.e., the number of parameters.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: get_n_dim => sf_mapping_get_n_dim
<SF mappings: procedures>+≡
  function sf_mapping_get_n_dim (mapping) result (n)
    class(sf_mapping_t), intent(in) :: mapping
    integer :: n
    n = size (mapping%i)
  end function sf_mapping_get_n_dim

```

Computation: the values **p** are the input parameters, the values **r** are the output parameters. The values **rb** are defined as  $\bar{r} = 1 - r$ , but provided explicitly. They allow us to avoid numerical problems near  $r = 1$ .

The extra parameter **x\_free** indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is **f**. We modify only the two parameters indicated by the indices **i**.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_compute), deferred :: compute

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
      import
      class(sf_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: p, pb
      real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_compute
  end interface

```

The inverse mapping. Use **r** and/or **rb** to reconstruct **p** and also compute **f**.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_inverse), deferred :: inverse

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
      import
      class(sf_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(in) :: r, rb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(out) :: p, pb
      real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_inverse
  end interface

```

## 15.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: check => sf_mapping_check

<SF mappings: procedures>+≡
  subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: u
    real(default), dimension(:), intent(in) :: p_in, pb_in

```

```

character(*), intent(in) :: fmt_p
character(*), intent(in), optional :: fmt_f
real(default), dimension(size(p_in)) :: p, pb, r, rb
real(default) :: f, tolerance
tolerance = 1.5E-17
p = p_in
pb= pb_in
call mapping%compute (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "rb=", rb
if (present (fmt_f)) then
  write (u, "(3x,A,9(1x," // fmt_f // "))" ) "f =", f
else
  write (u, "(3x,A,9(1x," // fmt_p // "))" ) "f =", f
end if
write (u, *)
call mapping%inverse (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "rb=", rb
if (present (fmt_f)) then
  write (u, "(3x,A,9(1x," // fmt_f // "))" ) "f =", f
else
  write (u, "(3x,A,9(1x," // fmt_p // "))" ) "f =", f
end if
write (u, *)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "*r=", product (r)
end subroutine sf_mapping_check

```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: integral => sf_mapping_integral

<SF mappings: procedures>+≡
function sf_mapping_integral (mapping, n_calls) result (integral)
  class(sf_mapping_t), intent(inout) :: mapping
  integer, intent(in) :: n_calls
  real(default) :: integral

```

```

integer :: n_dim, n_bin, k

integer, dimension(:), allocatable :: ii
real(default) :: dx, f, s

n_dim = mapping%get_n_dim ()
allocate (p (n_dim))
allocate (pb(n_dim))
allocate (r (n_dim))
allocate (rb(n_dim))
allocate (ii(n_dim))
n_bin = nint (real (n_calls, default) ** (1._default / n_dim))
dx = 1._default / n_bin
s = 0
ii = 1

SAMPLE: do
  do k = 1, n_dim
    p(k) = ii(k) * dx - dx/2
    pb(k) = (n_bin - ii(k)) * dx + dx/2
  end do
  call mapping%compute (r, rb, f, p, pb)
  s = s + f
INCR: do k = 1, n_dim
  ii(k) = ii(k) + 1
  if (ii(k) <= n_bin) then
    exit INCR
  else if (k < n_dim) then
    ii(k) = 1
  else
    exit SAMPLE
  end if
end do INCR
end do SAMPLE

integral = s / real (n_bin, default) ** n_dim

end function sf_mapping_integral

```

### 15.4.3 Implementation: standard mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio.

```

<SF mappings: public>+≡
  public :: sf_s_mapping_t

        end do
    end subroutine sf_s_mapping_inverse

```

#### 15.4.4 Implementation: resonance pair mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio, then it maps  $p_1$  to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in  $p_1$  results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

```

<SF mappings: public>+≡
    public :: sf_res_mapping_t

<SF mappings: types>+≡
    type, extends (sf_mapping_t) :: sf_res_mapping_t

    pb(mapping%i(2)) = 1 - p2(2)
    f = fbw * f2
  end subroutine sf_res_mapping_inverse

```

### 15.4.5 Implementation: on-shell mapping

This is a degenerate version of the unit-square mapping where the product  $r_1 r_2$  is constant. This product is given by the rescaled squared mass. We introduce an artificial first parameter  $p_1$  to keep the counting, but nothing depends on it. The second parameter is the same  $p_2$  as for the standard unit-square mapping for  $\alpha = 1$ , it parameterizes the ratio of  $r_1$  and  $r_2$ .

```

<SF mappings: public>+≡
  public :: sf_os_mapping_t

<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_os_mapping_t
    real(default) :: m = 0
    real(default) :: lm2 = 0
  contains
    <SF mappings: sf on-shell mapping: TBP>
  end type sf_os_mapping_t

```

Output.

```

<SF mappings: sf on-shell mapping: TBP>≡
  procedure :: write => sf_os_mapping_write

<SF mappings: procedures>+≡
  subroutine sf_os_mapping_write (object, unit)
    class(sf_os_mapping_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)

```

```

write (u, "(1x,A)", advance="no") "map"
if (any (object%i /= 0)) then
  write (u, "('(',I0,',',I0,')')", advance="no") object%i
end if
write (u, "(A,F7.5,A)" ": on-shell (" , object%m, ")")
end subroutine sf_os_mapping_write

```

Initialize: index pair and dimensionless mass parameter.

```

<SF mappings: sf on-shell mapping: TBP>+≡
procedure :: init => sf_os_mapping_init

<SF mappings: procedures>+≡
subroutine sf_os_mapping_init (mapping, m)
  class(sf_os_mapping_t), intent(out) :: mapping
  real(default), intent(in) :: m
  call mapping%base_init (2)
  mapping%m = m
  mapping%lm2 = abs (2 * log (mapping%m))
end subroutine sf_os_mapping_init

```

Apply mapping. The `x_free` parameter rescales the total energy, which must be accounted for in the enclosed mapping.

```

<SF mappings: sf on-shell mapping: TBP>+≡
procedure :: compute => sf_os_mapping_compute

<SF mappings: procedures>+≡
subroutine sf_os_mapping_compute (mapping, r, rb, f, p, pb, x_free)
  class(sf_os_mapping_t), intent(inout) :: mapping

p (mapping%i(1)) = p2(1)
pb(mapping%i(1)) = 1 - p2(1)
p (mapping%i(2)) = p2(2)
pb(mapping%i(2)) = 1 - p2(2)
end subroutine sf_os_mapping_inverse

```

#### 15.4.6 Implementation: endpoint mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ . The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in  $r_1$  and/or  $r_2$ . The singularity is smeared to an interval of width  $\epsilon$ . If nonzero, we distinguish the kinematical momentum fractions  $r_i$  from effective values  $x_i$ , which should go into the structure-function evaluation. A bin of width  $\epsilon$  in  $r$  is mapped to  $x = 1$  exactly, while the interval  $(0, 1 - \epsilon)$  is mapped to  $(0, 1)$  in  $x$ . The Jacobian reflects this distinction, and the logical `in_peak` allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

### 15.4.7 Implementation: endpoint mapping with resonance

Like the endpoint mapping for  $p_2$ , but replace the endpoint mapping by a Breit-Wigner mapping for  $p_1$ . This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter  $p_1$  remains equal to  $r_1 r_2$ , as in the standard s-channel mapping.

```

<SF mappings: public>+≡
    public :: sf_epr_mapping_t

<SF mappings: types>+≡
    type, extends (sf_mapping_t) :: sf_epr_mapping_t
        real(default) :: a = 1
        real(default) :: m = 0
        real(default) :: w = 0
        logical :: resonance = .true.
    contains
    <SF mappings: sf endpoint/res mapping: TBP>
    end type sf_epr_mapping_t

```

Output.

```

#### 15.4.11 Implementation: ISR on-shell mapping

Similar to the endpoint mapping above: This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is ignored while the product  $r_1 r_2$  is constant.  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ .

The enhancement is such that ISR singularity  $(1 - x)^{-1+\epsilon}$  is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

### 15.4.13 Implementation: Endpoint + ISR + resonance

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping, adapted for an s-channel resonance. The first two internal parameters apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. The first and third parameters are the result of an overall resonance mapping, so on the outside, the first parameter is the total momentum fraction, the third one describes the distribution between beamstrahlung and ISR.

## 15.4.15 Basic formulas

### Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ( $\ln x$  which is zero at  $x = 1$ ), corresponding to an initial concentration of sampling points at the maximum energy. If **power** is greater than one (the default), points are also concentrated at the lower end.

The formula is (**power**= $\alpha$ ):

$$r_1 = (p_1^{p_2})^\alpha \quad (15.15)$$

$$r_2 = (p_1^{1-p_2})^\alpha \quad (15.16)$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \quad (15.17)$$

and for the default case  $\alpha = 1$ :

$$r_1 = p_1^{p_2} \quad (15.18)$$

$$r_2 = p_1^{1-p_2} \quad (15.19)$$

$$f = |\log p_1| \quad (15.20)$$

*(SF mappings: procedures)* +≡

end if
end subroutine map_unit_square_inverse

```

### Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be numerically stable near  $x = 1$  and  $y = 0, 1$ . The formulas are again

$$r_1 = p_1^{p_2}, \quad r_2 = p_1^{\bar{p}_2}, \quad f = -\log p_1 \quad (15.21)$$

but we compute both  $r_i$  and  $\bar{r}_i$  simultaneously and make direct use of both  $p_i$  and  $\bar{p}_i$  as appropriate.

*(SF mappings: procedures)+≡*

```

subroutine map_unit_square_prec (r, rb, factor, p, pb)
  real(default), dimension(2), intent(out) :: r
  real(default), dimension(2), intent(out) :: rb
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), dimension(2), intent(in) :: pb
  if (p(1) > 0.5_default) then
    call compute_prec_xy_1 (r(1), rb(1), p(1), pb(1), p (2))
    call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
    factor = - log_prec (p(1), pb(1))
  else if (.not. vanishes (p(1))) then
    call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
    call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
    factor = - log_prec (p(1), pb(1))
  else
    r = 0
    rb = 1
  end if
end subroutine map_unit_square_prec

```

```

        factor = 0
    end if
end subroutine map_unit_square_prec

```

This is the inverse mapping.

*(SF mappings: procedures)*+≡

```

subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
    real(default), dimension(2), intent(in) :: r
    real(default), dimension(2), intent(in) :: rb
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(out) :: p
    real(default), dimension(2), intent(out) :: pb
    call inverse_prec_x (r, rb, p(1), pb(1))
    if (all (r > 0)) then
        if (rb(1) < rb(2)) then
            call inverse_prec_y (r, rb, p(2), pb(2))
        else
            call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
        end if
        factor = - log_prec (p(1), pb(1))
    else
        p(1) = 0
        pb(1) = 1
        p(2) = 0.5_default
        pb(2) = 0.5_default
        factor = 0
    end if
end subroutine map_unit_square_inverse_prec

```

This is an auxiliary function: evaluate the expression  $\bar{z} = 1 - x^y$  in a numerically stable way. Instabilities occur for  $y = 0$  and  $x = 1$ . The idea is to replace the bracket by the first terms of its Taylor expansion around  $x = 1$  (read  $\bar{x} \equiv 1 - x$ )

$$1 - x^y = y\bar{x} \left( 1 + \frac{1}{2}(1 - y)\bar{x} + \frac{1}{6}(2 - y)(1 - y)\bar{x}^2 \right) \quad (15.22)$$

whenever this is the better approximation. Actually, the relative numerical error of the exact formula is about  $\eta/(y\bar{x})$  where  $\eta$  is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by  $(y\bar{x})$ .

The first subroutine computes  $z$  and  $\bar{z}$  near  $x = 1$  where  $\log x$  should be expanded, the second one near  $x = 0$  where  $\log x$  can be kept.

*(SF mappings: procedures)*+≡

```

subroutine compute_prec_xy_1 (z, zb, x, xb, y)
    real(default), intent(out) :: z, zb
    real(default), intent(in) :: x, xb, y
    real(default) :: a1, a2, a3
    a1 = y * xb
    a2 = a1 * (1 - y) * xb / 2
    a3 = a2 * (2 - y) * xb / 3
    if (abs (a3) < epsilon (a3)) then
        zb = a1 + a2 + a3
        z = 1 - zb
    end if
end subroutine compute_prec_xy_1

```

```

else
  z = x ** y
  zb = 1 - z
end if
end subroutine compute_prec_xy_1

subroutine compute_prec_xy_0 (z, zb, x, xb, y)
  real(default), intent(out) :: z, zb
  real(default), intent(in) :: x, xb, y
  real(default) :: a1, a2, a3, lx
  lx = -log (x)
  a1 = y * lx
  a2 = a1 * y * lx / 2
  a3 = a2 * y * lx / 3
  if (abs (a3) < epsilon (a3)) then
    zb = a1 + a2 + a3
    z = 1 - zb
  else
    z = x ** y
    zb = 1 - z
  end if
end subroutine compute_prec_xy_0

```

For the inverse calculation, we evaluate  $x = r_1 r_2$  in a stable way. Since it is just a polynomial, the expansion near  $x = 1$  is analytically exact, and we don't need to choose based on precision.

*(SF mappings: procedures)* +≡

```

subroutine inverse_prec_x (r, rb, x, xb)
  real(default), dimension(2), intent(in) :: r, rb
  real(default), intent(out) :: x, xb
  real(default) :: a0, a1
  a0 = rb(1) + rb(2)
  a1 = rb(1) * rb(2)
  if (a0 > 0.5_default) then
    xb = a0 - a1
    x = 1 - xb
  else
    x = r(1) * r(2)
    xb = 1 - x
  end if
end subroutine inverse_prec_x

```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \quad (15.23)$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near  $r_i = 1$ . A series expansion is required if  $r_1 \ll r_2$ , since then  $y$  becomes small. (We assume  $r_1 < r_2$  here; for the opposite case, the arguments can be exchanged.)

*(SF mappings: procedures)* +≡

```

subroutine inverse_prec_y (r, rb, y, yb)

```

```

real(default), dimension(2), intent(in) :: r, rb
real(default), intent(out) :: y, yb
real(default) :: log1, log2, a1, a2, a3
log1 = log_prec (r(1), rb(1))
log2 = log_prec (r(2), rb(2))
a1 = - rb(1) / log2
a2 = - rb(1) ** 2 * (one / log2**2 + one/(2*log2))
if (abs (log2**3) < epsilon (one)) then
  if (abs(log1) < epsilon (one)) then
    y = zero
  else
    y = one / (one+log2/log1)
  end if
  if (abs(log2) < epsilon (one)) then
    yb = zero
  else
    yb = one / (one+log1/log2)
  end if
  return
else
  a3 = - rb(1) ** 3 * (one / log2**3 + one/log2**2 + one/(3 * log2))
end if
if (abs (a3) < epsilon (a3)) then
  y = a1 + a2 + a3
  yb = one - y
else
  y = one / (one+log2/log1)
  yb = one / (one+log1/log2)
end if
end subroutine inverse_prec_y

```

We also need an evaluation of  $\log x$  which is stable near  $x = 1$ .

```

<SF mappings: public>+≡
public :: log_prec

<SF mappings: procedures>+≡
function log_prec (x, xb) result (lx)
  real(default), intent(in) :: x, xb
  real(default) :: a1, a2, a3, lx
  a1 = xb
  a2 = a1 * xb / 2
  a3 = a2 * xb * 2 / 3
  if (abs (a3) < epsilon (a3)) then
    lx = - a1 - a2 - a3
  else
    lx = log (x)
  end if
end function log_prec

```

### Mapping for on-shell s-channel

The limiting case, if the product  $r_1 r_2$  is fixed for on-shell production. The parameter  $p_1$  is ignored. In the inverse mapping, it is returned zero.

The parameter `x_free`, if present, rescales the total energy. If it is less than one, the rescaled mass parameter  $m^2$  should be increased accordingly.

Public for access in unit test.

```

<SF mappings: public>+≡
  public :: map_on_shell
  public :: map_on_shell_inverse

<SF mappings: procedures>+≡
  subroutine map_on_shell (r, factor, p, lm2, x_free)
    real(default), dimension(2), intent(out) :: r
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(in) :: p
    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2; if (present (x_free)) lx = lx + log (x_free)
    r(1) = exp (- p(2) * lx)
    r(2) = exp (- (1 - p(2)) * lx)
    factor = lx
  end subroutine map_on_shell

  subroutine map_on_shell_inverse (r, factor, p, lm2, x_free)
    real(default), dimension(2), intent(in) :: r
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(out) :: p
    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2; if (present (x_free)) lx = lx + log (x_free)
    p(1) = 0
    p(2) = abs (log (r(1))) / lx
    factor = lx
  end subroutine map_on_shell_inverse

```

This is the standard Breit-Wigner mapping. We apply it to a single variable, independently of or in addition to a unit-square mapping. We assume here that the limits for the variable are 0 and 1, and that the mass  $m$  and width  $w$  are rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If `x_free` is set, it rescales the total energy and thus mass and width, since these are defined with respect to the total energy.

```

<SF mappings: procedures>+≡
  subroutine map_breit_wigner (r, factor, p, m, w, x_free)
    real(default), intent(out) :: r
    real(default), intent(out) :: factor

    factor = a3 * (1 + tmp ** 2)
end subroutine map_breit_wigner_inverse

```

### Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the endpoint(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2}x)) \quad (15.24)$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

*(SF mappings: procedures)+≡*

```

subroutine map_endpoint_1 (x3, factor, x1, a)
    real(default), intent(out) :: x3, factor
    real(default), intent(in) :: x1

```

```

real(default), intent(in) :: a
real(default) :: x2
if (abs (x1) < 1) then
    x2 = tan (x1 * pi / 2)
    x3 = tanh (a * x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
else
    x3 = x1
    factor = 0
end if
end subroutine map_endpoint_1

subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
real(default), intent(in) :: x3
real(default), intent(out) :: x1, factor
real(default), intent(in) :: a
real(default) :: x2
if (abs (x3) < 1) then
    x2 = atanh (x3) / a
    x1 = 2 / pi * atan (x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
else
    x1 = x3
    factor = 0
end if
end subroutine map_endpoint_inverse_1

subroutine map_endpoint_01 (x4, factor, x0, a)
real(default), intent(out) :: x4, factor
real(default), intent(in) :: x0
real(default), intent(in) :: a
real(default) :: x1, x3
x1 = 2 * x0 - 1
call map_endpoint_1 (x3, factor, x1, a)
x4 = (x3 + 1) / 2
end subroutine map_endpoint_01

subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
real(default), intent(in) :: x4
real(default), intent(out) :: x0, factor
real(default), intent(in) :: a
real(default) :: x1, x3
x3 = 2 * x4 - 1
call map_endpoint_inverse_1 (x3, factor, x1, a)
x0 = (x1 + 1) / 2
end subroutine map_endpoint_inverse_01

```

### Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity which is of power type at  $x = 1$ , i.e., if

$$\sigma = \int_0^1 dx f(x) G(x) = \int_0^1 dx \epsilon (1-x)^{-1+\epsilon} G(x), \quad (15.25)$$

we replace this by

$$r = x^\epsilon \implies \sigma = \int_0^1 dr G(1 - (1-r)^{1/\epsilon}). \quad (15.26)$$

We expect that  $\epsilon$  is small.

The actual mapping is  $r \rightarrow x$  (so  $x$  emerges closer to 1). The Jacobian that we return is thus  $1/f(x)$ . We compute the mapping in terms of  $\bar{x} \equiv 1 - x$ , so we can achieve the required precision. Because some compilers show quite wild numeric fluctuations, we internally convert numeric types to explicit `double` precision.

```

<SF mappings: public>+≡
  public :: map_power_1
  public :: map_power_inverse_1

<SF mappings: procedures>+≡
  subroutine map_power_1 (xb, factor, rb, eps)
    real(default), intent(out) :: xb, factor
    real(default), intent(in) :: rb
    real(double) :: rb_db, factor_db, eps_db, xb_db
    real(default), intent(in) :: eps
    rb_db = real (rb, kind=double)
    eps_db = real (eps, kind=double)
    xb_db = rb_db ** (1 / eps_db)
    if (rb_db > 0) then
      factor_db = xb_db / rb_db / eps_db
      factor = real (factor_db, kind=default)
    else
      factor = 0
    end if
    xb = real (xb_db, kind=default)
  end subroutine map_power_1

  subroutine map_power_inverse_1 (xb, factor, rb, eps)
    real(default), intent(in) :: xb
    real(default), intent(out) :: rb, factor
    real(double) :: xb_db, factor_db, eps_db, rb_db
    real(default), intent(in) :: eps
    xb_db = real (xb, kind=double)
    eps_db = real (eps, kind=double)
    rb_db = xb_db ** eps_db
    if (xb_db > 0) then
      factor_db = xb_db / rb_db / eps_db
      factor = real (factor_db, kind=default)
    else
      factor = 0
    end if
  end subroutine map_power_inverse_1

```

```

end if
rb = real (rb_db, kind=default)
end subroutine map_power_inverse_1

```

Here we apply a power mapping to both endpoints. We divide the interval in two equal halves and apply the power mapping for the nearest endpoint, either 0 or 1.

*(SF mappings: procedures)+≡*

```

subroutine map_power_01 (y, yb, factor, r, eps)
  real(default), intent(out) :: y, yb, factor
  real(default), intent(in) :: r
  real(default), intent(in) :: eps
  real(default) :: u, ub, zp, zm
  u = 2 * r - 1
  if (u > 0) then
    ub = 2 * (1 - r)
    call map_power_1 (zm, factor, ub, eps)
    zp = 2 - zm
  else if (u < 0) then
    ub = 2 * r
    call map_power_1 (zp, factor, ub, eps)
    zm = 2 - zp
  else
    factor = 1 / eps
    zp = 1
    zm = 1
  end if
  y = zp / 2
  yb = zm / 2
end subroutine map_power_01

subroutine map_power_inverse_01 (y, yb, factor, r, eps)
  real(default), intent(in) :: y, yb
  real(default), intent(out) :: r, factor
  real(default), intent(in) :: eps
  real(default) :: ub, zp, zm
  zp = 2 * y
  zm = 2 * yb
  if (zm < zp) then
    call map_power_inverse_1 (zm, factor, ub, eps)
    r = 1 - ub / 2
  else if (zp < zm) then
    call map_power_inverse_1 (zp, factor, ub, eps)
    r = ub / 2
  else
    factor = 1 / eps
    ub = 1
    r = ub / 2
  end if
end subroutine map_power_inverse_01

```

## Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping that applies to multiple structure functions. This is described by an extension of the `sf_mapping_t` type. In addition, it may contain mappings that apply to (other) individual structure functions. The details of these mappings are implementation-specific.

The `sf_channel_t` type combines this information. It contains an array of map codes, one for each structure-function entry. The code values are:

**none** MC input parameters  $r$  directly become energy fractions  $x$

**single** default mapping for a single structure-function entry

**multi/s** map  $r \rightarrow x$  such that one MC input parameter is  $\hat{s}/s$

**multi/resonance** as before, adapted to s-channel resonance

**multi/on-shell** as before, adapted to an on-shell particle in the s channel

**multi/endpoint** like multi/s, but enhance the region near  $r_i = 1$

**multi/endpoint/res** endpoint mapping with resonance

**multi/endpoint/os** endpoint mapping for on-shell

**multi/power/os** like multi/endpoint, regulating a power singularity

```

⟨SF mappings: parameters⟩≡
  integer, parameter :: SFMAP_NONE = 0
  integer, parameter :: SFMAP_SINGLE = 1
  integer, parameter :: SFMAP_MULTI_S = 2
  integer, parameter :: SFMAP_MULTI_RES = 3
  integer, parameter :: SFMAP_MULTI_ONS = 4
  integer, parameter :: SFMAP_MULTI_EP = 5
  integer, parameter :: SFMAP_MULTI_EPR = 6
  integer, parameter :: SFMAP_MULTI_EPO = 7
  integer, parameter :: SFMAP_MULTI_IP = 8
  integer, parameter :: SFMAP_MULTI_IPR = 9
  integer, parameter :: SFMAP_MULTI_IPO = 10
  integer, parameter :: SFMAP_MULTI_EI = 11

```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

```

⟨SF mappings: public⟩+≡
  public :: sf_channel_t

⟨SF mappings: types⟩+≡
  type :: sf_channel_t
    integer, dimension(:), allocatable :: map_code
    class(sf_mapping_t), allocatable :: multi_mapping
  contains
    ⟨SF mappings: sf channel: TBP⟩
  end type sf_channel_t

```

The output format prints a single character for each structure-function entry and, if applicable, an account of the mapping parameters.

```

```

Initializer for a single `sf_channel` object.

```

<SF mappings: sf channel: TBP>+≡
  procedure :: init => sf_channel_init

```

```

<SF mappings: procedures>+≡
subroutine sf_channel_init (channel, n_strfun)
  class(sf_channel_t), intent(out) :: channel
  integer, intent(in) :: n_strfun
  allocate (channel%map_code (n_strfun))
  channel%map_code = SFMAP_NONE
end subroutine sf_channel_init

```

Assignment. This merely copies intrinsic assignment, but apparently the latter is bugged in gfortran 4.6.3, causing memory corruption.

```

<SF mappings: sf channel: TBP>+≡
generic :: assignment (=) => sf_channel_assign
procedure :: sf_channel_assign

<SF mappings: procedures>+≡
subroutine sf_channel_assign (copy, original)
  class(sf_channel_t), intent(out) :: copy
  type(sf_channel_t), intent(in) :: original
  allocate (copy%map_code (size (original%map_code)))
  copy%map_code = original%map_code
  if (allocated (original%multi_mapping)) then
    allocate (copy%multi_mapping, source = original%multi_mapping)
  end if
end subroutine sf_channel_assign

```

This initializer allocates an array of channels with common number of structure-function entries, therefore it is not a type-bound procedure.

```

<SF mappings: public>+≡
public :: allocate_sf_channels

<SF mappings: procedures>+≡
subroutine allocate_sf_channels (channel, n_channel, n_strfun)
  type(sf_channel_t), dimension(:), intent(out), allocatable :: channel
  integer, intent(in) :: n_channel
  integer, intent(in) :: n_strfun
  integer :: c
  allocate (channel (n_channel))
  do c = 1, n_channel
    call channel(c)%init (n_strfun)
  end do
end subroutine allocate_sf_channels

```

This marks a given subset of indices as single-mapping.

```

<SF mappings: sf channel: TBP>+≡
procedure :: activate_mapping => sf_channel_activate_mapping

<SF mappings: procedures>+≡
subroutine sf_channel_activate_mapping (channel, i_sf)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  channel%map_code(i_sf) = SFMAP_SINGLE
end subroutine sf_channel_activate_mapping

```

This sets an s-channel multichannel mapping. The length of the `i_sf` array must be 2. The parameter indices are not yet set.

```

<SF mappings: sf channel: TBP>+≡
  procedure :: set_s_mapping => sf_channel_set_s_mapping

<SF mappings: procedures>+≡
  subroutine sf_channel_set_s_mapping (channel, i_sf, power)
    class(sf_channel_t), intent(inout) :: channel
    integer, dimension(:), intent(in) :: i_sf
    real(default), intent(in), optional :: power
    channel%map_code(i_sf) = SFMAP_MULTI_S
    allocate (sf_s_mapping_t :: channel%multi_mapping)

```

### Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by  $|\log m^2|$ , so this is also the value of the integral. The factor results from the variable change in the  $\delta$  function  $\delta(m^2 - x_1 x_2)$  which multiplies the cross section for the case at hand.

For the test, the (rescaled) resonance mass is set at 1/2 the energy.

```

<SF mappings: execute tests>+≡
  call test (sf_mappings_4, "sf_mappings_4", &
    "on-shell pair mapping", &
    u, results)

<SF mappings: test declarations>+≡
  public :: sf_mappings_4

<SF mappings: tests>+≡
  subroutine sf_mappings_4 (u)
    integer, intent(in) :: u
    class(sf_mapping_t), allocatable :: mapping
    real(default), dimension(2) :: p

    write (u, "(A)")  "* Test output: sf_mappings_4"
    write (u, "(A)")  "* Purpose: probe on-shell pair mapping"
    write (u, "(A)")

  ⟨SF base: interfaces⟩

contains

```

```
⟨SF base: procedures⟩
```

```
end module sf_base
```

### 15.5.1 Abstract structure-function data type

This type should hold all configuration data for a specific type of structure function. The base object is empty; the implementations will fill it.

```
⟨SF base: public⟩≡
```

```
public :: sf_data_t
```

```
⟨SF base: types⟩≡
```

```
type, abstract :: sf_data_t
```

```
contains
```

```
⟨SF base: sf data: TBP⟩
```

```
end type sf_data_t
```

Output.

```
⟨SF base: sf data: TBP⟩≡
```

```
procedure (sf_data_write), deferred :: write
```

```
⟨SF base: interfaces⟩≡
```

```
abstract interface
```

```
subroutine sf_data_write (data, unit, verbose)
```

```
import
```

```
class(sf_data_t), intent(in) :: data
```

```
integer, intent(in), optional :: unit
```

```
logical, intent(in), optional :: verbose
```

```
end subroutine sf_data_write
```

```
end interface
```

Return true if this structure function is in generator mode. In that case, all parameters are free, otherwise bound. (We do not support mixed cases.) Default is: no generator.

```
⟨SF base: sf data: TBP⟩+≡
```

```
procedure :: is_generator => sf_data_is_generator
```

```
⟨SF base: procedures⟩≡
```

```
function sf_data_is_generator (data) result (flag)
```

```
class(sf_data_t), intent(in) :: data
```

```
logical :: flag
```

```
flag = .false.
```

```
end function sf_data_is_generator
```

Return the number of input parameters that determine the structure function.

```
⟨SF base: sf data: TBP⟩+≡
```

```
procedure (sf_data_get_int), deferred :: get_n_par
```

```

<SF base: interfaces>+≡
  abstract interface
    function sf_data_get_int (data) result (n)
      import
      class(sf_data_t), intent(in) :: data
      integer :: n
    end function sf_data_get_int
  end interface

```

Return the outgoing particle PDG codes for the current setup. The codes can be an array of particles, for each beam.

```

<SF base: sf data: TBP>+≡
  procedure (sf_data_get_pdg_out), deferred :: get_pdg_out

<SF base: interfaces>+≡
  abstract interface
    subroutine sf_data_get_pdg_out (data, pdg_out)
      import
      class(sf_data_t), intent(in) :: data
      type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
    end subroutine sf_data_get_pdg_out
  end interface

```

Allocate a matching structure function interaction object and properly initialize it.

```

<SF base: sf data: TBP>+≡
  procedure (sf_data_allocate_sf_int), deferred :: allocate_sf_int

<SF base: interfaces>+≡
  abstract interface
    subroutine sf_data_allocate_sf_int (data, sf_int)
      import
      class(sf_data_t), intent(in) :: data
      class(sf_int_t), intent(inout), allocatable :: sf_int
    end subroutine sf_data_allocate_sf_int
  end interface

```

Return the PDF set index, if applicable. We implement a default method which returns zero. The PDF (builtin and LHA) implementations will override this.

```

<SF base: sf data: TBP>+≡
  procedure :: get_pdf_set => sf_data_get_pdf_set

<SF base: procedures>+≡
  function sf_data_get_pdf_set (data) result (pdf_set)
    class(sf_data_t), intent(in) :: data
    integer :: pdf_set
    pdf_set = 0
  end function sf_data_get_pdf_set

```

## 15.5.2 Structure-function chain configuration

This is the data type that the `processes` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

```
<SF base: public>+≡
    public :: sf_config_t
```

```
<SF base: types>+≡
    type :: sf_config_t
        integer, dimension(:), allocatable :: i
        class(sf_data_t), allocatable :: data
    contains
        <SF base: sf config: TBP>
    end type sf_config_t
```

Output:

```
<SF base: sf config: TBP>≡
    procedure :: write => sf_config_write

<SF base: procedures>+≡
    subroutine sf_config_write (object, unit)
        class(sf_config_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        if (allocated (object%i)) then
            write (u, "(1x,A,2(1x,I0))") "Structure-function configuration: &
                &beam(s)", object%i
            if (allocated (object%data)) call object%data%write (u)
        else
            write (u, "(1x,A)") "Structure-function configuration: [undefined]"
        end if
    end subroutine sf_config_write
```

Initialize.

```
<SF base: sf config: TBP>+≡
    procedure :: init => sf_config_init

<SF base: procedures>+≡
    subroutine sf_config_init (sf_config, i_beam, sf_data)
        class(sf_config_t), intent(out) :: sf_config
        integer, dimension(:), intent(in) :: i_beam
        class(sf_data_t), intent(in) :: sf_data
        allocate (sf_config%i (size (i_beam)), source = i_beam)
        allocate (sf_config%data, source = sf_data)
    end subroutine sf_config_init
```

Return the PDF set, if any.

```
<SF base: sf config: TBP>+≡
    procedure :: get_pdf_set => sf_config_get_pdf_set
```

```

(SF base: procedures)+≡
function sf_config_get_pdf_set (sf_config) result (pdf_set)
  class(sf_config_t), intent(in) :: sf_config
  integer :: pdf_set
  pdf_set = sf_config%data%get_pdf_set ()
end function sf_config_get_pdf_set

```

### 15.5.3 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

```

(SF base: public)+≡
public :: sf_int_t

(SF base: types)+≡
type, abstract, extends (interaction_t) :: sf_int_t
  integer :: status = SF_UNDEFINED
  real(default), dimension(:), allocatable :: mi2
  real(default), dimension(:), allocatable :: mr2
  real(default), dimension(:), allocatable :: mo2
  integer :: on_shell_mode = KEEP_ENERGY
  logical :: qmin_defined = .false.
  logical :: qmax_defined = .false.
  real(default), dimension(:), allocatable :: qmin
  real(default), dimension(:), allocatable :: qmax
  integer, dimension(:), allocatable :: beam_index
  integer, dimension(:), allocatable :: incoming
  integer, dimension(:), allocatable :: radiated
  integer, dimension(:), allocatable :: outgoing
  integer, dimension(:), allocatable :: par_index
  integer, dimension(:), allocatable :: par_primary

```

```

contains
  <SF base: sf_int: TBP>
end type sf_int_t

```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

```

<SF base: parameters>≡
integer, parameter, public :: SF_UNDEFINED = 0
integer, parameter, public :: SF_INITIAL = 1
integer, parameter, public :: SF_DONE_LINKS = 2
integer, parameter, public :: SF_FAILED_MASK = 3
integer, parameter, public :: SF_DONE_MASK = 4
integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
integer, parameter, public :: SF_DONE_CONNECTIONS = 6
integer, parameter, public :: SF_SEED_KINEMATICS = 10
integer, parameter, public :: SF_FAILED_KINEMATICS = 11
integer, parameter, public :: SF_DONE_KINEMATICS = 12
integer, parameter, public :: SF_FAILED_EVALUATION = 13
integer, parameter, public :: SF_EVALUATED = 20

```

Write a string version of the status code:

```

<SF base: procedures>+≡
subroutine write_sf_status (status, u)
  integer, intent(in) :: status
  integer, intent(in) :: u
  select case (status)
    case (SF_UNDEFINED)
      write (u, "(1x,'[,A,']')") "undefined"
    case (SF_INITIAL)
      write (u, "(1x,'[,A,']')") "initialized"
    case (SF_DONE_LINKS)
      write (u, "(1x,'[,A,']')") "links set"
    case (SF_FAILED_MASK)
      write (u, "(1x,'[,A,']')") "mask mismatch"
    case (SF_DONE_MASK)
      write (u, "(1x,'[,A,']')") "mask set"
    case (SF_FAILED_CONNECTIONS)
      write (u, "(1x,'[,A,']')") "connections failed"
    case (SF_DONE_CONNECTIONS)
      write (u, "(1x,'[,A,']')") "connections set"
    case (SF_SEED_KINEMATICS)
      write (u, "(1x,'[,A,']')") "incoming momenta set"
    case (SF_FAILED_KINEMATICS)
      write (u, "(1x,'[,A,']')") "kinematics failed"
    case (SF_DONE_KINEMATICS)
      write (u, "(1x,'[,A,']')") "kinematics set"
    case (SF_FAILED_EVALUATION)
      write (u, "(1x,'[,A,']')") "evaluation failed"
    case (SF_EVALUATED)
      write (u, "(1x,'[,A,']')") "evaluated"
  end select
end subroutine write_sf_status

```

This is the basic output routine. Display status and interaction.

```

<SF base: sf int: TBP>≡

    end function sf_int_type_string
  end interface

```

Output of the concrete object. We should not forget to call the output routine for the base type.

```

<SF base: sf int: TBP>+≡
  procedure (sf_int_write), deferred :: write

<SF base: interfaces>+≡
  abstract interface
    subroutine sf_int_write (object, unit, testflag)
      import

```

```

        class(sf_int_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
    end subroutine sf_int_write
end interface

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually required for non-collinear splitting.

```

    sf_int%outgoing = outgoing
  end subroutine sf_int_set_outgoing

```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

```

<SF base: sf_int: TBP>+=
  procedure (sf_int_init), deferred :: init

<SF base: interfaces>+=
  abstract interface
    subroutine sf_int_init (sf_int, data)
      import
      class(sf_int_t), intent(out) :: sf_int
      class(sf_data_t), intent(in), target :: data
    end subroutine sf_int_init
  end interface

```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

```

<SF base: sf_int: TBP>+=
  procedure :: setup_constants => sf_int_setup_constants

<SF base: procedures>+=
  subroutine sf_int_setup_constants (sf_int)
    class(sf_int_t), intent(inout) :: sf_int
  end subroutine sf_int_setup_constants

```

Set beam indices, i.e., the beam(s) on which this structure function applies.

```

(SF base: sf_int: TBP)+≡
  procedure :: set_beam_index => sf_int_set_beam_index

(SF base: procedures)+≡

```

Tell if in generator mode. By default, this is false. To be overridden where appropriate; we may refer to the `is_generator` method of the `data` component in the concrete type.

```

<SF base: sf_int: TBP>+=
    procedure :: is_generator => sf_int_is_generator

<SF base: procedures>+=
    function sf_int_is_generator (sf_int) result (flag)
        class(sf_int_t), intent(in) :: sf_int
        logical :: flag
        flag = .false.
    end function sf_int_is_generator

```

Generate free parameters `r`. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value `x_free` is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

```

<SF base: sf_int: TBP>+=
    procedure :: generate_free => sf_int_generate_free

<SF base: procedures>+=
    subroutine sf_int_generate_free (sf_int, r, rb, x_free)
        class(sf_int_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: r, rb
        real(default), intent(inout) :: x_free
        r = 0
        rb = 1
    end subroutine sf_int_generate_free

```

Complete the structure-function kinematics, derived from an input parameter (array)  $r$  between 0 and 1. The interaction momenta are calculated, and we return  $x$  (the momentum fraction), and  $f$  (the Jacobian factor for the map  $r \rightarrow x$ ), if `map` is set.

If the `map` flag is unset,  $r$  and  $x$  values will coincide, and  $f$  will become unity. If it is set, the structure-function implementation chooses a convenient mapping from  $r$  to  $x$  with Jacobian  $f$ .

In the `inverse_kinematics` variant, we exchange the intent of `x` and `r`. The momenta are calculated only if the optional flag `set_momenta` is present and set.

```

The inverse procedure: we compute the  $x$  array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

NOTE: We should also improve this in the sense of extracting both  $x$  and  $\bar{x}$ , where for the latter we may consult the beam remnant. The current implementation is not sensitive to small  $\bar{x}$  values.

    end interface

```

#### 15.5.4 Accessing the structure function

Return metadata. Once `interaction_t` is rewritten in OO, some of this will be inherited.

The number of outgoing is equal to the number of incoming particles. The radiated particles are the difference.

```

<SF base: sf_int: TBP>+≡
    procedure :: get_n_in => sf_int_get_n_in
    procedure :: get_n_rad => sf_int_get_n_rad
    procedure :: get_n_out => sf_int_get_n_out

<SF base: procedures>+≡
    function sf_int_get_n_in (object) result (n_in)
        class(sf_int_t), intent(in) :: object
        integer :: n_in
        n_in = object%interaction_t%get_n_in ()
    end function sf_int_get_n_in

    function sf_int_get_n_rad (object) result (n_rad)
        class(sf_int_t), intent(in) :: object
        integer :: n_rad
        n_rad = object%interaction_t%get_n_out () &
            - object%interaction_t%get_n_in ()
    end function sf_int_get_n_rad

    function sf_int_get_n_out (object) result (n_out)
        class(sf_int_t), intent(in) :: object
        integer :: n_out
        n_out = object%interaction_t%get_n_in ()
    end function sf_int_get_n_out

```

Number of matrix element entries in the interaction:

```

<SF base: sf_int: TBP>+=
  procedure :: get_n_states => sf_int_get_n_states

<SF base: procedures>+=
  function sf_int_get_n_states (sf_int) result (n_states)
    class(sf_int_t), intent(in) :: sf_int
    integer :: n_states
    n_states = sf_int%get_n_matrix_elements ()
  end function sf_int_get_n_states

```

Return a specific state as a quantum-number array.

```

<SF base: sf_int: TBP>+=
  procedure :: get_state => sf_int_get_state

<SF base: procedures>+=
  function sf_int_get_state (sf_int, i) result (qn)
    class(sf_int_t), intent(in) :: sf_int
    type(quantum_numbers_t), dimension(:), allocatable :: qn
    integer, intent(in) :: i
    allocate (qn (sf_int%get_n_tot ()))
    qn = sf_int%get_quantum_numbers (i)
  end function sf_int_get_state

```

Return the matrix-element values for all states. We can assume that the matrix elements are real, so we take the real part.

```

<SF base: sf_int: TBP>+=
  procedure :: get_values => sf_int_get_values

<SF base: procedures>+=
  subroutine sf_int_get_values (sf_int, value)
    class(sf_int_t), intent(in) :: sf_int
    real(default), dimension(:), intent(out) :: value
    integer :: i
    if (sf_int%status >= SF_EVALUATED) then
      do i = 1, size (value)
        value(i) = real (sf_int%get_matrix_element (i))
      end do
    else
      value = 0
    end if
  end subroutine sf_int_get_values

```

### 15.5.5 Direct calculations

Compute a structure function value (array) directly, given an array of  $x$  values and a scale. If the energy is also given, we initialize the kinematics for that energy, otherwise take it from a previous run.

We assume that the E array has dimension `n_in`, and the x array has `n_par`.

```

<SF base: sf_int: TBP>+=
  procedure :: compute_values => sf_int_compute_values

```

```

<SF base: procedures>+=
subroutine sf_int_compute_values (sf_int, value, x, xb, scale, E)
  class(sf_int_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: value
  real(default), dimension(:), intent(in) :: x
  real(default), dimension(:), intent(in) :: xb
  real(default), intent(in) :: scale
  real(default), dimension(:), intent(in), optional :: E
  real(default), dimension(size (x)) :: xx
  real(default) :: f
  if (present (E)) call sf_int%seed_kinematics (E)
  if (sf_int%status >= SF_SEED_KINEMATICS) then
    call sf_int%complete_kinematics (xx, f, x, xb, map=.false.)
    call sf_int%apply (scale)
    call sf_int%get_values (value)
    value = value * f
  else
    value = 0
  end if
end subroutine sf_int_compute_values

```

Compute just a single value for one of the states, i.e., throw the others away.

```

<SF base: sf_int: TBP>+=
procedure :: compute_value => sf_int_compute_value

<SF base: procedures>+=
subroutine sf_int_compute_value &
  (sf_int, i_state, value, x, xb, scale, E)
  class(sf_int_t), intent(inout) :: sf_int
  integer, intent(in) :: i_state
  real(default), intent(out) :: value
  real(default), dimension(:), intent(in) :: x
  real(default), dimension(:), intent(in) :: xb
  real(default), intent(in) :: scale
  real(default), dimension(:), intent(in), optional :: E
  real(default), dimension(:), allocatable :: value_array
  if (sf_int%status >= SF_INITIAL) then
    allocate (value_array (sf_int%get_n_states ()))
    call sf_int%compute_values (value_array, x, xb, scale, E)
    value = value_array(i_state)
  else
    value = 0
  end if
end subroutine sf_int_compute_value

```

### 15.5.6 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

```

<SF base: types>+≡
  type :: sf_instance_t
    class(sf_int_t), allocatable :: int
    type(evaluator_t) :: eval
    real(default), dimension(:,:), allocatable :: r
    real(default), dimension(:,:), allocatable :: rb
    real(default), dimension(:), allocatable :: f
    logical, dimension(:), allocatable :: m
    real(default), dimension(:), allocatable :: x
  end type sf_instance_t

```

### 15.5.7 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and `n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

### 15.5.8 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the random-number generator. The `r` array results from applying global mappings. The `x` array results from applying structure-function local mappings. The `x` values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The `f` factor is the Jacobian that results from applying all mappings.

The `mapping` entry may store a global mapping that is applied to a combination of `x` values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the `p` array to the `r` array. For parameters affected by this

mapping, we should ensure that they are not involved in a local mapping.

```

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the `p` etc. arrays.

The brute-force assignment of the `sf` component would be straightforward, but at least gfortran 4.6.3 would like a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained `interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time calling the proper defined assignment. Furthermore, we allocate the parameter arrays for each structure function.

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the `channel` object are allocatable und thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

```

      chain%status = SF_DONE_CONNECTIONS
    end if
  contains
  (SF base: init evaluators: find outgoing particles)
  end subroutine sf_chain_instance_init_evaluators

```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

*(SF base: init evaluators: find outgoing particles)≡*

```
subroutine find_outgoing_particles ()
  type(interaction_t), pointer :: int, int_next
  integer :: i, j, out_sf, out_i

      out_i = interaction_find_link (int_next, int, out_i)
      int => int_next
    end do
    chain%out_eval_i(j) = out_i
  end do
end subroutine find_outgoing_particles
```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, the use up the MC input parameter array `p` to compute the radiated and outgoing momenta.

In the multi-channel case, `c_sel` is the channel which we use for computing the kinematics and the `x` values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the `r` array, and the Jacobian `f`.

We first apply any global mapping to transform the input `p` into the array `r`. This is then given to the structure functions which compute the final array `x` and Jacobian factors `f`, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the  $x$  parameters and reconstruct the momenta and the MC input parameters  $p$ . We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all  $x$  parameters, and then inverts mappings. See below `recover_kinematics`.

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the

preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the  $x$  and  $p$  parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

### 15.5.11 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

#### Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

```
<SF base: public test auxiliary>≡
  public :: sf_test_data_t

<SF base: test types>≡
  type, extends (sf_data_t) :: sf_test_data_t
    class(model_data_t), pointer :: model => null ()
    integer :: mode = 0
    type(flavor_t) :: flv_in
    type(flavor_t) :: flv_out
    type(flavor_t) :: flv_rad
    real(default) :: m = 0
    logical :: collinear = .true.
    real(default), dimension(:), allocatable :: qbounds
  contains
    <SF base: sf test data: TBP>
  end type sf_test_data_t
```

Output.

```
<SF base: sf test data: TBP>≡
  procedure :: write => sf_test_data_write

<SF base: test auxiliary>≡
  subroutine sf_test_data_write (data, unit, verbose)
    class(sf_test_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "SF test data:"
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
    write (u, "(3x,A)", advance="no") "incoming  = "
    call data%flv_in%write (u); write (u, *)
    write (u, "(3x,A)", advance="no") "outgoing  = "
    call data%flv_out%write (u); write (u, *)
    write (u, "(3x,A)", advance="no") "radiated  = "
    call data%flv_rad%write (u); write (u, *)
    write (u, "(3x,A," // FMT_19 // ")") "mass      = ", data%m
    write (u, "(3x,A,L1)") "collinear = ", data%collinear
    if (.not. data%collinear .and. allocated (data%qbounds)) then
      write (u, "(3x,A," // FMT_19 // ")") "qmin      = ", data%qbounds(1)
      write (u, "(3x,A," // FMT_19 // ")") "qmax      = ", data%qbounds(2)
    end if
  end subroutine sf_test_data_write
```

Initialization.

```

<SF base: sf test data: TBP>+=
  procedure :: init => sf_test_data_init

    type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
    pdg_out(1) = 25
  end subroutine sf_test_data_get_pdg_out

```

Allocate the matching interaction.

```
<SF base: sf test data: TBP>+≡
  procedure :: allocate_sf_int => sf_test_data_allocate_sf_int

<SF base: test auxiliary>+≡
  subroutine sf_test_data_allocate_sf_int (data, sf_int)
    class(sf_test_data_t), intent(in) :: data
    class(sf_int_t), intent(inout), allocatable :: sf_int
    allocate (sf_test_t :: sf_int)
  end subroutine sf_test_data_allocate_sf_int
```

## Interaction

```
<SF base: test types>+≡
  type, extends (sf_int_t) :: sf_test_t
    type(sf_test_data_t), pointer :: data => null ()
    real(default) :: x = 0
  contains
    <SF base: sf test int: TBP>
  end type sf_test_t
```

Type string: constant

```
<SF base: sf test int: TBP>≡
  procedure :: type_string => sf_test_type_string

<SF base: test auxiliary>+≡
  function sf_test_type_string (object) result (string)
    class(sf_test_t), intent(in) :: object
    type(string_t) :: string
    string = "Test"
  end function sf_test_type_string
```

Output. Call the interaction routine after displaying the configuration.

```
<SF base: sf test int: TBP>+≡
  procedure :: write => sf_test_write

<SF base: test auxiliary>+≡
  subroutine sf_test_write (object, unit, testflag)
    class(sf_test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    integer :: u
    u = given_output_unit (unit)
    if (associated (object%data)) then
      call object%data%write (u)
      call object%base_write (u, testflag)
    else
      write (u, "(1x,A)") "SF test data: [undefined]"
    end if
  end subroutine sf_test_write
```

Initialize. We know that `data` will be of concrete type `sf_test_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass, but keep the radiated mass zero.

Optionally, we can provide minimum and maximum values for the momentum transfer.

```

<SF base: sf test int: TBP>+=
  procedure :: init => sf_test_init

<SF base: test auxiliary>+=
  subroutine sf_test_init (sf_int, data)
    class(sf_test_t), intent(out) :: sf_int
    class(sf_data_t), intent(in), target :: data
    type(quantum_numbers_mask_t), dimension(3) :: mask
    type(helicity_t) :: hel0
    type(color_t) :: col0
    type(quantum_numbers_t), dimension(3) :: qn
    mask = quantum_numbers_mask (.false., .false., .false.)
    select type (data)
    type is (sf_test_data_t)
      if (allocated (data%qbounds)) then
        call sf_int%base_init (mask, &
          [data%m**2], [0._default], [data%m**2], &
          [data%qbounds(1)], [data%qbounds(2)])
      else
        call sf_int%base_init (mask, &
          [data%m**2], [0._default], [data%m**2])
      end if
      sf_int%data => data
      call hel0%init (0)
      call col0%init ()
      call qn(1)%init (data%flv_in, col0, hel0)
      call qn(2)%init (data%flv_rad, col0, hel0)
      call qn(3)%init (data%flv_out, col0, hel0)
      call sf_int%add_state (qn)
      call sf_int%freeze ()
      call sf_int%set_incoming ([1])
      call sf_int%set_radiated ([2])
      call sf_int%set_outgoing ([3])
    end select
    sf_int%status = SF_INITIAL
  end subroutine sf_test_init

```

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

<SF base: sf test int: TBP>+=
  procedure :: complete_kinematics => sf_test_complete_kinematics

<SF base: test auxiliary>+=
  subroutine sf_test_complete_kinematics (sf_int, x, f, r, rb, map)
    class(sf_test_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x

```

```

real(default), intent(out) :: f
real(default), dimension(:), intent(in) :: r
real(default), dimension(:), intent(in) :: rb
logical, intent(in) :: map
real(default) :: xb1
if (map) then
  x(1) = r(1)**2
  f = 2 * r(1)
else
  x(1) = r(1)
  f = 1
end if
xb1 = 1 - x(1)
if (size (x) == 3) x(2:3) = r(2:3)
call sf_int%split_momentum (x, xb1)
sf_int%x = x(1)
select case (sf_int%status)
case (SF_FAILED_KINEMATICS); f = 0
end select
end subroutine sf_test_complete_kinematics

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

*(SF base: sf test int: TBP)+≡*

    end subroutine sf_test_apply

```

### 15.5.12 Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two radiated and two outgoing particles.

#### Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```

<SF base: test types>+≡
    type, extends (sf_data_t) :: sf_test_spectrum_data_t
        class(model_data_t), pointer :: model => null ()
        type(flavor_t) :: flv_in
        type(flavor_t) :: flv_out
        type(flavor_t) :: flv_rad
        logical :: with_radiation = .true.
        real(default) :: m = 0
    contains
        <SF base: sf test spectrum data: TBP>
    end type sf_test_spectrum_data_t

```

Output.

```

<SF base: sf test spectrum data: TBP>≡
    procedure :: write => sf_test_spectrum_data_write

```

```

<SF base: test auxiliary>+=
subroutine sf_test_spectrum_data_write (data, unit, verbose)
  class(sf_test_spectrum_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "SF test spectrum data:"
  write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming  = "
  call data%flv_in%write (u); write (u, *)
  write (u, "(3x,A)", advance="no") "outgoing  = "
  call data%flv_out%write (u); write (u, *)

end subroutine sf_test_spectrum_init

```

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  (as above) for both  $x$  parameters and consequently  $f(r) = 4r_1r_2$ .

*(SF base: sf test spectrum: TBP)+≡*

```

    procedure :: complete_kinematics => sf_test_spectrum_complete_kinematics

```

*(SF base: test auxiliary)+≡*

```

    subroutine sf_test_spectrum_complete_kinematics (sf_int, x, f, r, rb, map)

### Structure function instance configuration

We create a structure-function chain instance which implements a configured structure-function chain. We link the momentum entries in the interactions and compute kinematics.

We do not actually connect the interactions and create evaluators. We skip this step and manually advance the status of the chain instead.

```

<SF base: execute tests>+≡
call test (sf_base_9, "sf_base_9", &
  "structure function chain instance", &

## Structure function chain evaluation

Here, we test the complete workflow for a structure-function chain with generator. First, we create the template chain, then initialize an instance. We set up links, mask, and evaluators. Finally, we set kinematics and evaluate the matrix elements and their products.

```

<SF base: execute tests>+≡

### 15.6.1 Physics

The ISR structure function is in the most crude approximation (LLA without  $\alpha$  corrections, i.e.  $\epsilon^0$ )

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (15.27)$$

where  $m$  is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of  $\epsilon$  results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit  $m^2 \ll s$  are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \quad (15.28)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \quad (15.29)$$

so the integration over the propagator  $1/(t-m^2)$  yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \quad (15.30)$$

In  $f_0(x)$ , there is an integrable singularity at  $x = 1$  which does not spoil the integration, but would lead to an unbounded  $f_{\max}$ . Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \quad (15.31)$$

such that

$$\int dx f_0(x) = \int dx' \quad (15.32)$$

The structure function has three parameters:  $\alpha$ ,  $m_{\text{in}}$  of the incoming particle and  $s$ , the hard scale. Internally, we store the exponent  $\epsilon$  which is the relevant

parameter. (In conventional notation,  $\epsilon = \beta/2$ .) As defaults, we take the actual values of  $\alpha$  (which is probably  $\alpha(s)$ ), the actual mass  $m_{\text{in}}$  and the squared total c.m. energy  $s$ .

Including  $\epsilon$ ,  $\epsilon^2$ , and  $\epsilon^3$  corrections, the successive approximation of the ISR structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad (15.33)$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \quad (15.34)$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left( \frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \quad (15.35)$$

$$f_3(x) = g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left( \frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) - \frac{\epsilon^3}{48} \left( (1+x) [6 \text{Li}_2(x) + 12 \ln^2(1-x) - 3\pi^2] + 6(x+5) \ln(1-x) + \frac{1}{1-x} \left[ \frac{3}{2}(1+8x+3x^2) \ln x + 12(1+x^2) \ln x \ln(1-x) - \frac{1}{2}(1+7x^2) \ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \right) \quad (15.36)$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \quad (15.37)$$

are given by

$$g_0(\epsilon) = 1 \quad (15.38)$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \quad (15.39)$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (15.40)$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 + \frac{27-24\pi^2+128\zeta(3)}{384}\epsilon^3, \quad (15.41)$$

where, numerically

$$\zeta(3) = 1.20205690315959428539973816151 \dots \quad (15.42)$$

Although one could calculate the function  $g(\epsilon)$  exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx f_i(x) = 1 \quad \text{for all } i. \quad (15.43)$$

Effectively, the  $O(\epsilon)$  correction reduces the low- $x$  tail of the structure function by 50% while increasing the coefficient of the singularity by  $O(\epsilon)$ . Relative

to this, the  $O(\epsilon^2)$  correction slightly enhances  $x > \frac{1}{2}$  compared to  $x < \frac{1}{2}$ . At  $x = 0$ ,  $f_2(x)$  introduces a logarithmic singularity which should be cut off at  $x_0 = O(e^{-1/\epsilon})$ : for lower  $x$  the perturbative series breaks down. The  $f_3$  correction is slightly positive for low  $x$  values and negative near  $x = 1$ , where the  $\text{Li}_2$  piece slightly softens the singularity at  $x = 1$ .

Instead of the definition for  $\epsilon$  given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left( \ln \frac{s}{m^2} - 1 \right) \quad (15.44)$$

### 15.6.2 Implementation

In the concrete implementation, the zeroth order mapping (15.31) is implemented, and the Jacobian is equal to  $f_i(x)/f_0(x)$ . This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (15.45)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1-x^2}{2(1-x')} \quad (15.46)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 - \frac{1-x^2}{2(1-x')} \\ - \frac{(1+3x^2)\ln x + (1-x)(4(1+x)\ln(1-x) + 5+x)}{8(1-x')}\epsilon \end{aligned} \quad (15.47)$$

For  $x = 1$  (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (15.48)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (15.49)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (15.50)$$

The last line in (15.47) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (15.51)$$

(Mathematica result), independent of  $\epsilon$ . For  $x$  values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

### 15.6.3 The ISR data block

```

### 15.6.4 The ISR object

The `isr_t` data type is a  $1 \rightarrow 2$  interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```

<SF isr: public>+≡
  public :: isr_t
<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
    private
      type(isr_data_t), pointer :: data => null ()

    end subroutine isr_set_order

```

### 15.6.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number  $\mathbf{r}$  to generate the momentum fraction  $\mathbf{x}$  and the function value  $\mathbf{f}$ . For numerical stability reasons, we also output  $\mathbf{xb}$ , which is  $\bar{x} = 1 - x$ .

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian  $\mathbf{f}$  and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian  $\mathbf{f}$  includes the value of the (zeroth-order) structure function, and strongly peaked.

```

⟨SF isr: isr: TBP⟩+≡
    procedure :: complete_kinematics => isr_complete_kinematics

⟨SF isr: procedures⟩+≡
    subroutine isr_complete_kinematics (sf_int, x, f, r, rb, map)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: r
        real(default), dimension(:), intent(in) :: rb
        logical, intent(in) :: map
        real(default) :: eps
        eps = sf_int%data%eps
        if (map) then
            call map_power_1 (sf_int%xb, f, rb(1), eps)
        else
            sf_int%xb = rb(1)
        end if
    end subroutine isr_complete_kinematics

```

```

        if (rb(1) > 0) then
            f = 1
        else
            f = 0
        end if
    end if
    sf_int%x = 1 - sf_int%xb
    x(1) = sf_int%x
    if (size(x) == 3) x(2:3) = r(2:3)
    call sf_int%split_momentum(x, sf_int%xb)
    select case (sf_int%status)
    case (SF_FAILED_KINEMATICS)
        sf_int%x = 0
        sf_int%xb = 0
        f = 0
    end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the  $x$  array from the momentum configuration. In the specific case of ISR, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

Note: the extraction of  $\bar{x}$  is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF isr: isr: TBP>+≡
    procedure :: recover_x => sf_isr_recover_x

<SF isr: procedures>+≡
    subroutine sf_isr_recover_x (sf_int, x, x_free)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(inout), optional :: x_free
        call sf_int%base_recover_x(x, x_free)
        sf_int%x = x(1)
        sf_int%xb = 1 - x(1)
    end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

For extracting  $x$ , we rely on the stored  $\bar{x}$  value, since the  $x$  value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

### 15.6.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

### 15.7.1 Physics

The EPA structure function for a photon inside an (elementary) particle  $p$  with energy  $E$ , mass  $m$  and charge  $q_p$  (e.g., electron) is given by ( $\bar{x} \equiv 1 - x$ )

$$\begin{aligned}
 f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} \left[ \left( \bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right. \\
 \left. - \left( 1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left( 1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (15.52)
 \end{aligned}$$

If no explicit  $Q$  bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (15.53)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (15.54)$$

The second and third terms in (15.52) are negative definite (and subleading). Noting that  $\bar{x} + x^2/2$  is bounded between  $1/2$  and  $1$ , we derive that  $f(x)$  is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (15.55)$$

where we allow for explicit  $Q$  bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (15.56)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4 [x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (15.57)$$

such that  $x(0) = x_0$  and  $x(1) = x_1$  and

$$\frac{dx}{dx'} = \left( \frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (15.58)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (15.59)$$

such that (15.56) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (15.60)$$

where  $x'$  is calculated from  $x$  via (15.57).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x (L - \log x) - \log x_0 (L - \log x_0)}{\log x_1 (L - \log x_1) - \log x_0 (L - \log x_0)}. \quad (15.61)$$

### 15.7.2 The EPA data block

The EPA parameters are:  $\alpha$ ,  $E_{\max}$ ,  $m$ ,  $Q_{\min}$ , and  $x_{\min}$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition  $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1} (L - \ln x_{0/1})$ , the c.m. energy squared and the incoming particle mass.

### 15.7.3 The EPA object

The `epa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

```

### 15.7.4 Kinematics

Set kinematics. If *map* is unset, the *r* and *x* values coincide, and the Jacobian  $f(r)$  is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The *x* value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number *r* to generate the momentum fraction *x* and the function value *f*. For numerical stability reasons, we also output *xb*, which is  $\bar{x} = 1 - x$ .

*(SF epa: epa: TBP)+≡*

```

procedure :: complete_kinematics => epa_complete_kinematics

```

*(SF epa: procedures)+≡*

```

subroutine epa_complete_kinematics (sf_int, x, f, r, rb, map)

                r (1) = (c - data%c0) / data%dc
                rb(1) = (data%c1 - c) / data%dc
                f = x(1) * data%dc / sqrt_delta
            end associate
        else
            r (1) = x(1)
            rb(1) = 1 - x(1)
            if (sf_int%data%x_min < x(1) .and. x(1) < sf_int%data%x_max) then
                f = 1
            else
                f = 0
            end if
        end if
    end subroutine

```

```

        end if
    end if
    if (size(r) == 3) then
        r (2:3) = x(2:3)
        rb(2:3) = 1 - x(2:3)
    end if
    if (set_mom) then
        call sf_int%split_momentum (x, sf_int%xb)
        select case (sf_int%status)
        case (SF_DONE_KINEMATICS)
            sf_int%x = x(1)
            sf_int%xb = 1 - x(1)
            sf_int%E = energy (sf_int%get_momentum (1))
        case (SF_FAILED_KINEMATICS)
            sf_int%x = 0
            f = 0
        end select
    end if
end subroutine epa_inverse_kinematics

```

Overriding the default method: we compute the  $x$  array from the momentum configuration. In the specific case of EPA, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

Note: the extraction of  $\bar{x}$  is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF epa: epa: TBP>+=
    procedure :: recover_x => sf_epa_recover_x

<SF epa: procedures>+=
    subroutine sf_epa_recover_x (sf_int, x, x_free)
        class(epa_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(inout), optional :: x_free
        call sf_int%base_recover_x (x, x_free)
        sf_int%x = x(1)
        sf_int%xb = 1 - x(1)
    end subroutine sf_epa_recover_x

```

### 15.7.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for  $x$ , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

```

<SF epa: epa: TBP>+=
    procedure :: apply => epa_apply

```

```

<SF epa: procedures>+≡
subroutine epa_apply (sf_int, scale)
  class(epa_t), intent(inout) :: sf_int
  real(default), intent(in) :: scale
  real(default) :: x, xb, qminsq, qmaxsq, f, E
  associate (data => sf_int%data)
    x = sf_int%x
    xb= sf_int%xb
    E = sf_int%E
    qminsq = max (x ** 2 / xb * data%mass ** 2, data%q_min ** 2)
    qmaxsq = min (4 * xb * E ** 2, data%q_max ** 2)
    if (qminsq < qmaxsq) then
      f = data%a / x &
        * ((xb + x ** 2 / 2) * log (qmaxsq / qminsq) &
          - (1 - x / 2) ** 2 &
          * log ((x**2 + qmaxsq / E ** 2) / (x**2 + qminsq / E ** 2)) &
          - x ** 2 * data%mass ** 2 / qminsq * (1 - qminsq / qmaxsq))
    else
      f = 0
    end if
    call sf_int%set_matrix_element &
      (cmplx (f, kind=default) * sf_int%charge2)
  end associate

```

### 15.8.1 Physics

The EWA structure function for a  $Z$  or  $W$  inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal ( $\pm$ ) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (15.62)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (15.63)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (15.64)$$

where  $p_{\perp,\max}$  is the cutoff in transversal momentum,  $M$  is the vector-boson mass,  $v$  and  $a$  are the vector and axial-vector couplings, and  $\bar{x} \equiv 1-x$ . Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (15.65)$$

The vector and axial couplings for a fermion branching into a  $W$  are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (15.66)$$

For  $Z$  emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (15.67)$$

where  $t_3 = \pm\frac{1}{2}$  is the fermion isospin, and  $q$  its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of  $v$  and  $a$  is irrelevant.

The EWA depends on the parameters  $g$ ,  $\sin^2\theta_w$ ,  $M_W$ , and  $M_Z$ . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a  $1/x$  singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial  $x$  bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (15.68)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (15.69)$$

As a user parameter, we have the cutoff  $p_{\perp,\max}$ . The divergence  $1/x$  also requires a  $x_0$  cutoff; and for completeness we introduce a corresponding  $x_1$ . Physically, the minimal sensible value of  $x$  is  $M^2/s$ , although the approximation loses its value already at higher  $x$  values.

## 15.8.2 The EWA data block

The EWA parameters are:  $p_{T,\max}$ ,  $c_V$ ,  $c_A$ , and  $m$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a  $W$  or a  $Z$  is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors  $g/2 = e/2/\sin\theta_W$ .

In principle, for EWA it would make sense to allow the user to also set the upper bound for  $x$ ,  $x_{\max}$ , but we fix it to one here.

### 15.8.3 The EWA object

The `ewa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision:  $W/Z$  bosons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated,  $W/Z$ ), where the  $W/Z$  initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the  $W/Z$  polarization. If we are having  $Z$  bosons, both up- and down-type fermions can participate. Otherwise, with a  $W^+$  an up-type fermion is transferred to a down-type fermion, and the other way round.

```

<SF ewa: types>+≡

#### 15.8.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, the exponential mapping for the  $1/x$  singularity discussed above is applied.

```

### 15.8.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for  $x$ , one for  $Q^2$ , and two for the polar and azimuthal angles. Alternatively, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

```

## 15.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum  $f(x)$ , applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (15.70)$$

We want to compute the distribution of  $E = \sqrt{\hat{s}} = \sqrt{xs}$ , i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (15.71)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (15.72)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (15.73)$$

We implement this as a spectrum with a single parameter  $x$ . The parameters for the individual beams are computed as  $x_i = \sqrt{x}$ , so they are equal and the kinematics is always symmetric.

### 15.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and  $\sqrt{s}$  if it should be normalized to the total energy. In the latter case, the differential distribution  $d\sigma/d\sqrt{\hat{s}}$  coincides with the partonic cross section  $\hat{\sigma}$  as a function of  $\sqrt{\hat{s}}$ .

## 15.10 Gaussian beam spread

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `gaussian_t` objects act as proxies to this registry.

```
<sf_gaussian.f90>≡  
  <File header>  
  
  module sf_gaussian  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use format_defs, only: FMT_12  
    use file_registries  
    use diagnostics  
    use lorentz  
    use rng_base  
    use pdg_arrays  
    use model_data  
    use flavors  
    use quantum_numbers  
    use state_matrices  
    use polarizations  
    use sf_base  
  
    <Standard module head>  
  
    <SF gaussian: public>  
  
    <SF gaussian: types>  
  
    contains  
  
    <SF gaussian: procedures>  
  
  end module sf_gaussian
```

### 15.10.1 The beam-data file registry

We manage data files via the `file_registries` module. To this end, we keep the registry as a private module variable here.

```
<CCC SF gaussian: variables>≡
```

```
type(file_registry_t), save :: beam_file_registry
```

## 15.10.2 Data type

We store the spread for each beam, as a relative number related to the beam energy. For the actual generation, we include an (abstract) random-number generator factory.

```
<SF gaussian: public>≡
  public :: gaussian_data_t

<SF gaussian: types>≡
  type, extends(sf_data_t) :: gaussian_data_t
  private
    type(flavor_t), dimension(2) :: flv_in
    real(default), dimension(2) :: spread
    class(rng_factory_t), allocatable :: rng_factory
  contains
    <SF gaussian: gaussian data: TBP>
  end type gaussian_data_t

<SF gaussian: gaussian data: TBP>≡
  procedure :: init => gaussian_data_init

<SF gaussian: procedures>≡
  subroutine gaussian_data_init (data, model, pdg_in, spread, rng_factory)
    class(gaussian_data_t), intent(out) :: data
    class(model_data_t), intent(in), target :: model
    type(pdg_array_t), dimension(2), intent(in) :: pdg_in
    real(default), dimension(2), intent(in) :: spread
    class(rng_factory_t), intent(inout), allocatable :: rng_factory
    if (any (spread < 0)) then
      call msg_fatal ("Gaussian beam spread: must not be negative")
    end if
    call data%flv_in(1)%init (pdg_array_get (pdg_in(1), 1), model)
    call data%flv_in(2)%init (pdg_array_get (pdg_in(2), 1), model)
    data%spread = spread
    call move_alloc (from = rng_factory, to = data%rng_factory)
  end subroutine gaussian_data_init
```

Return true since this spectrum is always in generator mode.

```
<SF gaussian: gaussian data: TBP>+≡
  procedure :: is_generator => gaussian_data_is_generator

<SF gaussian: procedures>+≡
  function gaussian_data_is_generator (data) result (flag)
    class(gaussian_data_t), intent(in) :: data
    logical :: flag
    flag = .true.
  end function gaussian_data_is_generator
```

The number of parameters is two. They are free parameters.

```
<SF gaussian: gaussian data: TBP>+≡
  procedure :: get_n_par => gaussian_data_get_n_par
```

```

<SF gaussian: procedures>+≡
function gaussian_data_get_n_par (data) result (n)
  class(gaussian_data_t), intent(in) :: data
  integer :: n
  n = 2
end function gaussian_data_get_n_par

<SF gaussian: gaussian data: TBP>+≡
procedure :: get_pdg_out => gaussian_data_get_pdg_out

<SF gaussian: procedures>+≡
subroutine gaussian_data_get_pdg_out (data, pdg_out)

## 15.11 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `beam_events_t` objects act as proxies to this registry.

```
(sf_beam_events.f90)≡
  <File header>

  module sf_beam_events

    <Use kinds>
    <Use strings>
    use io_units
    use file_registries
    use diagnostics
    use lorentz
    use pdg_arrays
    use model_data
    use flavors
    use quantum_numbers
    use state_matrices
    use polarizations
    use sf_base

    <Standard module head>

    <SF beam events: public>

    <SF beam events: types>

    <SF beam events: variables>

    contains

    <SF beam events: procedures>

  end module sf_beam_events
```

### 15.11.1 The beam-data file registry

We manage data files via the `file_registries` module. To this end, we keep the registry as a private module variable here.

This is public only for the unit tests.

```

<SF beam events: public>≡
    public :: beam_file_registry

<SF beam events: variables>≡
    type(file_registry_t), save :: beam_file_registry

```

### 15.12.1 Physics

Beamstrahlung is applied before ISR. The **CIRCE1** implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the **CIRCE1** parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1-x)^\gamma \quad (15.74)$$

for  $x < 1 - \epsilon$  (resp.  $x > \epsilon$  in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at  $x = 1$  (resp.  $x = 0$ ). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the **kirke** version of the **CIRCE1** subroutines, and is used here.

The parameter `circe1\eps` sets the peak mapping of the CIRCE1 structure function. Its default value is  $10^{-5}$ . The other parameters are the parameterization version and revision number, the accelerator type, and the  $\sqrt{s}$  value used by CIRCE1. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1\epsilon` which is taken from the CIRCE1 internal data structure.

The  $\sqrt{s}$  value, if not explicitly set, is taken from the process data. Note that interpolating  $\sqrt{s}$  is not recommended; one should rather choose one of the distinct values known to CIRCE1.

### 15.12.2 The CIRCE1 data block

The CIRCE1 parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter  $\epsilon$ ,  $\sqrt{s}$  and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the  $x$  values are actually discarded and a random number generator is used instead.

```

### 15.12.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe1: types>+≡
  type, extends (circe1_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe1: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

### 15.12.4 The CIRCE1 object

This is a  $2 \rightarrow 4$  interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

In the case that no radiated particle is kept (which actually is the default), polarization is always transferred to the electrons, too. If there is a recoil photon in the event, the radiated particles are 3 and 4, respectively, and 5 and 6 are the outgoing ones (triggering the hard scattering process), while in the case of no radiation, the outgoing particles are 3 and 4, respectively. In the case of the electron being the radiated particle, helicity is not kept.

```

### 15.12.5 Kinematics

Refer to the data component.

```

<SF circe1: circe1: TBP>+≡
  procedure :: is_generator => circe1_is_generator

<SF circe1: procedures>+≡
  function circe1_is_generator (sf_int) result (flag)
    class(circe1_t), intent(in) :: sf_int
    logical :: flag
    flag = sf_int%data%is_generator ()
  end function

```

```
end function circe1_is_generator
```

Generate free parameters, if generator mode is on. Otherwise, the parameters will be discarded.

```
<SF circe1: circe1: TBP>+≡
  procedure :: generate_free => circe1_generate_free

<SF circe1: procedures>+≡
  subroutine circe1_generate_free (sf_int, r, rb, x_free)
    class(circe1_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: r, rb
    real(default), intent(inout) :: x_free

    if (sf_int%data%generate) then
      call circe_generate (r, sf_int%data%get_pdg_int (), sf_int%rng_obj)
      rb = 1 - r
      x_free = x_free * product (r)
    else
      r = 0
      rb = 1
    end if
  end subroutine circe1_generate_free
```

Generator mode: depending on the particle codes, call one of the available girce generators. Illegal particle code combinations should have been caught during data initialization.

```
<SF circe1: procedures>+≡
  subroutine circe_generate (x, pdg, rng_obj)
    real(default), dimension(2), intent(out) :: x
    integer, dimension(2), intent(in) :: pdg
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double) :: xc1, xc2
    select case (abs (pdg(1)))
    case (ELECTRON)
      select case (abs (pdg(2)))
      case (ELECTRON)
        call gircee (xc1, xc2, rng_obj = rng_obj)
      case (PHOTON)
        call girceg (xc1, xc2, rng_obj = rng_obj)
      end select
    case (PHOTON)
      select case (abs (pdg(2)))
      case (ELECTRON)
        call girceg (xc2, xc1, rng_obj = rng_obj)
      case (PHOTON)
        call gircgg (xc1, xc2, rng_obj = rng_obj)
      end select
    end select
    x = [xc1, xc2]
  end subroutine circe_generate
```

Set kinematics. The  $r$  values (either from integration or from the generator call above) are copied to  $x$  unchanged, and  $f$  is unity. We store the  $x$  values, so we can use them for the evaluation later.

```

<SF circe1: circe1: TBP>+≡
  procedure :: complete_kinematics => circe1_complete_kinematics

<SF circe1: procedures>+≡
  subroutine circe1_complete_kinematics (sf_int, x, f, r, rb, map)
    class(circe1_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default), dimension(2) :: xb1
    x = r
    sf_int%x = x
    f = 1
    if (sf_int%data%with_radiation) then
      xb1 = 1 - x

    logical :: set_mom
    set_mom = .false.; if (present (set_momenta)) set_mom = set_momenta
    r = x
    rb = 1 - x
    sf_int%x = x
    f = 1
    if (set_mom) then
      xb1 = 1 - x
      call sf_int%split_momenta (x, xb1)
      select case (sf_int%status)

```

```

        case (SF_FAILED_KINEMATICS); f = 0
      end select
    end if
  end subroutine circe1_inverse_kinematics

```

### 15.12.6 CIRCE1 application

CIRCE is applied for the two beams at once. We can safely assume that no structure functions are applied before this, so the incoming particles are on-shell electrons/positrons.

The scale is ignored.

```

<SF circe1: circe1: TBP>+≡
  procedure :: apply => circe1_apply
<SF circe1: procedures>+≡
  subroutine circe1_apply (sf_int, scale)
    class(circe1_t), intent(inout) :: sf_int
    real(default), intent(in) :: scale
    real(default), dimension(2) :: xb
    real(double), dimension(2) :: xc
    real(double), parameter :: one = 1
    associate (data => sf_int%data)
      xc = sf_int%x
      xb = 1 - sf_int%x
      if (data%generate) then
        sf_int%f = 1
      else
        sf_int%f = 0
        if (all (sf_int%continuum)) then
          sf_int%f = circe (xc(1), xc(2), data%pdg_in(1), data%pdg_in(2))
        end if
        if (sf_int%continuum(2) .and. sf_int%peak(1)) then
          sf_int%f = sf_int%f &
            + circe (one, xc(2), data%pdg_in(1), data%pdg_in(2)) &
            * peak (xb(1), data%eps)
        end if
        if (sf_int%continuum(1) .and. sf_int%peak(2)) then
          sf_int%f = sf_int%f &
            + circe (xc(1), one, data%pdg_in(1), data%pdg_in(2)) &
            * peak (xb(2), data%eps)
        end if
        if (all (sf_int%peak)) then
          sf_int%f = sf_int%f &
            + circe (one, one, data%pdg_in(1), data%pdg_in(2)) &
            * peak (xb(1), data%eps) * peak (xb(2), data%eps)
        end if
      end if
    end associate
    call sf_int%set_matrix_element (cmplx (sf_int%f, kind=default))
    sf_int%status = SF_EVALUATED
  end subroutine circe1_apply

```

This is a smeared delta peak at zero, as an endpoint singularity. We choose an exponentially decreasing function, starting at zero, with integral (from 0 to 1)  $1 - e^{-1/\epsilon}$ . For small  $\epsilon$ , this reduces to one.

```

<SF circe1: procedures>+≡
  function peak (x, eps) result (f)
    real(default), intent(in) :: x, eps
    real(default) :: f
    f = exp (-x / eps) / eps
  end function peak

```

### 15.12.7 Unit tests

### 15.13.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

### 15.13.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

```

```

### 15.13.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe2: types>+≡
  type, extends (circe2_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe2: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

### 15.13.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a  $2 \rightarrow 2$  interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

#### 15.15.4 The PDF object

The PDF  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

### 15.15.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

*(SF pdf builtin: pdf builtin: TBP)* +≡

```
procedure :: complete_kinematics => pdf_builtin_complete_kinematics
```

*(SF pdf builtin: procedures)* +≡

```

subroutine pdf_builtin_complete_kinematics (sf_int, x, f, r, rb, map)
  class(pdf_builtin_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), intent(out) :: f

```

```

real(default), dimension(:), intent(in) :: r
real(default), dimension(:), intent(in) :: rb
logical, intent(in) :: map
real(default) :: xb1
if (map) then
  call msg_fatal ("PDF builtin: map flag not supported")
else
  x(1) = r(1)
  f = 1
end if
xb1 = 1 - x(1)
call sf_int%split_momentum (x, xb1)
select case (sf_int%status)
case (SF_DONE_KINEMATICS)
  sf_int%x = x(1)
case (SF_FAILED_KINEMATICS)
  sf_int%x = 0
  f = 0
end select
end subroutine pdf_builtin_complete_kinematics

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

*<SF pdf builtin: pdf builtin: TBP>+≡*

```

```

### 15.15.7 Strong Coupling

Since the PDF codes provide a function for computing the running  $\alpha_s$  value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

```

⟨SF pdf builtin: public⟩+≡
    public :: alpha_qcd_pdf_builtin_t

⟨SF pdf builtin: types⟩+≡
    type, extends (alpha_qcd_t) :: alpha_qcd_pdf_builtin_t
        type(string_t) :: pdfset_name
        integer :: pdfset_id = -1
    contains
        ⟨SF pdf builtin: alpha qcd: TBP⟩
    end type alpha_qcd_pdf_builtin_t

```

Output.

```

⟨SF pdf builtin: alpha qcd: TBP⟩≡
    procedure :: write => alpha_qcd_pdf_builtin_write

⟨SF pdf builtin: procedures⟩+≡
    subroutine alpha_qcd_pdf_builtin_write (object, unit)
        class(alpha_qcd_pdf_builtin_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A)") "QCD parameters (pdf_builtin):"
        write (u, "(5x,A,A)") "PDF set = ", char (object%pdfset_name)
        write (u, "(5x,A,I0)") "PDF ID = ", object%pdfset_id
    end subroutine alpha_qcd_pdf_builtin_write

```

Calculation: the numeric ID selects the correct PDF set, which must be properly initialized.

```

⟨SF pdf builtin: alpha qcd: TBP⟩+≡
    procedure :: get => alpha_qcd_pdf_builtin_get

⟨SF pdf builtin: procedures⟩+≡
    function alpha_qcd_pdf_builtin_get (alpha_qcd, scale) result (alpha)
        class(alpha_qcd_pdf_builtin_t), intent(in) :: alpha_qcd
        real(default), intent(in) :: scale
        real(default) :: alpha
        alpha = pdf_alphas (alpha_qcd%pdfset_id, scale)
    end function alpha_qcd_pdf_builtin_get

```

```
end function alpha_qcd_pdf_builtin_get
```

Initialization. We need to access the global initialization status.

```

```

### 15.16.2 Codes for default PDF sets

The default PDF for protons set is chosen to be CTEQ6ll (LO fit with LO  $\alpha_s$ ).

```
<SF lhpdf: parameters>≡
  character(*), parameter :: LHAPDF5_DEFAULT_PROTON = "cteq6ll.LHpdf"
  character(*), parameter :: LHAPDF5_DEFAULT_PION   = "ABFKWPI.LHgrid"
  character(*), parameter :: LHAPDF5_DEFAULT_PHOTON = "GSG960.LHgrid"
  character(*), parameter :: LHAPDF6_DEFAULT_PROTON = "CT10"
```

### 15.16.3 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

```
<SF lhpdf: interfaces>≡
  interface
    subroutine InitPDFsetM (set, file)
      integer, intent(in) :: set
      character(*), intent(in) :: file
    end subroutine InitPDFsetM
  end interface

<SF lhpdf: interfaces>+≡
  interface
    subroutine InitPDFM (set, mem)
      integer, intent(in) :: set, mem
    end subroutine InitPDFM
  end interface

<SF lhpdf: interfaces>+≡
  interface
    subroutine numberPDFM (set, n_members)
      integer, intent(in) :: set
      integer, intent(out) :: n_members
    end subroutine numberPDFM
  end interface

<SF lhpdf: interfaces>+≡
  interface
    subroutine evolvePDFM (set, x, q, ff)
      integer, intent(in) :: set
      double precision, intent(in) :: x, q
      double precision, dimension(-6:6), intent(out) :: ff
    end subroutine evolvePDFM
  end interface

<SF lhpdf: interfaces>+≡
  interface
    subroutine evolvePDFphotonM (set, x, q, ff, fphot)
      integer, intent(in) :: set
      double precision, intent(in) :: x, q
      double precision, dimension(-6:6), intent(out) :: ff
      double precision, intent(out) :: fphot
    end subroutine evolvePDFphotonM
```

```

end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine evolvePDFpM (set, x, q, s, scheme, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q, s
    integer, intent(in) :: scheme
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFpM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXminM (set, mem, xmin)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmin
  end subroutine GetXminM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXmaxM (set, mem, xmax)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmax
  end subroutine GetXmaxM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2minM (set, mem, q2min)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: q2min
  end subroutine GetQ2minM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2maxM (set, mem, q2max)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: q2max
  end subroutine GetQ2maxM
end interface

<SF lhpdf: interfaces>+≡
interface
  function has_photon () result(flag)
    logical :: flag
  end function has_photon
end interface

```

### 15.16.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global object. We implement it as a private module variable. To access it from elsewhere, the caller has to create and initialize an object of type `lhpdf_status_t`, which acts as a proxy.

```

<SF lhpdf: types>≡
  type :: lhpdf_global_status_t
    private
      logical, dimension(3) :: initialized = .false.
    end type lhpdf_global_status_t

<SF lhpdf: variables>≡
  type(lhpdf_global_status_t), save :: lhpdf_global_status

<SF lhpdf: procedures>≡
  function lhpdf_global_status_is_initialized (set) result (flag)
    logical :: flag
    integer, intent(in), optional :: set
    if (present (set)) then
      select case (set)
        case (1:3);   flag = lhpdf_global_status%initialized(set)
        case default; flag = .false.
      end select
    else
      flag = any (lhpdf_global_status%initialized)
    end if
  end function lhpdf_global_status_is_initialized

<SF lhpdf: procedures>+≡
  subroutine lhpdf_global_status_set_initialized (set)
    integer, intent(in) :: set
    lhpdf_global_status%initialized(set) = .true.
  end subroutine lhpdf_global_status_set_initialized

```

This is the only public procedure, it tells the system to forget about previous initialization, allowing for changing the chosen PDF set. Note that such a feature works only if the global program flow is serial, so no two distinct sets are accessed simultaneously. But this applies to LHAPDF anyway.

```

<SF lhpdf: public>≡
  public :: lhpdf_global_reset

<SF lhpdf: procedures>+≡
  subroutine lhpdf_global_reset ()
    lhpdf_global_status%initialized = .false.
  end subroutine lhpdf_global_reset

```

### 15.16.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an  $\alpha_s$  formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf.builtin` is that these things are outsourced to a separate module (inc. `lhpdf.status` etc.).

```

<SF lhpdf: public>+≡
  public :: lhpdf_initialize

<SF lhpdf: procedures>+≡
  subroutine lhpdf_initialize (set, prefix, file, member, pdf, b_match)
    integer, intent(in) :: set
    type(string_t), intent(inout) :: prefix
    type(string_t), intent(inout) :: file
    type(lhpdf_pdf_t), intent(inout), optional :: pdf

### 15.16.6 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

<SF lhpdf: lhpdf: TBP>≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

<SF lhpdf: procedures>+≡
  subroutine lhpdf_complete_kinematics (sf_int, x, f, r, rb, map)
    class(lhpdf_t), intent(inout) :: sf_int

    f = 0
  end select
end if
end subroutine lhpdf_inverse_kinematics

```

### 15.16.7 The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

```

<SF lhpdf: public>+≡
  public :: lhpdf_data_t

### 15.16.8 The LHAPDF object

The `lhpdf_t` data type is a  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the  $x$  momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

<SF lhpdf: public>+≡
    public :: lhpdf_t

### 15.16.10 Strong Coupling

Since the PDF codes provide a function for computing the running  $\alpha_s$  value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

```

<SF lhpdf: public>+≡
    public :: alpha_qcd_lhpdf_t

<SF lhpdf: types>+≡
    type, extends (alpha_qcd_t) :: alpha_qcd_lhpdf_t
        type(string_t) :: pdfset_dir
        type(string_t) :: pdfset_file
        integer :: pdfset_member = -1
        type(lhpdf_pdf_t) :: pdf
    contains
        <SF lhpdf: alpha qcd: TBP>
    end type alpha_qcd_lhpdf_t

```

Output. As in earlier versions we leave the LHAPDF path out.

```

<SF lhpdf: alpha qcd: TBP>≡
    procedure :: write => alpha_qcd_lhpdf_write

<SF lhpdf: procedures>+≡
    subroutine alpha_qcd_lhpdf_write (object, unit)
        class(alpha_qcd_lhpdf_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A)") "QCD parameters (lhpdf):"
        write (u, "(5x,A,A)") "PDF set      = ", char (object%pdfset_file)
        write (u, "(5x,A,I0)") "PDF member = ", object%pdfset_member
    end subroutine alpha_qcd_lhpdf_write

```

Calculation: the numeric member ID selects the correct PDF set, which must be properly initialized.

```

<SF lhpdf: interfaces>+≡
    interface
        double precision function alphasPDF (Q)
            double precision, intent(in) :: Q
        end function alphasPDF
    end interface

```

```

<SF lhpdf: alpha qcd: TBP>+≡
    procedure :: get => alpha_qcd_lhpdf_get

```

```

## 15.17 Easy PDF Access

For the shower, subtraction and matching, it is very useful to have direct access to  $f(x, Q)$  independently of the used library.

$\langle \text{pdf.f90} \rangle \equiv$

$\langle \text{File header} \rangle$

```
module pdf
```

$\langle \text{Use kinds with double} \rangle$

```

  use io_units
  use system_dependencies, only: LHAPDF5_AVAILABLE, LHAPDF6_AVAILABLE
  use diagnostics
  use beam_structures
  use lhpdf !NODEP!
  use pdf_builtin !NODEP!

```

*<Standard module head>*

*<PDF: public>*

*<PDF: parameters>*

*<PDF: types>*

**contains**

*<PDF: procedures>*

**end module pdf**

We support the following implementations:

*<PDF: parameters>*≡

```
integer, parameter, public :: STRF_NONE = 0
integer, parameter, public :: STRF_LHAPDF6 = 1
integer, parameter, public :: STRF_LHAPDF5 = 2
integer, parameter, public :: STRF_PDF_BUILTIN = 3
```

A container to bundle all necessary PDF data. Could be moved to a more central location.

*<PDF: public>*≡

```
public :: pdf_data_t
```

*<PDF: types>*≡

```
type :: pdf_data_t

## Chapter 16

# Interface for Matrix Element Objects

These modules manage internal and, in particular, external matrix-element code.

**prc\_core** We define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes. This abstract type supplements the `prc_core_def_t` type and related types in another module. Together, they provide a complete set of matrix-element handlers that are implemented in the concrete types below.

These are the implementations:

**prc\_template\_me** Implements matrix-element code without actual content (trivial value), but full-fledged interface. This can be used for injecting user-defined matrix-element code.

**prc\_omega** Matrix elements calculated by `O'MEGA` are the default for WHIZARD. Here, we provide all necessary support.

**prc\_gosam**

**prc\_openloops**

**prc\_user\_defined\_test**

**prc\_threshold**

### 16.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the `O'MEGA` matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

**prc\_core\_def\_t** process and matrix-element configuration

**prc\_writer\_t** (optional) writing external matrix-element code

**prc\_driver\_t** accessing the matrix element (internal or external)

**prc\_core\_t** evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the **processes** module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the **processes** module.

```
(prc_core.f90)≡
  <File header>
  module prc_core

    <Use kinds>
    <Use strings>
    use io_units
    use diagnostics
    use lorentz
    use interactions

    use process_constants
    use prc_core_def
    use process_libraries
    use sf_base

    <Standard module head>

    <Prc core: public>

    <Prc core: types>

    <Prc core: interfaces>

    contains

    <Prc core: procedures>

  end module prc_core
```

### 16.1.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

```
<Prc core: public>≡
  public :: prc_core_t
```

```

<Prc core: types>≡
  type, abstract :: prc_core_t
    class(prc_core_def_t), pointer :: def => null ()
    logical :: data_known = .false.
    type(process_constants_t) :: data
    class(prc_core_driver_t), allocatable :: driver
    logical :: use_color_factors = .false.
    integer :: nc = 3
  contains
    <Prc core: process core: TBP>
  end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine prc_core_write
  end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: procedures>≡
  subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

```

```

<Prc core: procedures>+≡
  function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object
    logical :: flag
    flag = object%data%n_flg /= 0
  end function prc_core_has_matrix_element

```

Return true if a MC dataset should be attached to this process component.  
False if it shares the dataset with another component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_flag), deferred :: needs_mcset

```

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_flag (object) result (flag)
      import
      class(prc_core_t), intent(in) :: object
      logical :: flag
    end function prc_core_get_flag
  end interface

```

Return an integer number

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_integer (object) result (i)
      import
      class(prc_core_t), intent(in) :: object
      integer :: i
    end function prc_core_get_integer
  end interface

```

Return the number of distinct terms requested by this process component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_integer), deferred :: get_n_terms

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_is_allowed), deferred :: is_allowed

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
    end function prc_core_is_allowed
  end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: procedures>+≡
  subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that  $\alpha_s$  is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the process-specific workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: procedures>+≡
  function prc_core_get_alpha_s (object, core_state) result (alpha)
    class(prc_core_t), intent(in) :: object
    class(prc_core_state_t), intent(in), allocatable :: core_state
    real(default) :: alpha
    alpha = -1
  end function prc_core_get_alpha_s

```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: allocate_workspace => prc_core_ignore_workspace

<Prc core: procedures>+≡
  subroutine prc_core_ignore_workspace (object, core_state)
    class(prc_core_t), intent(in) :: object
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_ignore_workspace

```

Initialize the structure-function instance that corresponds to a process component. In ordinary cases, this amounts to a straightforward copy of the given template, but the process core may also choose to modify the setup, and it may access its own workspace.

The `sf_chain_instance` is the object that we want to prepare. The `sf_chain` argument is a template for its structure. For the initialization, we also need the number of channels `n_channel`.

Note: crash with nagfor 5.3.1 if `sf_chain_instance` is declared `intent(out)`, as would be more appropriate.

```

<Prc core: process core: TBP>+≡
  procedure :: init_sf_chain => prc_core_init_sf_chain

<Prc core: procedures>+≡
  subroutine prc_core_init_sf_chain &
    (object, sf_chain_instance, sf_chain, n_channel, core_state)
    class(prc_core_t), intent(in) :: object
    type(sf_chain_instance_t), intent(inout), target :: sf_chain_instance
    type(sf_chain_t), intent(in), target :: sf_chain
    integer, intent(in) :: n_channel
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    call sf_chain_instance%init (sf_chain, n_channel)
  end subroutine prc_core_init_sf_chain

```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The `i_term` index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_hard_kinematics), deferred :: &
    compute_hard_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_hard_kinematics &
      (object, p_seed, i_term, int_hard, core_state)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_compute_hard_kinematics
  end interface

```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_eff_kinematics), deferred :: &
    compute_eff_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_eff_kinematics &
      (object, i_term, int_hard, int_eff, core_state)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_compute_eff_kinematics

```

```
end interface
```

Recover the missing pieces. We know the incoming momenta of the `p_seed` array and the outgoing momenta of the `int_eff` interaction. We have to recover the outgoing momenta of `p_seed` and the incoming momenta of `int_eff`.

(The trivial case is that these are identical.)

Furthermore, if `int_hard` and `int_eff` are not aliased, we have to set the momenta there. In the trivial case, `int_eff` is a pointer to `int_hard`, so `int_hard` should not be touched at all.

```
<Prc core: process core: TBP>+≡
  procedure(prc_core_recover_kinematics), deferred :: &
    recover_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_recover_kinematics &
      (object, p_seed, int_hard, int_eff, core_state)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_recover_kinematics
end interface
```

The process core must implement this function. Here, `j` is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `core_state` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```
<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_compute_amplitude &
      (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, &
       core_state) result (amp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    real(default), intent(in), allocatable :: alpha_qcd_forced
    class(prc_core_state_t), intent(inout), allocatable, optional :: &
      core_state
    complex(default) :: amp
  end function prc_core_compute_amplitude
end interface
```

### 16.1.2 Storage for intermediate results

The abstract `prc_core_state_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```
<Prc core: public>+≡
    public :: prc_core_state_t

<Prc core: types>+≡
    type, abstract :: prc_core_state_t
    contains
        procedure(workspace_write), deferred :: write
        procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
    end type prc_core_state_t
```

For debugging, we should at least have an output routine.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_write (object, unit)
            import
                class(prc_core_state_t), intent(in) :: object
                integer, intent(in), optional :: unit
            end subroutine workspace_write
        end interface
```

This is used during the NLO calculation, see there for more information.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_reset_new_kinematics (object)
            import
                class(prc_core_state_t), intent(inout) :: object
            end subroutine workspace_reset_new_kinematics
        end interface
```

### 16.1.3 Helicity selection data

This is intended for use with O'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is  $10^{10}$ ) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

```
<Prc core: public>+≡
    public :: helicity_selection_t
```

```

<Prc core: types>+=
  type :: helicity_selection_t
    logical :: active = .false.
    real(default) :: threshold = 0
    integer :: cutoff = 0
    contains
    <Prc core: helicity selection: TBP>
  end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>=
  procedure :: write => helicity_selection_write

<Prc core: procedures>+=
  subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%active) then
      write (u, "(3x,A)") "Helicity selection data:"
      write (u, "(5x,A,ES17.10)") &
        "threshold =", object%threshold
      write (u, "(5x,A,I0)") &
        "cutoff    =", object%cutoff
    end if
  end subroutine helicity_selection_write

```

## 16.2 Template matrix elements

Here, we provide template matrix elements that are in structure very similar to O'MEGA matrix elements, but do not need its infrastructure. Per default, the matrix elements are flat, i.e. they have the constant value one. Analogous to the O'MEGA implementation, this section implements the interface to the templates (via the makefile) and the driver.

```

<prc_template_me.f90>=
  <File header>

  module prc_template_me

    use, intrinsic :: iso_c_binding !NODEP!

    use kinds
    <Use strings>
    use io_units
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use lorentz
    use flavors
    use interactions

```

```

    use model_data

    use particle_specifiers, only: new_prt_spec
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use process_libraries
    use prc_core

    <Standard module head>

    <Template matrix elements: public>

    <Template matrix elements: types>

    <Template matrix elements: interfaces>

    contains

    <Template matrix elements: procedures>

    end module prc_template_me

```

### 16.2.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

<Template matrix elements: public>≡
    public :: template_me_def_t

<Template matrix elements: types>≡
    type, extends (prc_core_def_t) :: template_me_def_t
    contains
    <Template matrix elements: template ME def: TBP>
    end type template_me_def_t

<Template matrix elements: template ME def: TBP>≡
    procedure, nopass :: type_string => template_me_def_type_string

<Template matrix elements: procedures>≡
    function template_me_def_type_string () result (string)
        type(string_t) :: string
        string = "template"
    end function template_me_def_type_string

```

Initialization: allocate the writer for the template matrix element. Also set any data for this process that the writer needs.

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: init => template_me_def_init

<Template matrix elements: procedures>+≡
    subroutine template_me_def_init &
        (object, model, prt_in, prt_out, unity)
        class(template_me_def_t), intent(out) :: object

```

```

class(model_data_t), intent(in), target :: model
type(string_t), dimension(:), intent(in) :: prt_in
type(string_t), dimension(:), intent(in) :: prt_out
logical, intent(in) :: unity
allocate (template_me_writer_t :: object%writer)
select type (writer => object%writer)
type is (template_me_writer_t)
    call writer%init (model, prt_in, prt_out, unity)
end select
end subroutine template_me_def_init

```

Write/read process- and method-specific data.

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: write => template_me_def_write

```

```

<Template matrix elements: procedures>+≡
    subroutine template_me_def_write (object, unit)
        class(template_me_def_t), intent(in) :: object
        integer, intent(in) :: unit
        select type (writer => object%writer)
        type is (template_me_writer_t)
            call writer%write (unit)
        end select
    end subroutine template_me_def_write

```

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: read => template_me_def_read

```

```

<Template matrix elements: procedures>+≡
    subroutine template_me_def_read (object, unit)
        class(template_me_def_t), intent(out) :: object
        integer, intent(in) :: unit
        call msg_bug &
            ("WHIZARD template process definition: input not supported (yet)")
    end subroutine template_me_def_read

```

Allocate the driver for template matrix elements.

```

<Template matrix elements: template ME def: TBP>+≡
    procedure :: allocate_driver => template_me_def_allocate_driver

```

```

<Template matrix elements: procedures>+≡
    subroutine template_me_def_allocate_driver (object, driver, basename)
        class(template_me_def_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (template_me_driver_t :: driver)
    end subroutine template_me_def_allocate_driver

```

We need code:

```

<Template matrix elements: template ME def: TBP>+≡
    procedure, nopass :: needs_code => template_me_def_needs_code

```

```

<Template matrix elements: procedures>+≡
function template_me_def_needs_code () result (flag)
    logical :: flag
    flag = .true.
end function template_me_def_needs_code

```

These are the features that a template matrix element provides.

```

<Template matrix elements: template ME def: TBP>+≡
procedure, nopass :: get_features => template_me_def_get_features

<Template matrix elements: procedures>+≡
subroutine template_me_def_get_features (features)
    type(string_t), dimension(:), allocatable, intent(out) :: features
    allocate (features (5))
    features = [ &
        var_str ("init"), &
        var_str ("update_alpha_s"), &
        var_str ("is_allowed"), &
        var_str ("new_event"), &
        var_str ("get_amplitude")]
end subroutine template_me_def_get_features

```

The interface of the specific features.

```

<Template matrix elements: interfaces>≡
abstract interface
    subroutine init_t (par) bind(C)
        import
        real(c_default_float), dimension(*), intent(in) :: par
    end subroutine init_t
end interface

abstract interface
    subroutine update_alpha_s_t (alpha_s) bind(C)
        import
        real(c_default_float), intent(in) :: alpha_s
    end subroutine update_alpha_s_t
end interface

abstract interface
    subroutine is_allowed_t (flv, hel, col, flag) bind(C)
        import
        integer(c_int), intent(in) :: flv, hel, col
        logical(c_bool), intent(out) :: flag
    end subroutine is_allowed_t
end interface

abstract interface
    subroutine new_event_t (p) bind(C)
        import
        real(c_default_float), dimension(0:3,*), intent(in) :: p
    end subroutine new_event_t
end interface

```

```

abstract interface
  subroutine get_amplitude_t (flv, hel, col, amp) bind(C)
    import
    integer(c_int), intent(in) :: flv, hel, col
    complex(c_default_complex), intent(out):: amp
  end subroutine get_amplitude_t
end interface

```

Connect the template matrix element features with the process driver.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: connect => template_me_def_connect

<Template matrix elements: procedures>+≡
  subroutine template_me_def_connect (def, lib_driver, i, proc_driver)
    class(template_me_def_t), intent(in) :: def
    class(prclib_driver_t), intent(in) :: lib_driver
    integer, intent(in) :: i
    class(prc_core_driver_t), intent(inout) :: proc_driver
    integer(c_int) :: pid, fid
    type(c_funptr) :: fptr
    select type (proc_driver)
    type is (template_me_driver_t)
      pid = i
      fid = 1
      call lib_driver%get_fptr (pid, fid, fptr)
      call c_f_procpointer (fptr, proc_driver%init)
      fid = 2
      call lib_driver%get_fptr (pid, fid, fptr)
      call c_f_procpointer (fptr, proc_driver%update_alpha_s)
      fid = 3
      call lib_driver%get_fptr (pid, fid, fptr)
      call c_f_procpointer (fptr, proc_driver%is_allowed)
      fid = 4
      call lib_driver%get_fptr (pid, fid, fptr)
      call c_f_procpointer (fptr, proc_driver%new_event)
      fid = 5
      call lib_driver%get_fptr (pid, fid, fptr)
      call c_f_procpointer (fptr, proc_driver%get_amplitude)
    end select
  end subroutine template_me_def_connect

```

### 16.2.2 The Template Matrix element writer

Unlike O'MEGA, the template matrix element is directly written by the main WHIZARD program, so there will be no entry in the makefile for calling an external program. The template matrix element writer is responsible for writing interfaces and wrappers.

```

<Template matrix elements: types>+≡
  type, extends (prc_writer_f_module_t) :: template_me_writer_t
    class(model_data_t), pointer :: model => null ()
    type(string_t) :: model_name
    logical :: unity

```

```

    type(string_t), dimension(:), allocatable :: prt_in
    type(string_t), dimension(:), allocatable :: prt_out
    integer :: n_in
    integer :: n_out
    integer :: n_tot
contains
    <Template matrix elements: template ME writer: TBP>
end type template_me_writer_t

```

The reported type is the same as for the `template_me_def_t` type.

```

<Template matrix elements: template ME writer: TBP>≡
    procedure, nopass :: type_name => template_me_writer_type_name
<Template matrix elements: procedures>+≡
    function template_me_writer_type_name () result (string)
        type(string_t) :: string
        string = "template"
    end function template_me_writer_type_name

```

Taking into account the prefix for template ME module names.

```

<Template matrix elements: template ME writer: TBP>+≡
    procedure, nopass :: get_module_name => template_me_writer_get_module_name
<Template matrix elements: procedures>+≡
    function template_me_writer_get_module_name (id) result (name)
        type(string_t) :: name
        type(string_t), intent(in) :: id
        name = "tpr_" // id
    end function template_me_writer_get_module_name

```

Output. This is called by `template_me_def.write`.

```

<Template matrix elements: template ME writer: TBP>+≡
    procedure :: write => template_me_writer_write
<Template matrix elements: procedures>+≡
    subroutine template_me_writer_write (object, unit)
        class(template_me_writer_t), intent(in) :: object
        integer, intent(in) :: unit
        integer :: i, j
        write (unit, "(5x,A,I0)") "# incoming part. = ", object%n_in
        write (unit, "(7x,A)", advance="no") &
            "    Initial state: "
        do i = 1, object%n_in - 1
            write (unit, "(1x,A)", advance="no") char (object%prt_in(i))
        end do
        write (unit, "(1x,A)") char (object%prt_in(object%n_in))
        write (unit, "(5x,A,I0)") "# outgoing part. = ", object%n_out
        write (unit, "(7x,A)", advance="no") &
            "    Final state:  "
        do j = 1, object%n_out - 1
            write (unit, "(1x,A)", advance="no") char (object%prt_out(i))
        end do
        write (unit, "(1x,A)") char (object%prt_out(object%n_out))
        write (unit, "(5x,A,I0)") "# part. (total) = ", object%n_tot
    end subroutine template_me_writer_write

```

```
end subroutine template_me_writer_write
```

Initialize with process data.

```
<Template matrix elements: template ME writer: TBP>+=
  procedure :: init => template_me_writer_init

<Template matrix elements: procedures>+=
  subroutine template_me_writer_init (writer, model, &
    prt_in, prt_out, unity)
    class(template_me_writer_t), intent(out) :: writer
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: unity
    writer%model => model
    writer%model_name = model%get_name ()
    writer%n_in = size (prt_in)
    writer%n_out = size (prt_out)
    writer%n_tot = size (prt_in) + size (prt_out)
    allocate (writer%prt_in (size (prt_in)), source = prt_in)
    allocate (writer%prt_out (size (prt_out)), source = prt_out)
    writer%unity = unity
  end subroutine template_me_writer_init
```

The makefile is the driver file for the test matrix elements.

```
<Template matrix elements: template ME writer: TBP>+=
  procedure :: write_makefile_code => template_me_write_makefile_code

<Template matrix elements: procedures>+=
  subroutine template_me_write_makefile_code (writer, unit, id, os_data, testflag)
    class(template_me_writer_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    type(os_data_t), intent(in) :: os_data
    logical, intent(in), optional :: testflag
    write (unit, "(5A)") "SOURCES += ", char (id), ".f90"
    write (unit, "(5A)") "OBJECTS += ", char (id), ".lo"
    write (unit, "(5A)") "clean-", char (id), ":"

    string = "template"
  end function template_me_driver_type_name

```

#### 16.2.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an template matrix element.

NOTE: For calling the `import_component` method, we must explicitly address the `process_def_t` parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments `prt_in` and `prt_out` become corrupted and cause a segfault.

```

<Template matrix elements: public>+≡
  public :: template_me_make_process_component

<Template matrix elements: procedures>+≡
  subroutine template_me_make_process_component (entry, component_index, &
    model, model_name, prt_in, prt_out, unity)

  end subroutine template_me_make_process_component

```

## 16.2.5 The prc\_template\_me\_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`template_me_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`template_me_driver_t`).

```

<Template matrix elements: public>+≡
    public :: prc_template_me_t

<Template matrix elements: types>+≡
    type, extends (prc_core_t) :: prc_template_me_t
        real(default), dimension(:), allocatable :: par
    contains
        <Template matrix elements: prc template ME: TBP>
    end type prc_template_me_t

```

The workspace associated to a `prc_template_me_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Template matrix elements: types>+≡
    type, extends (prc_core_state_t) :: template_me_state_t
        logical :: new_kinematics = .true.
        real(default) :: alpha_qcd = -1
    contains
        procedure :: write => template_me_state_write
        procedure :: reset_new_kinematics => template_me_state_reset_new_kinematics
    end type template_me_state_t

<Template matrix elements: procedures>+≡
    subroutine template_me_state_write (object, unit)
        class(template_me_state_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A,L1)") "Template ME state: new kinematics = ", &
            object%new_kinematics
    end subroutine template_me_state_write

<Template matrix elements: procedures>+≡
    subroutine template_me_state_reset_new_kinematics (object)
        class(template_me_state_t), intent(inout) :: object
    end subroutine template_me_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Template matrix elements: prc template ME: TBP>≡
    procedure :: allocate_workspace => prc_template_me_allocate_workspace

```

```

<Template matrix elements: procedures>+≡
subroutine prc_template_me_allocate_workspace (object, core_state)
  class(prc_template_me_t), intent(in) :: object
  class(prc_core_state_t), intent(inout), allocatable :: core_state
  allocate (template_me_state_t :: core_state)
end subroutine prc_template_me_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters.

```

<Template matrix elements: prc template ME: TBP>+≡
procedure :: write => prc_template_me_write

<Template matrix elements: procedures>+≡
subroutine prc_template_me_write (object, unit)
  class(prc_template_me_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit)
  write (u, "(3x,A)", advance="no") "Template process core:"
  if (object%data_known) then
    write (u, "(1x,A)") char (object%data%id)
  else
    write (u, "(1x,A)") "[undefined]"
  end if
  if (allocated (object%par)) then
    write (u, "(3x,A)") "Parameter array:"
    do i = 1, size (object%par)
      write (u, "(5x,I0,1x,ES17.10)") i, object%par(i)
    end do
  end if
end subroutine prc_template_me_write

```

Temporarily store the parameter array inside the `prc_template_me` object, so we can use it later during the actual initialization.

```

<Template matrix elements: prc template ME: TBP>+≡
procedure :: set_parameters => prc_template_me_set_parameters

<Template matrix elements: procedures>+≡
subroutine prc_template_me_set_parameters (prc_template_me, model)
  class(prc_template_me_t), intent(inout) :: prc_template_me
  class(model_data_t), intent(in), target, optional :: model
  if (present (model)) then
    if (.not. allocated (prc_template_me%par)) &
      allocate (prc_template_me%par (model%get_n_real ()))
    call model%real_parameters_to_c_array (prc_template_me%par)
  end if
end subroutine prc_template_me_set_parameters

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

```

<Template matrix elements: prc template ME: TBP>+≡
  procedure :: init => prc_template_me_init

<Template matrix elements: procedures>+≡
  subroutine prc_template_me_init (object, def, lib, id, i_component)

  end subroutine prc_template_me_recover_kinematics

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index `j` is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

```

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

### 16.3 O'MEGA Interface

The standard method for process computation with WHIZARD is the O'MEGA matrix element generator.

This section implements the interface to the code generator (via the makefile) and the driver for the features provided by the O'MEGA matrix element.

There are actually two different methods steered by this interface, the traditional one which delivers compiled Fortran code, while the O'MEGA virtual machine (OVM) produces bytecode with look-up tables.

```

<prc_omega.f90>≡
  <File header>

  module prc_omega

    use, intrinsic :: iso_c_binding !NODEP!

    use kinds
    <Use strings>
    use io_units
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use lorentz
    use sm_qcd
    use interactions
    use model_data

    use particle_specifiers, only: new_prt_spec
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use process_libraries
    use prc_core

    <Standard module head>

    <Omega interface: public>

    <Omega interface: types>

```

*⟨Omega interface: interfaces⟩*

contains

*⟨Omega interface: procedures⟩*

end module prc\_omega

### 16.3.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

*⟨Omega interface: public⟩*≡

public :: omega\_def\_t

*⟨Omega interface: types⟩*≡

type, abstract, extends (prc\_core\_def\_t) :: omega\_def\_t

contains

*⟨Omega interface: omega def: TBP⟩*

end type omega\_def\_t

*⟨Omega interface: public⟩*+≡

public :: omega\_omega\_def\_t

*⟨Omega interface: types⟩*+≡

type, extends (omega\_def\_t) :: omega\_omega\_def\_t

contains

*⟨Omega interface: omega omega def: TBP⟩*

end type omega\_omega\_def\_t

*⟨Omega interface: public⟩*+≡

public :: omega\_ovm\_def\_t

*⟨Omega interface: types⟩*+≡

type, extends (omega\_def\_t) :: omega\_ovm\_def\_t

contains

*⟨Omega interface: omega ovm def: TBP⟩*

end type omega\_ovm\_def\_t

*⟨Omega interface: omega omega def: TBP⟩*≡

procedure, nopass :: type\_string => omega\_omega\_def\_type\_string

*⟨Omega interface: procedures⟩*≡

function omega\_omega\_def\_type\_string () result (string)

type(string\_t) :: string

string = "omega"

end function omega\_omega\_def\_type\_string

*⟨Omega interface: omega ovm def: TBP⟩*≡

procedure, nopass :: type\_string => omega\_ovm\_def\_type\_string

```

<Omega interface: procedures>+≡
function omega_ovm_def_type_string () result (string)
  type(string_t) :: string
  string = "ovm"
end function omega_ovm_def_type_string

```

Initialization: allocate the writer for the O'MEGA matrix element. Also set any data for this process that the writer needs.

```

<Omega interface: omega def: TBP>≡
procedure :: init => omega_def_init

<Omega interface: procedures>+≡
subroutine omega_def_init (object, model_name, prt_in, prt_out, &
  restrictions, openmp_support, report_progress, extra_options, &
  diags, diags_color)
  class(omega_def_t), intent(out) :: object

### 16.3.3 Driver

```

<Omega interface: public>+≡
    public :: omega_driver_t

<Omega interface: types>+≡
    type, extends (prc_core_driver_t) :: omega_driver_t
        procedure(init_t), nopass, pointer :: &
            init => null ()
        procedure(update_alpha_s_t), nopass, pointer :: &
            update_alpha_s => null ()
        procedure(reset_helicity_selection_t), nopass, pointer :: &
            reset_helicity_selection => null ()
        procedure(is_allowed_t), nopass, pointer :: &
            is_allowed => null ()
        procedure(new_event_t), nopass, pointer :: &
            new_event => null ()
        procedure(get_amplitude_t), nopass, pointer :: &
            get_amplitude => null ()
    contains
        <Omega interface: omega driver: TBP>
    end type omega_driver_t

```

The reported type is the same as for the `omega_def_t` type.

```

<Omega interface: omega driver: TBP>≡
    procedure, nopass :: type_name => omega_driver_type_name

<Omega interface: procedures>+≡
    function omega_driver_type_name () result (string)
        type(string_t) :: string
        string = "omega"
    end function omega_driver_type_name

```

### 16.3.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an O'MEGA matrix element.

NOTE: For calling the `import_component` method, we must explicitly address the `process_def_t` parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments `prt_in` and `prt_out` become corrupted and cause a segfault.

```

<Omega interface: public>+≡
    public :: omega_make_process_component

<Omega interface: procedures>+≡
    subroutine omega_make_process_component (entry, component_index, &
        model_name, prt_in, prt_out, restrictions, openmp_support, &
        report_progress, extra_options, diags, diags_color)
        class(process_def_entry_t), intent(inout) :: entry
        integer, intent(in) :: component_index

### 16.3.5 The prc\_omega\_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`omega_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`omega_driver_t`).

```

<Omega interface: public>+≡
    public :: prc_omega_t

<Omega interface: types>+≡
    type, extends (prc_core_t) :: prc_omega_t
        real(default), dimension(:), allocatable :: par
        type(helicity_selection_t) :: helicity_selection
        type(qcd_t) :: qcd
    contains
        <Omega interface: prc_omega: TBP>
    end type prc_omega_t

```

The workspace associated to a `prc_omega_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Omega interface: types>+≡
    type, extends (prc_core_state_t) :: omega_state_t
        logical :: new_kinematics = .true.
        real(default) :: alpha_qcd = -1
    contains
        procedure :: write => omega_state_write

```

```

    procedure :: reset_new_kinematics => omega_state_reset_new_kinematics
end type omega_state_t

```

```

<Omega interface: procedures>+≡
subroutine omega_state_write (object, unit)
  class(omega_state_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(3x,A,L1)") "0'Mega state: new kinematics = ", &
    object%new_kinematics
end subroutine omega_state_write

```

```

<Omega interface: procedures>+≡
subroutine omega_state_reset_new_kinematics (object)
  class(omega_state_t), intent(inout) :: object
  object%new_kinematics = .true.
end subroutine omega_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Omega interface: prc omega: TBP>≡
  procedure :: allocate_workspace => prc_omega_allocate_workspace

<Omega interface: procedures>+≡
subroutine prc_omega_allocate_workspace (object, core_state)
  class(prc_omega_t), intent(in) :: object
  class(prc_core_state_t), intent(inout), allocatable :: core_state
  allocate (omega_state_t :: core_state)
end subroutine prc_omega_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters and the helicity selection data. (The latter are printed only if active.)

```

<Omega interface: prc omega: TBP>+≡
  procedure :: write => prc_omega_write

<Omega interface: procedures>+≡
subroutine prc_omega_write (object, unit)
  class(prc_omega_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit)
  write (u, "(3x,A)", advance="no") "0'Mega process core:"
  if (object%data_known) then
    write (u, "(1x,A)") char (object%data%id)
  else
    write (u, "(1x,A)") "[undefined]"
  end if
  if (allocated (object%par)) then

```

```

        write (u, "(3x,A)") "Parameter array:"
        do i = 1, size (object%par)
            write (u, "(5x,I0,1x,ES17.10)") i, object%par(i)
        end do
    end if
    call object%helicity_selection%write (u)
    call object%qcd%write (u)
end subroutine prc_omega_write

```

Temporarily store the parameter array inside the `prc_omega` object, so we can use it later during the actual initialization. Also store threshold and cutoff for helicity selection.

```

<Omega interface: prc omega: TBP>+≡
    procedure :: set_parameters => prc_omega_set_parameters

<Omega interface: procedures>+≡
    subroutine prc_omega_set_parameters (prc_omega, model, &

        end if
        if (present (use_color_factors)) then
            prc_omega%use_color_factors = use_color_factors
        end if
    end subroutine prc_omega_set_parameters

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

If requested, we initialize the helicity selection counter.

```

<Omega interface: prc omega: TBP>+≡
    procedure :: init => prc_omega_init

<Omega interface: procedures>+≡
    subroutine prc_omega_init (object, def, lib, id, i_component)
        class(prc_omega_t), intent(inout) :: object
        class(prc_core_def_t), intent(in), target :: def

```

```

        end if
      end if
    end select
  end subroutine prc_omega_reset_helicity_selection

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index `j` is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the

`new_kinematics` flag.

The core objects computes the appropriate  $\alpha_s$  value via the `qcd` subobject, taking into account the provided `fac_scale` value. However, if the extra parameter `alpha_qcd_forced` is allocated, it overrides this setting.

The `is_allowed` query is not redundant, since the status may change during the run if helicities are switched off.

```

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

### Check prc\_omega\_t wrapper and options

The process is  $e^-e^+ \rightarrow e^-e^+$  for vanishing masses and  $e = 0.3$ . We build the library using the high-level procedure `omega_make_process_component` and the “black box” `prc_omega_t` object. Two variants with different settings for restrictions and OpenMP.

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

```

### QCD coupling

The process is  $u\bar{u} \rightarrow d\bar{d}$  for vanishing masses. We compute the amplitude for a fixed configuration once, then reset  $\alpha_s$ , then compute again.

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

## 16.4 User-defined matrix elements squared

For certain applications, only the squared matrix elements instead of the pure amplitude can be obtained, e.g. for BLHA One-Loop providers or for the QCD-resummed top-threshold calculation. This is enabled by the `prc_user_defined_base_t`-type.

```

### 16.4.2 Abstract user defined processes

This process class allows us to factor out common necessities of user defined processes.

#### Workspace

This is the workspace that is available for user defined processes.

```

<Prc User: public>≡
    public :: user_defined_state_t

<Prc User: types>+≡
    type, abstract, extends (prc_core_state_t) :: user_defined_state_t
        logical :: new_kinematics = .true.
        real(default) :: alpha_qcd = -1
    contains
    <Prc User: user defined state: TBP>
    end type user_defined_state_t

<Prc User: user defined state: TBP>≡
    procedure :: reset_new_kinematics => user_defined_state_reset_new_kinematics

<Prc User: procedures>+≡
    subroutine user_defined_state_reset_new_kinematics (object)
        class(user_defined_state_t), intent(inout) :: object
        object%new_kinematics = .true.
    end subroutine user_defined_state_reset_new_kinematics

```

#### Driver

We have to add two O'Mega-routines to the user-defined driver to ensure proper process setup. The problem is that during the setup of the real component, the particle and flavor data are taken from the Born component to set up the subtraction terms. However, the Born component expects this data to be obtained from the Omega code, accessed by the driver.

```

<Prc User: public>+≡
    public :: user_defined_driver_t

<Prc User: types>+≡
    type, abstract, extends (prc_core_driver_t) :: user_defined_driver_t
        procedure(omega_update_alpha_s), nopass, pointer :: &
            update_alpha_s => null ()
        procedure(omega_is_allowed), nopass, pointer :: &
            is_allowed => null ()
    !contains
    !<Prc User: user defined driver: TBP>>
    end type user_defined_driver_t

```

## Core

```
<Prc User: public>+≡
  public :: prc_user_defined_base_t

<Prc User: types>+≡
  type, abstract, extends (prc_core_t) :: prc_user_defined_base_t
    type(qcd_t) :: qcd
    integer :: n_flv = 1
    real(default), dimension(:), allocatable :: par
    type(sf_handler_t) :: sf_handler
  contains
    <Prc User: prc user defined base: TBP>
    end type prc_user_defined_base_t

<Prc User: prc user defined base: TBP>≡
  procedure :: get_flv_state => prc_user_defined_base_get_flv_state

<Prc User: procedures>+≡
  function prc_user_defined_base_get_flv_state (object, i_flv) result (flv)
    integer, dimension(:), allocatable :: flv
    class(prc_user_defined_base_t), intent(in) :: object
    integer, intent(in) :: i_flv
    allocate (flv (size (object%data%flv_state (:,i_flv))))
    flv = object%data%flv_state (:,i_flv)
  end function prc_user_defined_base_get_flv_state

Return one single squared test matrix element. It is fixed to 1, therefore the
integration output will be the phase space volume.

<Prc User: prc user defined base: TBP>+≡
  procedure :: compute_sqme => prc_user_defined_base_compute_sqme

<Prc User: procedures>+≡
  function prc_user_defined_base_compute_sqme (object, i_flv, p) result (sqme)

### 16.4.3 User defined test

#### Writer

```
<Prc User: public>+≡
  public :: user_defined_test_writer_t
<Prc User: types>+≡
  type, extends (prc_user_defined_writer_t) :: user_defined_test_writer_t
  contains
  <Prc User: user test writer: TBP>
  end type user_defined_test_writer_t

<Prc User: user test writer: TBP>≡
  procedure, nopass :: type_name => user_defined_test_writer_type_name
<Prc User: procedures>+≡
  function user_defined_test_writer_type_name () result (string)
    type(string_t) :: string
    string = "User-defined dummy"
  end function user_defined_test_writer_type_name
```

#### Workspace

This looks pretty useless. Why don't we make `user_defined_state_t` nonabstract and remove this?

```
<Prc User: public>+≡
  public :: user_defined_test_state_t
<Prc User: types>+≡
  type, extends (user_defined_state_t) :: user_defined_test_state_t
  contains
  <Prc User: user defined test state: TBP>
  end type user_defined_test_state_t

<Prc User: user defined test state: TBP>≡
  procedure :: write => user_defined_test_state_write
<Prc User: procedures>+≡
  subroutine user_defined_test_state_write (object, unit)
    class(user_defined_test_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine user_defined_test_state_write
```

#### Driver

```
<Prc User: public>+≡
  public :: user_defined_test_driver_t
<Prc User: types>+≡
  type, extends (user_defined_driver_t) :: user_defined_test_driver_t
  contains
  <Prc User: user test driver: TBP>
  end type user_defined_test_driver_t
```

```

<Prc User: user test driver: TBP>≡
  procedure, nopass :: type_name => user_defined_test_driver_type_name

<Prc User: procedures>+≡
  function user_defined_test_driver_type_name () result (type)
    type(string_t) :: type
    type = "User-defined dummy"
  end function user_defined_test_driver_type_name

```

## Configuration

A user defined test definition.

```

## Chapter 17

# Generic Event Handling

Event records allow the MC to communicate with the outside world. The event record should exhibit the observable contents of a physical event. We should be able to read and write events. The actual implementation of the event need not be defined yet, for that purpose.

We have the following basic modules:

**event\_base** Abstract base type for event records. The base type contains a reference to a **particle\_set\_t** object as the event core, and it holds some data that we should always expect, such as the squared matrix element and event weight.

**eio\_data** Transparent container for the metadata of an event sample.

**eio\_base** Abstract base type for event-record input and output. The implementations of this base type represent specific event I/O formats.

These are the implementation modules:

**eio\_checkpoints** Auxiliary output format. The only purpose is to provide screen diagnostics during event output.

**eio\_callback** Auxiliary output format. The only purpose is to execute a callback procedure, so we have a hook for external access during event output.

**eio\_weights** Print some event summary data, no details. The main use if for testing purposes.

**eio\_dump** Dump the contents of WHIZARD's **particle\_set** internal record, using the **write** method of that record as-is. The main use if for testing purposes.

**hep\_common** Implements traditional HEP common blocks that are (still) used by some of the event I/O formats below.

**hepmc\_interface** Access particle objects of the HepMC package. Functional only if this package is linked.

**lcio\_interface** Access objects of the LCIO package. Functional only if this package is linked.

**hep\_events** Interface between the event record and the common blocks.

**eio\_ascii** Collection of event output formats that write ASCII files.

**eio\_lhef** LHEF for input and output.

**eio\_stdhep** Support for the StdHEP format (binary, machine-independent).

**eio\_hepmc** Support for the HepMC format (C++).

**eio\_lcio** Support for the LCIO format (C++).

## 17.1 Generic Event Handling

We introduce events first in form of an abstract type, together with some utilities. Abstract events can be used by other modules, in particular event I/O, without introducing an explicit dependency on the event implementation.

```
<event_base.f90>≡  
<File header>  
  
module event_base  
  
    use system_defs, only: LF  
<Use kinds>  
    use kinds, only: i64  
<Use strings>  
    use io_units  
    use string_utils, only: lower_case  
    use diagnostics  
    use model_data  
    use particles  
  
<Standard module head>  
  
<Event base: public>  
  
<Event base: parameters>  
  
<Event base: types>  
  
<Event base: interfaces>  
  
contains  
  
<Event base: procedures>  
  
end module event_base
```

### 17.1.1 NLO event information

This type stores information about fixed-order NLO events.

```
<Event base: parameters>≡  
    integer, parameter :: N_SUPPORTED_EVENT_FORMATS = 2
```

```

<Event base: types>≡
  type :: nlo_event_info_t
  logical :: nlo_event = .false.
  type(string_t), dimension(N_SUPPORTED_EVENT_FORMATS) :: &
    supported_event_formats
contains
  <Event base: nlo event info: TBP>
end type nlo_event_info_t

```

Somehow, the use of the intrinsic `var_str` cannot be used in the type specification in an array. Therefore, it has to be done separately.

```

<Event base: nlo event info: TBP>≡
  procedure :: init_sample_formats => nlo_event_info_init_sample_formats

<Event base: procedures>≡
  subroutine nlo_event_info_init_sample_formats (nlo_info)
    class(nlo_event_info_t), intent(inout) :: nlo_info
    nlo_info%supported_event_formats(1) = var_str ("hepmc")
    nlo_info%supported_event_formats(2) = var_str ("debug")
  end subroutine nlo_event_info_init_sample_formats

<Event base: nlo event info: TBP>+≡
  procedure :: check_supported_sample_formats &
    => nlo_event_info_check_supported_sample_formats

<Event base: procedures>+≡
  subroutine nlo_event_info_check_supported_sample_formats (nlo_info, format)
    class(nlo_event_info_t), intent(in) :: nlo_info
    type(string_t), intent(in) :: format
    logical :: value
    type(string_t) :: err_message
    integer :: i
    value = any (nlo_info%supported_event_formats == format)
    if (.not. value) then
      err_message = var_str ("NLO event setup: sample_format ") // format // &
        var_str (" is not supported yet. Please choose one of the following: ") // LF
      do i = 1, N_SUPPORTED_EVENT_FORMATS
        err_message = err_message // nlo_info%supported_event_formats (i) // LF
      end do
      call msg_fatal (char (err_message))
    end if
  end subroutine nlo_event_info_check_supported_sample_formats

```

### 17.1.2 generic event type

```

<Event base: public>≡
  public :: generic_event_t

<Event base: types>+≡
  type, abstract :: generic_event_t
  !private
  logical :: particle_set_is_valid = .false.
  type(particle_set_t), pointer :: particle_set => null ()

```

```

    logical :: sqme_ref_known = .false.
    real(default) :: sqme_ref = 0
    logical :: sqme_prc_known = .false.
    real(default) :: sqme_prc = 0
    logical :: weight_ref_known = .false.
    real(default) :: weight_ref = 0
    logical :: weight_prc_known = .false.
    real(default) :: weight_prc = 0
    logical :: excess_prc_known = .false.
    real(default) :: excess_prc = 0
    integer :: n_alt = 0
    logical :: sqme_alt_known = .false.
    real(default), dimension(:), allocatable :: sqme_alt
    logical :: weight_alt_known = .false.
    real(default), dimension(:), allocatable :: weight_alt
    type(nlo_event_info_t) :: nlo_info
contains
  <Event base: generic event: TBP>
end type generic_event_t

```

### 17.1.3 Initialization

This determines the number of alternate weights and sqme values.

```

<Event base: generic event: TBP>≡
  procedure :: base_init => generic_event_init

<Event base: procedures>+≡
  subroutine generic_event_init (event, n_alt)
    class(generic_event_t), intent(out) :: event
    integer, intent(in) :: n_alt
    event%n_alt = n_alt
    allocate (event%sqme_alt (n_alt))
    allocate (event%weight_alt (n_alt))
  end subroutine generic_event_init

```

### 17.1.4 Access particle set

The particle set is the core of the event. We allow access to it via a pointer, and we maintain the information whether the particle set is valid, i.e., has been filled with meaningful data.

```

<Event base: generic event: TBP>+≡
  procedure :: has_valid_particle_set => generic_event_has_valid_particle_set
  procedure :: accept_particle_set => generic_event_accept_particle_set
  procedure :: discard_particle_set => generic_event_discard_particle_set

<Event base: procedures>+≡
  function generic_event_has_valid_particle_set (event) result (flag)
    class(generic_event_t), intent(in) :: event
    logical :: flag
    flag = event%particle_set_is_valid
  end function generic_event_has_valid_particle_set

```

```

subroutine generic_event_accept_particle_set (event)
  class(generic_event_t), intent(inout) :: event
  event%particle_set_is_valid = .true.
end subroutine generic_event_accept_particle_set

subroutine generic_event_discard_particle_set (event)
  class(generic_event_t), intent(inout) :: event
  event%particle_set_is_valid = .false.
end subroutine generic_event_discard_particle_set

```

These procedures deal with the particle set directly. Return the pointer:

```

(Event base: generic event: TBP)+≡
  procedure :: get_particle_set_ptr => generic_event_get_particle_set_ptr

(Event base: procedures)+≡
  function generic_event_get_particle_set_ptr (event) result (ptr)
    class(generic_event_t), intent(in) :: event
    type(particle_set_t), pointer :: ptr
    ptr => event%particle_set
  end function generic_event_get_particle_set_ptr

```

Let it point to some existing particle set:

```

(Event base: generic event: TBP)+≡
  procedure :: link_particle_set => generic_event_link_particle_set

(Event base: procedures)+≡
  subroutine generic_event_link_particle_set (event, particle_set)
    class(generic_event_t), intent(inout) :: event
    type(particle_set_t), intent(in), target :: particle_set
    event%particle_set => particle_set
    call event%accept_particle_set ()
  end subroutine generic_event_link_particle_set

```

### 17.1.5 Access sqme and weight

There are several incarnations: the current value, a reference value, alternate values.

```

(Event base: generic event: TBP)+≡
  procedure :: sqme_prc_is_known => generic_event_sqme_prc_is_known
  procedure :: sqme_ref_is_known => generic_event_sqme_ref_is_known
  procedure :: sqme_alt_is_known => generic_event_sqme_alt_is_known
  procedure :: weight_prc_is_known => generic_event_weight_prc_is_known
  procedure :: weight_ref_is_known => generic_event_weight_ref_is_known
  procedure :: weight_alt_is_known => generic_event_weight_alt_is_known
  procedure :: excess_prc_is_known => generic_event_excess_prc_is_known

(Event base: procedures)+≡
  function generic_event_sqme_prc_is_known (event) result (flag)
    class(generic_event_t), intent(in) :: event
    logical :: flag
    flag = event%sqme_prc_known

```

```

end function generic_event_sqme_prc_is_known

function generic_event_sqme_ref_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%sqme_ref_known
end function generic_event_sqme_ref_is_known

function generic_event_sqme_alt_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%sqme_alt_known
end function generic_event_sqme_alt_is_known

function generic_event_weight_prc_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%weight_prc_known
end function generic_event_weight_prc_is_known

        end subroutine generic_event_set_scale_forced
    end interface

```

### 17.1.7 Utilities

Applying this, current event contents are marked as incomplete but are not deleted. In particular, the initialization is kept.

```

<Event base: generic event: TBP>+≡
    procedure :: reset => generic_event_reset
    procedure :: base_reset => generic_event_reset
<Event base: procedures>+≡
    subroutine generic_event_reset (event)
        class(generic_event_t), intent(inout) :: event
        call event%discard_particle_set ()
        event%sqme_ref_known = .false.
        event%sqme_prc_known = .false.
        event%sqme_alt_known = .false.
        event%weight_ref_known = .false.
        event%weight_prc_known = .false.
        event%weight_alt_known = .false.
        event%excess_prc_known = .false.
    end subroutine generic_event_reset

```

Pacify particle set.

```

<Event base: generic event: TBP>+≡
    procedure :: pacify_particle_set => generic_event_pacify_particle_set
<Event base: procedures>+≡
    subroutine generic_event_pacify_particle_set (event)
        class(generic_event_t), intent(inout) :: event
        if (event%has_valid_particle_set ()) call pacify (event%particle_set)
    end subroutine generic_event_pacify_particle_set

```

### 17.1.8 NLO info

```
<Event base: generic event: TBP>+≡
  procedure :: set_nlo_event => generic_event_set_nlo_event

<Event base: procedures>+≡
  subroutine generic_event_set_nlo_event (event, value)
    class(generic_event_t), intent(inout) :: event
    logical, intent(in) :: value
    event%nlo_info%nlo_event = value
  end subroutine generic_event_set_nlo_event

<Event base: generic event: TBP>+≡
  procedure :: is_nlo_event => generic_event_is_nlo_event

<Event base: procedures>+≡
  function generic_event_is_nlo_event (event) result (value)
    logical :: value
    class(generic_event_t), intent(in) :: event
    value = event%nlo_info%nlo_event
  end function generic_event_is_nlo_event

<Event base: generic event: TBP>+≡
  procedure :: init_sample_formats => generic_event_init_sample_formats

<Event base: procedures>+≡
  subroutine generic_event_init_sample_formats (event)
    class(generic_event_t), intent(inout) :: event
    call event%nlo_info%init_sample_formats ()
  end subroutine generic_event_init_sample_formats

<Event base: generic event: TBP>+≡
  procedure :: check_supported_sample_formats &
    => generic_event_check_supported_sample_formats

<Event base: procedures>+≡
  subroutine generic_event_check_supported_sample_formats (event, format)
    class(generic_event_t), intent(in) :: event
    type(string_t), intent(in) :: format
    call event%nlo_info%check_supported_sample_formats (format)
  end subroutine generic_event_check_supported_sample_formats
```

### 17.1.9 Event normalization

The parameters for event normalization. For unweighted events, NORM\_UNIT is intended as default, while for weighted events, it is NORM\_SIGMA.

Note: the unit test for this is in eio\_data\_2 below.

```
<Event base: parameters>+≡
  integer, parameter, public :: NORM_UNDEFINED = 0
  integer, parameter, public :: NORM_UNIT = 1
  integer, parameter, public :: NORM_N_EVT = 2
  integer, parameter, public :: NORM_SIGMA = 3
  integer, parameter, public :: NORM_S_N = 4
```

These functions translate between the user representation and the internal one.

```

(Event base: public)+≡
  public :: event_normalization_mode
  public :: event_normalization_string

(Event base: procedures)+≡
  function event_normalization_mode (string, unweighted) result (mode)
    integer :: mode
    type(string_t), intent(in) :: string
    logical, intent(in) :: unweighted
    select case (lower_case (char (string)))
    case ("auto")
      if (unweighted) then
        mode = NORM_UNIT
      else
        mode = NORM_SIGMA
      end if
    case ("1")
      mode = NORM_UNIT
    case ("1/n")
      mode = NORM_N_EVT
    case ("sigma")
      mode = NORM_SIGMA
    case ("sigma/n")
      mode = NORM_S_N
    case default
      call msg_fatal ("Event normalization: unknown value '" &
        // char (string) // "'")
    end select
  end function event_normalization_mode

  function event_normalization_string (norm_mode) result (string)
    integer, intent(in) :: norm_mode
    type(string_t) :: string
    select case (norm_mode)
    case (NORM_UNDEFINED); string = "[undefined]"
    case (NORM_UNIT);      string = "'1'"
    case (NORM_N_EVT);     string = "'1/n'"
    case (NORM_SIGMA);     string = "'sigma'"
    case (NORM_S_N);       string = "'sigma/n'"
    case default;          string = "???"
    end select
  end function event_normalization_string

```

We place this here as a generic helper, so we can update event weights whenever we need, not just in connection with an event sample data object.

```

(Event base: public)+≡
  public :: event_normalization_update

(Event base: procedures)+≡
  subroutine event_normalization_update (weight, sigma, n, mode_new, mode_old)
    real(default), intent(inout) :: weight
    real(default), intent(in) :: sigma
    integer, intent(in) :: n

```

```

integer, intent(in) :: mode_new, mode_old
if (mode_new /= mode_old) then
  if (sigma > 0 .and. n > 0) then
    weight = weight / factor (mode_old) * factor (mode_new)
  else
    call msg_fatal ("Event normalization update: null sample")
  end if
end if
contains
function factor (mode)
  real(default) :: factor
  integer, intent(in) :: mode
  select case (mode)
    case (NORM_UNIT);   factor = 1._default
    case (NORM_N_EVT);  factor = 1._default / n
    case (NORM_SIGMA);  factor = sigma
    case (NORM_S_N);    factor = sigma / n
    case default
      call msg_fatal ("Event normalization update: undefined mode")
  end select
end function factor
end subroutine event_normalization_update

```

### 17.1.10 Callback container

This derived type contains a callback procedure that can be executed during event I/O. The callback procedure is given the event object (with class `generic_event`) and an event index.

This is a simple wrapper. The object is abstract, so the the actual procedure is introduced by overriding the deferred one. We use the PASS attribute, so we may supplement runtime data in the callback object if desired.

```

(Event base: public)+≡
  public :: event_callback_t
(Event base: types)+≡
  type, abstract :: event_callback_t
  private
  contains
    procedure(event_callback_write), deferred :: write
    procedure(event_callback_proc), deferred :: proc
  end type event_callback_t

```

Identify the callback procedure in output

```

(Event base: interfaces)+≡
  abstract interface
    subroutine event_callback_write (event_callback, unit)
      import
      class(event_callback_t), intent(in) :: event_callback
      integer, intent(in), optional :: unit
    end subroutine event_callback_write
  end interface

```

This is the procedure interface.

```

(Event base: interfaces)+≡
  abstract interface
    subroutine event_callback_proc (event_callback, i, event)
      import
      class(event_callback_t), intent(in) :: event_callback
      integer(i64), intent(in) :: i
      class(generic_event_t), intent(in) :: event
    end subroutine event_callback_proc
  end interface

```

A dummy implementation for testing and fallback.

```

(Event base: public)+≡
  public :: event_callback_nop_t

(Event base: types)+≡
  type, extends (event_callback_t) :: event_callback_nop_t
  private
  contains
    procedure :: write => event_callback_nop_write
    procedure :: proc => event_callback_nop
  end type event_callback_nop_t

(Event base: procedures)+≡
  subroutine event_callback_nop_write (event_callback, unit)
    class(event_callback_nop_t), intent(in) :: event_callback
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "NOP"
  end subroutine event_callback_nop_write

  subroutine event_callback_nop (event_callback, i, event)
    class(event_callback_nop_t), intent(in) :: event_callback
    integer(i64), intent(in) :: i
    class(generic_event_t), intent(in) :: event
  end subroutine event_callback_nop

```

## 17.2 Event Sample Data

We define a simple and transparent container for (meta)data that are associated with an event sample.

```

(eio_data.f90)≡
  <File header>

  module eio_data

    <Use kinds>
    <Use strings>
    use io_units
    use unit_tests, only: vanishes

```

```

    use diagnostics

    use event_base

    <Standard module head>

    <EIO data: public>

    <EIO data: types>

contains

    <EIO data: procedures>

end module eio_data

```

### 17.2.1 Event Sample Data

These are data that apply to an event sample as a whole. They are given in an easily portable form (no fancy structure) and are used for initializing event formats.

There are two MD5 sums here. `md5sum_proc` depends only on the definition of the contributing processes. A sample with matching checksum can be rescanned with modified model parameters, beam structure etc, to recalculate observables. `md5sum_config` includes all relevant data. Rescanning a sample with matching checksum will produce identical observables. (A third checksum might be added which depends on the event sample itself. This is not needed, so far.)

If alternate weights are part of the event sample (`n_alt` nonzero), there is a configuration MD5 sum for each of them.

```

<EIO data: public>≡
    public :: event_sample_data_t

<EIO data: types>≡
    type :: event_sample_data_t
        character(32) :: md5sum_prc = ""
        character(32) :: md5sum_cfg = ""
        logical :: unweighted = .true.
        logical :: negative_weights = .false.
        integer :: norm_mode = NORM_UNDEFINED
        integer :: n_beam = 0
        integer, dimension(2) :: pdg_beam = 0
        real(default), dimension(2) :: energy_beam = 0
        integer :: n_proc = 0
        integer :: n_evt = 0
        integer :: nlo_multiplier = 1
        integer :: split_n_evt = 0
        integer :: split_n_kbytes = 0
        integer :: split_index = 0
        real(default) :: total_cross_section = 0
        integer, dimension(:), allocatable :: proc_num_id
        integer :: n_alt = 0
        character(32), dimension(:), allocatable :: md5sum_alt

```

```

        real(default), dimension(:), allocatable :: cross_section
        real(default), dimension(:), allocatable :: error
contains
    <EIO data: event sample data: TBP>
end type event_sample_data_t

```

Initialize: allocate for the number of processes

```

<EIO data: event sample data: TBP>≡

```

## 17.3 Abstract I/O Handler

This module defines an abstract object for event I/O and the associated methods.

There are **output** and **input** methods which write or read a single event from/to the I/O stream, respectively. The I/O stream itself may be a file, a common block, or an externally linked structure, depending on the concrete implementation.

A **write** method prints the current content of the implementation-dependent event record in human-readable form.

The **init\_in/init\_out** and **final** prepare and finalize the I/O stream, respectively. There is also a **switch\_inout** method which turns an input stream into an output stream where events can be appended.

Optionally, output files can be split in chunks of well-defined size. The **split\_out** method takes care of this.

```
<eio_base.f90>≡
  <File header>

  module eio_base

    use kinds, only: i64
  <Use strings>
    use io_units
    use diagnostics
    use model_data
    use event_base
    use eio_data

  <Standard module head>

  <EIO base: public>

  <EIO base: types>

  <EIO base: interfaces>

  contains

  <EIO base: procedures>

  end module eio_base
```

### 17.3.1 Type

We can assume that most implementations will need the file extension as a fixed string and, if they support file splitting, the current file index.

The fallback model is useful for implementations that are able to read unknown files which may contain hadrons etc., not in the current hard-interaction model.

```
<EIO base: public>≡
  public :: eio_t
```

```

<EIO base: types>≡
  type, abstract :: eio_t
    type(string_t) :: sample
    type(string_t) :: extension
    type(string_t) :: filename
    logical :: has_file = .false.
    logical :: split = .false.
    integer :: split_n_evt = 0
    integer :: split_n_kbytes = 0
    integer :: split_index = 0
    integer :: split_count = 0
    class(model_data_t), pointer :: fallback_model => null ()
  contains
    <EIO base: eio: TBP>
  end type eio_t

```

Write to screen. If possible, this should display the contents of the current event, i.e., the last one that was written or read.

```

<EIO base: eio: TBP>≡
  procedure (eio_write), deferred :: write

<EIO base: interfaces>≡
  abstract interface
    subroutine eio_write (object, unit)
      import
      class(eio_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine eio_write
  end interface

```

Finalize. This should write/read footer data and close input/output channels.

```

<EIO base: eio: TBP>+≡
  procedure (eio_final), deferred :: final

<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_final (object)
      import
      class(eio_t), intent(inout) :: object
    end subroutine eio_final
  end interface

```

Determine splitting parameters from the event sample data.

```

<EIO base: eio: TBP>+≡
  procedure :: set_splitting => eio_set_splitting

<EIO base: procedures>≡
  subroutine eio_set_splitting (eio, data)
    class(eio_t), intent(inout) :: eio
    type(event_sample_data_t), intent(in) :: data
    eio%split = data%split_n_evt > 0 .or. data%split_n_kbytes > 0
    if (eio%split) then
      eio%split_n_evt = data%split_n_evt

```

```

        eio%split_n_kbytes = data%split_n_kbytes
        eio%split_index = data%split_index
        eio%split_count = 0
    end if
end subroutine eio_set_splitting

```

Update the byte count and check if it has increased. We use integer division to determine the number of `n_kbytes` blocks that are in the event file.

```

(EIO base: eio: TBP)+≡
    procedure :: update_split_count => eio_update_split_count

(EIO base: procedures)+≡
    subroutine eio_update_split_count (eio, increased)
        class(eio_t), intent(inout) :: eio
        logical, intent(out) :: increased
        integer :: split_count_old
        if (eio%split_n_kbytes > 0) then
            split_count_old = eio%split_count
            eio%split_count = eio%file_size_kbytes () / eio%split_n_kbytes
            increased = eio%split_count > split_count_old
        end if
    end subroutine eio_update_split_count

```

Generate a filename, taking a possible split index into account.

```

(EIO base: eio: TBP)+≡
    procedure :: set_filename => eio_set_filename

(EIO base: procedures)+≡
    subroutine eio_set_filename (eio)
        class(eio_t), intent(inout) :: eio
        character(32) :: buffer
        if (eio%split) then
            write (buffer, "(I0,'.')") eio%split_index
            eio%filename = eio%sample // "." // trim (buffer) // eio%extension
            eio%has_file = .true.
        else
            eio%filename = eio%sample // "." // eio%extension
            eio%has_file = .true.
        end if
    end subroutine eio_set_filename

```

Set the fallback model.

```

(EIO base: eio: TBP)+≡
    procedure :: set_fallback_model => eio_set_fallback_model

(EIO base: procedures)+≡
    subroutine eio_set_fallback_model (eio, model)
        class(eio_t), intent(inout) :: eio
        class(model_data_t), intent(in), target :: model
        eio%fallback_model => model
    end subroutine eio_set_fallback_model

```

Initialize for output. We provide process names. This should open an event file if appropriate and write header data. Some methods may require event sample data.

```

(EIO base: eio: TBP)+≡
  procedure (eio_init_out), deferred :: init_out

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_init_out (eio, sample, data, success, extension)
      import
      class(eio_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(event_sample_data_t), intent(in), optional :: data
      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
    end subroutine eio_init_out
  end interface

```

Initialize for input. We provide process names. This should open an event file if appropriate and read header data. The `md5sum` can be used to check the integrity of the configuration, it it provides a checksum to compare with. In case the extension has changed the extension is also given as an argument.

The `data` argument is `intent(inout)`: we may read part of it and keep other parts and/or check them against the data in the file.

```

(EIO base: eio: TBP)+≡
  procedure (eio_init_in), deferred :: init_in

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_init_in (eio, sample, data, success, extension)
      import
      class(eio_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(event_sample_data_t), intent(inout), optional :: data
      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
    end subroutine eio_init_in
  end interface

```

Re-initialize for output. This should change the status of any event file from input to output and position it for appending new events.

```

(EIO base: eio: TBP)+≡
  procedure (eio_switch_inout), deferred :: switch_inout

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_switch_inout (eio, success)
      import
      class(eio_t), intent(inout) :: eio
      logical, intent(out), optional :: success
    end subroutine eio_switch_inout
  end interface

```

This is similar: split the output, i.e., close the current file and open a new one. The default implementation does nothing. For the feature to work, an implementation must override this.

```

(EIO base: eio: TBP)+≡
  procedure :: split_out => eio_split_out

(EIO base: procedures)+≡
  subroutine eio_split_out (eio)
    class(eio_t), intent(inout) :: eio
  end subroutine eio_split_out

```

Determine the file size in kilobytes. More exactly, determine the size in units of 1024 storage units, as returned by the INQUIRE statement.

The implementation returns zero if there is no file. The `has_file` flag is set by the `set_filename` method, so we can be confident that the `inquire` call is meaningful. If this algorithm doesn't apply for a particular format, we still can override the procedure.

```

(EIO base: eio: TBP)+≡
  procedure :: file_size_kbytes => eio_file_size_kbytes

(EIO base: procedures)+≡
  function eio_file_size_kbytes (eio) result (kbytes)
    class(eio_t), intent(in) :: eio
    integer :: kbytes
    integer(i64) :: bytes
    if (eio%has_file) then
      inquire (file = char (eio%filename), size = bytes)
      if (bytes > 0) then
        kbytes = bytes / 1024
      else
        kbytes = 0
      end if
    else
      kbytes = 0
    end if
  end function eio_file_size_kbytes

```

Output an event. All data can be taken from the `event` record. The index `i_prc` identifies the process among the processes that are contained in the current sample. The `reading` flag, if present, indicates that the event was read from file, not generated.

The `passed` flag tells us that this event has passed the selection criteria. Depending on the event format, we may choose to skip events that have not passed.

```

(EIO base: eio: TBP)+≡
  procedure (eio_output), deferred :: output

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_output (eio, event, i_prc, reading, passed, pacify)
      import
      class(eio_t), intent(inout) :: eio
      class(generic_event_t), intent(in), target :: event
    end subroutine eio_output
  end abstract interface

```

```

        integer, intent(in) :: i_prc
        logical, intent(in), optional :: reading, passed, pacify
    end subroutine eio_output
end interface

```

Input an event. This should fill all event data that cannot be inferred from the associated process.

The input is broken down into two parts. First we read the `i_prc` index. So we know which process to expect in the subsequent event. If we have reached end of file, we also will know. Then, we read the event itself.

The parameter `iostat` is supposed to be set as the Fortran standard requires, negative for EOF and positive for error.

```

<EIO base: eio: TBP>+≡
    procedure (eio_input_i_prc), deferred :: input_i_prc
    procedure (eio_input_event), deferred :: input_event

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_input_i_prc (eio, i_prc, iostat)
            import
            class(eio_t), intent(inout) :: eio
            integer, intent(out) :: i_prc
            integer, intent(out) :: iostat
        end subroutine eio_input_i_prc
    end interface

    abstract interface
        subroutine eio_input_event (eio, event, iostat)
            import
            class(eio_t), intent(inout) :: eio
            class(generic_event_t), intent(inout), target :: event
            integer, intent(out) :: iostat
        end subroutine eio_input_event
    end interface

    procedure (eio_skip), deferred :: skip

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_skip (eio, iostat)
            import
            class(eio_t), intent(inout) :: eio
            integer, intent(out) :: iostat
        end subroutine eio_skip
    end interface

```

### 17.3.2 Unit tests

Test module, followed by the corresponding implementation module.

```

(eio_base.ut.f90)≡

```

```

    <File header>

    module eio_base_ut
        use unit_tests
        use eio_base_utl

    <Standard module head>

    <EIO base: public test>

    <EIO base: public test auxiliary>

    contains

    <EIO base: test driver>

    end module eio_base_ut
<eio_base_uti.f90>≡
    <File header>

    module eio_base_uti

    <Use kinds>
    <Use strings>
        use io_units
        use lorentz
        use model_data
        use particles
        use event_base
        use eio_data

        use eio_base

    <Standard module head>

    <EIO base: public test auxiliary>

    <EIO base: test declarations>

    <EIO base: test types>

    <EIO base: test variables>

    contains

    <EIO base: tests>

    <EIO base: test auxiliary>

    end module eio_base_uti
API: driver for the unit tests below.
<EIO base: public test>≡
    public :: eio_base_test

```

```

<EIO base: test driver>≡
  subroutine eio_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <EIO base: execute tests>
  end subroutine eio_base_test

```

The caller has to provide procedures that prepare and cleanup the test environment. They depend on modules that are not available here.

```

<EIO base: test types>≡
  abstract interface
    subroutine eio_prepare_event (event, unweighted, n_alt)
      import
      class(generic_event_t), intent(inout), pointer :: event
      logical, intent(in), optional :: unweighted
      integer, intent(in), optional :: n_alt
    end subroutine eio_prepare_event
  end interface

  abstract interface
    subroutine eio_cleanup_event (event)
      import
      class(generic_event_t), intent(inout), pointer :: event
    end subroutine eio_cleanup_event
  end interface

```

We store pointers to the test-environment handlers as module variables. This allows us to call them from the test routines themselves, which don't allow for extra arguments.

```

<EIO base: public test auxiliary>≡
  public :: eio_prepare_test, eio_cleanup_test

<EIO base: test types>+≡
  procedure(eio_prepare_event), pointer :: eio_prepare_test => null ()
  procedure(eio_cleanup_event), pointer :: eio_cleanup_test => null ()

```

Similarly, for the fallback (hadron) model that some eio tests require:

```

<EIO base: test types>+≡
  abstract interface
    subroutine eio_prepare_model (model)
      import
      class(model_data_t), intent(inout), pointer :: model
    end subroutine eio_prepare_model
  end interface

  abstract interface
    subroutine eio_cleanup_model (model)
      import
      class(model_data_t), intent(inout), pointer :: model
    end subroutine eio_cleanup_model
  end interface

```

```

<EIO base: public test auxiliary>+≡
    public :: eio_prepare_fallback_model, eio_cleanup_fallback_model

<EIO base: test variables>≡
    procedure(eio_prepare_model), pointer :: eio_prepare_fallback_model => null ()
    procedure(eio_cleanup_model), pointer :: eio_cleanup_fallback_model => null ()

```

## Test type for event I/O

The contents simulate the contents of an external file. We have the `sample` string as the file name and the array of momenta `event_p` as the list of events. The second index is the event index. The `event_i` component is the pointer to the current event, `event_n` is the total number of stored events.

```

<EIO base: test types>+≡
    type, extends (eio_t) :: eio_test_t
        integer :: event_n = 0
        integer :: event_i = 0
        integer :: i_prc = 0
        type(vector4_t), dimension(:,,:), allocatable :: event_p
    contains
        <EIO base: eio test: TBP>
    end type eio_test_t

```

Write to screen. Pretend that this is an actual event format.

```

<EIO base: eio test: TBP>≡
    procedure :: write => eio_test_write

<EIO base: test auxiliary>≡
    subroutine eio_test_write (object, unit)
        class(eio_test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "(1x,A)") "Test event stream"
        if (object%event_i /= 0) then
            write (u, "(1x,A,I0,A)") "Event #", object%event_i, ":"
            do i = 1, size (object%event_p, 1)
                call vector4_write (object%event_p(i, object%event_i), u)
            end do
        end if
    end subroutine eio_test_write

```

Finalizer. For the test case, we just reset the event count, but keep the stored “events”. For the real implementations, the events would be stored on an external medium, so we would delete the object contents.

```

<EIO base: eio test: TBP>+≡
    procedure :: final => eio_test_final

<EIO base: test auxiliary>+≡
    subroutine eio_test_final (object)
        class(eio_test_t), intent(inout) :: object
        object%event_i = 0
    end subroutine eio_test_final

```

```
end subroutine eio_test_final
```

Initialization: We store the process IDs and the energy from the beam-data object. We also allocate the momenta (i.e., the simulated event record) for a fixed maximum size of 10 events, 2 momenta each. There is only a single process.

```
<EIO base: eio test: TBP>+≡
  procedure :: init_out => eio_test_init_out

<EIO base: test auxiliary>+≡
  subroutine eio_test_init_out (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(in), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    eio%sample = sample
    eio%event_n = 0
    eio%event_i = 0
    allocate (eio%event_p (2, 10))
    if (present (success)) success = .true.
  end subroutine eio_test_init_out
```

Initialization for input. Nothing to do for the test type.

```
<EIO base: eio test: TBP>+≡
  procedure :: init_in => eio_test_init_in

<EIO base: test auxiliary>+≡
  subroutine eio_test_init_in (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(inout), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    if (present (success)) success = .true.
  end subroutine eio_test_init_in
```

Switch from output to input. Again, nothing to do for the test type.

```
<EIO base: eio test: TBP>+≡
  procedure :: switch_inout => eio_test_switch_inout

<EIO base: test auxiliary>+≡
  subroutine eio_test_switch_inout (eio, success)
    class(eio_test_t), intent(inout) :: eio
    logical, intent(out), optional :: success
    if (present (success)) success = .true.
  end subroutine eio_test_switch_inout
```

Output. Increment the event counter and store the momenta of the current event.

```
<EIO base: eio test: TBP>+≡
  procedure :: output => eio_test_output
```

```

(EIO base: test auxiliary)+≡
subroutine eio_test_output (eio, event, i_prc, reading, passed, pacify)
  class(eio_test_t), intent(inout) :: eio
  class(generic_event_t), intent(in), target :: event
  logical, intent(in), optional :: reading, passed, pacify
  integer, intent(in) :: i_prc
  type(particle_set_t), pointer :: pset
  type(particle_t) :: prt
  eio%event_n = eio%event_n + 1
  eio%event_i = eio%event_n
  eio%i_prc = i_prc
  pset => event%get_particle_set_ptr ()
  prt = pset%get_particle (3)
  eio%event_p(1, eio%event_i) = prt%get_momentum ()
  prt = pset%get_particle (4)
  eio%event_p(2, eio%event_i) = prt%get_momentum ()
end subroutine eio_test_output

```

Input. Increment the event counter and retrieve the momenta of the current event. For the test case, we do not actually modify the current event.

```

(EIO base: eio test: TBP)+≡
  procedure :: input_i_prc => eio_test_input_i_prc
  procedure :: input_event => eio_test_input_event

(EIO base: test auxiliary)+≡
subroutine eio_test_input_i_prc (eio, i_prc, iostat)
  class(eio_test_t), intent(inout) :: eio
  integer, intent(out) :: i_prc
  integer, intent(out) :: iostat
  i_prc = eio%i_prc
  iostat = 0
end subroutine eio_test_input_i_prc

subroutine eio_test_input_event (eio, event, iostat)
  class(eio_test_t), intent(inout) :: eio

## 17.6 Event Weight Output

This is an output-only format. For each event, we print the indices that identify process, process part (MCI group), and term. As numerical information we print the squared matrix element (trace) and the event weight.

```

<eio_weights.f90>≡
  <File header>

```

```

module eio_weights

  <Use kinds>
  <Use strings>
    use io_units
    use diagnostics
    use event_base
    use eio_data
    use eio_base

  <Standard module head>

  <EIO weights: public>

  <EIO weights: types>

  contains

  <EIO weights: procedures>

end module eio_weights

```

### 17.6.1 Type

```

<EIO weights: public>≡
  public :: eio_weights_t

<EIO weights: types>≡
  type, extends (eio_t) :: eio_weights_t
    logical :: writing = .false.
    integer :: unit = 0
    logical :: pacify = .false.
  contains
    <EIO weights: eio weights: TBP>
  end type eio_weights_t

```

### 17.6.2 Specific Methods

Set pacify flags.

```

<EIO weights: eio weights: TBP>≡
  procedure :: set_parameters => eio_weights_set_parameters

<EIO weights: procedures>≡
  subroutine eio_weights_set_parameters (eio, pacify)

end subroutine eio_weights_switch_inout

```

Output an event. Write first the event indices, then weight and two values of the squared matrix element: `sqme_ref` is the value stored in the event record, and `sqme_prc` is the one stored in the process instance. (They can differ: when recalculating, the former is read from file and the latter is the result of the new calculation.)

For the alternative entries, the `sqme` value is always obtained by a new calculation, and thus qualifies as `sqme_prc`.

```

## 17.8 ASCII File Formats

Here, we implement several ASCII file formats. It is possible to switch between them using flags.

```

(eio_ascii.f90)≡
  <File header>

```

```

module eio_ascii

```

```

    <Use strings>
    use io_units
    use diagnostics
    use event_base
    use eio_data
    use eio_base
    use hep_common
    use hep_events

    <Standard module head>

    <EIO ascii: public>

    <EIO ascii: types>

contains

    <EIO ascii: procedures>

end module eio_ascii

```

### 17.8.1 Type

```

    <EIO ascii: public>≡
    public :: eio_ascii_t

    <EIO ascii: types>≡
    type, abstract, extends (eio_t) :: eio_ascii_t
    logical :: writing = .false.
    integer :: unit = 0
    logical :: keep_beams = .false.
    logical :: keep_remnants = .true.
    logical :: ensure_order = .false.
    contains
    <EIO ascii: eio ascii: TBP>
    end type eio_ascii_t

    <EIO ascii: public>+≡
    public :: eio_ascii_ascii_t

## 17.9 HEP Common Blocks

Long ago, to transfer data between programs one had to set up a common block and link both programs as libraries to the main executable. The HEP community standardizes several of those common blocks.

The modern way of data exchange uses data files with standard formats. However, the LHEF standard data format derives from a common block (actually, two).

WHIZARD used to support those common blocks, and LHEF was implemented via writing/reading blocks. We still keep this convention, but intend to eliminate common blocks (or any other static storage) from the workflow in the future. This will gain flexibility towards concurrent running of program images.

We encapsulate everything here in a module. The module holds the variables which are part of the common block. To access the common block variables, we just have to use this module. (They are nevertheless in the common block, since external software may access it in this way.)

Note: This code is taken essentially unchanged from WHIZARD 2.1 and does not (yet) provide unit tests.

```

(hep_common.f90)≡
  <File header>

  module hep_common

    <Use kinds>
    use kinds, only: double
    use constants
    <Use strings>

    <Standard module head>

```

```

    <HEP common: public>

    <HEP common: interfaces>

    <HEP common: parameters>

    <HEP common: variables>

    <HEP common: common blocks>

contains

    <HEP common: procedures>

end module hep_common

```

### 17.9.1 Event characteristics

The maximal number of particles in an event record.

```

<HEP common: parameters>≡
    integer, parameter, public :: MAXNUP = 500

```

The number of particles in this event.

```

<HEP common: variables>≡
    integer, public :: NUP

```

The process ID for this event.

```

<HEP common: variables>+≡
    integer, public :: IDPRUP

```

The weight of this event ( $\pm 1$  for unweighted events).

```

<HEP common: variables>+≡
    double precision, public :: XWGTUP

```

The factorization scale that is used for PDF calculation ( $-1$  if undefined).

```

<HEP common: variables>+≡
    double precision, public :: SCALUP

```

The QED and QCD couplings  $\alpha$  used for this event ( $-1$  if undefined).

```

<HEP common: variables>+≡
    double precision, public :: AQEDUP
    double precision, public :: AQCDUP

```

### 17.9.2 Particle characteristics

The PDG code:

```

<HEP common: variables>+≡
    integer, dimension(MAXNUP) :: IDUP

```

The status code. Incoming:  $-1$ , outgoing:  $+1$ . Intermediate t-channel propagator:  $-2$  (currently not used by WHIZARD). Intermediate resonance whose mass should be preserved:  $2$ . Intermediate resonance for documentation:  $3$  (currently not used). Beam particles:  $-9$ .

```

<HEP common: variables>+≡
    integer, dimension(MAXNUP), public :: ISTUP

```

Index of first and last mother.

```
<HEP common: variables>+≡  
integer, dimension(2,MAXNUP), public :: MOTHUP
```

Color line index of the color and anticolor entry for the particle. The standard recommends using large numbers; we start from MAXNUP+1.

```
<HEP common: variables>+≡  
integer, dimension(2,MAXNUP), public :: ICOLUP
```

Momentum, energy, and invariant mass:  $(p_x, p_y, p_z, E, M)$ . For space-like particles,  $M$  is the negative square root of the absolute value of the invariant mass.

```
<HEP common: variables>+≡  
double precision, dimension(5,MAXNUP), public :: PUP
```

Invariant lifetime (distance) from production to decay in mm.

```
<HEP common: variables>+≡  
double precision, dimension(MAXNUP), public :: VTIMUP
```

Cosine of the angle between the spin-vector and a particle and the 3-momentum of its mother, given in the lab frame. If undefined/unpolarized: 9.

```
<HEP common: variables>+≡  
double precision, dimension(MAXNUP), public :: SPINUP
```

### 17.9.3 The HEPRUP common block

This common block is filled once per run.

#### Run characteristics

The maximal number of different processes.

```
<HEP common: parameters>+≡  
integer, parameter, public :: MAXPUP = 100
```

The beam PDG codes.

```
<HEP common: variables>+≡  
integer, dimension(2), public :: IDBMUP
```

The beam energies in GeV.

```
<HEP common: variables>+≡  
double precision, dimension(2), public :: EBMUP
```

The PDF group and set for the two beams. (Undefined: use -1; LHAPDF: use group = 0).

```
<HEP common: variables>+≡  
integer, dimension(2), public :: PDFGUP  
integer, dimension(2), public :: PDFSUP
```

The (re)weighting model. 1: events are weighted, the shower generator (SHG) selects processes according to the maximum weight (in pb) and unweights events. 2: events are weighted, the SHG selects processes according to their cross section (in pb) and unweights events. 3: events are unweighted and simply run through the SHG. 4: events are weighted, and the SHG keeps the weight. Negative numbers: negative weights are allowed (and are reweighted to  $\pm 1$  by the SHG, if allowed).

WHIZARD only supports modes 3 and 4, as the SHG is not given control over process selection. This is consistent with writing events to file, for offline showering.

```
<HEP common: variables>+≡
    integer, public :: IDWTUP
```

The number of different processes.

```
<HEP common: variables>+≡
    integer, public :: NPRUP
```

### Process characteristics

Cross section and error in pb. (Cross section is needed only for IDWTUP = 2, so here both values are given for informational purposes only.)

```
<HEP common: variables>+≡
    double precision, dimension(MAXPUP), public :: XSECUP
    double precision, dimension(MAXPUP), public :: XERRUP
```

Maximum weight, i.e., the maximum value that XWGTUP can take. Also unused for the supported weighting models. It is  $\pm 1$  for unweighted events.

```
<HEP common: variables>+≡
    double precision, dimension(MAXPUP), public :: XMAXUP
```

Internal ID of the selected process, matches IDPRUP below.

```
<HEP common: variables>+≡
    integer, dimension(MAXPUP), public :: LPRUP
```

### The common block

```
<HEP common: common blocks>≡
    common /HEPRUP/ &
        IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP, &
        XSECUP, XERRUP, XMAXUP, LPRUP
    save /HEPRUP/
```

Fill the run characteristics of the common block. The initialization sets the beam properties, number of processes, and weighting model.

```
<HEP common: public>≡
    public :: heprup_init
```

```
<HEP common: procedures>≡
    subroutine heprup_init &
        (beam_pdg, beam_energy, n_processes, unweighted, negative_weights)
        integer, dimension(2), intent(in) :: beam_pdg
        real(default), dimension(2), intent(in) :: beam_energy
        integer, intent(in) :: n_processes
        logical, intent(in) :: unweighted
        logical, intent(in) :: negative_weights
        IDBMUP = beam_pdg
        EBMUP = beam_energy
        PDFGUP = -1
        PDFSUP = -1
        if (unweighted) then
            IDWTUP = 3
```

```

else
  IDWTUP = 4
end if
if (negative_weights) IDWTUP = - IDWTUP
NPRUP = n_processes
end subroutine heprup_init

```

The HEPRUP (event) common block is needed for the interface to the shower. Filling of it is triggered by some output file formats. If these are not present, the common block is filled with some dummy information. Be generous with the number of processes in HEPRUP so that PYTHIA only rarely needs to be reinitialized in case events with higher process ids are generated.

```

end do
end subroutine heprup_write_verbose

```

### 17.9.5 Run parameter output (other formats)

This routine writes the initialization block according to the LHEF standard. It uses the current contents of the HEPRUP block.

```

<HEP common: public>+≡
    public :: heprup_write_lhef

<HEP common: procedures>+≡
    subroutine heprup_write_lhef (unit)
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
            IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
        do i = 1, NPRUP
            write (u, "(3(1x,ES17.10),1x,I0)") &
                XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
        end do
    end subroutine heprup_write_lhef

```

This routine is a complete dummy at the moment. It uses the current contents of the HEPRUP block. At the end, it should depend on certain input flags for the different ASCII event formats.

```

<HEP common: public>+≡
    public :: heprup_write_ascii

<HEP common: procedures>+≡
    subroutine heprup_write_ascii (unit)
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
            IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
        do i = 1, NPRUP
            write (u, "(3(1x,ES17.10),1x,I0)") &
                XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
        end do
    end subroutine heprup_write_ascii

```

```

        end do
    end subroutine heprup_write_ascii

```

### Run parameter input (LHEF)

In a LHEF file, the parameters are written in correct order on separate lines, but we should not count on the precise format. List-directed input should just work.

```

<HEP common: public>+≡
    public :: heprup_read_lhef

<HEP common: procedures>+≡
    subroutine heprup_read_lhef (u)
        integer, intent(in) :: u
        integer :: i
        read (u, *) &
            IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
        do i = 1, NPRUP
            read (u, *) &
                XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
        end do
    end subroutine heprup_read_lhef

```

### 17.9.6 The HEPEUP common block

```

<HEP common: common blocks>+≡
    common /HEPEUP/ &
        NUP, IDPRUP, XWGTUP, SCALUP, AQEDUP, AQCDUP, &
        IDUP, ISTUP, MOTHUP, ICOLUP, PUP, VTIMUP, SPINUP
    save /HEPEUP/

```

#### Initialization

Fill the event characteristics of the common block. The initialization sets only the number of particles and initializes the rest with default values. The other routine sets the optional parameters.

```

<HEP common: public>+≡
    public :: hepeup_init
    public :: hepeup_set_event_parameters

<HEP common: procedures>+≡
    subroutine hepeup_init (n_tot)
        integer, intent(in) :: n_tot
        NUP = n_tot
        IDPRUP = 0
        XWGTUP = 1
        SCALUP = -1
        AQEDUP = -1
        AQCDUP = -1
    end subroutine hepeup_init

```

```

subroutine hepeup_set_event_parameters &
  (proc_id, weight, scale, alpha_qed, alpha_qcd)
  integer, intent(in), optional :: proc_id
  real(default), intent(in), optional :: weight, scale, alpha_qed, alpha_qcd
  if (present (proc_id)) IDPRUP = proc_id
  if (present (weight)) XWGTUP = weight
  if (present (scale)) SCALUP = scale
  if (present (alpha_qed)) AQEDUP = alpha_qed
  if (present (alpha_qcd)) AQCDUP = alpha_qcd
end subroutine hepeup_set_event_parameters

```

Extract event information. The caller determines the parameters.

```

<HEP common: public>+≡
  public :: hepeup_get_event_parameters

<HEP common: procedures>+≡
  subroutine hepeup_get_event_parameters &
    (proc_id, weight, scale, alpha_qed, alpha_qcd)
    integer, intent(out), optional :: proc_id
    real(default), intent(out), optional :: weight, scale, alpha_qed, alpha_qcd
    if (present (proc_id)) proc_id = IDPRUP
    if (present (weight)) weight = XWGTUP
    if (present (scale)) scale = SCALUP
    if (present (alpha_qed)) alpha_qed = AQEDUP
    if (present (alpha_qcd)) alpha_qcd = AQCDUP
  end subroutine hepeup_get_event_parameters

```

## Particle data

Below we need the particle status codes which are actually defined in the `subevents` module.

Set the entry for a specific particle. All parameters are set with the exception of lifetime and spin, where default values are stored.

```

<HEP common: public>+≡
  public :: hepeup_set_particle

<HEP common: procedures>+≡
  subroutine hepeup_set_particle (i, pdg, status, parent, col, p, m2)
    integer, intent(in) :: i
    integer, intent(in) :: pdg, status
    integer, dimension(:), intent(in) :: parent
    type(vector4_t), intent(in) :: p
    integer, dimension(2), intent(in) :: col
    real(default), intent(in) :: m2
    if (i > MAXNUP) then
      call msg_error (arr=[ &
        var_str ("Too many particles in HEPEUP common block. " // &
          "If this happened "), &
        var_str ("during event output, your events will be " // &
          "invalid; please consider "), &
        var_str ("switching to a modern event format like HEPMC. " // &
          "If you are not "), &

```

```

        var_str ("using an old, HEPEUP based format and " // &
                "nevertheless get this error,"), &
        var_str ("please notify the WHIZARD developers,") ])
    return
end if
IDUP(i) = pdg
select case (status)
case (PRT_BEAM);          ISTUP(i) = -9
case (PRT_INCOMING);      ISTUP(i) = -1
case (PRT_BEAM_REMNANT);  ISTUP(i) = 3
case (PRT_OUTGOING);      ISTUP(i) = 1
case (PRT_RESONANT);      ISTUP(i) = 2
case (PRT_VIRTUAL);       ISTUP(i) = 3
case default;             ISTUP(i) = 0
end select
select case (size (parent))
case (0);      MOTHUP(:,i) = 0
case (1);      MOTHUP(1,i) = parent(1); MOTHUP(2,i) = 0
case default;  MOTHUP(:,i) = [ parent(1), parent(size (parent)) ]
end select
if (col(1) > 0) then
    ICOLUP(1,i) = 500 + col(1)
else
    ICOLUP(1,i) = 0
end if
if (col(2) > 0) then
    ICOLUP(2,i) = 500 + col(2)
else
    ICOLUP(2,i) = 0
end if
PUP(1:3,i) = vector3_get_components (space_part (p))
PUP(4,i) = energy (p)
PUP(5,i) = sign (sqrt (abs (m2)), m2)
VTIMUP(i) = 0
SPINUP(i) = 9
end subroutine hepeup_set_particle

```

Set the lifetime, actually  $c\tau$  measured in mm, where  $\tau$  is the invariant lifetime.

```

<HEP common: public>+=
    public :: hepeup_set_particle_lifetime

<HEP common: procedures>+=
    subroutine hepeup_set_particle_lifetime (i, lifetime)
        integer, intent(in) :: i
        real(default), intent(in) :: lifetime
        VTIMUP(i) = lifetime
    end subroutine hepeup_set_particle_lifetime

```

Set the particle spin entry. We need the cosine of the angle of the spin axis with respect to the three-momentum of the parent particle.

If the particle has a full polarization density matrix given, we need the particle momentum and polarization as well as the mother-particle momentum. The polarization is transformed into a spin vector (which is sensible only for

spin-1/2 or massless particles), which then is transformed into the lab frame (by a rotation of the 3-axis to the particle momentum axis). Finally, we compute the scalar product of this vector with the mother-particle three-momentum.

This puts severe restrictions on the applicability of this definition, and Lorentz invariance is lost. Unfortunately, the Les Houches Accord requires this computation.

```

<HEP common: public>+≡
  public :: hepeup_set_particle_spin

<HEP common: interfaces>≡
  interface hepeup_set_particle_spin
    module procedure hepeup_set_particle_spin_pol
  end interface

<HEP common: procedures>+≡
  subroutine hepeup_set_particle_spin_pol (i, p, pol, p_mother)
    integer, intent(in) :: i
    type(vector4_t), intent(in) :: p
    type(polarization_t), intent(in) :: pol
    type(vector4_t), intent(in) :: p_mother
    type(vector3_t) :: s3, p3
    type(vector4_t) :: s4
    s3 = vector3_moving (polarization_get_axis (pol))
    p3 = space_part (p)
    s4 = rotation_to_2nd (3, p3) * vector4_moving (0._default, s3)
    SPINUP(i) = enclosed_angle_ct (s4, p_mother)
  end subroutine hepeup_set_particle_spin_pol

```

Extract particle data. The caller decides which ones to retrieve.

Status codes: beam remnants share the status code with virtual particles. However, for the purpose of WHIZARD we should identify them. We use the PDG code for this.

```

<HEP common: public>+≡
  public :: hepeup_get_particle

<HEP common: procedures>+≡

```

### 17.9.7 The HEPEVT and HEPEV4 common block

For the LEP Monte Carlos, a standard common block has been proposed in AKV89. We strongly recommend its use. (The description is an abbreviated transcription of AKV89, Vol. 3, pp. 327-330).

NMXHEP is the maximum number of entries:

```

<HEP common: variables>+≡
    integer, parameter :: NMXHEP = 4000

```

NEVHEP is normally the event number, but may take special values as follows:

0 the program does not keep track of event numbers. -1 a special initialization record. -2 a special final record.

```

<HEP common: variables>+≡
    integer :: NEVHEP

```

NHEP holds the number of entries for this event.

```

<HEP common: variables>+≡
    integer :: NHEP

```

The entry ISTHEP(N) gives the status code for the Nth entry, with the following semantics: 0 a null entry. 1 an existing entry, which has not decayed or fragmented. 2 a decayed or fragmented entry, which is retained for event history

information. 3 documentation line. 4- 10 reserved for future standards. 11-200 at the disposal of each model builder. 201- at the disposal of users.

```
<HEP common: variables>+≡
integer, dimension(NMXHEP) :: ISTHEP
```

The Particle Data Group has proposed standard particle codes, which are to be stored in IDHEP(N).

```
<HEP common: variables>+≡
integer, dimension(NMXHEP) :: IDHEP
```

JMOHEP(1,N) points to the mother of the Nth entry, if any. It is set to zero for initial entries. JMOHEP(2,N) points to the second mother, if any.

```
<HEP common: variables>+≡
integer, dimension(2, NMXHEP) :: JMOHEP
```

JDAHEP(1,N) and JDAHEP(2,N) point to the first and last daughter of the Nth entry, if any. These are zero for entries which have not yet decayed. The other daughters are stored in between these two.

```
<HEP common: variables>+≡
integer, dimension(2, NMXHEP) :: JDAHEP
```

In PHEP we store the momentum of the particle, more specifically this means that PHEP(1,N), PHEP(2,N), and PHEP(3,N) contain the momentum in the  $x$ ,  $y$ , and  $z$  direction (as defined by the machine people), measured in GeV/c. PHEP(4,N) contains the energy in GeV and PHEP(5,N) the mass in GeV/ $c^2$ . The latter may be negative for spacelike partons.

```
<HEP common: variables>+≡
double precision, dimension(5, NMXHEP) :: PHEP
```

Finally VHEP is the place to store the position of the production vertex. VHEP(1,N), VHEP(2,N), and VHEP(3,N) contain the  $x$ ,  $y$ , and  $z$  coordinate (as defined by the machine people), measured in mm. VHEP(4,N) contains the production time in mm/c.

```
<HEP common: variables>+≡
double precision, dimension(4, NMXHEP) :: VHEP
```

As an amendment to the proposed standard common block HEPEVT, we also have a polarisation common block HEPSPN, as described in AKV89. SHEP(1,N), SHEP(2,N), and SHEP(3,N) give the  $x$ ,  $y$ , and  $z$  component of the spinvector  $s$  of a fermion in the fermions restframe.

Furthermore, we add the polarization of the corresponding outgoing particles:

```
<HEP common: variables>+≡
integer, dimension(NMXHEP) :: hepevt_pol
```

By this variable the identity of the current process is given, defined via the LPRUP codes.

```
<HEP common: variables>+≡
    integer, public :: idruplh
```

This is the event weight, i.e. the cross section divided by the total number of generated events for the output of the parton shower programs.

```
<HEP common: variables>+≡
    double precision, public :: eventweightlh
```

There are the values for the electromagnetic and the strong coupling constants,  $\alpha_{em}$  and  $\alpha_s$ .

```
<HEP common: variables>+≡
    double precision, public :: alphaqedlh, alphaqcdlh
```

This is the squared scale  $Q$  of the event.

```
<HEP common: variables>+≡
    double precision, dimension(10), public :: scalelh
```

Finally, these variables contain the spin information and the color/anticolor flow of the particles.

```
<HEP common: variables>+≡
    double precision, dimension (3,NMXHEP), public :: spinlh
    integer, dimension (2,NMXHEP), public :: icolorflowlh
```

By convention, SHEP(4,N) is always 1. All this is taken from StdHep 4.06 manual and written using Fortran90 conventions.

```
<HEP common: common blocks>+≡
    common /HEPEVT/ &
        NEVHEP, NHEP, ISTHEP, IDHEP, &
        JMOHEP, JDAHEP, PHEP, VHEP
    save /HEPEVT/
```

Here we store HEPEVT parameters of the WHIZARD 1 realization which are not part of the HEPEVT common block.

```
<HEP common: variables>+≡
    integer :: hepevt_n_out, hepevt_n_remnants
```

```
<HEP common: variables>+≡
    double precision :: hepevt_weight, hepevt_function_value
    double precision :: hepevt_function_ratio
```

The HEPEV4 common block is an extension of the HEPEVT common block to allow for partonic colored events, including especially the color flow etc.

```
<HEP common: common blocks>+≡
    common /HEPEV4/ &
        eventweightlh, alphaqedlh, alphaqcdlh, scalelh, &
        spinlh, icolorflowlh, idruplh
    save /HEPEV4/
```

Filling HEPEVT: If the event count is not provided, set `NEVHEP` to zero. If the event count is -1 or -2, the record corresponds to initialization and finalization, and the event is irrelevant.

Note that the event count may be larger than  $2^{31}$  (2 GEvents). In that case, cut off the upper bits since `NEVHEP` is probably limited to default integer.

For the HEPEV4 common block, it is unclear why the `scalelh` variable is 10-dimensional. We choose to only set the first value of the array.

```

<HEP common: public>+≡
  public :: hepevt_init
  public :: hepevt_set_event_parameters

<HEP common: procedures>+≡
  subroutine hepevt_init (n_tot, n_out)
    integer, intent(in) :: n_tot, n_out
    NHEP                = n_tot

    end do
end subroutine hepeup_write_lha

```

This routine writes event output according to the HEPEVT standard. It uses the current contents of the HEPEVT block and some additional parameters according to the standard in WHIZARD 1. For the long ASCII format, the value of the sample function (i.e. the product of squared matrix element, structure functions and phase space factor is printed out). The option of reweighting matrix elements with respect to some reference cross section is not implemented in WHIZARD 2 for this event format, therefore the second entry in the long ASCII format (the function ratio) is always one. The ATHENA format is an implementation of the HEPEVT format that is readable by the ATLAS ATHENA software framework. It is very similar to the WHIZARD 1 HEPEVT format, except that it contains an event counter, a particle counter inside the event, and has the HEPEVT ISTHEP status before the PDG code. The MOKKA format is a special ASCII format that contains the information to be parsed to the MOKKA LC fast simulation software.

          PUP(:,i), VTIMUP(i), SPINUP(i)
    end do
  end subroutine hepeup_read_lhef
```

### 17.9.11 Data Transfer: particle sets

The WHIZARD format for handling particle data in events is `particle_set_t`. We have to interface this to the common blocks.

We first create a new particle set that contains only the particles that are supported by the LHEF format. These are: beam, incoming, resonant, outgoing. We drop particles with unknown, virtual or beam-remnant status.

From this set we fill the common block. Event information such as process ID and weight is not transferred here; this has to be done by the caller. The spin information is set only if the particle has a unique mother, and if its polarization is fully defined.

```
<HEP common: public>+≡
  public :: hepeup_from_particle_set

<HEP common: procedures>+≡
  subroutine hepeup_from_particle_set (pset_in, &
    keep_beams, keep_remnants)
    type(particle_set_t), intent(in) :: pset_in
    type(particle_set_t), target :: pset
    logical, intent(in), optional :: keep_beams
    logical, intent(in), optional :: keep_remnants
    integer :: i, n_parents, status, n_tot
    integer, dimension(1) :: i_mother
    logical :: activate_remnants
    activate_remnants = .true.
    if (present (keep_remnants)) activate_remnants = keep_remnants
    call pset_in%filter_particles (pset, real_parents = .true. , &
      keep_beams = keep_beams, keep_virtualls = .false.)
    n_tot = pset%get_n_tot ()
    call hepeup_init (n_tot)
    do i = 1, n_tot
      associate (prt => pset%prt(i))
        status = prt%get_status ()
```

```

    if (activate_remnants &
        .and. status == PRT_BEAM_REMNANT &
        .and. prt%get_n_children () == 0) &
        status = PRT_OUTGOING
    call hepeup_set_particle (i, &
        prt%get_pdg (), &
        status, &
        prt%get_parents (), &
        prt%get_color (), &
        prt%get_momentum (), &
        prt%get_p2 ())
    n_parents = prt%get_n_parents ()
    if (n_parents == 1) then
        i_mother = prt%get_parents ()
        select case (prt%get_polarization_status ())
        case (PRT_GENERIC_POLARIZATION)
            call hepeup_set_particle_spin (i, &
                prt%get_momentum (), &
                prt%get_polarization (), &
                pset%prt(i_mother(1))%get_momentum ())
        end select
    end if
end associate
end do
end subroutine hepeup_from_particle_set

```

Input. The particle set should be allocated properly, but we replace the particle contents.

If there are no beam particles in the event, we try to reconstruct beam particles and beam remnants. We assume for simplicity that the beam particles, if any, are the first two particles. If they are absent, the first two particles should be the incoming partons.

```

<HEP common: public>+≡

## 17.10 HepMC events

This section provides the interface to the HepMC C++ library for handling Monte-Carlo events.

Each C++ class of HepMC that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of HepMC that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

```

<hepmc.interface.f90>≡
  <File header>

  module hepmc_interface

    use, intrinsic :: iso_c_binding !NODEP!

    <Use kinds>
    <Use strings>
    use constants, only: PI
    use lorentz
    use flavors
    use colors
    use helicities
    use polarizations

    <Standard module head>

    <HepMC interface: public>

    <HepMC interface: types>

    <HepMC interface: parameters>

    <HepMC interface: interfaces>

    contains

    <HepMC interface: procedures>

  end module hepmc_interface

```

### 17.10.1 Interface check

This function can be called in order to verify that we are using the actual HepMC library, and not the dummy version.

```
<HepMC interface: interfaces>≡
  interface
    logical(c_bool) function hepmc_available () bind(C)
    import
    end function hepmc_available
  end interface

<HepMC interface: public>≡
  public :: hepmc_is_available

<HepMC interface: procedures>≡
  function hepmc_is_available () result (flag)
    logical :: flag
    flag = hepmc_available ()
  end function hepmc_is_available
```

### 17.10.2 FourVector

The C version of four-vectors is often transferred by value, and the associated procedures are all inlined. The wrapper needs to transfer by reference, so we create FourVector objects on the heap which have to be deleted explicitly. The input is a `vector4_t` or `vector3_t` object from the `lorentz` module.

```
<HepMC interface: public>+≡
  public :: hepmc_four_vector_t

<HepMC interface: types>≡
  type :: hepmc_four_vector_t
  private
    type(c_ptr) :: obj
  end type hepmc_four_vector_t
```

In the C constructor, the zero-component (fourth argument) is optional; if missing, it is set to zero. The Fortran version has initializer form and takes either a three-vector or a four-vector. A further version extracts the four-vector from a HepMC particle object.

```
<HepMC interface: interfaces>+≡
  interface

### 17.10.3 Polarization

Polarization objects are temporarily used for assigning particle polarization. We add a flag `polarized`. If this is false, the polarization is not set and should not

be transferred to `hepmc_particle` objects.

```

<HepMC interface: public>+≡
    public :: hepmc_polarization_t

<HepMC interface: types>+≡
    type :: hepmc_polarization_t
    private
    logical :: polarized = .false.
    type(c_ptr) :: obj
    end type hepmc_polarization_t

```

Constructor. The C wrapper takes polar and azimuthal angle as arguments. The Fortran version allows for either a complete polarization density matrix, or for a definite (diagonal) helicity.

*HepMC does not allow to specify the degree of polarization, therefore we have to map it to either 0 or 1. We choose 0 for polarization less than 0.5 and 1 for polarization greater than 0.5. Even this simplification works only for spin-1/2 and for massless particles; massive vector bosons cannot be treated this way. In particular, zero helicity is always translated as unpolarized.*

*For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle  $\pi/2$ . This works under the condition that helicity is projected onto one of the basis states.*

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function new_polarization (theta, phi) bind(C)
            import

### 17.10.5 GenVertex

Vertices are made of particles (incoming and outgoing).

```

<HepMC interface: public>+≡
  public :: hepmc_vertex_t

<HepMC interface: types>+≡
  type :: hepmc_vertex_t
  private
  type(c_ptr) :: obj
  end type hepmc_vertex_t

```

Constructor. Two versions, one plain, one with the position in space and time (measured in mm) as argument. The Fortran version has initializer form, and the vertex position is an optional argument.

A destructor is unnecessary as long as all vertices are entered into an event container.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_gen_vertex () bind(C)
      import
    end function new_gen_vertex
  end interface
  interface
    type(c_ptr) function new_gen_vertex_pos (prt_obj) bind(C)
      import
      type(c_ptr), value :: prt_obj
    end function new_gen_vertex_pos
  end interface

<HepMC interface: public>+≡
  public :: hepmc_vertex_init

```

```

<HepMC interface: procedures>+≡
subroutine hepmc_vertex_init (v, x)
  type(hepmc_vertex_t), intent(out) :: v
  type(vector4_t), intent(in), optional :: x
  type(hepmc_four_vector_t) :: pos
  if (present (x)) then
    call hepmc_four_vector_init (pos, x)
    v%obj = new_gen_vertex_pos (pos%obj)
    call hepmc_four_vector_final (pos)
  else
    v%obj = new_gen_vertex ()
  end if
end subroutine hepmc_vertex_init

```

Return true if the vertex pointer is non-null:

```

<HepMC interface: interfaces>+≡
interface
  function gen_vertex_is_valid (v_obj) result (flag) bind(C)
    import
    logical(c_bool) :: flag
    type(c_ptr), value :: v_obj
  end function gen_vertex_is_valid
end interface

```

```

<HepMC interface: public>+≡
public :: hepmc_vertex_is_valid

```

```

<HepMC interface: procedures>+≡

  end function hepmc_vertex_get_n_out

```

### 17.10.6 Vertex-particle-in iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer to the vertex in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡

```

```

    public :: hepmc_vertex_particle_in_iterator_t
  <HepMC interface: types>+≡
    type :: hepmc_vertex_particle_in_iterator_t
    private
    type(c_ptr) :: obj
    type(c_ptr) :: v_obj
  end type hepmc_vertex_particle_in_iterator_t

```

Constructor. The iterator is initialized at the first particle in the vertex.

```

  <HepMC interface: interfaces>+≡
    interface
      type(c_ptr) function &
        new_vertex_particles_in_const_iterator (v_obj) bind(C)
      import
      type(c_ptr), value :: v_obj
    end function new_vertex_particles_in_const_iterator
    end interface
  <HepMC interface: public>+≡
    public :: hepmc_vertex_particle_in_iterator_init
  <HepMC interface: procedures>+≡
    subroutine hepmc_vertex_particle_in_iterator_init (it, v)
      type(hepmc_vertex_particle_in_iterator_t), intent(out) :: it
      type(hepmc_vertex_t), intent(in) :: v
      it%obj = new_vertex_particles_in_const_iterator (v%obj)
      it%v_obj = v%obj
    end subroutine hepmc_vertex_particle_in_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```

  <HepMC interface: interfaces>+≡
    interface
      subroutine vertex_particles_in_const_iterator_delete (it_obj) bind(C)

    end interface

```

```

        real(c_double), value :: xs, xs_err
    end subroutine gen_event_set_cross_section
end interface

```

### 17.10.9 Event-particle iterator

This iterator iterates over all particles in an event. We store a pointer to the event in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
    public :: hepmc_event_particle_iterator_t

<HepMC interface: types>+≡
    type :: hepmc_event_particle_iterator_t
    private
    type(c_ptr) :: obj
    type(c_ptr) :: evt_obj
    end type hepmc_event_particle_iterator_t

```

Constructor. The iterator is initialized at the first particle in the event.

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function new_event_particle_const_iterator (evt_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj
        end function new_event_particle_const_iterator
    end interface

<HepMC interface: public>+≡
    public :: hepmc_event_particle_iterator_init

<HepMC interface: procedures>+≡
    subroutine hepmc_event_particle_iterator_init (it, evt)
        type(hepmc_event_particle_iterator_t), intent(out) :: it
        type(hepmc_event_t), intent(in) :: evt
        it%obj = new_event_particle_const_iterator (evt%obj)
        it%evt_obj = evt%obj
    end subroutine hepmc_event_particle_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```

<HepMC interface: interfaces>+≡
    interface
        subroutine event_particle_const_iterator_delete (it_obj) bind(C)
        import
        type(c_ptr), value :: it_obj
        end subroutine event_particle_const_iterator_delete
    end interface

<HepMC interface: public>+≡
    public :: hepmc_event_particle_iterator_final

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_final (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_delete (it%obj)
  end subroutine hepmc_event_particle_iterator_final

```

Increment

```

<HepMC interface: interfaces>+≡
  interface
    subroutine event_particle_const_iterator_advance (it_obj) bind(C)
      import
      type(c_ptr), value :: it_obj
    end subroutine event_particle_const_iterator_advance
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_advance

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_advance (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_advance (it%obj)
  end subroutine hepmc_event_particle_iterator_advance

```

Reset to the beginning

```

<HepMC interface: interfaces>+≡
  interface
    subroutine event_particle_const_iterator_reset (it_obj, evt_obj) bind(C)
      import
      type(c_ptr), value :: it_obj, evt_obj
    end subroutine event_particle_const_iterator_reset
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_reset

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_reset (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_reset (it%obj, it%evt_obj)
  end subroutine hepmc_event_particle_iterator_reset

```

Test: return true as long as we are not past the end.

```

<HepMC interface: interfaces>+≡
  interface
    function event_particle_const_iterator_is_valid &
      (it_obj, evt_obj) result (flag) bind(C)
      import
      logical(c_bool) :: flag
      type(c_ptr), value :: it_obj, evt_obj
    end function event_particle_const_iterator_is_valid
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_is_valid

```

```

<HepMC interface: procedures>+≡
function hepmc_event_particle_iterator_is_valid (it) result (flag)
  logical :: flag
  type(hepmc_event_particle_iterator_t), intent(in) :: it
  flag = event_particle_const_iterator_is_valid (it%obj, it%evt_obj)
end function hepmc_event_particle_iterator_is_valid

```

Return the particle pointed to by the iterator. (The particle object should not be finalized, since it contains merely a pointer to the particle which is owned by the vertex.)

```

<HepMC interface: interfaces>+≡
interface
  type(c_ptr) function event_particle_const_iterator_get (it_obj) bind(C)
  import
    type(c_ptr), value :: it_obj
  end function event_particle_const_iterator_get
end interface

```

```

<HepMC interface: public>+≡
public :: hepmc_event_particle_iterator_get

```

```

<HepMC interface: procedures>+≡
function hepmc_event_particle_iterator_get (it) result (prt)
  type(hepmc_particle_t) :: prt
  type(hepmc_event_particle_iterator_t), intent(in) :: it
  prt%obj = event_particle_const_iterator_get (it%obj)
end function hepmc_event_particle_iterator_get

```

### 17.10.10 I/O streams

There is a specific I/O stream type for handling the output of GenEvent objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```

<HepMC interface: public>+≡
public :: hepmc_iostream_t

```

```

<HepMC interface: types>+≡
type :: hepmc_iostream_t
private
  type(c_ptr) :: obj
end type hepmc_iostream_t

```

Constructor for an output stream associated to a file.

```

<HepMC interface: interfaces>+≡
interface
  type(c_ptr) function new_io_gen_event_out (filename) bind(C)
  import
    character(c_char), dimension(*), intent(in) :: filename
  end function new_io_gen_event_out
end interface

```

```

<HepMC interface: public>+≡
public :: hepmc_iostream_open_out

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_open_out (iostream, filename)
    type(hepmc_iostream_t), intent(out) :: iostream
    type(string_t), intent(in) :: filename
    iostream%obj = new_io_gen_event_out (char (filename) // c_null_char)
  end subroutine hepmc_iostream_open_out

```

Constructor for an input stream associated to a file.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_io_gen_event_in (filename) bind(C)
    import
      character(c_char), dimension(*), intent(in) :: filename
    end function new_io_gen_event_in
  end interface

<HepMC interface: public>+≡
  public :: hepmc_iostream_open_in

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_open_in (iostream, filename)
    type(hepmc_iostream_t), intent(out) :: iostream
    type(string_t), intent(in) :: filename
    iostream%obj = new_io_gen_event_in (char (filename) // c_null_char)
  end subroutine hepmc_iostream_open_in

```

Destructor:

```

<HepMC interface: interfaces>+≡
  interface

    <HepMC interface: tests>

end module hepmc_interface_util
API: driver for the unit tests below.
<HepMC interface: public test>≡
    public :: hepmc_interface_test
<HepMC interface: test driver>≡
    subroutine hepmc_interface_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <HepMC interface: execute tests>
    end subroutine hepmc_interface_test

```

This test example is an abridged version from the build-from-scratch example in the HepMC distribution. We create two vertices for  $p \rightarrow q$  PDF splitting, then a vertex for a  $qq \rightarrow W^-g$  hard-interaction process, and finally a vertex for  $W^- \rightarrow qq$  decay. The setup is for LHC kinematics.

Extending the original example, we set color flow for the incoming quarks and polarization for the outgoing photon. For the latter, we have to define a particle-data object for the photon, so a flavor object can be correctly initialized.

```

## 17.11 LCIO events

This section provides the interface to the LCIO C++ library for handling Monte-Carlo events.

Each C++ class of LCIO that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of LCIO that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

```

(lcio_interface.f90)≡
  {File header}

```

```

module lcio_interface

    use, intrinsic :: iso_c_binding !NODEP!

    <Use kinds>
    <Use strings>
    use constants, only: PI
    use diagnostics
    use lorentz
    use flavors
    use colors
    use helicities
    use polarizations

    <Standard module head>

    <LCIO interface: public>

    <LCIO interface: types>

    <LCIO interface: interfaces>

    contains

    <LCIO interface: procedures>

end module lcio_interface

```

### 17.11.1 Interface check

This function can be called in order to verify that we are using the actual LCIO library, and not the dummy version.

```

<LCIO interface: interfaces>≡
    interface
        logical(c_bool) function lcio_available () bind(C)
            import
        end function lcio_available
    end interface

<LCIO interface: public>≡
    public :: lcio_is_available

<LCIO interface: procedures>≡
    function lcio_is_available () result (flag)
        logical :: flag
        flag = lcio_available ()
    end function lcio_is_available

```

### 17.11.2 LCIO Run Header

This is a type for the run header of the LCIO file.

```

<LCIO interface: public>+≡

```

```

    public :: lcio_run_header_t
<LCIO interface: types>≡
    type :: lcio_run_header_t
    private
    type(c_ptr) :: obj
end type lcio_run_header_t

```

The Fortran version has initializer form.

```

<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function new_lcio_run_header (proc_id) bind(C)
        import
        integer(c_int), value :: proc_id
        end function new_lcio_run_header
    end interface

<LCIO interface: interfaces>+≡
    interface
        subroutine run_header_set_simstring &
            (runhdr_obj, simstring) bind(C)
        import
        type(c_ptr), value :: runhdr_obj
        character(c_char), dimension(*), intent(in) :: simstring
        end subroutine run_header_set_simstring
    end interface

<LCIO interface: public>+≡
    public :: lcio_run_header_init

<LCIO interface: procedures>+≡
    subroutine lcio_run_header_init (runhdr, proc_id, run_id)
        type(lcio_run_header_t), intent(out) :: runhdr
        integer, intent(in), optional :: proc_id, run_id
        integer(c_int) :: rid
        rid = 0; if (present (run_id)) rid = run_id
        runhdr%obj = new_lcio_run_header (rid)
        call run_header_set_simstring (runhdr%obj, &
            "WHIZARD version:" // "<Version>")
    end subroutine lcio_run_header_init

<LCIO interface: interfaces>+≡
    interface
        subroutine write_run_header (lcwrt_obj, runhdr_obj) bind(C)
        import
        type(c_ptr), value :: lcwrt_obj
        type(c_ptr), value :: runhdr_obj
        end subroutine write_run_header
    end interface

<LCIO interface: public>+≡
    public :: lcio_run_header_write

<LCIO interface: procedures>+≡
    subroutine lcio_run_header_write (wrt, hdr)
        type(lcio_writer_t), intent(inout) :: wrt

```

```

    type(lcio_run_header_t), intent(inout) :: hdr
    call write_run_header (wrt%obj, hdr%obj)
end subroutine lcio_run_header_write

```

### 17.11.3 LCIO Event and LC Collection

The main object of LCIO is a LCEventImpl. The object is filled by MCParticle objects, which are set as LCCollection.

```

<LCIO interface: public>+≡
    public :: lccollection_t

<LCIO interface: types>+≡
    type :: lccollection_t
    private
    type(c_ptr) :: obj
end type lccollection_t

```

Initializer.

```

<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function new_lccollection () bind(C)
        import
        end function new_lccollection
    end interface

<LCIO interface: public>+≡
    public :: lcio_event_t

<LCIO interface: types>+≡
    type :: lcio_event_t
    private
    type(c_ptr) :: obj
    type(lccollection_t) :: lccoll
end type lcio_event_t

```

Constructor. Arguments are process ID (integer) and event ID (integer).

The Fortran version has initializer form.

```

<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function new_lcio_event (proc_id, event_id, run_id) bind(C)
        import

### 17.11.5 Polarization

For polarization there is a three-component float entry foreseen in the LCIO format. Completely generic density matrices can in principle be attached to events as float vectors added to `LCCollection` of the `LCEvent`. This is not yet implemented currently. Here, we restrict ourselves to the same implementation as in HepMC format: we use two entries as the polarization angles, while the first entry gives the degree of polarization (something not specified in the HepMC format). *For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle  $\pi/2$ . This works under the condition that helicity is projected onto one of the basis states.*

```

### 17.11.6 LCIO Writer type

There is a specific LCIO Writer type for handling the output of LCEventImpl objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```

<LCIO interface: public>+≡
    public :: lcio_writer_t

<LCIO interface: types>+≡
    type :: lcio_writer_t
    private
    type(c_ptr) :: obj
end type lcio_writer_t

```

Constructor for an output associated to a file.

```

<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function open_lcio_writer_new (filename, complevel) bind(C)
        import
        character(c_char), dimension(*), intent(in) :: filename
        integer(c_int), intent(in) :: complevel
    end function open_lcio_writer_new
    end interface

<LCIO interface: public>+≡
    public :: lcio_writer_open_out

<LCIO interface: procedures>+≡
    subroutine lcio_writer_open_out (lcio_writer, filename)
        type(lcio_writer_t), intent(out) :: lcio_writer
        type(string_t), intent(in) :: filename
        lcio_writer%obj = open_lcio_writer_new (char (filename) // &
            c_null_char, 9_c_int)
    end subroutine lcio_writer_open_out

```

Destructor:

```

<LCIO interface: interfaces>+≡
    interface
        subroutine lcio_writer_delete (io_obj) bind(C)
        import
        type(c_ptr), value :: io_obj
    end interface

```

```

        end subroutine lcio_writer_delete
    end interface

    <LCIO interface: public>+≡
        public :: lcio_writer_close

    <LCIO interface: procedures>+≡
        subroutine lcio_writer_close (lciowriter)
            type(lcio_writer_t), intent(inout) :: lciowriter
            call lcio_writer_delete (lciowriter%obj)
        end subroutine lcio_writer_close

```

Write a single event to the LCIO writer.

```

    <LCIO interface: interfaces>+≡
        interface
            subroutine lcio_write_event (io_obj, evt_obj) bind(C)
                import
                type(c_ptr), value :: io_obj, evt_obj
            end subroutine lcio_write_event
        end interface

    <LCIO interface: public>+≡
        public :: lcio_event_write

    <LCIO interface: procedures>+≡
        subroutine lcio_event_write (wrt, evt)
            type(lcio_writer_t), intent(inout) :: wrt
            type(lcio_event_t), intent(in) :: evt
            call lcio_write_event (wrt%obj, evt%obj)
        end subroutine lcio_event_write

```

### 17.11.7 LCIO Reader type

There is a specific LCIO Reader type for handling the input of LCEventImpl objects (i.e., Monte Carlo event samples) from file. Opening the file is done by the constructor, closing by the destructor.

```

    <LCIO interface: public>+≡
        public :: lcio_reader_t

    <LCIO interface: types>+≡
        type :: lcio_reader_t
        private
        type(c_ptr) :: obj
    end type lcio_reader_t

```

Constructor for an output associated to a file.

```

    <LCIO interface: interfaces>+≡
        interface
            type(c_ptr) function open_lcio_reader (filename) bind(C)
                import
                character(c_char), dimension(*), intent(in) :: filename
            end function open_lcio_reader
        end interface

```

```

<LCIO interface: public>+≡
    public :: lcio_open_file
<LCIO interface: procedures>+≡
    subroutine lcio_open_file (lcio_reader, filename)
        type(lcio_reader_t), intent(out) :: lcio_reader
        type(string_t), intent(in) :: filename
        lcio_reader%obj = open_lcio_reader (char (filename) // c_null_char)
    end subroutine lcio_open_file

```

Destructor:

```

<LCIO interface: interfaces>+≡
    interface
        subroutine lcio_reader_delete (io_obj) bind(C)
            import
            type(c_ptr), value :: io_obj
        end subroutine lcio_reader_delete
    end interface
<LCIO interface: public>+≡
    public :: lcio_reader_close
<LCIO interface: procedures>+≡
    subroutine lcio_reader_close (lcio_reader)
        type(lcio_reader_t), intent(inout) :: lcio_reader
        call lcio_reader_delete (lcio_reader%obj)
    end subroutine lcio_reader_close

```

Read a single event from the event file. Return true if successful.

```

<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function read_lcio_event (io_obj) bind(C)
            import
            type(c_ptr), value :: io_obj
        end function read_lcio_event
    end interface
<LCIO interface: public>+≡
    public :: lcio_read_event
<LCIO interface: procedures>+≡
    subroutine lcio_read_event (lcrdr, evt, ok)
        type(lcio_reader_t), intent(inout) :: lcrdr
        type(lcio_event_t), intent(out) :: evt
        logical, intent(out) :: ok
        evt%obj = read_lcio_event (lcrdr%obj)
        ok = c_associated (evt%obj)
    end subroutine lcio_read_event

```

Extract the process ID. This is stored (at the moment abusively) in the RUN ID as well as in an additional event parameter.

```

<LCIO interface: interfaces>+≡
    interface
        integer(c_int) function lcio_event_signal_process_id (evt_obj) bind(C)
            import

```

```

        type(c_ptr), value :: evt_obj
    end function lcio_event_signal_process_id
end interface

<LCIO interface: public>+≡
    public :: lcio_event_get_process_id

<LCIO interface: procedures>+≡
    function lcio_event_get_process_id (evt) result (i_proc)
        integer :: i_proc
        type(lcio_event_t), intent(in) :: evt
        i_proc = lcio_event_signal_process_id (evt%obj)
    end function lcio_event_get_process_id

```

Number of particles in an LCIO event.

```

<LCIO interface: interfaces>+≡
    interface
        integer(c_int) function lcio_event_get_n_particles (evt_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj
    end function lcio_event_get_n_particles
    end interface

<LCIO interface:>≡

<LCIO interface: public>+≡
    public :: lcio_event_get_n_tot

<LCIO interface: procedures>+≡
    function lcio_event_get_n_tot (evt) result (n_tot)
        integer :: n_tot
        type(lcio_event_t), intent(in) :: evt
        n_tot = lcio_event_get_n_particles (evt%obj)
    end function lcio_event_get_n_tot

```

Extracting  $\alpha_s$  and the scale.

```

<LCIO interface: interfaces>+≡
    interface
        function lcio_event_get_alpha_qcd (evt_obj) result (as) bind(C)
        import
        real(c_double) :: as
        type(c_ptr), value :: evt_obj
    end function lcio_event_get_alpha_qcd
    end interface
    interface
        function lcio_event_get_scale (evt_obj) result (scale) bind(C)
        import
        real(c_double) :: scale
        type(c_ptr), value :: evt_obj
    end function lcio_event_get_scale
    end interface

<LCIO interface: public>+≡
    public :: lcio_event_get_alphas

```

```

<LCIO interface: procedures>+≡
  function lcio_event_get_alphas (evt) result (as)
    type(lcio_event_t), intent(in) :: evt
    real(default) :: as
    as = lcio_event_get_alpha_qcd (evt%obj)
  end function lcio_event_get_alphas

<LCIO interface: public>+≡
  public :: lcio_event_get_scaleval

<LCIO interface: procedures>+≡
  function lcio_event_get_scaleval (evt) result (scale)
    type(lcio_event_t), intent(in) :: evt
    real(default) :: scale
    scale = lcio_event_get_scale (evt%obj)
  end function lcio_event_get_scaleval

```

Extracting particles by index from an LCIO event.

```

<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function lcio_event_particle_k (evt_obj, k) bind(C)
    import
    type(c_ptr), value :: evt_obj
    integer(c_int), value :: k
  end function lcio_event_particle_k
end interface

<LCIO interface: public>+≡

## 17.12 HEP Common and Events

This is a separate module that manages data exchange between the common blocks and `event_t` objects. We separate this from the previous module in order to avoid a circular module dependency. It also contains the functions necessary for communication between `hepmc_event_t` and `event_t` or `lcio_event_t` and `event_t` as well as `particle_set_t` and `particle_t` objects.

`(hep_events.f90)≡`

```

```

        end if
    else
        call msg_bug ("HEPEUP: event incomplete")
    end if
end subroutine hepeup_from_event

```

Reverse.

Note: The current implementation sets the particle set of the hard process and is therefore not useful if the event on file is dressed. This should be reconsidered.

Note: setting of scale or alpha is not yet supported by the `event_t` object. Ticket #628.

```

<HEP events: public>+≡
    public :: hepeup_to_event

    end if
else
    call msg_bug ("HEPEVT: event incomplete")
end if
end subroutine hepevt_from_event

```

## HepMC format

The master output function fills a HepMC GenEvent object that is already initialized, but has no vertices in it.

We first set up the vertex lists and enter the vertices into the HepMC event. Then, we assign first all incoming particles and then all outgoing particles to their associated vertices. Particles which have neither parent nor children entries (this should not happen) are dropped.

Finally, we insert the beam particles. If there are none, use the incoming particles instead. Transform a particle into a `hepmc_particle` object, including

color and polarization. The HepMC status is equivalent to the HEPEVT status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see <http://herwig.hepforge.org/trac/wiki/FaQs>.

Initialize a particle from a HepMC particle object. The model is necessary for making a fully qualified flavor component. We have the additional flag `polarized` which tells whether the polarization information should be interpreted or ignored, and the lookup array of barcodes. Note that the lookup array is searched linearly, a possible bottleneck for large particle arrays. If necessary, the barcode array could be replaced by a hash table.

(*HEP events: procedures*) +=

If a particle set is initialized from a HepMC event record, we have to specify the treatment of polarization (unpolarized or density matrix) which is common to all particles. Correlated polarization information is not available.

There is some complication in reconstructing incoming particles and beam remnants. First of all, they all will be tagged as virtual. We then define an incoming particle as

```

## LCIO event format

The master output function fills a LCIO event object that is already initialized, but has no particles in it.

In contrast to HepMC in LCIO there are no vertices (except for tracker and other detector specifications). So we assign first all incoming particles and then all outgoing particles to LCIO particle types. Particles which have neither parent nor children entries (this should not happen) are dropped. Finally, we insert the beam particles. If there are none, use the incoming particles instead.

Transform a particle into a `lcio_particle` object, including color and polarization. The LCIO status is equivalent to the HepMC status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see <http://herwig.hepforge.org/trac/wiki/FaQs>.

A beam-remnant particle (e.g., ISR photon) that has no children is tagged as outgoing, otherwise unphysical.

  <HEP events: execute tests>
  end subroutine hep_events_test

```

If HepMC is available, check the routines via HepMC.

Set up a chain of production and decay and factorize the result into particles.

The process is  $d\bar{d} \rightarrow Z \rightarrow q\bar{q}$ .

```

## 17.13 LHEF Input/Output

The LHEF event record is standardized. It is an ASCII format. We try our best at using it for both input and output.

```
<eio_lhef.f90>≡  
  <File header>  
  
  module eio_lhef  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use string_utils  
    use unit_tests  
    use diagnostics  
    use os_interface  
    use xml  
    use event_base  
    use eio_data  
    use eio_base  
    use hep_common  
    use hep_events  
  
    <Standard module head>  
  
    <EIO LHEF: public>  
  
    <EIO LHEF: types>  
  
    contains  
  
    <EIO LHEF: procedures>  
  
  end module eio_lhef
```

### 17.13.1 Type

With sufficient confidence that it will always be three characters, we can store the version string with a default value.

```
<EIO LHEF: public>≡  
  public :: eio_lhef_t  
  
<EIO LHEF: types>≡  
  type, extends (eio_t) :: eio_lhef_t  
    logical :: writing = .false.  
    logical :: reading = .false.  
    integer :: unit = 0  
    type(event_sample_data_t) :: data  
    type(cstream_t) :: cstream  
    character(3) :: version = "1.0"  
    logical :: keep_beams = .false.  
    logical :: keep_remnants = .true.  
    logical :: keep_virtuals = .false.
```

```

logical :: recover_beams = .true.
logical :: unweighted = .true.
logical :: write_sqme_ref = .false.
logical :: write_sqme_prc = .false.
logical :: write_sqme_alt = .false.
logical :: use_alpha_s_from_file = .false.
logical :: use_scale_from_file = .false.

Input an event. Upon input of `i_prc`, we can just read in the whole HEPEUP common block. These data are known to come first. The `i_prc` value can be deduced from the IDPRUP value by a table lookup.

Reading the common block bypasses the `cstream` which accesses the input unit. This is consistent with the LHEF specification. After the common-block data have been swallowed, we can resume reading from stream.

We don't catch actual I/O errors. However, we return a negative value in `iostat` if we reached the terminating `</LesHouchesEvents>` tag.

Since we have already read the event information from file, this input routine can transfer the common-block contents to the event record. Also, we read any further information in the event record.

Since LHEF doesn't give this information, we must assume that the MCI group, term, and channel can all be safely set to 1. This works if there is only one MCI group and term. The channel doesn't matter for the matrix element.

### 17.13.5 Version-Specific Code: 1.0

In version 1.0, the init tag contains just HEPRUP data. While a `cstream` is connected to the input unit, we bypass it temporarily for the purpose of reading the HEPRUP contents. This is consistent with the LHEF standard.

This routine does not read the closing tag of the init block.

### 17.13.6 Version-Specific Code: 2.0

This is the init information for the 2.0 format, after the HEPRUP data. We have the following tags:

- **generator** Generator name and version.
- **xsecinfo** Cross section and weights data. We have the total cross section and number of events (assuming that the event file is intact), but information on minimum and maximum weights is not available before the file is complete. We just write the mandatory tags. (Note that the

default values of the other tags describe a uniform unit weight, but we can determine most values only after the sample is complete.)

- **cutsinfo** This optional tag is too specific to represent the possibilities of WHIZARD, so we skip it.
- **procinfo** This optional tag is useful for giving details of NLO calculations. Skipped.
- **mergetype** Optional, also not applicable.

```
<EIO LHEF: eio lhef: TBP>+≡
  procedure :: write_init_20 => eio_lhef_write_init_20
```

```
<EIO LHEF: procedures>+≡
  subroutine eio_lhef_write_init_20 (eio, data)
    class(eio_lhef_t), intent(in) :: eio
    type(event_sample_data_t), intent(in) :: data
    integer :: u
    u = eio%unit
    call eio%tag_generator%write (u)
    write (u, "(A)", advance="no") "WHIZARD"
    call eio%tag_generator%close (u); write (u, *)
    call eio%tag_xsecinfo%write (u); write (u, *)
  end subroutine eio_lhef_write_init_20
```

When reading the init block, we first call the 1.0 routine that fills HEPRUP. Then we consider the possible tags. Only the **generator** and **xsecinfo** tags are of interest. We skip everything else except for the closing tag.

```

### Version 3.0 Output

Version 3.0 is an update which removes some tags (which we didn't use anyway) and suggests a new treatment of weights.

```

## 17.14 STDHEP File Formats

Here, we implement the two existing STDHEP file formats, one based on the HEPUP/HEPEUP common blocks, the other based on the HEPEVT common block. The second one is actually the standard STDHEP format.

`<eio_stdhep.f90>`≡  
*<File header>*

```

module eio_stdhep

    use kinds, only: i32, i64
    <Use strings>
    use io_units

```

```

    use string_utils
    use diagnostics
    use event_base
    use hep_common
    use hep_events
    use eio_data
    use eio_base

    <Standard module head>

    <EIO stdhep: public>

    <EIO stdhep: types>

    <EIO stdhep: variables>

contains

    <EIO stdhep: procedures>

end module eio_stdhep

```

### 17.14.1 Type

```

<EIO stdhep: public>≡
    public :: eio_stdhep_t

<EIO stdhep: types>≡
    type, abstract, extends (eio_t) :: eio_stdhep_t
        logical :: writing = .false.
        logical :: reading = .false.
        integer :: unit = 0
        logical :: keep_beams = .false.
        logical :: keep_remnants = .true.
        logical :: ensure_order = .false.
        logical :: recover_beams = .false.
        logical :: use_alpha_s_from_file = .false.
        logical :: use_scale_from_file = .false.
        integer, dimension(:), allocatable :: proc_num_id
        integer(i64) :: n_events_expected = 0
    contains
        <EIO stdhep: eio stdhep: TBP>
    end type eio_stdhep_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepevt_t

## 17.15 HepMC Output

The HepMC event record is standardized. It is an ASCII format. We try our best at using it for both input and output.

```

⟨eio_hepmc.f90⟩≡
  ⟨File header⟩

module eio_hepmc

  ⟨Use strings⟩
  use io_units
  use string_utils
  use diagnostics
  use particles
  use model_data
  use event_base
  use hep_events
  use eio_data
  use eio_base
  use hepmc_interface

  ⟨Standard module head⟩

  ⟨EIO HepMC: public⟩

  ⟨EIO HepMC: types⟩

contains

  ⟨EIO HepMC: procedures⟩

end module eio_hepmc

```

### 17.15.1 Type

A type `hepmc_event` is introduced as container to store HepMC event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported. Beams will always be written. Tools like `Rivet` can use the cross section information of a HepMC file for scaling plots. As there is no header in HepMC and this is written for every event, we make it optional with `output_cross_section`.

```
(EIO HepMC: public)≡
    public :: eio_hepmc_t

(EIO HepMC: types)≡
    type, extends (eio_t) :: eio_hepmc_t
        logical :: writing = .false.
        logical :: reading = .false.
        type(event_sample_data_t) :: data
        ! logical :: keep_beams = .false.
        logical :: recover_beams = .false.
        logical :: use_alpha_s_from_file = .false.
        logical :: use_scale_from_file = .false.
        logical :: output_cross_section = .false.
        type(hepmc_iostream_t) :: iostream
        type(hepmc_event_t) :: hepmc_event
        integer, dimension(:), allocatable :: proc_num_id
        class(model_data_t), pointer :: default_model => null ()
    contains
        (EIO HepMC: eio_hepmc: TBP)
    end type eio_hepmc_t
```

### 17.15.2 Specific Methods

Set parameters that are specifically used with HepMC.

```
(EIO HepMC: eio_hepmc: TBP)≡
    procedure :: set_parameters => eio_hepmc_set_parameters

(EIO HepMC: procedures)≡
    ! subroutine eio_hepmc_set_parameters (eio, keep_beams, recover_beams, extension)
    subroutine eio_hepmc_set_parameters &
        (eio, default_model, &
         recover_beams, use_alpha_s_from_file, use_scale_from_file, &
         extension, output_cross_section)
        class(eio_hepmc_t), intent(inout) :: eio
        class(model_data_t), intent(in), optional, target :: default_model
        logical, intent(in), optional :: recover_beams
        logical, intent(in), optional :: use_alpha_s_from_file
        logical, intent(in), optional :: use_scale_from_file
        logical, intent(in), optional :: output_cross_section
        type(string_t), intent(in), optional :: extension
        if (present (default_model)) &
            eio%default_model => default_model
        if (present (recover_beams)) &
            eio%recover_beams = recover_beams
```

```

if (present (use_alpha_s_from_file)) &
    eio%use_alpha_s_from_file = use_alpha_s_from_file
if (present (use_scale_from_file)) &
    eio%use_scale_from_file = use_scale_from_file

## 17.16 LCIO Output

The LCIO event record is standardized for the use with Linear  $e^+e^-$  colliders. It is a binary event format. We try our best at using it for both input and output.

```

### 17.16.1 Type

A type `lcio_event` is introduced as container to store LCIO event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported.

⟨*EIO LCIO: public*⟩≡

## Chapter 18

# Phase Space

The abstract representation of a type that parameterizes phase space, with methods for construction and evaluation.

**phs\_base** Abstract phase-space representation.

A simple implementation:

**phs\_single** Parameterize the phase space of a single particle, i.e., the solid angle. This is useful only for very restricted problems, but it avoids the complexity of a generic approach in those trivial cases.

The standard implementation is called *wood* phase space. It consists of several auxiliary modules and the actual implementation module.

**mappings** Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

**phs\_trees** Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

**phs\_forests** The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

**cascades** This module is a pseudo Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant

ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

**phs\_wood** Make the functionality available in form of an implementation of the abstract phase-space type.

## 18.1 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

```
<phs_base.f90>≡  
  <File header>  
  
  module phs_base  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use constants, only: TWOPI, TWOPI4  
    use format_defs, only: FMT_19  
    use unit_tests  
    use diagnostics  
    use md5  
    use physics_defs  
    use lorentz  
    use model_data  
    use flavors  
    use process_constants  
  
    <Standard module head>  
  
    <PHS base: public>  
  
    <PHS base: types>  
  
    <PHS base: interfaces>  
  
    contains  
  
    <PHS base: procedures>  
  
  end module phs_base
```

### 18.1.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

#### Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

```
<PHS base: public>≡  
  public :: channel_prop_t  
  
<PHS base: types>≡  
  type, abstract :: channel_prop_t  
  contains
```

```

    procedure (channel_prop_to_string), deferred :: to_string
    generic :: operator (==) => is_equal
    procedure (channel_eq), deferred :: is_equal
end type channel_prop_t

```

```

<PHS base: interfaces>≡
abstract interface
    function channel_prop_to_string (object) result (string)
    import
        class(channel_prop_t), intent(in) :: object
        type(string_t) :: string
    end function channel_prop_to_string
end interface

```

```

<PHS base: interfaces>+≡
abstract interface
    function channel_eq (prop1, prop2) result (flag)
    import
        class(channel_prop_t), intent(in) :: prop1, prop2
        logical :: flag
    end function channel_eq
end interface

```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

```

<PHS base: public>+≡
public :: resonance_t

<PHS base: types>+≡
type, extends (channel_prop_t) :: resonance_t
    real(default) :: mass = 0
    real(default) :: width = 0
contains
    procedure :: to_string => resonance_to_string
    procedure :: is_equal => resonance_is_equal
end type resonance_t

```

Print mass and width.

```

<PHS base: procedures>≡
function resonance_to_string (object) result (string)
    class(resonance_t), intent(in) :: object
    type(string_t) :: string
    character(32) :: buffer
    string = "resonant: m ="
    write (buffer, "(" // FMT_19 // ")") object%mass
    string = string // trim (buffer) // " GeV, w ="
    write (buffer, "(" // FMT_19 // ")") object%width
    string = string // trim (buffer) // " GeV"
end function resonance_to_string

```

Equality.

```

(PHS base: procedures)+≡
function resonance_is_equal (prop1, prop2) result (flag)
  class(resonance_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (resonance_t)
    flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width
  class default
    flag = .false.
  end select
end function resonance_is_equal

```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

```

(PHS base: public)+≡
public :: on_shell_t

(PHS base: types)+≡
type, extends (channel_prop_t) :: on_shell_t
  real(default) :: mass = 0
contains
  procedure :: to_string => on_shell_to_string
  procedure :: is_equal => on_shell_is_equal
end type on_shell_t

```

Print mass and width.

```

(PHS base: procedures)+≡
function on_shell_to_string (object) result (string)
  class(on_shell_t), intent(in) :: object
  type(string_t) :: string
  character(32) :: buffer
  string = "on shell: m ="
  write (buffer, "(" // FMT_19 // ")") object%mass
  string = string // trim (buffer) // " GeV"
end function on_shell_to_string

```

Equality.

```

(PHS base: procedures)+≡
function on_shell_is_equal (prop1, prop2) result (flag)
  class(on_shell_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (on_shell_t)
    flag = prop1%mass == prop2%mass
  class default
    flag = .false.
  end select
end function on_shell_is_equal

```

## Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

```

<PHS base: types>+≡
  type :: phs_equivalence_t
    integer :: c = 0
    integer, dimension(:), allocatable :: perm
    integer, dimension(:), allocatable :: mode
    contains
    <PHS base: phs equivalence: TBP>
  end type phs_equivalence_t

```

The mapping modes are

```

<PHS base: types>+≡
  integer, parameter, public :: &
    EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3

```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the integrand can be assumed to be symmetric w.r.t. a reflection  $x \rightarrow 1 - x$  of the corresponding integration variable.

These are the associated tags, for output:

```

<PHS base: types>+≡
  character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]

```

Write an equivalence.

```

<PHS base: phs equivalence: TBP>≡
  procedure :: write => phs_equivalence_write

<PHS base: procedures>+≡
  subroutine phs_equivalence_write (object, unit)
    class(phs_equivalence_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(5x,'=',1x,I0,1x)", advance = "no") object%c
    if (allocated (object%perm)) then
      write (u, "(A)", advance = "no") "("
      do j = 1, size (object%perm)
        if (j > 1) write (u, "(1x)", advance = "no")
        write (u, "(I0,A1)", advance = "no") &
          object%perm(j), TAG(object%mode(j))
      end do
      write (u, "(A)" ) ")"
    else
      write (u, "(A)")
    end if
  end subroutine phs_equivalence_write

```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

```

(PHS base: phs equivalence: TBP)+≡
  procedure :: init => phs_equivalence_init

(PHS base: procedures)+≡
  subroutine phs_equivalence_init (eq, n_dim)
    class(phs_equivalence_t), intent(out) :: eq
    integer, intent(in) :: n_dim
    allocate (eq%perm (n_dim), source = 0)
    allocate (eq%mode (n_dim), source = EQ_IDENTITY)
  end subroutine phs_equivalence_init

```

## Channel objects

The channel entry holds (optionally) specific properties.

`sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

```

(PHS base: public)+≡
  public :: phs_channel_t

(PHS base: types)+≡
  type :: phs_channel_t
    class(channel_prop_t), allocatable :: prop
    integer :: sf_channel = 1
    type(phs_equivalence_t), dimension(:), allocatable :: eq
  contains
    (PHS base: phs channel: TBP)
  end type phs_channel_t

```

Output.

```

(PHS base: phs channel: TBP)≡
  procedure :: write => phs_channel_write

(PHS base: procedures)+≡
  subroutine phs_channel_write (object, unit)
    class(phs_channel_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(1x,I0)", advance="no") object%sf_channel
    if (allocated (object%prop)) then
      write (u, "(1x,A)") char (object%prop%to_string ())
    else
      write (u, *)
    end if
    if (allocated (object%eq)) then
      do j = 1, size (object%eq)
        call object%eq(j)%write (u)
      end do
    end if
  end subroutine

```

```
end subroutine phs_channel_write
```

Identify the channel with an s-channel resonance.

```
<PHS base: phs channel: TBP>+≡
  procedure :: set_resonant => channel_set_resonant

<PHS base: procedures>+≡
  subroutine channel_set_resonant (channel, mass, width)
    class(phs_channel_t), intent(inout) :: channel
    real(default), intent(in) :: mass, width
    allocate (resonance_t :: channel%prop)
    select type (prop => channel%prop)
    type is (resonance_t)
      prop%mass = mass
      prop%width = width
    end select
  end subroutine channel_set_resonant
```

Identify the channel with an on-shell particle.

```
<PHS base: phs channel: TBP>+≡
  procedure :: set_on_shell => channel_set_on_shell

<PHS base: procedures>+≡
  subroutine channel_set_on_shell (channel, mass)
    class(phs_channel_t), intent(inout) :: channel
    real(default), intent(in) :: mass
    allocate (on_shell_t :: channel%prop)
    select type (prop => channel%prop)
    type is (on_shell_t)
      prop%mass = mass
    end select
  end subroutine channel_set_on_shell
```

### 18.1.2 Property collection

We can set up a list of all distinct channel properties for a given set of channels.

```
<PHS base: public>+≡
  public :: phs_channel_collection_t

<PHS base: types>+≡
  type :: prop_entry_t
    integer :: i = 0
    class(channel_prop_t), allocatable :: prop
    type(prop_entry_t), pointer :: next => null ()
  end type prop_entry_t

  type :: phs_channel_collection_t
    integer :: n = 0
    type(prop_entry_t), pointer :: first => null ()
  contains
    <PHS base: phs channel collection: TBP>
  end type phs_channel_collection_t
```

Finalizer for the list.

```

(PHS base: phs channel collection: TBP)≡
  procedure :: final => phs_channel_collection_final

(PHS base: procedures)+≡
  subroutine phs_channel_collection_final (object)
    class(phs_channel_collection_t), intent(inout) :: object
    type(prop_entry_t), pointer :: entry
    do while (associated (object%first))
      entry => object%first
      object%first => entry%next
      deallocate (entry)
    end do
  end subroutine phs_channel_collection_final

```

Output.

Note: eliminating the `string` auxiliary triggers an ICE in gfortran 4.7.2.

```

(PHS base: phs channel collection: TBP)+≡
  procedure :: write => phs_channel_collection_write

(PHS base: procedures)+≡
  subroutine phs_channel_collection_write (object, unit)
    class(phs_channel_collection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    type(prop_entry_t), pointer :: entry
    type(string_t) :: string
    integer :: u
    u = given_output_unit (unit)
    entry => object%first
    do while (associated (entry))
      if (allocated (entry%prop)) then
        string = entry%prop%to_string ()
        write (u, "(1x,I0,1x,A)" entry%i, char (string))
      else
        write (u, "(1x,I0)" entry%i
      end if
      entry => entry%next
    end do
  end subroutine phs_channel_collection_write

```

Push a new property to the stack if it is not yet included. Simultaneously, set the `sf_channel` entry in the phase-space channel object to the index of the matching entry, or the new entry if there was no match.

```

(PHS base: phs channel collection: TBP)+≡
  procedure :: push => phs_channel_collection_push

(PHS base: procedures)+≡
  subroutine phs_channel_collection_push (coll, channel)
    class(phs_channel_collection_t), intent(inout) :: coll

        allocate (prop, source = entry%prop)
    end if
else
    call msg_bug ("PHS channel collection: get entry: illegal index")
end if
end subroutine phs_channel_collection_get_entry

```

### 18.1.3 Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It doesn't depend on the QCD setup.)

*(PHS base: public)+≡*

```
public :: phs_config_t
```

*(PHS base: types)+≡*

```

type, abstract :: phs_config_t
! private
type(string_t) :: id
integer :: n_in = 0
integer :: n_out = 0
integer :: n_tot = 0
integer :: n_state = 0
integer :: n_par = 0
integer :: n_channel = 0
real(default) :: sqrts = 0
logical :: sqrts_fixed = .true.
logical :: cm_frame = .true.
logical :: azimuthal_dependence = .false.
integer, dimension(:), allocatable :: dim_flat
logical :: provides_equivalences = .false.
logical :: provides_chains = .false.
logical :: vis_channels = .false.
integer, dimension(:), allocatable :: chain
class(model_data_t), pointer :: model => null ()
type(flavor_t), dimension(:,:), allocatable :: flv
type(phs_channel_t), dimension(:), allocatable :: channel

    if (allocated (object%dim_flat)) then
      write (u, "(3x,A,I0)")  "flat dim. = ", object%dim_flat
    end if
    write (u, "(1x,A)")  "Flavor combinations:"
    do i = 1, object%n_state
      write (u, "(3x,I0,'::~)", advance="no") i
      do j = 1, object%n_tot
        do j = 1, n_tot_flv
          write (u, "(1x,A)", advance="no") char (object%flv(j,i)%get_name ())
        end do
        write (u, "(A)")
      end do
    end do
    if (allocated (object%channel)) then

```

```

        write (u, "(1x,A)") "Phase-space / structure-function channels:"
        do i = 1, object%n_channel
            write (u, "(3x,I0,':')", advance="no") i
            call object%channel(i)%write (u)
        end do
    end if
    if (object%md5sum_process /= "") then
        write (u, "(3x,A,A,A)") "MD5 sum (process) = ", &
            object%md5sum_process, ""
    end if
    if (object%md5sum_model_par /= "") then
        write (u, "(3x,A,A,A)") "MD5 sum (model par) = ", &
            object%md5sum_model_par, ""
    end if
    if (object%md5sum_phs_config /= "") then
        write (u, "(3x,A,A,A)") "MD5 sum (phs config) = ", &
            object%md5sum_phs_config, ""
    end if
end subroutine phs_config_write

```

Similarly, a basic initializer and an interface. The model pointer is taken as an argument; we may verify that this has the expected model name.

The intent is `inout`. We want to be able to set parameters in advance.

*(PHS base: phs config: TBP)+≡*

```

    procedure :: init => phs_config_init

```

*(PHS base: procedures)+≡*

```

subroutine phs_config_init (phs_config, data, model)
    class(phs_config_t), intent(inout) :: phs_config

```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the  $z$  axis is the direction of the first beam, the second beam is along the negative  $z$  axis. The transformation from the c.m. to the lab frame is a rotation from the  $z$  axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

```

Compute flux factor. We do this during initialization (when the incoming momenta  $\mathbf{p}$  are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \quad (18.1)$$

2. For a  $2 \rightarrow n$  scattering process with  $n > 1$ , the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \quad (18.2)$$

where for massless incoming particles,  $\sqrt{\lambda} = s$ .

3. For a  $2 \rightarrow 1$  on-shell production process, the factor includes an extra  $1/(2\pi)^3$  factor and a  $1/m^2$  factor from the phase-space delta function  $\delta(x_1x_2 - m^2/s)$ , which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \quad (18.3)$$

The delta function is handled by the structure-function parameterization.

```

(PHS base: phs: TBP)+≡
  procedure :: compute_flux => phs_compute_flux

(PHS base: procedures)+≡
  subroutine phs_compute_flux (phs)
    class(phs_t), intent(inout) :: phs

        phs%flux = 0
    end select
end select
end subroutine phs_compute_flux

```

Evaluate the phase-space point for a particular channel and compute momenta, Jacobian, and phase-space volume. This is, of course, deferred to the implementation.

```

<PHS base: phs: TBP>+=
    procedure (phs_evaluate_selected_channel), deferred :: &
        evaluate_selected_channel

<PHS base: interfaces>+=
    abstract interface
        subroutine phs_evaluate_selected_channel (phs, c_in, r_in)
            import
            class(phs_t), intent(inout) :: phs
            integer, intent(in) :: c_in
            real(default), dimension(:), intent(in) :: r_in
        end subroutine phs_evaluate_selected_channel
    end interface

```

Compute the inverse mappings to completely fill the **r** and **f** arrays, for the non-selected channels.

```

<PHS base: phs: TBP>+=
    procedure (phs_evaluate_other_channels), deferred :: &
        evaluate_other_channels

<PHS base: interfaces>+=
    abstract interface
        subroutine phs_evaluate_other_channels (phs, c_in)
            import
            class(phs_t), intent(inout) :: phs
            integer, intent(in) :: c_in
        end subroutine phs_evaluate_other_channels
    end interface

```

Inverse evaluation. If all momenta are known, we compute the inverse mappings to fill the **r** and **f** arrays.

```

<PHS base: phs: TBP>+=
    procedure (phs_inverse), deferred :: inverse

<PHS base: interfaces>+=
    abstract interface
        subroutine phs_inverse (phs)
            import
            class(phs_t), intent(inout) :: phs

```

```

        end subroutine phs_inverse
    end interface

```

### Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters  $x_1$  and  $x_2$ :

$$\cos \theta = 1 - 2x_1, \quad \phi = 2\pi x_2 \quad (18.4)$$

We generate a rotation (Lorentz transformation) which rotates the positive  $z$  axis into this point on the unit sphere. This rotation is applied to the  $\mathbf{p}$  momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

```

<PHS base: public>+≡
    public :: compute_kinematics_solid_angle

<PHS base: procedures>+≡
    subroutine compute_kinematics_solid_angle (p, q, x)
        type(vector4_t), dimension(2), intent(in) :: p
        type(vector4_t), dimension(2), intent(out) :: q
        real(default), dimension(2), intent(in) :: x
        real(default) :: ct, st, phi
        type(lorentz_transformation_t) :: rot
        integer :: i
        ct = 1 - 2*x(1)
        st = sqrt (1 - ct**2)
        phi = twopi * x(2)
        rot = rotation (phi, 3) * rotation (ct, st, 2)
        do i = 1, 2
            q(i) = rot * p(i)
        end do
    end subroutine compute_kinematics_solid_angle

```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from  $q(1)$  alone.  $p$  is unused.

```

<PHS base: public>+≡
    public :: inverse_kinematics_solid_angle

<PHS base: procedures>+≡
    subroutine inverse_kinematics_solid_angle (p, q, x)
        type(vector4_t), dimension(:), intent(in) :: p
        type(vector4_t), dimension(2), intent(in) :: q
        real(default), dimension(2), intent(out) :: x
        real(default) :: ct, phi
        ct = polar_angle_ct (q(1))
        phi = azimuthal_angle (q(1))
        x(1) = (1 - ct) / 2
        x(2) = phi / twopi
    end subroutine inverse_kinematics_solid_angle

```

### 18.1.6 Auxiliary stuff

The `pacify` subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. This is useful for numerical checks.

```
<PHS base: public>+≡
    public :: pacify

<PHS base: interfaces>+≡
    interface pacify
        module procedure pacify_phs
    end interface pacify

<PHS base: procedures>+≡
    subroutine pacify_phs (phs)
        class(phs_t), intent(inout) :: phs
        if (phs%p_defined) then
            call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
            call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
        end if
        if (phs%q_defined) then
            call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
        end if
    end subroutine pacify_phs
```

### 18.1.7 Unit tests

    <PHS base: tests>

    <PHS base: test auxiliary>

end module phs_base_util

API: driver for the unit tests below.
<PHS base: public test>≡
    public :: phs_base_test
<PHS base: test driver>≡
    subroutine phs_base_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <PHS base: execute tests>
    end subroutine phs_base_test

```

## Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

```

<PHS base: public test auxiliary>≡
    public :: init_test_process_data
<PHS base: test auxiliary>≡
    subroutine init_test_process_data (id, data)
        type(process_constants_t), intent(out) :: data
        type(string_t), intent(in), optional :: id
        if (present (id)) then
            data%id = id
        else

```

```

        data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 2
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state = 25
end subroutine init_test_process_data

```

This is the variant for a decay process.

```

<PHS base: public test auxiliary>+≡
    public :: init_test_decay_data

<PHS base: test auxiliary>+≡
    subroutine init_test_decay_data (id, data)
        type(process_constants_t), intent(out) :: data
        type(string_t), intent(in), optional :: id
        if (present (id)) then
            data%id = id
        else
            data%id = "testproc"
        end if
        data%model_name = "Test"
        data%n_in = 1
        data%n_out = 2
        data%n_flv = 1
        allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
        data%flv_state(:,1) = [25, 6, -6]
    end subroutine init_test_decay_data

```

## Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

```

<PHS base: public test auxiliary>+≡
    public :: phs_test_config_t

<PHS base: test types>≡
    type, extends (phs_config_t) :: phs_test_config_t
        logical :: create_equivalences = .false.
    contains
        procedure :: final => phs_test_config_final
        procedure :: write => phs_test_config_write
        procedure :: configure => phs_test_config_configure
        procedure :: startup_message => phs_test_config_startup_message
        procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t

```

The finalizer is empty.

```

<PHS base: test auxiliary>+≡
    subroutine phs_test_config_final (object)
        class(phs_test_config_t), intent(inout) :: object
    end subroutine

```

```
end subroutine phs_test_config_final
```

The `cm_frame` parameter is not tested here; we defer this to the `phs.single` implementation.

*(PHS base: test auxiliary)*+≡

```
subroutine phs_test_config_write (object, unit)

  end associate
  associate (eq => channel%eq(2))
    eq%c = 2; eq%perm = [2, 1]; eq%mode = [EQ_INVARIANT, EQ_IDENTITY]
  end associate
end associate
end subroutine setup_test_equivalences

```

Ditto, for channel properties.

```

<PHS base: test auxiliary>+≡
subroutine setup_test_channel_props (phs_config)
  class(phs_test_config_t), intent(inout) :: phs_config
  associate (channel => phs_config%channel(2))
    call channel%set_resonant (140._default, 3.1415_default)
  end associate
end subroutine setup_test_channel_props

```

Startup message

```

<PHS base: test auxiliary>+≡
subroutine phs_test_config_startup_message (phs_config, unit)
  class(phs_test_config_t), intent(in) :: phs_config
  integer, intent(in), optional :: unit
  call phs_config%base_startup_message (unit)
  write (msg_buffer, "(A)") "Phase space: Test"
  call msg_message (unit = unit)
end subroutine phs_test_config_startup_message

```

The instance type that matches `phs_test_config_t` is `phs_test_t`.

```

<PHS base: test auxiliary>+≡
subroutine phs_test_config_allocate_instance (phs)
  class(phs_t), intent(inout), pointer :: phs
  allocate (phs_test_t :: phs)
end subroutine phs_test_config_allocate_instance

```

## Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates  $\cos \theta$  and  $\phi$  uniformly, in the other channel we map the  $r_1$  parameter which belongs to  $\cos \theta$ .

We should store the mass parameter that we need.

```

<PHS base: public test auxiliary>+≡
public :: phs_test_t

```

```

<PHS base: test types>+≡
  type, extends (phs_t) :: phs_test_t
    real(default) :: m = 0
    real(default), dimension(:), allocatable :: x
  contains
    <PHS base: phs test: TBP>
  end type phs_test_t

```

Output. The specific data are displayed only if `verbose` is set.

```

<PHS base: phs test: TBP>≡
  procedure :: write => phs_test_write

<PHS base: test auxiliary>+≡
  subroutine phs_test_write (object, unit, verbose)
    class(phs_test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    logical :: verb
    u = given_output_unit (unit)
    verb = .false.; if (present (verbose)) verb = verbose
    if (verb) then
      write (u, "(1x,A)") "Partonic phase space: data"
      write (u, "(3x,A," // FMT_19 // ")") "m = ", object%m
    end if
    call object%base_write (u)
  end subroutine phs_test_write

```

The finalizer is empty.

```

<PHS base: phs test: TBP>+≡
  procedure :: final => phs_test_final

<PHS base: test auxiliary>+≡
  subroutine phs_test_final (object)
    class(phs_test_t), intent(inout) :: object
  end subroutine phs_test_final

```

Initialization: set the mass value.

```

<PHS base: phs test: TBP>+≡
  procedure :: init => phs_test_init

<PHS base: test auxiliary>+≡
  subroutine phs_test_init (phs, phs_config)
    class(phs_test_t), intent(out) :: phs
    class(phs_config_t), intent(in), target :: phs_config
    call phs%base_init (phs_config)
    phs%m = phs%config%flv(1,1)%get_mass ()
    allocate (phs%x (phs_config%n_par), source = 0._default)
  end subroutine phs_test_init

```

Evaluation. In channel 1, we uniformly generate  $\cos\theta$  and  $\phi$ , with Jacobian normalized to one. In channel 2, we prepend a mapping  $r_1 \rightarrow r_1^{(1/3)}$  with Jacobian  $f = 3r_1^2$ .

The component `x` is allocated in the first subroutine, used and deallocated in the second one.

## 18.2 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for  $1 \rightarrow 2$  decays or for  $2 \rightarrow 2$  scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic  $2 \rightarrow 2$  situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

```
<phs_single.f90>≡  
  <File header>  
  
  module phs_single  
  
    <Use kinds>  
    use io_units

    end subroutine phs_single_config_allocate_instance

```

## 18.2.2 Kinematics implementation

We generate  $\cos\theta$  and  $\phi$  uniformly, covering the solid angle.

Note: The incoming momenta must be in the c.m. system.

```

<PHS single: public>+≡
    public :: phs_single_t
<PHS single: types>+≡
    type, extends (phs_t) :: phs_single_t
        contains
        <PHS single: phs single: TBP>
    end type phs_single_t

```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

```

<PHS single: phs single: TBP>≡
  procedure :: write => phs_single_write

<PHS single: procedures>+≡
  subroutine phs_single_write (object, unit, verbose)
    class(phs_single_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    call object%base_write (u)
  end subroutine phs_single_write

```

The finalizer is empty.

```

<PHS single: phs single: TBP>+≡
  procedure :: final => phs_single_final

<PHS single: procedures>+≡
  subroutine phs_single_final (object)
    class(phs_single_t), intent(inout) :: object
  end subroutine phs_single_final

```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \quad (18.5)$$

For a decay with nonvanishing masses ( $m_3, m_4$ ), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (18.6)$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (18.7)$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying  $\hat{s}$ .

```

<PHS single: phs single: TBP>+≡
  procedure :: init => phs_single_init

<PHS single: procedures>+≡
  subroutine phs_single_init (phs, phs_config)
    class(phs_single_t), intent(out) :: phs
    class(phs_config_t), intent(in), target :: phs_config
    call phs%base_init (phs_config)
    phs%volume = 1 / (4 * twopi5)
    call phs%compute_factor ()
  end subroutine phs_single_init

```

Compute the correction factor for nonzero masses. We do this during initialization (when the incoming momenta  $\mathbf{p}$  are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

```

<PHS single: phs single: TBP>+≡
  procedure :: compute_factor => phs_single_compute_factor

## 18.3 Mappings

Mappings are objects that encode the transformation of the interval  $(0,1)$  to a physical variable  $m^2$  or  $\cos\theta$  (and back), as it is used in the phase space parameterization. The mapping objects contain fixed parameters, the associated methods implement the mapping and inverse mapping operations, including the computation of the Jacobian (phase space factor).

```
<mappings.f90>≡  
  <File header>  
  
  module mappings  
  
    <Use kinds>  
    use kinds, only: TC  
    <Use strings>  
    use io_units  
    use constants, only: pi  
    use format_defs, only: FMT_19  
    use diagnostics  
    use md5  
    use model_data  
    use flavors  
  
    <Standard module head>  
  
    <Mappings: public>  
  
    <Mappings: parameters>  
  
    <Mappings: types>  
  
    <Mappings: interfaces>  
  
    contains  
  
    <Mappings: procedures>  
  
  end module mappings
```

### 18.3.1 Default parameters

This type holds the default parameters, needed for setting the scale in cases where no mass parameter is available. The contents are public.

```
<Mappings: public>≡  
  public :: mapping_defaults_t  
  
<Mappings: types>≡  
  type :: mapping_defaults_t

    end function mapping_defaults_md5sum

```

### 18.3.2 The Mapping type

Each mapping has a type (e.g., s-channel, infrared), a binary code (redundant, but useful for debugging), and a reference particle. The flavor code of this particle is stored for bookkeeping reasons, what matters are the mass and width of this particle. Furthermore, depending on the type, various mapping parameters can be set and used.

The parameters **a1** to **a3** (for  $m^2$  mappings) and **b1** to **b3** (for  $\cos \theta$  mappings) are values that are stored once to speed up the calculation, if **variable\_limits** is false. The exact meaning of these parameters depends on the mapping type. The limits are fixed if there is a fixed c.m. energy.

```

<Mappings: public>+≡
    public :: mapping_t

<Mappings: types>+≡
    type :: mapping_t
    private
        integer :: type = NO_MAPPING
        integer(TC) :: bincode
        type(flavor_t) :: flv
        real(default) :: mass = 0
        real(default) :: width = 0
        logical :: a_unknown = .true.
        real(default) :: a1 = 0
        real(default) :: a2 = 0
        real(default) :: a3 = 0
        logical :: b_unknown = .true.
        real(default) :: b1 = 0
        real(default) :: b2 = 0
        real(default) :: b3 = 0
        logical :: variable_limits = .true.
    end type mapping_t

```

The valid mapping types. The extra type **STEP\_MAPPING** is used only internally.

```

<Mappings: parameters>≡
    <Mapping modes>

```

### 18.3.3 Screen output

Do not write empty mappings.

```

<Mappings: public>+≡
    public :: mapping_write

<Mappings: procedures>+≡
    subroutine mapping_write (map, unit, verbose)
        type(mapping_t), intent(in) :: map
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        character(len=9) :: str
        u = given_output_unit (unit); if (u < 0) return
        select case(map%type)
        case(S_CHANNEL); str = "s_channel"

```

```

case(COLLINEAR); str = "collinear"

case(U_CHANNEL); str = "u_channel"
case(STEP_MAPPING_E); str = "step_exp"
case(STEP_MAPPING_H); str = "step_hyp"
case(ON_SHELL); str = "on_shell"
case default; str = "??????"
end select
if (map%type /= NO_MAPPING) then
  write (u, '(1x,A,I4,A)') &
    "Branch #", map%bincode, ": " // &
    "Mapping (" // str // ") for particle " // &
    "' ' // char (map%flv%get_name ()) // ' '"
  if (present (verbose)) then
    if (verbose) then
      select case (map%type)
      case (S_CHANNEL, RADIATION, STEP_MAPPING_E, STEP_MAPPING_H)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " m/w = ", map%mass, map%width
      case default
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " m = ", map%mass
      end select
      select case (map%type)
      case (S_CHANNEL, T_CHANNEL, U_CHANNEL, &
        STEP_MAPPING_E, STEP_MAPPING_H, &
        COLLINEAR, INFRARED, RADIATION)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " a1/2/3 = ", map%a1, map%a2, map%a3
      end select
      select case (map%type)
      case (T_CHANNEL, U_CHANNEL, COLLINEAR)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " b1/2/3 = ", map%b1, map%b2, map%b3
      end select
    end if
  end if
end if
end subroutine mapping_write

```

### 18.3.4 Define a mapping

The initialization routine sets the mapping type and the particle (binary code and flavor code) for which the mapping applies (e.g., a  $Z$  resonance in branch #3). We only need the absolute value of the flavor code.

*(Mappings: public)*+≡

public :: mapping\_init

*(Mappings: procedures)*+≡

```

subroutine mapping_init (mapping, bincode, type, f, model)
  type(mapping_t), intent(inout) :: mapping

```

```

integer(TC), intent(in) :: bincode
type(string_t), intent(in) :: type
integer, intent(in), optional :: f
class(model_data_t), intent(in), optional, target :: model
mapping%bincode = bincode
select case (char (type))
case ("s_channel"); mapping%type = S_CHANNEL
case ("collinear"); mapping%type = COLLINEAR
case ("infrared"); mapping%type = INFRARED
case ("radiation"); mapping%type = RADIATION
case ("t_channel"); mapping%type = T_CHANNEL
case ("u_channel"); mapping%type = U_CHANNEL
case ("step_exp"); mapping%type = STEP_MAPPING_E
case ("step_hyp"); mapping%type = STEP_MAPPING_H
case ("on_shell"); mapping%type = ON_SHELL
case default
    call msg_bug ("Mappings: encountered undefined mapping key '" &
        // char (type) // "'")
end select
if (present (f) .and. present (model)) &
    call mapping%flv%init (abs (f), model)
end subroutine mapping_init

```

This sets the actual mass and width, using a parameter set. Since the auxiliary parameters will only be determined when the mapping is first called, they are marked as unknown.

```

<Mappings: public>+≡
    public :: mapping_set_parameters

<Mappings: procedures>+≡
    subroutine mapping_set_parameters (map, mapping_defaults, variable_limits)
        type(mapping_t), intent(inout) :: map
        type(mapping_defaults_t), intent(in) :: mapping_defaults
        logical, intent(in) :: variable_limits
        if (map%type /= NO_MAPPING) then
            map%mass = map%flv%get_mass ()
            map%width = map%flv%get_width ()
            map%variable_limits = variable_limits
            map%a_unknown = .true.
            map%b_unknown = .true.
            select case (map%type)
            case (S_CHANNEL)
                if (map%mass <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive mass")
                else if (map%width <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive width")
                end if
            case (RADIATION)
                map%width = max (map%width, mapping_defaults%energy_scale)
            case (INFRARED, COLLINEAR)

```

```

        map%mass = max (map%mass, mapping_defaults%invariant_mass_scale)
    case (T_CHANNEL, U_CHANNEL)
        map%mass = max (map%mass, mapping_defaults%momentum_transfer_scale)
    end select
end if
end subroutine mapping_set_parameters

```

For a step mapping the mass and width are set directly, instead of being determined from the flavor parameter (which is meaningless here). They correspond to the effective upper bound of phase space due to a resonance, as opposed to the absolute upper bound.

            equal = .false.
        end if
    end function mapping_equal

```

### 18.3.7 Mappings of the invariant mass

Inserting an  $x$  value between 0 and 1, we want to compute the corresponding invariant mass  $m^2(x)$  and the jacobian, aka phase space factor  $f(x)$ . We also need the reverse operation.

In general, the phase space factor  $f$  is defined by

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx \frac{1}{s} \frac{dm^2}{dx} g(m^2(x)) = \int_0^1 dx f(x) g(x), \quad (18.8)$$

where thus

$$f(x) = \frac{1}{s} \frac{dm^2}{dx}. \quad (18.9)$$

With this mapping, a function of the form

$$g(m^2) = c \frac{dx(m^2)}{dm^2} \quad (18.10)$$

is mapped to a constant:

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx f(x) g(m^2(x)) = \int_0^1 dx \frac{c}{s}. \quad (18.11)$$

Here is the mapping routine. Input are the available energy squared  $s$ , the limits for  $m^2$ , and the  $x$  value. Output are the  $m^2$  value and the phase space factor  $f$ .

```

    case default
      call msg_fatal ( " Attempt to apply undefined msq mapping")
    end select
  end subroutine mapping_compute_x_from_msq

```

### Trivial mapping

We simply map the boundaries of the interval  $(m_{\min}, m_{\max})$  to  $(0, 1)$ :

$$m^2 = (1 - x)m_{\min}^2 + xm_{\max}^2; \quad (18.12)$$

the inverse is

$$x = \frac{m^2 - m_{\min}^2}{m_{\max}^2 - m_{\min}^2}. \quad (18.13)$$

Hence

$$f(x) = \frac{m_{\max}^2 - m_{\min}^2}{s}, \quad (18.14)$$

and we have, as required,

$$f(x) \frac{dx}{dm^2} = \frac{1}{s}. \quad (18.15)$$

We store the constant parameters the first time the mapping is called – or, if limits vary, recompute them each time.

```

⟨Constants for trivial msq mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a1 = 0
    map%a2 = msq_max - msq_min
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply trivial msq mapping⟩≡
  msq = (1-x) * msq_min + x * msq_max
  f = map%a3

⟨Apply inverse trivial msq mapping⟩≡
  if (map%a2 /= 0) then
    x = (msq - msq_min) / map%a2
  else
    x = 0
  end if
  f = map%a3

```

Resonance or step mapping does not make much sense if the resonance mass is outside the kinematical bounds. If this is the case, revert to `NO_MAPPING`. This is possible even if the kinematical bounds vary from event to event.

```

⟨Modify mapping type if necessary⟩≡
  select case (type)
  case (S_CHANNEL, STEP_MAPPING_E, STEP_MAPPING_H)
    msq0 = map%mass**2
    if (msq0 < msq_min .or. msq0 > msq_max) type = NO_MAPPING
  end select

```

### Breit-Wigner mapping

A Breit-Wigner resonance with mass  $M$  and width  $\Gamma$  is flattened by the following mapping:

This mapping does not make much sense if the resonance mass is too low. If this is the case, revert to `NO_MAPPING`. There is a tricky point with this if the

mass is too high: `msq_max` is not a constant if structure functions are around. However, switching the type depending on the overall energy does not change the integral, it is just another branching point.

$$m^2 = M(M + t\Gamma), \quad (18.16)$$

where

$$t = \tan \left[ (1-x) \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} + x \arctan \frac{m_{\max}^2 - M^2}{M\Gamma} \right]. \quad (18.17)$$

The inverse:

$$x = \frac{\arctan \frac{m^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}}{\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}} \quad (18.18)$$

The phase-space factor of this transformation is

$$f(x) = \frac{M\Gamma}{s} \left( \arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} \right) (1 + t^2). \quad (18.19)$$

This maps any function proportional to

$$g(m^2) = \frac{M\Gamma}{(m^2 - M^2)^2 + M^2\Gamma^2} \quad (18.20)$$

to a constant times  $1/s$ .

```

⟨Constants for s-channel resonance mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    msq0 = map%mass ** 2
    map%a1 = atan ((msq_min - msq0) / (map%mass * map%width))
    map%a2 = atan ((msq_max - msq0) / (map%mass * map%width))
    map%a3 = (map%a2 - map%a1) * (map%mass * map%width) / s
    map%a_unknown = .false.
  end if

⟨Apply s-channel resonance mapping⟩≡
  z = (1-x) * map%a1 + x * map%a2
  if (-pi/2 < z .and. z < pi/2) then
    tmp = tan (z)
    msq = map%mass * (map%mass + map%width * tmp)
    f = map%a3 * (1 + tmp**2)
  else
    msq = 0
    f = 0
  end if

⟨Apply inverse s-channel resonance mapping⟩≡
  tmp = (msq - msq0) / (map%mass * map%width)
  x = (atan (tmp) - map%a1) / (map%a2 - map%a1)
  f = map%a3 * (1 + tmp**2)

```

### Mapping for massless splittings

This mapping accounts for approximately scale-invariant behavior where  $\ln M^2$  is evenly distributed.

$$m^2 = m_{\min}^2 + M^2 (\exp(xL) - 1) \quad (18.21)$$

where

$$L = \ln \left( \frac{m_{\max}^2 - m_{\min}^2}{M^2} + 1 \right). \quad (18.22)$$

The inverse:

$$x = \frac{1}{L} \ln \left( \frac{m^2 - m_{\min}^2}{M^2} + 1 \right) \quad (18.23)$$

The constant  $M$  is a characteristic scale. Above this scale ( $m^2 - m_{\min}^2 \gg M^2$ ), this mapping behaves like  $x \propto \ln m^2$ , while below the scale it reverts to a linear mapping.

The phase-space factor is

$$f(x) = \frac{M^2}{s} \exp(xL) L. \quad (18.24)$$

A function proportional to

$$g(m^2) = \frac{1}{(m^2 - m_{\min}^2) + M^2} \quad (18.25)$$

is mapped to a constant, i.e., a simple pole near  $m_{\min}$  with a regulator mass  $M$ .

This type of mapping is useful for massless collinear and infrared singularities, where the scale is stored as the mass parameter. In the radiation case (IR radiation off massive particle), the heavy particle width is the characteristic scale.

```

⟨Constants for s-channel pole mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    if (type == RADIATION) then
      msq0 = map%width**2
    else
      msq0 = map%mass**2
    end if
    map%a1 = msq0
    map%a2 = log ((msq_max - msq_min) / msq0 + 1)
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply s-channel pole mapping⟩≡
  msq1 = map%a1 * exp (x * map%a2)
  msq = msq1 - map%a1 + msq_min
  f = map%a3 * msq1

⟨Apply inverse s-channel pole mapping⟩≡
  msq1 = msq - msq_min + map%a1
  x = log (msq1 / map%a1) / map%a2
  f = map%a3 * msq1

```

### Mapping for t-channel poles

This is also approximately scale-invariant, and we use the same type of mapping as before. However, we map  $1/x$  singularities at both ends of the interval; again, the mapping becomes linear when the distance is less than  $M^2$ :

$$m^2 = \begin{cases} m_{\min}^2 + M^2 (\exp(xL) - 1) & \text{for } 0 < x < \frac{1}{2} \\ m_{\max}^2 - M^2 (\exp((1-x)L) - 1) & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (18.26)$$

where

$$L = 2 \ln \left( \frac{m_{\max}^2 - m_{\min}^2}{2M^2} + 1 \right). \quad (18.27)$$

The inverse:

$$x = \begin{cases} \frac{1}{L} \ln \left( \frac{m^2 - m_{\min}^2}{M^2} + 1 \right) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1 - \frac{1}{L} \ln \left( \frac{m_{\max}^2 - m^2}{M^2} + 1 \right) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (18.28)$$

The phase-space factor is

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L. & \text{for } 0 < x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L. & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (18.29)$$

A (continuous) function proportional to

$$g(m^2) = \begin{cases} 1/(m^2 - m_{\min}^2) + M^2 & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1/((m_{\max}^2 - m^2) + M^2) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (18.30)$$

is mapped to a constant by this mapping, i.e., poles near both ends of the interval.

```

⟨Constants for t-channel pole mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    msq0 = map%mass**2
    map%a1 = msq0
    map%a2 = 2 * log ((msq_max - msq_min)/(2*msq0) + 1)
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply t-channel pole mapping⟩≡
  if (x < .5_default) then
    msq1 = map%a1 * exp (x * map%a2)
    msq = msq1 - map%a1 + msq_min
  else
    msq1 = map%a1 * exp ((1-x) * map%a2)
    msq = -(msq1 - map%a1) + msq_max
  end if
  f = map%a3 * msq1

⟨Apply inverse t-channel pole mapping⟩≡
  if (msq < (msq_max + msq_min)/2) then
    msq1 = msq - msq_min + map%a1
    x = log (msq1/map%a1) / map%a2

```

```

else
  msq1 = msq_max - msq + map%a1
  x = 1 - log (msq1/map%a1) / map%a2
end if
f = map%a3 * msq1

```

### 18.3.8 Step mapping

Step mapping is useful when the allowed range for a squared-mass variable is large, but only a fraction at the lower end is populated because the particle in question is an (off-shell) decay product of a narrow resonance. I.e., if the resonance was forced to be on-shell, the upper end of the range would be the resonance mass, minus the effective (real or resonance) mass of the particle(s) in the sibling branch of the decay.

The edge of this phase space section has a width which is determined by the width of the parent, plus the width of the sibling branch. (The widths might be added in quadrature, but this precision is probably not important.)

#### Fermi function

A possible mapping is derived from the Fermi function which has precisely this behavior. The Fermi function is given by

$$f(x) = \frac{1}{1 + \exp \frac{x-\mu}{\gamma}} \quad (18.31)$$

where  $x$  is taken as the invariant mass squared,  $\mu$  is the invariant mass squared of the edge, and  $\gamma$  is the effective width which is given by the widths of the parent and the sibling branch. (Widths might be added in quadrature, but we do not require this level of precision.)

$$x = \frac{m^2 - m_{\min}^2}{\Delta m^2} \quad (18.32)$$

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (18.33)$$

$$\gamma = \frac{2m_{\max, \text{eff}}\Gamma}{\Delta m^2} \quad (18.34)$$

with

$$\Delta m^2 = m_{\max}^2 - m_{\min}^2 \quad (18.35)$$

$m^2$  is thus given by

$$m^2(x) = xm_{\max}^2 + (1-x)m_{\min}^2 \quad (18.36)$$

For the mapping, we compute the integral  $g(x)$  of the Fermi function, normalized such that  $g(0) = 0$  and  $g(1) = 1$ . We introduce the abbreviations

$$\alpha = 1 - \gamma \ln \frac{1 + \beta e^{1/\gamma}}{1 + \beta} \quad (18.37)$$

$$\beta = e^{-\mu/\gamma} \quad (18.38)$$

and obtain

$$g(x) = \frac{1}{\alpha} \left( x - \gamma \ln \frac{1 + \beta e^{x/\gamma}}{1 + \beta} \right) \quad (18.39)$$

The actual mapping is the inverse function  $h(y) = g^{-1}(y)$ ,

$$h(y) = -\gamma \ln \left( e^{-\alpha y/\gamma} (1 + \beta) - \beta \right) \quad (18.40)$$

The Jacobian is

$$\frac{dh}{dy} = \alpha \left( 1 - e^{\alpha y/\gamma} \frac{\beta}{1 + \beta} \right)^{-1} \quad (18.41)$$

which is equal to  $1/(dg/dx)$ , namely

$$\frac{dg}{dx} = \frac{1}{\alpha} \frac{1}{1 + \beta e^{x/\gamma}} \quad (18.42)$$

The final result is

$$\int_{m_{\min}^2}^{m_{\max}^2} dm^2 F(m^2) = \Delta m^2 \int_0^1 dx F(m^2(x)) \quad (18.43)$$

$$= \Delta m^2 \int_0^1 dy F(m^2(h(y))) \frac{dh}{dy} \quad (18.44)$$

Here is the implementation. We fill `a1`, `a2`, `a3` with  $\alpha, \beta, \gamma$ , respectively.

```

```

## Hyperbolic mapping

The Fermi function has the drawback that it decreases exponentially. It might be preferable to take a function with a power-law decrease, such that the high-mass region is not completely depopulated.

Here, we start with the actual mapping which we take as

$$h(y) = \frac{b}{a - y} - \frac{b}{a} + \mu y \quad (18.45)$$

with the abbreviation

$$a = \frac{1}{2} \left( 1 + \sqrt{1 + \frac{4b}{1-\mu}} \right) \quad (18.46)$$

This is a hyperbola in the  $xy$  plane. The derivative is

$$\frac{dh}{dy} = \frac{b}{(a-y)^2} + \mu \quad (18.47)$$

The constants correspond to

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (18.48)$$

$$b = \frac{1}{\mu} \left( \frac{2m_{\max, \text{eff}} \Gamma}{\Delta m^2} \right)^2 \quad (18.49)$$

The inverse function is the solution of a quadratic equation,

$$g(x) = \frac{1}{2} \left[ \left( a + \frac{x}{\mu} + \frac{b}{a\mu} \right) - \sqrt{\left( a - \frac{x}{\mu} \right)^2 + 2 \frac{b}{a\mu} \left( a + \frac{x}{\mu} \right) + \left( \frac{b}{a\mu} \right)^2} \right] \quad (18.50)$$

The constants  $a_{1,2,3}$  are identified with  $a, b, \mu$ .

```

                + tmp**2)) / 2
  f = (map%a2 / (map%a1 - x)**2 + map%a3) * (msq_max - msq_min) / s

```

### 18.3.9 Mappings of the polar angle

The other type of singularity, a simple pole just outside the integration region, can occur in the integration over  $\cos \theta$ . This applies to exchange of massless (or light) particles.

Double poles (Coulomb scattering) are also possible, but only in certain cases. These are also handled by the single-pole mapping.

The mapping is analogous to the previous  $m^2$  pole mapping, but with a different normalization and notation of variables:

$$\frac{1}{2} \int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx \frac{d \cos \theta}{dx} g(\theta(x)) = \int_0^1 dx f(x) g(x), \quad (18.51)$$

where thus

$$f(x) = \frac{1}{2} \frac{d \cos \theta}{dx}. \quad (18.52)$$

With this mapping, a function of the form

$$g(\theta) = c \frac{dx(\cos \theta)}{d \cos \theta} \quad (18.53)$$

is mapped to a constant:

$$\int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx f(x) g(\theta(x)) = \int_0^1 dx c. \quad (18.54)$$

```

```

### Trivial mapping

This is just the mapping of the interval  $(-1, 1)$  to  $(0, 1)$ :

$$\cos \theta = -1 + 2x \quad (18.55)$$

and

$$f(x) = 1 \quad (18.56)$$

with the inverse

$$x = \frac{1 + \cos \theta}{2} \quad (18.57)$$

```

<Apply trivial ct mapping>≡
  tmp = 2 * (1-x)
  ct = 1 - tmp
  st = sqrt (tmp * (2-tmp))
  f = 1
<Apply inverse trivial ct mapping>≡
  x = (ct + 1) / 2
  f = 1

```

### Pole mapping

As above for  $m^2$ , we simultaneously map poles at both ends of the  $\cos \theta$  interval. The formulae are completely analogous:

$$\cos \theta = \begin{cases} \frac{M^2}{s} [\exp(xL) - 1] - 1 & \text{for } x < \frac{1}{2} \\ -\frac{M^2}{s} [\exp((1-x)L) - 1] + 1 & \text{for } x \geq \frac{1}{2} \end{cases} \quad (18.58)$$

where

$$L = 2 \ln \frac{M^2 + s}{M^2}. \quad (18.59)$$

Inverse:

$$x = \begin{cases} \frac{1}{2L} \ln \frac{1 + \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta < 0 \\ 1 - \frac{1}{2L} \ln \frac{1 - \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta \geq 0 \end{cases} \quad (18.60)$$

The phase-space factor:

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L & \text{for } x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L & \text{for } x \geq \frac{1}{2} \end{cases} \quad (18.61)$$

```

<Constants for ct pole mapping>≡
  if (map%variable_limits .or. map%b_unknown) then

```

```

        map%b1 = map%mass**2 / s
        map%b2 = log ((map%b1 + 1) / map%b1)
        map%b3 = 0
        map%b_unknown = .false.
    end if

    <Apply ct pole mapping>≡
    if (x < .5_default) then
        ct1 = map%b1 * exp (2 * x * map%b2)
        ct = ct1 - map%b1 - 1
    else
        ct1 = map%b1 * exp (2 * (1-x) * map%b2)
        ct = -(ct1 - map%b1) + 1
    end if
    if (ct >= -1 .and. ct <= 1) then
        st = sqrt (1 - ct**2)
        f = ct1 * map%b2
    else
        ct = 1;  st = 0;  f = 0
    end if

    <Apply inverse ct pole mapping>≡
    if (ct < 0) then
        ct1 = ct + map%b1 + 1
        x = log (ct1 / map%b1) / (2 * map%b2)
    else
        ct1 = -ct + map%b1 + 1
        x = 1 - log (ct1 / map%b1) / (2 * map%b2)
    end if
    f = ct1 * map%b2

```

## 18.4 Phase-space trees

The phase space evaluation is organized in terms of trees, where each branch corresponds to three integrations:  $m^2$ ,  $\cos\theta$ , and  $\phi$ . The complete tree thus makes up a specific parameterization of the multidimensional phase-space integral. For the multi-channel integration, the phase-space tree is a single channel.

The trees imply mappings of formal Feynman tree graphs into arrays of integer numbers: Each branch, corresponding to a particular line in the graph, is assigned an integer code  $c$  (with kind value  $\text{TC} = \text{tree code}$ ).

In this integer, each bit determines whether a particular external momentum flows through the line. The external branches therefore have codes 1, 2, 4, 8, ... An internal branch has those bits ORed corresponding to the momenta flowing through it. For example, a branch with momentum  $p_1 + p_4$  has code  $2^0 + 2^3 = 1 + 8 = 9$ .

There is a two-fold ambiguity: Momentum conservation implies that the branch with code

$$c_0 = \sum_{i=1}^{n(\text{ext})} 2^{i-1} \quad (18.62)$$

i.e. the branch with momentum  $p_1 + p_2 + \dots p_n$  has momentum zero, which is equivalent to tree code 0 by definition. Correspondingly,

$$c \quad \text{and} \quad c_0 - c = c \text{ XOR } c_0 \quad (18.63)$$

are equivalent. E.g., if there are five externals with codes  $c = 1, 2, 4, 8, 16$ , then  $c = 9$  and  $\bar{c} = 31 - 9 = 22$  are equivalent.

This ambiguity may be used to assign a direction to the line: If all momenta are understood as outgoing,  $c = 9$  in the example above means  $p_1 + p_4$ , but  $c = 22$  means  $p_2 + p_3 + p_5 = -(p_1 + p_4)$ .

Here we make use of the ambiguity in a slightly different way. First, the initial particles are singled out as those externals with the highest bits, the IN-bits. (Here: 8 and 16 for a  $2 \rightarrow 3$  scattering process, 16 only for a  $1 \rightarrow 4$  decay.) Then we invert those codes where all IN-bits are set. For a decay process this maps each tree of an equivalence class onto a unique representative (that one with the smallest integer codes). For a scattering process we proceed further:

The ambiguity remains in all branches where only one IN-bit is set, including the initial particles. If there are only externals with this property, we have an  $s$ -channel graph which we leave as it is. In all other cases, an internal with only one IN-bit is a  $t$ -channel line, which for phase space integration should be associated with one of the initial momenta as a reference axis. We take that one whose bit is set in the current tree code. (E.g., for branch  $c = 9$  we use the initial particle  $c = 8$  as reference axis, whereas for the same branch we would take  $c = 16$  if it had been assigned  $\bar{c} = 31 - 9 = 22$  as tree code.) Thus, different ways of coding the same  $t$ -channel graph imply different phase space parameterizations.

$s$ -channel graphs have a unique parameterization. The same sets of parameterizations are used for  $t$ -channel graphs, except for the reference frames of their angular parts. We map each  $t$ -channel graph onto an  $s$ -channel graph as follows:

Working in ascending order, for each  $t$ -channel line (whose code has exactly one IN-bit set) the attached initial line is flipped upstream, while the outgoing

line is flipped downstream. (This works only if  $t$ -channel graphs are always parameterized beginning at their outer vertices, which we require as a restriction.) After all possible flips have been applied, we have an  $s$ -channel graph. We only have to remember the initial particle a vertex was originally attached to.

## 18.4.2 The phase-space tree type

### Definition

In the concrete implementation, each branch  $c$  may have two *daughters*  $c_1$  and  $c_2$  such that  $c_1 + c_2 = c$ , a *sibling*  $c_s$  and a *mother*  $c_m$  such that  $c + c_s = c_m$ , and a *friend* which is kept during flips, such that it can indicate a fixed reference frame. Absent entries are set  $c = 0$ .

First, declare the branch type. There is some need to have this public. Give initializations for all components, so no `init` routine is necessary. The branch has some information about the associated coordinates and about connections.

```

(PHS trees: types)+≡
  type :: phs_branch_t
    private
    logical :: set = .false.
    logical :: inverted_decay = .false.
    logical :: inverted_axis = .false.
    integer(TC) :: mother = 0
    integer(TC) :: sibling = 0
    integer(TC) :: friend = 0
    integer(TC) :: origin = 0
    integer(TC), dimension(2) :: daughter = 0
    integer :: firstborn = 0
    logical :: has_children = .false.
    logical :: has_friend = .false.
    logical :: is_real = .false.
  end type phs_branch_t

```

The tree type: No initialization, this is done by `phs_tree_init`. In addition to the branch array which

The branches are collected in an array which holds all possible branches, of which only a few are set. After flips have been applied, the branch  $c_M = \sum_{i=1}^{n(\text{fin})} 2^{i-1}$  must be there, indicating the mother of all decay products. In addition, we should check for consistency at the beginning.

`n_branches` is the number of those actually set. `n externals` defines the number of significant bit, and `mask` is a code where all bits are set. Analogous: `n_in` and `mask_in` for the incoming particles.

The mapping array contains the mappings associated to the branches (corresponding indices). The array `mass_sum` contains the sum of the real masses of the external final-state particles associated to the branch. During phase-space evaluation, this determines the boundaries.

```

(PHS trees: public)+≡
  public :: phs_tree_t

(PHS trees: types)+≡
  type :: phs_tree_t
    private
    integer :: n_branches, n externals, n_in, n_msq, n_angles
    integer(TC) :: n_branches_tot, n_branches_out
    integer(TC) :: mask, mask_in, mask_out
    type(phs_branch_t), dimension(:), allocatable :: branch
    type(mapping_t), dimension(:), allocatable :: mapping
    real(default), dimension(:), allocatable :: mass_sum
    real(default), dimension(:), allocatable :: effective_mass
    real(default), dimension(:), allocatable :: effective_width
    logical :: real_phsp = .false.
    integer(TC) :: emitter = 0
    integer, dimension(:), allocatable :: momentum_link
  end type phs_tree_t

```

The maximum number of external particles that can be represented is related to the bit size of the integer that stores binary codes. With the default integer of 32 bit on common machines, this is more than enough space. If TC is actually the default integer kind, there is no need to keep it separate, but doing so marks this as a special type of integer. So, just state that the maximum number is 32:

```
<Limits: public parameters>≡
    integer, parameter, public :: MAX_EXTERNAL = 32
```

### Constructor and destructor

Allocate memory for a phase-space tree with given number of externals and incoming. The number of allocated branches can easily become large, but appears manageable for realistic cases, e.g., for `n_in=2` and `n_out=8` we get  $2^{10}-1 = 1023$ .

```
<PHS trees: public>+≡
    public :: phs_tree_init
    public :: phs_tree_final
```

Here we set the masks for incoming and for all externals.

```
<PHS trees: procedures>+≡
    elemental subroutine phs_tree_init (tree, n_in, n_out, n_masses, n_angles)
        type(phs_tree_t), intent(inout) :: tree
        integer, intent(in) :: n_in, n_out, n_masses, n_angles
        integer(TC) :: i
        tree%n_externals = n_in + n_out
        tree%n_branches_tot = 2**(n_in+n_out) - 1
        tree%n_branches_out = 2**n_out - 1
        tree%mask = 0
        do i = 0, n_in + n_out - 1
            tree%mask = ibset (tree%mask, i)
        end do
        tree%n_in = n_in
        tree%mask_in = 0
        do i = n_out, n_in + n_out - 1
            tree%mask_in = ibset (tree%mask_in, i)
        end do
        tree%mask_out = ieor (tree%mask, tree%mask_in)
        tree%n_msq = n_masses
        tree%n_angles = n_angles
        allocate (tree%branch (tree%n_branches_tot))
        tree%n_branches = 0
        allocate (tree%mapping (tree%n_branches_out))
        allocate (tree%mass_sum (tree%n_branches_out))
        allocate (tree%effective_mass (tree%n_branches_out))
        allocate (tree%effective_width (tree%n_branches_out))
    end subroutine phs_tree_init

    elemental subroutine phs_tree_final (tree)
        type(phs_tree_t), intent(inout) :: tree
        deallocate (tree%branch)
        deallocate (tree%mapping)
        deallocate (tree%mass_sum)
        deallocate (tree%effective_mass)
        deallocate (tree%effective_width)
```

```
end subroutine phs_tree_final
```

## Screen output

### 18.4.3 PHS tree setup

#### Transformation into an array of branch codes and back

Assume that the tree/array has been created before with the appropriate length and is empty.

```

<PHS trees: public>+≡
  public :: phs_tree_from_array

<PHS trees: procedures>+≡
  subroutine phs_tree_from_array (tree, a)
    type(phs_tree_t), intent(inout) :: tree
    integer(TC), dimension(:), intent(in) :: a
    integer :: i
    integer(TC) :: k

```

```

    <Set branches from array a>
    <Set external branches if necessary>
    <Check number of branches>
    <Determine the connections>
contains
    <Subroutine: set relatives>
end subroutine phs_tree_from_array

```

First, set all branches specified by the user. If all IN-bits are set, we invert the branch code.

```

<Set branches from array a>≡
do i=1, size(a)
  k = a(i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  tree%branch(k)%set = .true.
  tree%n_branches = tree%n_branches+1
end do

```

The external branches are understood, so set them now if not yet done. In all cases ensure that the representative with one bit set is used, except for decays where the in-particle is represented by all OUT-bits set instead.

```

<Set external branches if necessary>≡
do i=0, tree%n externals-1
  k = ibset(0,i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  if (tree%branch(ieor(tree%mask, k))%set) then
    tree%branch(ieor(tree%mask, k))%set = .false.
    tree%branch(k)%set = .true.
  else if (.not.tree%branch(k)%set) then
    tree%branch(k)%set = .true.
    tree%n_branches = tree%n_branches+1
  end if
end do

```

Now the number of branches set can be checked. Here we assume that the tree is binary. For three externals there are three branches in total, and for each additional external branch we get another internal one.

```

<Check number of branches>≡
if (tree%n_branches /= tree%n externals*2-3) then
  call phs_tree_write (tree)
  call msg_bug &
    & (" Wrong number of branches set in phase space tree")
end if

```

For all branches that are set, except for the externals, we try to find the daughter branches:

```

<Determine the connections>≡
do k=1, size (tree%branch)
  if (tree%branch(k)%set .and. tc_decay_level (k) /= 1) then
    call branch_set_relatives(k)
  end if
end do

```

To this end, we scan all codes less than the current code, whether we can find two branches which are set and which together give the current code. After that, the tree may still not be connected, but at least we know if a branch does not have daughters: This indicates some inconsistency.

The algorithm ensures that, at this stage, the first daughter has a smaller code value than the second one.

```

(Subroutine: set relatives)≡
subroutine branch_set_relatives (k)
  integer(TC), intent(in) :: k
  integer(TC) :: m,n
  do m=1, k-1
    if(iand(k,m)==m) then
      n = ieor(k,m)
      if ( tree%branch(m)%set .and. tree%branch(n)%set ) then
        tree%branch(k)%daughter(1) = m; tree%branch(k)%daughter(2) = n
        tree%branch(m)%mother      = k; tree%branch(n)%mother      = k
        tree%branch(m)%sibling     = n; tree%branch(n)%sibling     = m
        tree%branch(k)%has_children = .true.
      return
    end if
  end if
end do
call phs_tree_write (tree)
call msg_bug &
  & (" Missing daughter branch(es) in phase space tree")
end subroutine branch_set_relatives

```

The inverse: this is trivial, fortunately.

### Flip $t$ -channel into $s$ -channel

Flipping the tree is done upwards, beginning from the decay products. First we select a  $t$ -channel branch  $k$ : one which is set, which does have an IN-bit, and which is not an external particle.

Next, we determine the adjacent in-particle (called the 'friend'  $f$  here, since it will provide the reference axis for the angular integration). In addition, we look for the 'mother' and 'sibling' of this particle. If the latter field is empty, we select the (unique) other out-particle which has no mother, calling the internal subroutine `find_orphan`.

The flip is done as follows: We assume that the first daughter  $d$  is an  $s$ -channel line, which is true if the daughters are sorted. This will stay the first daughter. The second one is a  $t$ -channel line; it is exchanged with the 'sibling'  $s$ . The new line which replaces the branch  $k$  is just the sum of  $s$  and  $d$ . In addition, we have to rearrange the relatives of  $s$  and  $d$ , as well of  $f$ .

Finally, we flip 'sibling' and 'friend' and set the new  $s$ -channel branch  $n$  which replaces the  $t$ -channel branch  $k$ . After this is complete, we are ready to execute another flip.

[Although the friend is not needed for the final flip, since it would be an initial particle anyway, we need to know whether we have  $t$ - or  $u$ -channel.]

```

(PHS trees: public)+≡
public :: phs_tree_flip_t_to_s_channel

```

*<PHS trees: procedures>+≡*

```

subroutine phs_tree_flip_t_to_s_channel (tree)
  type(phs_tree_t), intent(inout) :: tree
  integer(TC) :: k, f, m, n, d, s
  if (tree%n_in == 2) then
    FLIP: do k=3, tree%mask-1
      if (.not. tree%branch(k)%set) cycle FLIP
      f = iand(k,tree%mask_in)
      if (f==0 .or. f==k) cycle FLIP
      m = tree%branch(k)%mother
      s = tree%branch(k)%sibling
      if (s==0) call find_orphan(s)
      d = tree%branch(k)%daughter(1)
      n = ior(d,s)
      tree%branch(k)%set = .false.
      tree%branch(n)%set = .true.
      tree%branch(n)%origin = k
      tree%branch(n)%daughter(1) = d; tree%branch(d)%mother = n
      tree%branch(n)%daughter(2) = s; tree%branch(s)%mother = n
      tree%branch(n)%has_children = .true.
      tree%branch(d)%sibling = s; tree%branch(s)%sibling = d
      tree%branch(n)%sibling = f; tree%branch(f)%sibling = n
      tree%branch(n)%mother = m
      tree%branch(f)%mother = m
      if (m/=0) then
        tree%branch(m)%daughter(1) = n
        tree%branch(m)%daughter(2) = f
      end if
      tree%branch(n)%friend = f
      tree%branch(n)%has_friend = .true.
      tree%branch(n)%firstborn = 2
    end do FLIP
  end if
contains
  subroutine find_orphan(s)
    integer(TC) :: s
    do s=1, tree%mask_out
      if (tree%branch(s)%set .and. tree%branch(s)%mother==0) return
    end do
    call phs_tree_write (tree)
    call msg_bug (" Can't flip phase space tree to channel")
  end subroutine find_orphan
end subroutine phs_tree_flip_t_to_s_channel

```

After the tree has been flipped, one may need to determine what has become of a particular *t*-channel branch. This function gives the bincode of the flipped tree. If the original bincode does not contain IN-bits, we leave it as it is.

*<PHS trees: procedures>+≡*

```

function tc_flipped (tree, kt) result (ks)
  type(phs_tree_t), intent(in) :: tree
  integer(TC), intent(in) :: kt
  integer(TC) :: ks
  if (iand (kt, tree%mask_in) == 0) then

```

```

        ks = kt
    else
        ks = tree%branch(iand (kt, tree%mask_out))%mother
    end if
end function tc_flipped

```

Scan a tree and make sure that the first daughter has always a smaller code than the second one. Furthermore, delete any **friend** entry in the root branch – this branching has the incoming particle direction as axis anyway. Keep track of reordering by updating **inverted\_axis**, **inverted\_decay** and **firstborn**.

```

<PHS trees: public>+≡
    public :: phs_tree_canonicalize

            end if
        end subroutine branch_canonicalize
    end subroutine phs_tree_canonicalize

```

## Mappings

Initialize a mapping for the current tree. This is done while reading from file, so the mapping parameters are read, but applied to the flipped tree. Thus, the size of the array of mappings is given by the number of outgoing particles only.

```

<PHS trees: public>+≡

```

```

    public :: phs_tree_init_mapping
<PHS trees: procedures>+≡
    subroutine phs_tree_init_mapping (tree, k, type, pdg, model)
        type(phs_tree_t), intent(inout) :: tree
        integer(TC), intent(in) :: k
        type(string_t), intent(in) :: type
        integer, intent(in) :: pdg
        class(model_data_t), intent(in), target :: model
        integer(TC) :: kk
        kk = tc_flipped (tree, k)
        call mapping_init (tree%mapping(kk), kk, type, pdg, model)
    end subroutine phs_tree_init_mapping

```

Set the physical parameters for the mapping, using a specific parameter set.  
Also set the mass sum array.

```

<PHS trees: public>+≡
    public :: phs_tree_set_mapping_parameters
<PHS trees: procedures>+≡
    subroutine phs_tree_set_mapping_parameters &
        (tree, mapping_defaults, variable_limits)
        type(phs_tree_t), intent(inout) :: tree
        type(mapping_defaults_t), intent(in) :: mapping_defaults
        logical, intent(in) :: variable_limits
        integer(TC) :: k
        do k = 1, tree%n_branches_out
            call mapping_set_parameters &
                (tree%mapping(k), mapping_defaults, variable_limits)
        end do
    end subroutine phs_tree_set_mapping_parameters

```

Return the mapping for the sum of all outgoing particles. This should either be no mapping or a global s-channel mapping.

```

<PHS trees: public>+≡
    public :: phs_tree_assign_s_mapping
<PHS trees: procedures>+≡
    subroutine phs_tree_assign_s_mapping (tree, mapping)
        type(phs_tree_t), intent(in) :: tree
        type(mapping_t), intent(out) :: mapping
        mapping = tree%mapping(tree%mask_out)
    end subroutine phs_tree_assign_s_mapping

```

## Kinematics

Fill the mass sum array, starting from the external particles and working down to the tree root. For each bincode  $k$  we scan the bits in  $k$ ; if only one is set, we take the physical mass of the corresponding external particle; if more then one is set, we sum up the two masses (which we know have already been set).

```

<PHS trees: public>+≡
    public :: phs_tree_set_mass_sum

```

*<PHS trees: procedures>+≡*

```

subroutine phs_tree_set_mass_sum (tree, flv)
  type(phs_tree_t), intent(inout) :: tree
  type(flavor_t), dimension(:), intent(in) :: flv
  integer(TC) :: k
  integer :: i
  tree%mass_sum = 0
  do k = 1, tree%n_branches_out
    do i = 0, size (flv) - 1
      if (btest(k,i)) then
        if (ibclr(k,i) == 0) then
          tree%mass_sum(k) = flv(i+1)%get_mass ()
        else
          tree%mass_sum(k) = &
            tree%mass_sum(ibclr(k,i)) + tree%mass_sum(ibset(0,i))
        end if
      end if
    end do
  end do
end subroutine phs_tree_set_mass_sum

```

Set the effective masses and widths. For each non-resonant branch in a tree, the effective mass is equal to the sum of the effective masses of the children (and analogous for the width). External particles have their real mass and width zero. For resonant branches, we insert mass and width from the corresponding mapping.

This routine has `phs_tree_set_mass_sum` and `phs_tree_set_mapping_parameters` as prerequisites.

*<PHS trees: public>+≡*

```

public :: phs_tree_set_effective_masses

```

*<PHS trees: procedures>+≡*

```

subroutine phs_tree_set_effective_masses (tree)
  type(phs_tree_t), intent(inout) :: tree
  tree%effective_mass = 0
  tree%effective_width = 0
  call set_masses_x (tree%mask_out)
contains
  recursive subroutine set_masses_x (k)
    integer(TC), intent(in) :: k
    integer(TC) :: k1, k2
    if (tree%branch(k)%has_children) then
      k1 = tree%branch(k)%daughter(1)
      k2 = tree%branch(k)%daughter(2)
      call set_masses_x (k1)
      call set_masses_x (k2)
      if (mapping_is_s_channel (tree%mapping(k))) then
        tree%effective_mass(k) = mapping_get_mass (tree%mapping(k))
        tree%effective_width(k) = mapping_get_width (tree%mapping(k))
      else
        tree%effective_mass(k) = &
          tree%effective_mass(k1) + tree%effective_mass(k2)
      end if
    end if
  end subroutine set_masses_x

```

```

        tree%effective_width(k) = &
            tree%effective_width(k1) + tree%effective_width(k2)
    end if
else
    tree%effective_mass(k) = tree%mass_sum(k)
end if
end subroutine set_masses_x
end subroutine phs_tree_set_effective_masses

```

Define step mappings, recursively, for the decay products of all intermediate resonances. Step mappings account for the fact that a branch may originate from a resonance, which almost replaces the upper limit on the possible invariant mass. The step mapping implements a smooth cutoff that interpolates between the resonance and the real kinematic limit. The mapping width determines the sharpness of the cutoff.

Step mappings are inserted only for branches that are not mapped otherwise.

At each branch, we record the mass that is effectively available for phase space, by taking the previous limit and subtracting the effective mass of the sibling branch. Widths are added, not subtracted.

If we encounter a resonance decay, we discard the previous limit and replace it by the mass and width of the resonance, also subtracting the sibling branch.

Initially, the limit is zero, so it becomes negative at any branch. Only if there is a resonance, the limit becomes positive. Whenever the limit is positive, and the current branch decays, we activate a step mapping for the current branch.

As a result, step mappings are implemented for all internal lines that originate from an intermediate resonance decay.

The flag `variable_limits` applies to the ultimate limit from the available energy, not to the intermediate resonances whose masses are always fixed.

This routine requires `phs_tree_set_effective_masses`

end subroutine phs_tree_set_step_mappings

```

### Structural comparison

This function allows to check whether one tree is the permutation of another one. The permutation is applied to the second tree in the argument list. We do not make up a temporary permuted tree, but compare the two trees directly. The branches are scanned recursively, where for each daughter we check the friend and the mapping as well. Once a discrepancy is found, the recursion is exited immediately.

## 18.4.4 Phase-space evaluation

### Phase-space volume

We compute the phase-space volume recursively, following the same path as for computing other kinematical variables. However, the volume depends just on  $\sqrt{\hat{s}}$ , not on the momentum configuration.

Note: counting branches, we may replace this by a simple formula.

```

<PHS trees: public>+≡
  public :: phs_tree_compute_volume

<PHS trees: procedures>+≡
  subroutine phs_tree_compute_volume (tree, sqrts, volume)
    type(phs_tree_t), intent(in) :: tree
    real(default), intent(in) :: sqrts
    real(default), intent(out) :: volume
    integer(TC) :: k
    k = tree%mask_out
    if (tree%branch(k)%has_children) then
      call compute_volume_x (tree%branch(k), k, volume, .true.)
    end if
  end subroutine

```

```

else
    volume = 1
end if
contains
recursive subroutine compute_volume_x (b, k, volume, initial)
    type(phs_branch_t), intent(in) :: b
    integer(TC), intent(in) :: k
    real(default), intent(out) :: volume
    logical, intent(in) :: initial
    integer(TC) :: k1, k2
    real(default) :: v1, v2
    k1 = b%daughter(1); k2 = b%daughter(2)
    if (tree%branch(k1)%has_children) then
        call compute_volume_x (tree%branch(k1), k1, v1, .false.)
    else
        v1 = 1
    end if
    if (tree%branch(k2)%has_children) then
        call compute_volume_x (tree%branch(k2), k2, v2, .false.)
    else
        v2 = 1
    end if
    if (initial) then
        volume = v1 * v2 / (4 * twopi5)
    else
        volume = v1 * v2 * sqrts**2 / (4 * twopi2)
    end if
end subroutine compute_volume_x
end subroutine phs_tree_compute_volume

```

### Determine momenta

This is done in two steps: First the masses are determined. This step may fail, in which case `ok` is set to false. If successful, we generate angles and the actual momenta. The array `decay_p` serves for transferring the individual three-momenta of the daughter particles in their mother rest frame from the mass generation to the momentum generation step.

```

<PHS trees: public>+≡
public :: phs_tree_compute_momenta_from_x

<PHS trees: procedures>+≡
subroutine phs_tree_compute_momenta_from_x &
    (tree, prt, factor, volume, sqrts, x, ok)
    type(phs_tree_t), intent(inout) :: tree
    type(phs_prt_t), dimension(:), intent(inout) :: prt
    real(default), intent(out) :: factor, volume
    real(default), intent(in) :: sqrts
    real(default), dimension(:), intent(in) :: x
    logical, intent(out) :: ok
    real(default), dimension(tree%mask_out) :: decay_p
    integer :: n1, n2
    integer :: n_out
    if (tree%real_phsp) then

```

```

        n_out = tree%n_externals - tree%n_in - 1
        n1 = max (n_out-2, 0)
        n2 = n1 + max (2*n_out, 0)
    else
        n1 = tree%n_msq
        n2 = n1 + tree%n_angles
    end if
    call phs_tree_set_msq &
        (tree, prt, factor, volume, decay_p, sqrts, x(1:n1), ok)
    if (ok) call phs_tree_set_angles &
        (tree, prt, factor, decay_p, sqrts, x(n1+1:n2))
end subroutine phs_tree_compute_momenta_from_x

```

Mass generation is done recursively. The `ok` flag causes the filled tree to be discarded if set to `.false.` This happens if a three-momentum turns out to be imaginary, indicating impossible kinematics. The index `ix` tells us how far we have used up the input array `x`.

*(PHS trees: procedures)+≡*

```

The heart of phase space generation: Now we have the invariant masses, let

us generate angles. At each branch, we take a Lorentz transformation and augment it by a boost to the current particle rest frame, and by rotations  $\phi$  and  $\theta$  around the  $z$  and  $y$  axis, respectively. This transformation is passed down to the daughter particles, if present.

## 18.5 The phase-space forest

Simply stated, a phase-space forest is a collection of phase-space trees. More precisely, a `phs_forest` object contains all parameterizations of phase space that `WHIZARD` will use for a single hard process, prepared in the form of `phs_tree` objects. This is suitable for evaluation by the `VAMP` integration package: each parameterization (tree) is a valid channel in the multi-channel adaptive integration, and each variable in a tree corresponds to an integration dimension, defined by an appropriate mapping of the  $(0, 1)$  interval to the allowed range of the integration variable.

The trees are grouped in groves. The trees (integration channels) within a grove share a common weight, assuming that they are related by some approximate symmetry.

Trees/channels that are related by an exact symmetry are connected by an array of equivalences; each equivalence object holds the data that relate one channel to another.

The phase-space setup, i.e., the detailed structure of trees and forest, are read from a file. Therefore, this module also contains the syntax definition and the parser needed for interpreting this file.

```
<phs_forests.f90>≡  
  <File header>  
  
  module phs_forests  
  
    <Use kinds>  
    use kinds, only: TC

```

### 18.5.1 Phase-space setup parameters

This transparent container holds the parameters that the algorithm needs for phase-space setup, with reasonable defaults.

The threshold mass (for considering a particle as effectively massless) is specified separately for s- and t-channel. The default is to treat  $W$  and  $Z$  bosons as massive in the s-channel, but as massless in the t-channel. The  $b$ -quark is treated always massless, the  $t$ -quark always massive.

```

<PHS forests: public>≡
  public :: phs_parameters_t
<PHS forests: types>≡
  type :: phs_parameters_t
    real(default) :: sqrts = 0
    real(default) :: m_threshold_s = 50._default
    real(default) :: m_threshold_t = 100._default
    integer :: off_shell = 1
    integer :: t_channel = 2
    logical :: keep_nonresonant = .true.
  end type phs_parameters_t

```

Write phase-space parameters to file.

```

<PHS forests: public>+≡

end function phs_parameters_ne

```

## 18.5.2 Equivalences

This type holds information about equivalences between phase-space trees. We make a linked list, where each node contains the two trees which are equivalent and the corresponding permutation of external particles. Two more arrays are

to be filled: The permutation of mass variables and the permutation of angular variables, where the signature indicates a necessary exchange of daughter branches.

```

(PHS forests: types)+≡
  type :: equivalence_t
  private
    integer :: left, right
    type(permutation_t) :: perm
    type(permutation_t) :: msq_perm, angle_perm
    logical, dimension(:), allocatable :: angle_sig
    type(equivalence_t), pointer :: next => null ()
  end type equivalence_t

(PHS forests: types)+≡
  type :: equivalence_list_t
  private
    integer :: length = 0
    type(equivalence_t), pointer :: first => null ()
    type(equivalence_t), pointer :: last => null ()
  end type equivalence_list_t

```

Append an equivalence to the list

```

(PHS forests: procedures)+≡
  subroutine equivalence_list_add (eql, left, right, perm)
    type(equivalence_list_t), intent(inout) :: eql
    integer, intent(in) :: left, right
    type(permutation_t), intent(in) :: perm
    type(equivalence_t), pointer :: eq
    allocate (eq)
    eq%left = left
    eq%right = right
    eq%perm = perm
    if (associated (eql%last)) then
      eql%last%next => eq
    else
      eql%first => eq
    end if
    eql%last => eq
    eql%length = eql%length + 1
  end subroutine equivalence_list_add

```

Delete the list contents. Has to be pure because it is called from an elemental subroutine.

```

(PHS forests: procedures)+≡
  pure subroutine equivalence_list_final (eql)
    type(equivalence_list_t), intent(inout) :: eql
    type(equivalence_t), pointer :: eq
    do while (associated (eql%first))
      eq => eql%first
      eql%first => eql%first%next
      deallocate (eq)
    end do
  end subroutine equivalence_list_final

```

```

    eql%last => null ()
    eql%length = 0
end subroutine equivalence_list_final

```

Make a deep copy of the equivalence list. This allows for deep copies of groves and forests.

```

<PHS forests: interfaces>+≡
interface assignment(=)

  do i = 1, size (eq%angle_sig)
    if (eq%angle_sig(i)) then
      write (u, "(1x,A)", advance="no") "+"
    else
      write (u, "(1x,A)", advance="no") "-"
    end if
  end do
  write (u, *)
  if (associated (eq%next)) call equivalence_write_rec (eq%next, u)
end subroutine equivalence_write_rec
end subroutine equivalence_list_write

```

### 18.5.3 Groves

A grove is a group of trees (phase-space channels) that share a common weight in the integration. Within a grove, channels can be declared equivalent, so they also share their integration grids (up to symmetries). The grove contains a list of equivalences. The `tree_count_offset` is the total number of trees of the preceding groves; when the trees are counted per forest (integration channels), the offset has to be added to all tree indices.

```

<PHS forests: types>+≡
  type :: phs_grove_t
  private
  integer :: tree_count_offset
  type(phs_tree_t), dimension(:), allocatable :: tree
  type(equivalence_list_t) :: equivalence_list
end type phs_grove_t

```

Call `phs_tree_init` which is also elemental:

```

<PHS forests: procedures>+≡
  elemental subroutine phs_grove_init &
    (grove, n_trees, n_in, n_out, n_masses, n_angles)
  type(phs_grove_t), intent(inout) :: grove
  integer, intent(in) :: n_trees, n_in, n_out, n_masses, n_angles
  grove%tree_count_offset = 0
  allocate (grove%tree (n_trees))
  call phs_tree_init (grove%tree, n_in, n_out, n_masses, n_angles)

```

```
end subroutine phs_grove_init
```

The trees do not have pointer components, thus no call to `phs_tree_final`:

```
(PHS forests: procedures)+≡
  elemental subroutine phs_grove_final (grove)
    type(phs_grove_t), intent(inout) :: grove
    deallocate (grove%tree)
    call equivalence_list_final (grove%equivalence_list)
  end subroutine phs_grove_final
```

Deep copy.

```
(PHS forests: interfaces)+≡
  interface assignment(=)
    module procedure phs_grove_assign0
    module procedure phs_grove_assign1
  end interface

(PHS forests: procedures)+≡
  subroutine phs_grove_assign0 (grove_out, grove_in)
    type(phs_grove_t), intent(out) :: grove_out
    type(phs_grove_t), intent(in) :: grove_in
    grove_out%tree_count_offset = grove_in%tree_count_offset
    if (allocated (grove_in%tree)) then
      allocate (grove_out%tree (size (grove_in%tree)))
      grove_out%tree = grove_in%tree
    end if
    grove_out%equivalence_list = grove_in%equivalence_list
  end subroutine phs_grove_assign0

  subroutine phs_grove_assign1 (grove_out, grove_in)
    type(phs_grove_t), dimension(:), intent(out) :: grove_out
    type(phs_grove_t), dimension(:), intent(in) :: grove_in
    integer :: i
    do i = 1, size (grove_in)
      call phs_grove_assign0 (grove_out(i), grove_in(i))
    end do
  end subroutine phs_grove_assign1
```

Get the global (s-channel) mappings. Implemented as a subroutine which returns an array (slice).

```
(PHS forests: procedures)+≡
  subroutine phs_grove_assign_s_mappings (grove, mapping)
    type(phs_grove_t), intent(in) :: grove
    type(mapping_t), dimension(:), intent(out) :: mapping
    integer :: i
    if (size (mapping) == size (grove%tree)) then
      do i = 1, size (mapping)
        call phs_tree_assign_s_mapping (grove%tree(i), mapping(i))
      end do
    else
      call msg_bug ("phs_grove_assign_s_mappings: array size mismatch")
    end if
```

```
end subroutine phs_grove_assign_s_mappings
```

#### 18.5.4 The forest type

This is a collection of trees and associated particles. In a given tree, each branch code corresponds to a particle in the `prt` array. Furthermore, we have an array of mass sums which is independent of the decay tree and of the particular event. The mappings directly correspond to the decay trees, and the decay groves collect the trees in classes. The permutation list consists of all permutations of outgoing particles that map the decay forest onto itself.

The particle codes `flv` (one for each external particle) are needed for determining masses and such. The trees and associated information are collected in the `grove` array, together with a lookup table that associates tree indices to groves. Finally, the `prt` array serves as workspace for phase-space evaluation.

The `prt_combination` is a list of index pairs, namely the particle momenta pairs that need to be combined in order to provide all momentum combinations that the phase-space trees need to know.

```
<PHS forests: public>+≡
  public :: phs_forest_t

<PHS forests: types>+≡
  type :: phs_forest_t
    private
    integer :: n_in, n_out, n_tot
    integer :: n_masses, n_angles, n_dimensions
    integer :: n_trees, n_equivalences
    type(flavor_t), dimension(:), allocatable :: flv
    type(phs_grove_t), dimension(:), allocatable :: grove
    integer, dimension(:), allocatable :: grove_lookup
    type(phs_prt_t), dimension(:), allocatable :: prt_in
    type(phs_prt_t), dimension(:), allocatable :: prt_out
    type(phs_prt_t), dimension(:), allocatable :: prt
    integer(TC), dimension(:,:), allocatable :: prt_combination
    type(mapping_t), dimension(:), allocatable :: s_mapping
  contains
    <PHS forests: phs forest: TBP>
  end type phs_forest_t
```

The initialization merely allocates memory. We have to know how many trees there are in each grove, so we can initialize everything. The number of groves is the size of the `n_tree` array.

In the `grove_lookup` table we store the grove index that belongs to each absolute tree index. The difference between the absolute index and the relative (to the grove) index is stored, for each grove, as `tree_count_offset`.

The particle array is allocated according to the total number of branches each tree has, but not filled.

```
<PHS forests: public>+≡
  public :: phs_forest_init
```

```

(PHS forests: procedures)+≡
subroutine phs_forest_init (forest, n_tree, n_in, n_out)
  type(phs_forest_t), intent(inout) :: forest
  integer, dimension(:), intent(in) :: n_tree
  integer, intent(in) :: n_in, n_out
  integer :: g, count, k_root
  forest%n_in = n_in
  forest%n_out = n_out
  forest%n_tot = n_in + n_out
  forest%n_masses = max (n_out - 2, 0)
  forest%n_angles = max (2*n_out - 2, 0)
  forest%n_dimensions = forest%n_masses + forest%n_angles
  forest%n_trees = sum (n_tree)
  forest%n_equivalences = 0
  allocate (forest%grove (size (n_tree)))
  call phs_grove_init &
    (forest%grove, n_tree, n_in, n_out, forest%n_masses, &
     forest%n_angles)
  allocate (forest%grove_lookup (forest%n_trees))
  count = 0
  do g = 1, size (forest%grove)
    forest%grove(g)%tree_count_offset = count
    forest%grove_lookup (count+1:count+n_tree(g)) = g
    count = count + n_tree(g)
  end do
  allocate (forest%pvt_in (n_in))
  allocate (forest%pvt_out (forest%n_out))
  k_root = 2**forest%n_tot - 1
  allocate (forest%pvt (k_root))
  allocate (forest%pvt_combination (2, k_root))
  allocate (forest%s_mapping (forest%n_trees))
end subroutine phs_forest_init

```

Assign the global (s-channel) mappings.

```

(PHS forests: public)+≡
public :: phs_forest_set_s_mappings

(PHS forests: procedures)+≡
subroutine phs_forest_set_s_mappings (forest)
  type(phs_forest_t), intent(inout) :: forest
  integer :: g, i0, i1, n
  do g = 1, size (forest%grove)
    call phs_forest_get_grove_bounds (forest, g, i0, i1, n)
    call phs_grove_assign_s_mappings &
      (forest%grove(g), forest%s_mapping(i0:i1))
  end do
end subroutine phs_forest_set_s_mappings

```

The grove finalizer is called because it contains the equivalence list:

```

(PHS forests: public)+≡
public :: phs_forest_final

(PHS forests: procedures)+≡
subroutine phs_forest_final (forest)

```

```

type(phs_forest_t), intent(inout) :: forest
if (allocated (forest%grove)) then
    call phs_grove_final (forest%grove)
    deallocate (forest%grove)
end if
if (allocated (forest%grove_lookup)) deallocate (forest%grove_lookup)
if (allocated (forest%prt)) deallocate (forest%prt)
if (allocated (forest%s_mapping)) deallocate (forest%s_mapping)
end subroutine phs_forest_final

```

### 18.5.5 Screen output

Write the particles that are non-null, then the trees which point to them:

```

<PHS forests: public>+≡
    public :: phs_forest_write

<PHS forests: phs_forest: TBP>≡
    procedure :: write => phs_forest_write

<PHS forests: procedures>+≡
    subroutine phs_forest_write (forest, unit)
        class(phs_forest_t), intent(in) :: forest
        integer, intent(in), optional :: unit
        integer :: u
        integer :: i, g, k

### 18.5.7 Read the phase space setup from file

The phase space setup is stored in a file. The file may be generated by the `cascades` module below, or by other means. This file has to be read and parsed to create the PHS forest as the internal phase-space representation.

Create lexer and syntax:

```

<PHS forests: procedures>+=
subroutine define_phs_forest_syntax (ifile)
  type(ifile_t) :: ifile
  call ifile_append (ifile, "SEQ phase_space_list = process_phase_space*")
  call ifile_append (ifile, "SEQ process_phase_space = " &
    // "process_def process_header phase_space")
  call ifile_append (ifile, "SEQ process_def = process process_list")
  call ifile_append (ifile, "KEY process")
  call ifile_append (ifile, "LIS process_list = process_tag*")
  call ifile_append (ifile, "IDE process_tag")
  call ifile_append (ifile, "SEQ process_header = " &
    // "md5sum_process = md5sum " &
    // "md5sum_model_par = md5sum " &
    // "md5sum_phs_config = md5sum " &
    // "sqrts = real " &
    // "m_threshold_s = real " &
    // "m_threshold_t = real " &

```

```

// "off_shell = integer " &
// "t_channel = integer " &
// "keep_nonresonant = logical")
call ifile_append (ifile, "KEY '='")
call ifile_append (ifile, "KEY md5sum_process")
call ifile_append (ifile, "KEY md5sum_model_par")
call ifile_append (ifile, "KEY md5sum_phs_config")
call ifile_append (ifile, "KEY sqrts")
call ifile_append (ifile, "KEY m_threshold_s")
call ifile_append (ifile, "KEY m_threshold_t")
call ifile_append (ifile, "KEY off_shell")
call ifile_append (ifile, "KEY t_channel")
call ifile_append (ifile, "KEY keep_nonresonant")
call ifile_append (ifile, "QUO md5sum = '""' ... '""'")
call ifile_append (ifile, "REA real")
call ifile_append (ifile, "INT integer")
call ifile_append (ifile, "IDE logical")
call ifile_append (ifile, "SEQ phase_space = grove_def+")
call ifile_append (ifile, "SEQ grove_def = grove tree_def+")
call ifile_append (ifile, "KEY grove")
call ifile_append (ifile, "SEQ tree_def = tree bincodes mapping*")
call ifile_append (ifile, "KEY tree")
call ifile_append (ifile, "SEQ bincodes = bincodes*")
call ifile_append (ifile, "INT bincodes")
call ifile_append (ifile, "SEQ mapping = map bincodes channel pdg")
call ifile_append (ifile, "KEY map")
call ifile_append (ifile, "ALT channel = &
    &s_channel | t_channel | u_channel | &
    &collinear | infrared | radiation | on_shell")
call ifile_append (ifile, "KEY s_channel")
! call ifile_append (ifile, "KEY t_channel")    !!! Key already exists
call ifile_append (ifile, "KEY u_channel")
call ifile_append (ifile, "KEY collinear")
call ifile_append (ifile, "KEY infrared")
call ifile_append (ifile, "KEY radiation")
call ifile_append (ifile, "KEY on_shell")
call ifile_append (ifile, "INT pdg")
end subroutine define_phs_forest_syntax

```

The model-file syntax and lexer are fixed, therefore stored as module variables:

```

<PHS forests: variables>≡
    type(syntax_t), target, save :: syntax_phs_forest

```

```

<PHS forests: public>+≡
    public :: syntax_phs_forest_init

  public :: syntax_phs_forest_final

<PHS forests: procedures>+≡
  subroutine syntax_phs_forest_final ()
    call syntax_final (syntax_phs_forest)
  end subroutine syntax_phs_forest_final

<PHS forests: public>+≡
  public :: syntax_phs_forest_write

<PHS forests: procedures>+≡
  subroutine syntax_phs_forest_write (unit)
    integer, intent(in), optional :: unit
    call syntax_write (syntax_phs_forest, unit)
  end subroutine syntax_phs_forest_write

```

The concrete parser and interpreter. Generate an input stream for the external `unit`, read the parse tree (with given `syntax` and `lexer`) from this stream, and transfer the contents of the parse tree to the PHS forest.

We look for the matching `process` tag, count groves and trees for initializing the forest, and fill the trees.

If the optional parameters are set, compare the parameters stored in the file to those. Set `match` true if everything agrees.

```

<PHS forests: public>+≡

### 18.5.8 Preparation

The trees that we read from file do not carry flavor information. This is set separately:

The flavor list must be unique for a unique set of masses; if a given particle can have different flavor, the mass must be degenerate, so we can choose one of the possible flavor combinations.

```

<PHS forests: public>+≡
  public :: phs_forest_set_flavors

```

Once the parameter set is fixed, the masses and the widths of the particles are known and the `mass_sum` arrays as well as the mapping parameters can be computed. Note that order is important: we first compute the mass sums, then the ordinary mappings. The resonances obtained here determine the effective masses, which in turn are used to implement step mappings for resonance decay products that are not mapped otherwise.

```

<PHS forests: public>+≡

```

Generate the particle combination table. Scan all trees and merge their individual combination tables. At the end, valid entries are non-zero, and they indicate the indices of a pair of particles to be combined to a new particle. If a particle is accessible by more than one tree (this is usual), only keep the first possibility.

### 18.5.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

*(PHS forests: procedures)*+≡

```

### 18.5.12 Phase-space evaluation

Given one row of the **x** parameter array and the corresponding channel index, compute first all relevant momenta and then recover the remainder of the **x** array, the Jacobians **phs\_factor**, and the phase-space volume.

The output argument **ok** indicates whether this was successful.

```

## 18.6 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should generate one.

The idea is to construct all Feynman diagrams subject to certain constraints which eliminate everything that is probably irrelevant for the integration. These Feynman diagrams (cascades) are grouped in groves by finding equivalence classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the integration.

This module may eventually disappear and be replaced by CAML code. In particular, we need here a set of Feynman rules (vertices with particle codes, but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program only via the generated ASCII phase-space configuration file.

```

### 18.6.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

```

<Mapping modes>≡
    integer, parameter :: &
        & EXTERNAL_PRT = -1, &
        & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &
        & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &
        & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &
        & ON_SHELL = 99

<Cascades: parameters>≡
    <Mapping modes>

```

### 18.6.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascades has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a  $t$ -channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the

information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of  $t$ -channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

### 18.6.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry in the tree is set undefined because the cascade is not resonant. However, the flavor entry is set, so the cascade flavor is identified nevertheless.

*(Cascades: procedures)+≡*

```

subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flv
    cascade%pdg = abs (cascade%flv%get_pdg ())

```

```

cascade%is_vector = flv%get_spin_type () == VECTOR
cascade%m_min = flv%get_mass ()
cascade%m_rea = cascade%m_min
if (cascade%m_rea >= m_thr) then
    cascade%m_eff = cascade%m_rea
end if
cascade%on_shell = .true.
cascade%multiplicity = 1
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_outgoing

```

The same for an incoming line:

```

<Cascades: procedures>+=
subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%incoming = .true.
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flv%anti ()
    cascade%pdg = abs (flv%get_pdg ())
    cascade%is_vector = flv%get_spin_type () == VECTOR
    cascade%m_min = flv%get_mass ()
    cascade%m_rea = cascade%m_min
    if (cascade%m_rea >= m_thr) then
        cascade%m_eff = cascade%m_rea
    end if
    cascade%on_shell = .true.
    cascade%n_t_channel = 0
    cascade%n_off_shell = 0
    cascade%tree(1) = cascade%bincode
    cascade%tree_pdg(1) = cascade%pdg
    cascade%tree_mapping(1) = EXTERNAL_PRT
    cascade%tree_resonant(1) = .false.
end subroutine cascade_init_incoming

```

## 18.6.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

```

<Cascades: interfaces>≡
interface operator(.disjunct.)
    module procedure cascade_disjunct
end interface

```

```

<Cascades: procedures>+=
function cascade_disjunct (cascade1, cascade2) result (flag)
    logical :: flag
    type(cascade_t), intent(in) :: cascade1, cascade2
    flag = iand (cascade1%bincode, cascade2%bincode) == 0
end function cascade_disjunct

```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to i8 integers, and compute the hash code from this byte stream.

```

<Cascades: procedures>+=
subroutine cascade_assign_resonance_hash (cascade)
    type(cascade_t), intent(inout) :: cascade
    integer(i8), dimension(1) :: mold
    cascade%res_hash = hash (transfer &
        (concat (sort (pack (cascade%tree_pdg, &
            cascade%tree_resonant))), &
            sort (pack (cascade%tree_pdg, &
                cascade%tree_mapping == T_CHANNEL .or. &
                cascade%tree_mapping == U_CHANNEL))), &
        mold))
end subroutine cascade_assign_resonance_hash

```

### 18.6.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

```

<Cascades: types>+=
type :: cascade_p
    type(cascade_t), pointer :: cascade => null ()
    type(cascade_p), pointer :: next => null ()
end type cascade_p

```

Here is the bucket or hash entry type:

```

<Cascades: types>+=
type :: hash_entry_t
    integer(i32) :: hashval = 0
    integer(i8), dimension(:), allocatable :: key
    type(cascade_p), pointer :: first => null ()
    type(cascade_p), pointer :: last => null ()
end type hash_entry_t

```

Finalize: just deallocate the list; the contents are just pointers.

```

<Cascades: procedures>+=
subroutine hash_entry_final (hash_entry)
    type(hash_entry_t), intent(inout) :: hash_entry
    type(cascade_p), pointer :: current

```

```

do while (associated (hash_entry%first))
  current => hash_entry%first
  hash_entry%first => current%next
  deallocate (current)
end do
end subroutine hash_entry_final

```

Output: concise format for debugging, just list cascade indices.

*(Cascades: procedures)+≡*

```

subroutine hash_entry_write (hash_entry, unit)
  type(hash_entry_t), intent(in) :: hash_entry
  integer, intent(in), optional :: unit
  type(cascade_p), pointer :: current
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(1x,A)", advance="no") "Entry:"
  do i = 1, size (hash_entry%key)
    write (u, "(1x,I0)", advance="no") hash_entry%key(i)
  end do
  write (u, "(1x,A)", advance="no") "->"
  current => hash_entry%first
  do while (associated (current))
    write (u, "(1x,I7)", advance="no") current%cascade%index
    current => current%next
  end do
  write (u, *)
end subroutine hash_entry_write

```

This function adds a cascade pointer to the bucket. If `ok` is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

*(Cascades: procedures)+≡*

```

subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(inout) :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out), optional :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  if (present (ok)) then
    call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    if (.not. ok) return
  end if
  allocate (current)
  current%cascade => cascade
  if (associated (hash_entry%last)) then
    hash_entry%last%next => current
  else
    hash_entry%first => current
  end if
  hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr

```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguished only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

```

(Cascades: procedures) +=
  subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(in), target :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    integer, dimension(:), allocatable :: tree_pdg
    ok = .true.
    allocate (tree_pdg (size (cascade%tree_pdg)))
    if (cascade%complete) then
      where (cascade%tree_mapping == INFRARED .or. &
             cascade%tree_mapping == COLLINEAR .or. &
             cascade%tree_mapping == T_CHANNEL .or. &
             cascade%tree_mapping == U_CHANNEL)
        tree_pdg = 0
      elsewhere
        tree_pdg = cascade%tree_pdg
      end where
    else
      tree_pdg = cascade%tree_pdg
    end if
    current => hash_entry%first
    do while (associated (current))
      if (current%cascade%depth == cascade%depth) then
        if (all (current%cascade%tree == cascade%tree)) then
          if (all (current%cascade%tree_mapping == cascade%tree_mapping)) &
             then
            if (all (current%cascade%tree_pdg .match. tree_pdg)) then
              if (present (cascade_ptr)) cascade_ptr => current%cascade
              ok = .false.; return
            end if
          end if
        end if
      end if
      current => current%next
    end do
    if (present (cascade_ptr)) cascade_ptr => cascade
  end subroutine hash_entry_check_cascade

```

For PDG codes, we specify that the undefined code matches any code. This is

already defined for flavor objects, but here we need it for the codes themselves.

```

<Cascades: interfaces>+≡
  interface operator(.match.)
    module procedure pdg_match
  end interface

<Cascades: procedures>+≡
  elemental function pdg_match (pdg1, pdg2) result (flag)
    logical :: flag
    integer(TC), intent(in) :: pdg1, pdg2
    select case (pdg1)
    case (0)
      flag = .true.
    case default
      select case (pdg2)
      case (0)
        flag = .true.
      case default
        flag = pdg1 == pdg2
      end select
    end select
  end function pdg_match

```

### 18.6.6 The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a linked list. In addition to the usual **first** and **last** pointers, there is a **first\_t** pointer which points to the first t-channel cascade (after all s-channel cascades), and a **first\_k** pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated parameters where an additional pointer is stored for each cascade. The keys are made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

```

<Cascades: public>≡
  public :: cascade_set_t

<Cascades: types>+≡
  type :: cascade_set_t
    private
    class(model_data_t), pointer :: model
    integer :: n_in, n_out, n_tot
    type(flavor_t), dimension(:, :), allocatable :: flv
    integer :: depth_out, depth_tot
    real(default) :: sqrts = 0
    real(default) :: m_threshold_s = 0
    real(default) :: m_threshold_t = 0
    integer :: off_shell = 0
    integer :: t_channel = 0
    logical :: keep_nonresonant
    integer :: n_groves = 0
    ! The cascade list
    type(cascade_t), pointer :: first => null ()

```

```

    type(cascade_t), pointer :: last => null ()
    type(cascade_t), pointer :: first_t => null ()
    type(cascade_t), pointer :: first_k => null ()
    ! The hashtable
    integer :: n_entries = 0
    real :: fill_ratio = 0
    integer :: n_entries_max = 0
    integer(i32) :: mask = 0
    logical :: fatal_beam_decay = .true.
    type(hash_entry_t), dimension(:), allocatable :: entry
end type cascade_set_t

```

Return true if there are cascades which are active and complete, so the phase space file would be nonempty.

```

<Cascades: public>+≡
    public :: cascade_set_is_valid

<Cascades: procedures>+≡
    function cascade_set_is_valid (cascade_set) result (flag)
        logical :: flag
        type(cascade_set_t), intent(in) :: cascade_set
        type(cascade_t), pointer :: cascade
        flag = .false.
        cascade => cascade_set%first_k
        do while (associated (cascade))
            if (cascade%active .and. cascade%complete) then
                flag = .true.
                return
            end if
            cascade => cascade%next
        end do
    end function cascade_set_is_valid

```

The initializer sets up the hash table with some initial size guessed by looking at the number of external particles. We choose 256 for 3 external particles and a factor of 4 for each additional particle, limited at  $2^{30}=1\text{G}$ .

Note: the explicit initialization loop might be avoided (ELEMENTAL), but a bug in nagfor 5.3.2 prevents this.

```

<Cascades: parameters>+≡
    real, parameter, public :: CASCADE_SET_FILL_RATIO = 0.1

### 18.6.7 Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original, but the pointers are nullified. We do not care whether insertion was successful or not. The pointer argument, if present, is assigned to the input cascade, or to the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-copied and added to the cascade set before the current copy is added.

*(Cascades: procedures)* +=

```

recursive subroutine cascade_set_add_copy &
  (cascade_set, cascade_in, cascade_ptr)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in) :: cascade_in
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_t), pointer :: cascade
  logical :: ok
  allocate (cascade)
  cascade = cascade_in
  if (associated (cascade_in%daughter1)) call cascade_set_add_copy &
    (cascade_set, cascade_in%daughter1, cascade%daughter1)
  if (associated (cascade_in%daughter2)) call cascade_set_add_copy &
    (cascade_set, cascade_in%daughter2, cascade%daughter2)
  if (associated (cascade_in%mother)) call cascade_set_add_copy &
    (cascade_set, cascade_in%mother, cascade%mother)
  cascade%next => null ()
  call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
  if (.not. ok) deallocate (cascade)
end subroutine cascade_set_add_copy

```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

*(Cascades: procedures)* +=

```

subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out) :: ok

```

```

type(cascade_t), optional, pointer :: cascade_ptr
integer(i8), dimension(1) :: mold
call cascade_set_hash_insert &
    (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
if (ok) call cascade_set_list_add (cascade_set, cascade)
end subroutine cascade_set_add

```

Add a new cascade to the list:

```

<Cascades: procedures>+=
subroutine cascade_set_list_add (cascade_set, cascade)
type(cascade_set_t), intent(inout) :: cascade_set
type(cascade_t), intent(in), target :: cascade
if (associated (cascade_set%last)) then
    cascade_set%last%next => cascade
else
    cascade_set%first => cascade
end if
cascade_set%last => cascade
end subroutine cascade_set_list_add

```

Add a cascade entry to the hash array:

```

<Cascades: procedures>+=
subroutine cascade_set_hash_insert &
    (cascade_set, key, cascade, ok, cascade_ptr)
type(cascade_set_t), intent(inout), target :: cascade_set
integer(i8), dimension(:), intent(in) :: key

type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
type(cascade_p), pointer :: current
integer :: i, s
allocate (table_tmp (0:cascade_set%mask))
table_tmp = cascade_set%entry
deallocate (cascade_set%entry)
s = 2 * size (table_tmp)
cascade_set%n_entries = 0
cascade_set%n_entries_max = s * cascade_set%fill_ratio
cascade_set%mask = s - 1
allocate (cascade_set%entry (0:cascade_set%mask))

```

```

do i = 0, ubound (table_tmp, 1)
  current => table_tmp(i)%first
  do while (associated (current))
    call cascade_set_hash_insert_rec &
      (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
        table_tmp(i)%key, current%cascade)
    current => current%next
  end do
end do
end subroutine cascade_set_hash_expand

```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If ok is present, before insertion we check whether the cascade is already stored, and return failure if yes.

*(Cascades: procedures)*+≡

        type(flavor_t), dimension(:,:), intent(in) :: flv  
        integer :: pos, prc, n_out, n_prc  
        type(cascade_t), pointer :: cascade  
        logical :: ok  
        n_out = size (flv, dim=1)  
        n_prc = size (flv, dim=2)  
        do prc = 1, n_prc  
            do pos = 1, n_out  
                allocate (cascade)  
                call cascade_init_outgoing &  
                    (cascade, flv(pos,prc), pos, cascade_set%m_threshold_s)  
                call cascade_set_add (cascade_set, cascade, ok)  
                if (.not. ok) then  
                    deallocate (cascade)  
                end if  
            end do  
        end do  
    end subroutine cascade_set_add_outgoing2  
  
    subroutine cascade_set_add_outgoing1 (cascade_set, flv)  
        type(cascade_set_t), intent(inout), target :: cascade_set  
        type(flavor_t), dimension(:), intent(in) :: flv  
        integer :: pos, n_out  
        type(cascade_t), pointer :: cascade  
        logical :: ok  
        n_out = size (flv, dim=1)  
        do pos = 1, n_out  
            allocate (cascade)  
            call cascade_init_outgoing &  
                (cascade, flv(pos), pos, cascade_set%m_threshold_s)  
            call cascade_set_add (cascade_set, cascade, ok)  
            if (.not. ok) then  
                deallocate (cascade)  
            end if  
        end do  
    end subroutine cascade_set_add_outgoing1
```

The incoming particles are added one at a time. Nevertheless, we may have several processes which are looped over. At the first opportunity, we set the

pointer `first_t` in the cascade set which should point to the first t-channel cascade.

Return the indices of the first and last cascade generated.

*(Cascades: interfaces)+≡*

end if
else
  deallocate (cascade)
end if
end subroutine cascade_set_add_incoming0

```

### 18.6.9 Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

```

<Cascades: procedures>+=
subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in), target :: cascade1, cascade2
  logical, intent(in) :: s_channel
  integer, dimension(:), allocatable :: pdg3
  integer :: i, depth_max
  type(flavor_t) :: flv
  if (s_channel) then
    depth_max = cascade_set%depth_out
  else
    depth_max = cascade_set%depth_tot
  end if
  if (cascade1%depth + cascade2%depth < depth_max) then
    call cascade_set%model%match_vertex ( &
      cascade1%flv%get_pdg (), &
      cascade2%flv%get_pdg (), &
      pdg3)
    do i = 1, size (pdg3)
      call flv%init (pdg3(i), cascade_set%model)
      if (s_channel) then
        call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
      else
        call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
      end if
    end do
    deallocate (pdg3)
  end if
end subroutine cascade_match_pair

```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

```

<Cascades: procedures>+=
subroutine cascade_match_triplet &
  (cascade_set, cascade1, cascade2, cascade3, s_channel)
  type(cascade_set_t), intent(inout), target :: cascade_set

```

```

type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
logical, intent(in) :: s_channel
integer :: depth_max
depth_max = cascade_set%depth_tot
if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
  if (cascade_set%model%check_vertex ( &
    cascade1%flv%get_pdg (), &
    cascade2%flv%get_pdg (), &
    cascade3%flv%get_pdg ())) then
    call cascade_combine_keystone &
      (cascade_set, cascade1, cascade2, cascade3, s_channel)
  end if
end if
end subroutine cascade_match_triplet

```

### 18.6.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

```

(Cascades: procedures)+≡

```

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a  $2 \rightarrow 1$  process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

### 18.6.11 Cascade combination III: node connections and tree fusion

Here we assign global tree properties. If the allowed number of off-shell lines is exceeded, discard the new cascade. Otherwise, assign the trees, sort them, and assign connections. Finally, append the cascade to the list. This may fail (because in the hash array there is already an equivalent cascade). On failure, discard the cascade.

```

(Cascades: procedures)+≡
subroutine cascade_fusion (cascade_set, cascade1, cascade2, cascade3)

    end if
end subroutine cascade_keystone

```

Sort a tree (array of binary codes) and particle code array simultaneously, by ascending binary codes. A convenient method is to use the `maxloc` function iteratively, to find and remove the largest entry in the tree array one by one.

*(Cascades: procedures)* +=

```

subroutine tree_sort (tree, pdg, mapping, resonant)
    integer(TC), dimension(:), intent(inout) :: tree
    integer, dimension(:), intent(inout) :: pdg, mapping
    logical, dimension(:), intent(inout) :: resonant
    integer(TC), dimension(size(tree)) :: tree_tmp

```

```

integer, dimension(size(pdg)) :: pdg_tmp, mapping_tmp
logical, dimension(size(resonant)) :: resonant_tmp
integer, dimension(1) :: pos
integer :: i
tree_tmp = tree
pdg_tmp = pdg
mapping_tmp = mapping
resonant_tmp = resonant
do i = size(tree),1,-1
  pos = maxloc (tree_tmp)
  tree(i) = tree_tmp (pos(1))
  pdg(i) = pdg_tmp (pos(1))
  mapping(i) = mapping_tmp (pos(1))
  resonant(i) = resonant_tmp (pos(1))
  tree_tmp(pos(1)) = 0
end do
end subroutine tree_sort

```

### 18.6.12 Cascade set generation

These procedures loop over cascades and build up the cascade set. After each iteration of the innermost loop, we set a breakpoint.

s-channel: We use a nested scan to combine all cascades with all other cascades.

```

(Cascades: procedures)+≡
subroutine cascade_set_generate_s (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  cascade1 => cascade_set%first
  LOOP1: do while (associated (cascade1))
    cascade2 => cascade_set%first
    LOOP2: do while (associated (cascade2))
      if (cascade2%index >= cascade1%index) exit LOOP2
      if (cascade1 .disjunct. cascade2) then
        call cascade_match_pair (cascade_set, cascade1, cascade2, .true.)
      end if
      call terminate_now_if_signal ()
      cascade2 => cascade2%next
    end do LOOP2
    cascade1 => cascade1%next
  end do LOOP1
end subroutine cascade_set_generate_s

```

The t-channel cascades are directed and have a seed (one of the incoming particles) and a target (the other one). We loop over all possible seeds and targets. Inside this, we loop over all t-channel cascades (*cascade1*) and s-channel cascades (*cascade2*) and try to combine them.

```

(Cascades: procedures)+≡
subroutine cascade_set_generate_t (cascade_set, pos_seed, pos_target)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(in) :: pos_seed, pos_target

```

```

type(cascade_t), pointer :: cascade_seed, cascade_target
type(cascade_t), pointer :: cascade1, cascade2
integer(TC) :: bc_seed, bc_target
bc_seed = ibset (0_TC, pos_seed-1)
bc_target = ibset (0_TC, pos_target-1)
cascade_seed => cascade_set%first_t
LOOP_SEED: do while (associated (cascade_seed))
  if (cascade_seed%bincode == bc_seed) then
    cascade_target => cascade_set%first_t
    LOOP_TARGET: do while (associated (cascade_target))
      if (cascade_target%bincode == bc_target) then
        cascade1 => cascade_set%first_t
        LOOP_T: do while (associated (cascade1))
          if ((cascade1 .disjunct. cascade_target) &
              .and. .not. (cascade1 .disjunct. cascade_seed)) then
            cascade2 => cascade_set%first
            LOOP_S: do while (associated (cascade2))
              if ((cascade2 .disjunct. cascade_target) &
                  .and. (cascade2 .disjunct. cascade1)) then
                call cascade_match_pair &
                  (cascade_set, cascade1, cascade2, .false.)
              end if
              call terminate_now_if_signal ()
              cascade2 => cascade2%next
            end do LOOP_S
          end if
          call terminate_now_if_signal ()
          cascade1 => cascade1%next
        end do LOOP_T
      end if
      call terminate_now_if_signal ()

                                cascade_seed => cascade_seed%next
                                end do LOOP_SEED
end subroutine cascade_set_generate_scattering

```

### 18.6.13 Groves

Before assigning groves, assign hashcodes to the resonance patterns, so they can easily be compared.

*(Cascades: procedures)* +=

```

subroutine cascade_set_assign_resonance_hash (cascade_set)
  type(cascade_set_t), intent(inout) :: cascade_set
  type(cascade_t), pointer :: cascade
  cascade => cascade_set%first_k
  do while (associated (cascade))
    call cascade_assign_resonance_hash (cascade)
    cascade => cascade%next
  end do
end subroutine cascade_set_assign_resonance_hash

```

After all cascades are recorded, we group the complete cascades in groves. A grove consists of cascades with identical multiplicity, number of resonances, log-enhanced, t-channel lines, and resonance flavors.

*(Cascades: procedures)* +=

```

subroutine cascade_set_assign_groves (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  integer :: multiplicity
  integer :: n_resonances, n_log_enhanced, n_t_channel, n_off_shell
  integer :: res_hash
  integer :: grove
  grove = 0
  cascade1 => cascade_set%first_k
  do while (associated (cascade1))
    if (cascade1%active .and. cascade1%complete &
      .and. cascade1%grove == 0) then
      grove = grove + 1
      cascade1%grove = grove
    end if
    cascade1 => cascade1%next
  end do
end subroutine cascade_set_assign_groves

```

```

multiplicity = cascade1%multiplicity
n_resonances = cascade1%n_resonances
n_log_enhanced = cascade1%n_log_enhanced
n_off_shell = cascade1%n_off_shell
n_t_channel = cascade1%n_t_channel
res_hash = cascade1%res_hash
cascade2 => cascade1%next
do while (associated (cascade2))
  if (cascade2%grove == 0) then
    if (cascade2%multiplicity == multiplicity &
        .and. cascade2%n_resonances == n_resonances &
        .and. cascade2%n_log_enhanced == n_log_enhanced &
        .and. cascade2%n_off_shell == n_off_shell &
        .and. cascade2%n_t_channel == n_t_channel &
        .and. cascade2%res_hash == res_hash) then
      cascade2%grove = grove
    end if
  end if
  call terminate_now_if_signal ()
  cascade2 => cascade2%next
end do
end if
call terminate_now_if_signal ()
cascade1 => cascade1%next
end do
cascade_set%n_groves = grove
end subroutine cascade_set_assign_groves

```

#### 18.6.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redundancies between flavor assignments.

```

<Cascades: public>+≡
  public :: cascade_set_generate

<Cascades: procedures>+≡
  subroutine cascade_set_generate &
    (cascade_set, model, n_in, n_out, flv, phs_par, fatal_beam_decay)
    type(cascade_set_t), intent(out) :: cascade_set
    class(model_data_t), intent(in), target :: model
    integer, intent(in) :: n_in, n_out
    type(flavor_t), dimension(:,:), intent(in) :: flv
    type(phs_parameters_t), intent(in) :: phs_par
    logical, intent(in) :: fatal_beam_decay
    type(cascade_set_t), dimension(:), allocatable :: cset
    type(cascade_t), pointer :: cascade

```

```

integer :: i
if (phase_space_vanishes (phs_par%sqrts, n_in, flv)) return
call cascade_set_init (cascade_set, model, n_in, n_out, phs_par, &
    fatal_beam_decay, flv)
allocate (cset (size (flv, 2)))
do i = 1, size (cset)
    call cascade_set_generate_single (cset(i), &
        model, n_in, n_out, flv(:,i), phs_par, fatal_beam_decay)
    cascade => cset(i)%first_k
    do while (associated (cascade))
        if (cascade%active .and. cascade%complete) then
            call cascade_set_add_copy (cascade_set, cascade)
        end if
        cascade => cascade%next
    end do
    call cascade_set_final (cset(i))
end do
cascade_set%first_k => cascade_set%first
call cascade_set_assign_resonance_hash (cascade_set)
call cascade_set_assign_groves (cascade_set)
end subroutine cascade_set_generate

```

This generates phase space for a single channel, without assigning groves.

*(Cascades: procedures)+≡*

```

## 18.7 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and the `cascades` module for generating phase-space channels. As an extension of the `phs_base` abstract type, the phase-space configuration and instance imple-

ment the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD. For trivial two-particle phase space, there is `phs_wood` as an alternative.)

```
<phs_wood.f90>≡  
<File header>  
  
module phs_wood  
  
  <Use kinds>  
  <Use strings>  
    use io_units  
    use constants  
    use unit_tests  
    use diagnostics  
    use os_interface  
    use md5  
    use physics_defs  
    use lorentz  
    use model_data  
    use flavors  
    use process_constants  
    use sf_mappings  
    use sf_base  
    use phs_base  
    use mappings  
    use phs_forests  
    use cascades  
  
  <Standard module head>  
  
  <PHS wood: public>  
  
  <PHS wood: types>  
  
contains  
  
  <PHS wood: procedures>

```

### 18.7.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

```

The MD5 sum of the forest is computed in addition to the MD5 sum of the configuration. The reason is that the forest may depend on a user-provided external file. On the other hand, this MD5 sum encodes all information that is relevant for further processing. Therefore, the `get_md5sum` method returns this result, once it is available.

```

    end select
  end subroutine

```

```
end subroutine phs_wood_init
```

### 18.7.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

```

## Chapter 19

# Multi-Channel Integration

The abstract representation of multi-channel Monte Carlo algorithms for integration and event generation.

**Module `mci_base`:** The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

**`iterations`** Container for defining integration call and pass settings.

**`integration_results`** This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

These are the implementations:

**Module `mci_midpoint`:** A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

**Module `mci_vamp`:** Interface for the VAMP package.

## 19.1 Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

```
<mci_base.f90>≡  
  <File header>  
  
  module mci_base  
  
    use kinds  
    use io_units  
    use format_utils, only: pac_fmt  
    use format_defs, only: FMT_14, FMT_17  
    use diagnostics  
    use cputime  
    use phs_base  
    use rng_base  
  
    <Standard module head>  
  
    <MCI base: public>  
  
    <MCI base: types>  
  
    <MCI base: interfaces>  
  
    contains  
  
    <MCI base: procedures>  
  
  end module mci_base
```

### 19.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as `rng`. It may or may not be used for integration. It will be used for event generation.

```
<MCI base: public>≡  
  public :: mci_t  
  
<MCI base: types>≡  
  type, abstract :: mci_t  
    integer :: n_dim = 0
```

      "Integrator:", &
      mci%n_channel, "channels,", &
      mci%n_dim, "dimensions"
  end if
  call msg_message (unit = unit)
end subroutine mci_startup_message

```

Dump type-specific info to a logfile.

*(MCI base: mci: TBP)*+≡

```

procedure(mci_write_log_entry), deferred :: write_log_entry

```

*(MCI base: interfaces)*≡

```

abstract interface

```

```

subroutine mci_write_log_entry (mci, u)
  import
  class(mci_t), intent(in) :: mci
  integer, intent(in) :: u
end subroutine mci_write_log_entry
end interface

```

In order to avoid dependencies on definite MCI implementations, we introduce a MD5 sum calculator.

```

⟨MCI base: mci: TBP⟩+≡
  procedure(mci_compute_md5sum), deferred :: compute_md5sum
⟨MCI base: interfaces⟩+≡
  abstract interface
    subroutine mci_compute_md5sum (mci, pacify)
      import
      class(mci_t), intent(inout) :: mci
      logical, intent(in), optional :: pacify
    end subroutine mci_compute_md5sum
  end interface

```

Record the index of the MCI object within a process. For multi-component processes with more than one integrator, the integrator should know about its own index, so file names can be unique, etc. The default implementation does nothing, however.

```

⟨MCI base: mci: TBP⟩+≡
  procedure :: record_index => mci_record_index
⟨MCI base: procedures⟩+≡
  subroutine mci_record_index (mci, i_mci)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: i_mci
  end subroutine mci_record_index

```

There is no Initializer for the abstract type, but a generic setter for the number of channels and dimensions. We make two aliases available, to be able to override it.

```

⟨MCI base: mci: TBP⟩+≡
  procedure :: set_dimensions => mci_set_dimensions
  procedure :: base_set_dimensions => mci_set_dimensions
⟨MCI base: procedures⟩+≡
  subroutine mci_set_dimensions (mci, n_dim, n_channel)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: n_dim
    integer, intent(in) :: n_channel
    mci%n_dim = n_dim
    mci%n_channel = n_channel
  end subroutine mci_set_dimensions

```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_flat_dimensions (mci, dim_flat)
      import
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_declare_flat_dimensions
  end interface

```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_equivalences), deferred :: declare_equivalences

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_equivalences (mci, channel, dim_offset)
      import
      class(mci_t), intent(inout) :: mci
      type(phs_channel_t), dimension(:), intent(in) :: channel
      integer, intent(in) :: dim_offset
    end subroutine mci_declare_equivalences
  end interface

```

Declare particular channels as chained together. The implementation may use this array for keeping their weights equal to each other, etc.

The chain array is an array sized by the number of channels. For each channel, there is an integer entry that indicates the corresponding chains. The total number of chains is the maximum value of this entry.

```

<MCI base: mci: TBP>+≡
  procedure :: declare_chains => mci_declare_chains

<MCI base: procedures>+≡
  subroutine mci_declare_chains (mci, chain)
    class(mci_t), intent(inout) :: mci
    integer, dimension(:), intent(in) :: chain
    allocate (mci%chain (size (chain)))
    mci%n_chain = maxval (chain)
    allocate (mci%chain_weights (mci%n_chain), source = 0._default)
    mci%chain = chain
  end subroutine mci_declare_chains

```

Collect channel weights according to chains and store them in the `chain_weights` for output. We sum up the weights for all channels that share the same `chain` index and store the results in the `chain_weights` array.

```

(MCI base: mci: TBP)+≡
  procedure :: collect_chain_weights => mci_collect_chain_weights

(MCI base: procedures)+≡
  subroutine mci_collect_chain_weights (mci, weight)
    class(mci_t), intent(inout) :: mci

            class(mci_instance_t), intent(out), pointer :: mci_instance
        end subroutine mci_allocate_instance
    end interface

```

Import a random-number generator. We transfer the allocation of an existing generator state into the object. The generator state may already be initialized, or we can reset it by its `init` method.

```

<MCI base: mci: TBP>+≡
    procedure :: import_rng => mci_import_rng
<MCI base: procedures>+≡
    subroutine mci_import_rng (mci, rng)
        class(mci_t), intent(inout) :: mci
        class(rng_t), intent(inout), allocatable :: rng
        call move_alloc (rng, mci%rng)
    end subroutine mci_import_rng

```

Activate or deactivate the timer.

```

<MCI base: mci: TBP>+≡
  procedure :: set_timer => mci_set_timer

<MCI base: procedures>+≡
  subroutine mci_set_timer (mci, active)
    class(mci_t), intent(inout) :: mci
    logical, intent(in) :: active
    mci%use_timer = active
  end subroutine mci_set_timer

```

Start and stop signal for the timer, if active. The elapsed time can then be retrieved from the MCI record.

```

<MCI base: mci: TBP>+≡
  procedure :: start_timer => mci_start_timer
  procedure :: stop_timer => mci_stop_timer

<MCI base: procedures>+≡
  subroutine mci_start_timer (mci)
    class(mci_t), intent(inout) :: mci
    if (mci%use_timer) call mci%timer%start ()
  end subroutine mci_start_timer

  subroutine mci_stop_timer (mci)
    class(mci_t), intent(inout) :: mci
    if (mci%use_timer) call mci%timer%stop ()
  end subroutine mci_stop_timer

```

Sampler test. Evaluate the sampler a given number of times. Results are discarded, so we don't need the MCI instance which would record them.

The evaluation channel is iterated, and the *x* parameters are randomly chosen.

```

<MCI base: mci: TBP>+≡
  procedure :: sampler_test => mci_sampler_test

<MCI base: procedures>+≡
  subroutine mci_sampler_test (mci, sampler, n_calls)
    class(mci_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout), target :: sampler
    integer, intent(in) :: n_calls
    real(default), dimension(:), allocatable :: x_in, f
    real(default), dimension(:,:), allocatable :: x_out
    real(default) :: val
    integer :: i, c
    allocate (x_in (mci%n_dim))
    allocate (f (mci%n_channel))
    allocate (x_out (mci%n_dim, mci%n_channel))
    do i = 1, n_calls
      c = mod (i, mci%n_channel) + 1
      call mci%rng%generate_array (x_in)
      call sampler%evaluate (c, x_in, val, x_out, f)
    end do
  end subroutine mci_sampler_test

```

Integrate: this depends on the implementation. We foresee a pacify flag to take care of small numerical noise on different platforms.

```

(MCI base: mci: TBP)+≡
  procedure (mci_integrate), deferred :: integrate

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_integrate (mci, instance, sampler, &
      n_it, n_calls, results, pacify)
    import
    class(mci_t), intent(inout) :: mci
    class(mci_instance_t), intent(inout) :: instance
    class(mci_sampler_t), intent(inout) :: sampler
    integer, intent(in) :: n_it
    integer, intent(in) :: n_calls
    logical, intent(in), optional :: pacify
    class(mci_results_t), intent(inout), optional :: results
  end subroutine mci_integrate
end interface

```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box `simulate` method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has `intent(inout)` for the `mci` passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the `mci` record.

```

(MCI base: mci: TBP)+≡
  procedure (mci_prepare_simulation), deferred :: prepare_simulation

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_prepare_simulation (mci)
    import
    class(mci_t), intent(inout) :: mci
  end subroutine mci_prepare_simulation
end interface

```

The generated event will reside in in the `instance` object (overall results and weight) and in the `sampler` object (detailed data). In the real application, we can subsequently call methods of the `sampler` in order to further process the generated event.

The `target` attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

```

(MCI base: mci: TBP)+≡
  procedure (mci_generate), deferred :: generate_weighted_event
  procedure (mci_generate), deferred :: generate_unweighted_event

```

```

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_generate (mci, instance, sampler)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout), target :: instance
      class(mci_sampler_t), intent(inout), target :: sampler
    end subroutine mci_generate
  end interface

```

This is analogous, but we rebuild the event from the information stored in `state` instead of generating it.

Note: currently unused outside of tests, might be deleted later.

```

<MCI base: mci: TBP>+≡
  procedure (mci_rebuild), deferred :: rebuild_event

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_rebuild (mci, instance, sampler, state)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance
      class(mci_sampler_t), intent(inout) :: sampler
      class(mci_state_t), intent(in) :: state
    end subroutine mci_rebuild
  end interface

```

Pacify: reduce numerical noise. The base implementation does nothing.

```

<MCI base: mci: TBP>+≡

### 19.1.2 MCI instance

The base type contains an array of channel weights. The value `mci_weight` is the combined MCI weight that corresponds to a particular sampling point.

For convenience, we also store the `x` and Jacobian values for this sampling point.

```

<MCI base: public>+≡

```

```

    public :: mci_instance_t
<MCI base: types>+≡
    type, abstract :: mci_instance_t
        logical :: valid = .false.
        real(default), dimension(:), allocatable :: w
        real(default), dimension(:), allocatable :: f
        real(default), dimension(:,:), allocatable :: x
        integer :: selected_channel = 0
        real(default) :: mci_weight = 0
        real(default) :: integrand = 0
        logical :: negative_weights = .false.
    contains
        <MCI base: mci instance: TBP>
    end type mci_instance_t

```

Output: deferred

```

<MCI base: mci instance: TBP>≡
    procedure (mci_instance_write), deferred :: write
<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_write (object, unit, pacify)
            import
            class(mci_instance_t), intent(in) :: object
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: pacify
        end subroutine mci_instance_write
    end interface

```

        end subroutine mci_instance_final
    end interface

```

Init: basic initializer for the arrays, otherwise deferred. Assigning the mci object is also deferred, because it depends on the concrete type.

The weights are initialized with an uniform normalized value.

```

<MCI base: mci instance: TBP>+≡
    procedure (mci_instance_base_init), deferred :: init
    procedure :: base_init => mci_instance_base_init
<MCI base: procedures>+≡
    subroutine mci_instance_base_init (mci_instance, mci)
        class(mci_instance_t), intent(out) :: mci_instance
        class(mci_t), intent(in), target :: mci
        allocate (mci_instance%w (mci%n_channel))

```

```

allocate (mci_instance%f (mci%n_channel))
allocate (mci_instance%x (mci%n_dim, mci%n_channel))
if (mci%n_channel > 0) then
    call mci_instance%set_channel_weights &
        (spread (1._default, dim=1, ncopies=mci%n_channel))
end if
mci_instance%f = 0
mci_instance%x = 0
end subroutine mci_instance_base_init

```

Explicitly set the array of channel weights.

```

<MCI base: mci instance: TBP>+≡
    procedure :: set_channel_weights => mci_instance_set_channel_weights

<MCI base: procedures>+≡
    subroutine mci_instance_set_channel_weights (mci_instance, weights)
        class(mci_instance_t), intent(inout) :: mci_instance
        real(default), dimension(:), intent(in) :: weights
        real(default) :: wsum
        wsum = sum (weights)
        if (wsum /= 0) then
            mci_instance%w = weights / wsum
        else
            call msg_fatal ("MC sampler initialization:&
                & sum of channel weights is zero")
        end if
    end subroutine mci_instance_set_channel_weights

```

Compute the overall weight factor for a configuration of  $x$  values and Jacobians  $f$ . The  $x$  values come in `n_channel` rows with `n_dim` entries each. The  $f$  factors constitute an array with `n_channel` entries.

We assume that the  $x$  and  $f$  arrays are already stored inside the MC instance. The result is also stored there.

```

<MCI base: mci instance: TBP>+≡
    procedure (mci_instance_compute_weight), deferred :: compute_weight

<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_compute_weight (mci, c)
            import
            class(mci_instance_t), intent(inout) :: mci
            integer, intent(in) :: c
        end subroutine mci_instance_compute_weight
    end interface

```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

```

<MCI base: mci instance: TBP>+≡
    procedure (mci_instance_record_integrand), deferred :: record_integrand

```

```

<MCI base: interfaces>+=
  abstract interface
    subroutine mci_instance_record_integrand (mci, integrand)
      import
      class(mci_instance_t), intent(inout) :: mci
      real(default), intent(in) :: integrand
    end subroutine mci_instance_record_integrand
  end interface

```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

```

<MCI base: mci instance: TBP>+=
  procedure :: evaluate => mci_instance_evaluate

<MCI base: procedures>+=
  subroutine mci_instance_evaluate (mci, sampler, c, x)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    integer, intent(in) :: c
    real(default), dimension(:), intent(in) :: x
    real(default) :: val
    call sampler%evaluate (c, x, val, mci%x, mci%f)
    mci%valid = sampler%is_valid ()
    if (mci%valid) then
      call mci%compute_weight (c)
      call mci%record_integrand (val)
    end if
  end subroutine mci_instance_evaluate

```

Initiate and terminate simulation. In contrast to integration, we implement these as methods of the process instance, since the `mci` configuration object is unchanged.

The safety factor reduces the acceptance probability for unweighted events. The implementation of this feature depends on the concrete type.

```

<MCI base: mci instance: TBP>+=
  procedure (mci_instance_init_simulation), deferred :: init_simulation
  procedure (mci_instance_final_simulation), deferred :: final_simulation

<MCI base: interfaces>+=
  abstract interface
    subroutine mci_instance_init_simulation (instance, safety_factor)
      import
      class(mci_instance_t), intent(inout) :: instance
      real(default), intent(in), optional :: safety_factor
    end subroutine mci_instance_init_simulation
  end interface

  abstract interface
    subroutine mci_instance_final_simulation (instance)

```

```

import
class(mci_instance_t), intent(inout) :: instance
end subroutine mci_instance_final_simulation
end interface

```

Assuming that the sampler is in a completely defined state, just extract the data that `evaluate` would compute. Also record the integrand.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: fetch => mci_instance_fetch
⟨MCI base: procedures⟩+≡
  subroutine mci_instance_fetch (mci, sampler, c)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(in) :: sampler
    integer, intent(in) :: c
    real(default) :: val
    mci%valid = sampler%is_valid ()
    if (mci%valid) then
      call sampler%fetch (val, mci%x, mci%f)
      call mci%compute_weight (c)
      call mci%record_integrand (val)
    end if
  end subroutine mci_instance_fetch

```

The value, i.e., the weighted integrand, is the integrand (which should be taken as-is from the sampler) multiplied by the MCI weight.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_value => mci_instance_get_value
⟨MCI base: procedures⟩+≡
  function mci_instance_get_value (mci) result (value)
    class(mci_instance_t), intent(in) :: mci
    real(default) :: value
    if (mci%valid) then
      value = mci%integrand * mci%mci_weight
    else
      value = 0
    end if
  end function mci_instance_get_value

```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_event_weight => mci_instance_get_value

```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized in the same way as the event weight above (which for unweighted events becomes unity).

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure (mci_instance_get_event_excess), deferred :: get_event_excess

```

```

<MCI base: interfaces>+≡
  abstract interface
    function mci_instance_get_event_excess (mci) result (excess)
      import
        class(mci_instance_t), intent(in) :: mci
        real(default) :: excess
    end function mci_instance_get_event_excess
  end interface

```

### 19.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

```

<MCI base: public>+≡
  public :: mci_state_t

<MCI base: types>+≡
  type :: mci_state_t
    integer :: selected_channel = 0
    real(default), dimension(:), allocatable :: x_in
    real(default) :: val
  contains
    <MCI base: mci state: TBP>
  end type mci_state_t

```

Output:

```

<MCI base: mci state: TBP>≡
  procedure :: write => mci_state_write

<MCI base: procedures>+≡
  subroutine mci_state_write (object, unit)
    class(mci_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "MCI state:"
    write (u, "(3x,A,I0)") "Channel   = ", object%selected_channel
    write (u, "(3x,A,999(1x,F12.10))") "x (in)    =", object%x_in
    write (u, "(3x,A,ES19.12)") "Integrand = ", object%val
  end subroutine mci_state_write

```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

```

(MCI base: mci instance: TBP)+≡
  procedure :: store => mci_instance_store

(MCI base: procedures)+≡
  subroutine mci_instance_store (mci, state)
    class(mci_instance_t), intent(in) :: mci
    class(mci_state_t), intent(out) :: state
    state%selected_channel = mci%selected_channel
    allocate (state%x_in (size (mci%x, 1)))
    state%x_in = mci%x(:,mci%selected_channel)
    state%val = mci%integrand
  end subroutine mci_instance_store

```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

```

(MCI base: mci instance: TBP)+≡
  procedure :: recall => mci_instance_recall

(MCI base: procedures)+≡
  subroutine mci_instance_recall (mci, sampler, state)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    class(mci_state_t), intent(in) :: state
    if (size (state%x_in) == size (mci%x, 1) &
        .and. state%selected_channel <= size (mci%x, 2)) then
      call sampler%rebuild (state%selected_channel, &
        state%x_in, state%val, mci%x, mci%f)
      call mci%compute_weight (state%selected_channel)
      call mci%record_integrand (state%val)
    else
      call msg_fatal ("Recalling event: mismatch in channel or dimension")
    end if
  end subroutine mci_instance_recall

```

#### 19.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of  $x$  MC parameter values, a the complete set of  $x$  values and associated Jacobian factors  $f$  for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

```

(MCI base: public)+≡
  public :: mci_sampler_t

```

```

<MCI base: types>+≡
  type, abstract :: mci_sampler_t
  contains
    <MCI base: mci_sampler: TBP>
  end type mci_sampler_t

```

Output, deferred to the implementation.

```

<MCI base: mci_sampler: TBP>≡
  procedure (mci_sampler_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_write (object, unit, testflag)
      import
      class(mci_sampler_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
    end subroutine mci_sampler_write
  end interface

```

The evaluation routine. Input is the channel index *c* and the one-dimensional parameter array *x\_in*. Output are the integrand value *val*, the two-dimensional parameter array *x* and the Jacobian array *f*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_evaluate), deferred :: evaluate

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_evaluate
  end interface

```

Query the validity of the sampling point. Can be called after *evaluate*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_is_valid), deferred :: is_valid

<MCI base: interfaces>+≡
  abstract interface
    function mci_sampler_is_valid (sampler) result (valid)
      import
      class(mci_sampler_t), intent(in) :: sampler
      logical :: valid
    end function mci_sampler_is_valid
  end interface

```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_rebuild), deferred :: rebuild

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_rebuild
  end interface

```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_fetch), deferred :: fetch

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_fetch (sampler, val, x, f)
      import
      class(mci_sampler_t), intent(in) :: sampler
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_fetch
  end interface

```

### 19.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

```

<MCI base: public>+≡
  public :: mci_results_t

<MCI base: types>+≡
  type, abstract :: mci_results_t
    contains
    <MCI base: mci_results: TBP>
  end type mci_results_t

```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

```

<MCI base: mci_results: TBP>≡
  procedure (mci_results_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_write (object, unit, verbose, suppress)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, suppress
    end subroutine mci_results_write
  end interface

```

This is the `record` method, which can be called directly from the integrator.

```

<MCI base: mci_results: TBP>+≡
  procedure (mci_results_record), deferred :: record

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_record (object, n_it, &
      n_calls, integral, error, efficiency, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      real(default), intent(in) :: integral
      real(default), intent(in) :: error
      real(default), intent(in) :: efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      logical, intent(in), optional :: suppress
    end subroutine mci_results_record
  end interface

```

### 19.1.6 Unit tests

Test module, followed by the corresponding implementation module.

```

<mci_base.ut.f90>≡
  <File header>

  module mci_base_ut
    use unit_tests
    use mci_base_ut_i

  <Standard module head>

  <MCI base: public test>

  <MCI base: public test auxiliary>

  contains

```

```

    <MCI base: test driver>

    end module mci_base_ut
<mci_base.uti.f90>≡
    <File header>

    module mci_base_uti

    <Use kinds>
        use io_units
        use diagnostics
        use phs_base
        use rng_base

        use mci_base

        use rng_base_ut, only: rng_test_t

    <Standard module head>

    <MCI base: public test auxiliary>

    <MCI base: test declarations>

    <MCI base: test types>

    contains

    <MCI base: tests>

    end module mci_base_uti
API: driver for the unit tests below.
<MCI base: public test>≡
    public :: mci_base_test
<MCI base: test driver>≡
    subroutine mci_base_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <MCI base: execute tests>
    end subroutine mci_base_test

```

### Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

```

<MCI base: public test auxiliary>≡

```

```

    public :: mci_test_t
<MCI base: test types>≡
type, extends (mci_t) :: mci_test_t
    integer :: divisions = 0
    integer :: tries = 0
    real(default) :: max_factor = 1
contains
    procedure :: final => mci_test_final
    procedure :: write => mci_test_write
    procedure :: startup_message => mci_test_startup_message

```

Integrate: sample at the midpoints of uniform bits and add the results. We implement this for one and for two dimensions. In the latter case, we scan over two channels and multiply with the channel weights.

The arguments `n_it` and `n_calls` are ignored in this implementations.

The test integrator does not set error or efficiency, so those will remain undefined.

    call instance%recall (sampler, state)
  end select
end subroutine mci_test_rebuild_event
```

### Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions  $g_i$  smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have  $n$  mappings of the unit hypercube

$$x = x(x^{(k)}) \quad \text{where } x = (x_1, \dots). \quad (19.1)$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \quad (19.2)$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \quad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \quad (19.3)$$

and weights

$$w_k \quad \text{with} \quad \sum_k w_k = 1 \quad (19.4)$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \quad (19.5)$$

which also satisfies

$$\int g(x) dx = 1. \quad (19.6)$$

The algorithm implements a resolution of unity as follows

$$\begin{aligned} 1 &= \int dx = \int \frac{g(x)}{g(x)} dx \\ &= \sum_k w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\ &= \sum_k w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x^{(k)})} \end{aligned} \quad (19.7)$$

where each of the integrals in the sum is evaluated using the channel-specific variables  $x^{(k)}$ .

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$\begin{aligned} x(x^{(1)}) &= (x_1^{(1)}, x_2^{(1)}) \\ x(x^{(2)}) &= (x_1^{(2)2}, x_2^{(2)}) \end{aligned} \quad (19.8)$$

hence

$$f^{(1)} \equiv 1, \quad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \quad (19.9)$$

The probability functions are

$$g^{(1)} \equiv 1, \quad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \quad (19.10)$$

In the concrete implementation of the integrator instance we store values for the channel probabilities  $g_i$  and the accumulated probability  $g$ .

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

```

## Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to  $x_1 = x_1^{(2)2}$ , so we have  $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$ .

For display purposes, we store the return values inside the object. This is not strictly necessary.

end subroutine mci_base_4

```

### Store and recall data

We generate an event and store the relevant data, i.e., the input parameters and the result value for a particular channel. Then we use those data to recover the event, as far as the MCI record is concerned.

*(MCI base: execute tests)* +≡

```

call test (mci_base_5, "mci_base_5", &
          "store and recall", &
          u, results)
<MCI base: test declarations>+≡
public :: mci_base_5
<MCI base: tests>+≡
subroutine mci_base_5 (u)
  integer, intent(in) :: u
  class(mci_t), allocatable, target :: mci
  class(mci_instance_t), pointer :: mci_instance => null ()
  class(mci_sampler_t), allocatable :: sampler
  class(rng_t), allocatable :: rng
  class(mci_state_t), allocatable :: state

  write (u, "(A)")  "* Test output: mci_base_5"
  write (u, "(A)")  "* Purpose: store and recall an event"
  write (u, "(A)")

  write (u, "(A)")  "* Initialize integrator, instance, sampler"
  write (u, "(A)")

  allocate (mci_test_t :: mci)
  call mci%set_dimensions (2, 2)
  select type (mci)
  type is (mci_test_t)
    call mci%set_divisions (10)
  end select

  call mci%allocate_instance (mci_instance)
  call mci_instance%init (mci)

  allocate (test_sampler_t :: sampler)
  select type (sampler)
  type is (test_sampler_t)
    call sampler%init (2)
  end select

  allocate (rng_test_t :: rng)
  call mci%import_rng (rng)

  write (u, "(A)")  "* Generate weighted event"
  write (u, "(A)")

write (u, "(A)")
write (u, "(A)")  "* Test output end: mci_base_8"

end subroutine mci_base_8

```

## 19.2 Iterations

This module defines a container for the list of iterations and calls, to be submitted to integration.

```
<iterations.f90>≡  
  <File header>  
  
  module iterations  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use diagnostics  
  
    <Standard module head>  
  
    <Iterations: public>  
  
    <Iterations: types>  
  
    contains  
  
    <Iterations: procedures>  
  
  end module iterations
```

### 19.2.1 The iterations list

Each integration pass has a number of iterations and a number of calls per iteration. The last pass produces the end result; the previous passes are used for adaptation.

The flags `adapt_grid` and `adapt_weight` are used only if `custom_adaptation` is set. Otherwise, default settings are used that depend on the integration pass.

```
<Iterations: types>≡  
  type :: iterations_spec_t  
    private  
    integer :: n_it = 0  
    integer :: n_calls = 0  
    logical :: custom_adaptation = .false.  
    logical :: adapt_grids = .false.  
    logical :: adapt_weights = .false.  
  end type iterations_spec_t
```

We build up a list of iterations.

```
<Iterations: public>≡  
  public :: iterations_list_t  
  
<Iterations: types>+≡  
  type :: iterations_list_t  
    private  
    integer :: n_pass = 0  
    type(iterations_spec_t), dimension(:), allocatable :: pass  
  contains
```

```

    <Iterations: iterations list: TBP>
end type iterations_list_t

```

Initialize an iterations list. For each pass, we have to specify the number of iterations and calls. We may provide the adaption conventions explicitly, either as character codes or as logicals.

For passes where the adaptation conventions are not specified, we use the following default setting: adapt weights and grids for all passes except the last one.

```

<Iterations: iterations list: TBP>≡
    procedure :: init => iterations_list_init

<Iterations: procedures>≡
    subroutine iterations_list_init &
        (it_list, n_it, n_calls, adapt, adapt_code, adapt_grids, adapt_weights)
    class(iterations_list_t), intent(inout) :: it_list
    integer, dimension(:), intent(in) :: n_it, n_calls
    logical, dimension(:), intent(in), optional :: adapt
    type(string_t), dimension(:), intent(in), optional :: adapt_code
    logical, dimension(:), intent(in), optional :: adapt_grids, adapt_weights
    integer :: i
    it_list%n_pass = size (n_it)
    if (allocated (it_list%pass)) deallocate (it_list%pass)
    allocate (it_list%pass (it_list%n_pass))
    it_list%pass%n_it = n_it
    it_list%pass%n_calls = n_calls
    if (present (adapt)) then
        it_list%pass%custom_adaptation = adapt
        do i = 1, it_list%n_pass
            if (adapt(i)) then
                if (verify (adapt_code(i), "wg") /= 0) then
                    call msg_error ("iteration specification: " &
                        // "adaptation code letters must be 'w' or 'g'")
                end if
                it_list%pass(i)%adapt_grids = scan (adapt_code(i), "g") /= 0
                it_list%pass(i)%adapt_weights = scan (adapt_code(i), "w") /= 0
            end if
        end do

## 19.2.2 Tools

Return the total number of passes.

```
<Iterations: iterations list: TBP>+≡
    procedure :: get_n_pass => iterations_list_get_n_pass

<Iterations: procedures>+≡
    function iterations_list_get_n_pass (it_list) result (n_pass)
        class(iterations_list_t), intent(in) :: it_list
        integer :: n_pass
        n_pass = it_list%n_pass
    end function iterations_list_get_n_pass
```

Return the number of calls for a specific pass.

```
<Iterations: iterations list: TBP>+≡
    procedure :: get_n_calls => iterations_list_get_n_calls

<Iterations: procedures>+≡
    function iterations_list_get_n_calls (it_list, pass) result (n_calls)
        class(iterations_list_t), intent(in) :: it_list
        integer :: n_calls
        integer, intent(in) :: pass
        if (pass <= it_list%n_pass) then
            n_calls = it_list%pass(pass)%n_calls
        else
            n_calls = 0
        end if
    end function iterations_list_get_n_calls
```

```
<Iterations: iterations list: TBP>+≡
    procedure :: set_n_calls => iterations_list_set_n_calls

<Iterations: procedures>+≡
    subroutine iterations_list_set_n_calls (it_list, pass, n_calls)
        class(iterations_list_t), intent(inout) :: it_list
        integer, intent(in) :: pass, n_calls
        it_list%pass(pass)%n_calls = n_calls
    end subroutine iterations_list_set_n_calls
```

Get the adaptation mode (automatic/custom) and, for custom adaptation, the flags for a specific pass.

```
<Iterations: iterations list: TBP>+≡
    procedure :: adapt_grids => iterations_list_adapt_grids
    procedure :: adapt_weights => iterations_list_adapt_weights

<Iterations: procedures>+≡
    function iterations_list_adapt_grids (it_list, pass) result (flag)
        logical :: flag
        class(iterations_list_t), intent(in) :: it_list

write (u, "(A)")
write (u, "(A,I0)")  "n_it(3) = ", it_list%get_n_it (3)

write (u, "(A)")
write (u, "(A)")  "* Test output end: iterations_2"

end subroutine iterations_2

```

## 19.3 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

```

<integration_results.f90>≡
module integration_results

  <Use kinds>
  <Use strings>
  use io_units
  use format_utils, only: mp_format, pac_fmt
  use format_defs, only: FMT_10, FMT_14
  use diagnostics
  use md5
  use os_interface
  use mci_base

  <Standard module head>

  <Integration results: public>

  <Integration results: parameters>

  <Integration results: types>

contains

  <Integration results: procedures>

end module integration_results

```

### 19.3.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of PRC\_UNKNOWN.

*(Integration results: types)*≡

```
type :: integration_entry_t
private
integer :: process_type = PRC_UNKNOWN
integer :: pass = 0
integer :: it = 0
integer :: n_it = 0
integer :: n_calls = 0
logical :: improved = .false.
real(default) :: integral = 0
real(default) :: error = 0
real(default) :: efficiency = 0
real(default) :: chi2 = 0
real(default), dimension(:), allocatable :: chain_weights
end type integration_entry_t
```

The possible values of the type indicator:

*(Integration results: parameters)*≡

```
integer, parameter, public :: PRC_UNKNOWN = 0
integer, parameter, public :: PRC_DECAY = 1
integer, parameter, public :: PRC_SCATTERING = 2
```

Initialize with all relevant data

*(Integration results: procedures)*≡

```
subroutine integration_entry_init (entry, &
    process_type, pass, it, n_it, n_calls, improved, &
    integral, error, efficiency, chi2, chain_weights)
type(integration_entry_t), intent(out) :: entry
integer, intent(in) :: process_type, pass, it, n_it, n_calls
logical, intent(in) :: improved
real(default), intent(in) :: integral, error, efficiency
real(default), intent(in), optional :: chi2
real(default), dimension(:), intent(in), optional :: chain_weights
entry%process_type = process_type
entry%pass = pass
entry%it = it
entry%n_it = n_it
entry%n_calls = n_calls
entry%improved = improved
entry%integral = integral
```

```

entry%error = error
entry%efficiency = efficiency
if (present (chi2)) &
    entry%chi2 = chi2
if (present (chain_weights)) then
    allocate (entry%chain_weights (size (chain_weights)))
    entry%chain_weights = chain_weights
end if
end subroutine integration_entry_init

```

Access values, some of them computed on demand:

*(Integration results: procedures)+≡*

```

elemental function integration_entry_get_pass (entry) result (n)
    integer :: n
    type(integration_entry_t), intent(in) :: entry
    n = entry%pass
end function integration_entry_get_pass

elemental function integration_entry_get_n_calls (entry) result (n)
    integer :: n
    type(integration_entry_t), intent(in) :: entry
    n = entry%n_calls
end function integration_entry_get_n_calls

elemental function integration_entry_get_integral (entry) result (int)
    real(default) :: int
    type(integration_entry_t), intent(in) :: entry
    int = entry%integral
end function integration_entry_get_integral

elemental function integration_entry_get_error (entry) result (err)
    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    err = entry%error
end function integration_entry_get_error

elemental function integration_entry_get_relative_error (entry) result (err)
    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    if (entry%integral /= 0) then
        err = entry%error / entry%integral
    else
        err = 0
    end if
end function integration_entry_get_relative_error

elemental function integration_entry_get_accuracy (entry) result (acc)
    real(default) :: acc
    type(integration_entry_t), intent(in) :: entry
    acc = accuracy (entry%integral, entry%error, entry%n_calls)
end function integration_entry_get_accuracy

elemental function accuracy (integral, error, n_calls) result (acc)
    real(default) :: acc

```

```

real(default), intent(in) :: integral, error
integer, intent(in) :: n_calls
if (integral /= 0) then
    acc = error / integral * sqrt (real (n_calls, default))
else
    acc = 0
end if
end function accuracy

elemental function integration_entry_get_efficiency (entry) result (eff)
real(default) :: eff
type(integration_entry_t), intent(in) :: entry
eff = entry%efficiency
end function integration_entry_get_efficiency

elemental function integration_entry_get_chi2 (entry) result (chi2)
real(default) :: chi2
type(integration_entry_t), intent(in) :: entry
chi2 = entry%chi2
end function integration_entry_get_chi2

elemental function integration_entry_has_improved (entry) result (flag)
logical :: flag
type(integration_entry_t), intent(in) :: entry
flag = entry%improved
end function integration_entry_has_improved

elemental function integration_entry_get_n_groves (entry) result (n_groves)
integer :: n_groves
type(integration_entry_t), intent(in) :: entry
if (allocated (entry%chain_weights)) then
    n_groves = size (entry%chain_weights, 1)
else
    n_groves = 0
end if
end function integration_entry_get_n_groves

```

Output. This writes the header line for the result account below:

```

<Integration results: procedures>+≡
subroutine write_header (process_type, unit, logfile)
integer, intent(in) :: process_type
integer, intent(in), optional :: unit
logical, intent(in), optional :: logfile
character(5) :: phys_unit
integer :: u
u = given_output_unit (unit); if (u < 0) return
select case (process_type)
case (PRC_DECAY);      phys_unit = "[GeV]"
case (PRC_SCATTERING); phys_unit = "[fb] "
case default
    phys_unit = ""
end select
write (msg_buffer, "(A)") &
    "It      Calls  Integral" // phys_unit // &

```

```

        " Error" // phys_unit // &
        " Err[%]    Acc Eff[%]    Chi2 N[It] |"
    call msg_message (unit=u, logfile=logfile)
end subroutine write_header

```

This writes a separator for result display:

```

<Integration results: procedures>+≡
subroutine write_hline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("-", 77)) // "|"
    flush (u)
end subroutine write_hline

subroutine write_dline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("=", 77)) // "|"
    flush (u)
end subroutine write_dline

```

This writes the standard result account into one screen line. The verbose version uses multiple lines and prints the unabridged values. Dummy entries are not written.

```

<Integration results: procedures>+≡

    end do
    write (u, *)
  end if
end subroutine integration_entry_write_chain_weights

```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the  $\chi^2$  value.

All error distributions are assumed Gaussian, of course. The  $\chi^2$  value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

*(Integration results: procedures)+≡*

```

### 19.3.2 Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily

compute averages.

We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

```

<Integration results: public>≡
  public :: integration_results_t

<Integration results: types>+≡
  type, extends (mci_results_t) :: integration_results_t
    private
      integer :: process_type = PRC_UNKNOWN
      integer :: current_pass = 0
      integer :: n_pass = 0
      integer :: n_it = 0
      logical :: screen = .false.
      integer :: unit = 0
      real(default) :: error_threshold = 0
      type(integration_entry_t), dimension(:), allocatable :: entry
      type(integration_entry_t), dimension(:), allocatable :: average
    contains
      <Integration results: integration results: TBP>
    end type integration_results_t

```

The array is extended in chunks of 10 entries.

```

<Integration results: parameters>+≡
  integer, parameter :: RESULTS_CHUNK_SIZE = 10

```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

```

<Integration results: integration results: TBP>≡
  procedure :: init => integration_results_init

<Integration results: procedures>+≡
  subroutine integration_results_init (results, process_type)
    class(integration_results_t), intent(out) :: results
    integer, intent(in) :: process_type
    results%process_type = process_type
    results%n_pass = 0
    results%n_it = 0
    allocate (results%entry (RESULTS_CHUNK_SIZE))
    allocate (results%average (RESULTS_CHUNK_SIZE))
  end subroutine integration_results_init

```

Set additional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

```

<Integration results: integration results: TBP>+≡
  procedure :: set_error_threshold => integration_results_set_error_threshold

```

```

<Integration results: procedures>+≡
  subroutine integration_results_set_error_threshold (results, error_threshold)
    class(integration_results_t), intent(inout) :: results
    real(default), intent(in) :: error_threshold
    results%error_threshold = error_threshold
  end subroutine integration_results_set_error_threshold

```

Output (ASCII format). The `verbose` format is used for writing the header in grid files.

```

<Integration results: integration results: TBP>+≡
  procedure :: write => integration_results_write

<Integration results: procedures>+≡
  subroutine integration_results_write (object, unit, verbose, suppress)
    class(integration_results_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    logical, intent(in), optional :: suppress

      call write_dline (unit)
    else
      write (u, *) "begin(integration_results)"
      write (u, *) "  n_pass = ", object%n_pass
      write (u, *) "  n_it = ", object%n_it
      if (object%n_it > 0) then
        write (u, *) "begin(integration_pass)"

```

```

do n = 1, object%n_it
  if (n > 1) then
    if (object%entry(n)%pass /= object%entry(n-1)%pass) then
      write (u, *) "end(integration_pass)"
      write (u, *) "begin(integration_pass)"
    end if
  end if
  write (u, *) "begin(iteration)"
  call integration_entry_write (object%entry(n), unit, &
    verbose = verb, suppress = suppress)
  write (u, *) "end(iteration)"
end do
write (u, *) "end(integration_pass)"
end if
write (u, *) "end(integration_results)"
end if
flush (u)
end subroutine integration_results_write

```

During integration, we do not want to print all results at once, but each intermediate result as soon as we get it. Thus, the previous procedure is chopped in pieces. First piece: store the output unit and a flag whether we want to print to standard output as well. Then write the header if the results are still empty, i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

### 19.3.3 Access results

Return true if the results object has entries.

*<Integration results: integration results: TBP>+≡*  
 procedure :: exist => integration\_results\_exist

*<Integration results: procedures>+≡*  
 function integration\_results\_exist (results) result (flag)  
 logical :: flag  
 class(integration\_results\_t), intent(in) :: results  
 flag = results%n\_pass > 0  
 end function integration\_results\_exist

Retrieve information from the results record. If **last** is set and true, take the last iteration. If it is set instead, take this iteration. If **pass** is set, take this average. If none is set, take the final average.

If the result would be invalid, the entry is not assigned. Due to default initialization, this returns a null entry.

*<Integration results: integration results: TBP>+≡*  
 procedure :: get\_entry => results\_get\_entry

*<Integration results: procedures>+≡*

## 19.4 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order  $h^2$ , where  $h$  is the bin width. Given that  $h = N^{-1/d}$ , where  $d$  is the integration dimension and  $N$  is the total number of sampling points, we get a relative error of order  $N^{-2/d}$ . This is superior to MC integration if  $d < 4$ , and equivalent if  $d = 4$ . It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

```
<mci_midpoint.f90>≡  
  <File header>  
  
  module mci_midpoint  
  
    <Use kinds>  
    use io_units  
    use diagnostics  
    use phs_base  
  
    use mci_base  
  
    <Standard module head>  
  
    <MCI midpoint: public>  
  
    <MCI midpoint: types>  
  
    contains  
  
    <MCI midpoint: procedures>  
  
  end module mci_midpoint
```

### 19.4.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This is required for event generation.

```
<MCI midpoint: public>≡

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

## Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function  $f(x) = 3x^2$  with integral  $\int_0^1 f(x) dx = 1$  and maximum  $f(1) = 3$ . If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can fetch results.

*<MCI midpoint: test types>*≡

```
type, extends (mci_sampler_t) :: test_sampler_1_t
```

```
real(default), dimension(:), allocatable :: x
```

```
real(default) :: val
```

```
contains
```

*<MCI midpoint: test sampler 1: TBP>*

```
end type test_sampler_1_t
```

Output: There is nothing stored inside, so just print an informative line.

*<MCI midpoint: test sampler 1: TBP>*≡

```
procedure :: write => test_sampler_1_write
```

*<MCI midpoint: tests>*≡

```
subroutine test_sampler_1_write (object, unit, testflag)
```

```
class(test_sampler_1_t), intent(in) :: object
```

```
integer, intent(in), optional :: unit
```

```
logical, intent(in), optional :: testflag
```

```
integer :: u
```

```
u = given_output_unit (unit)
```

```
write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"
```

```
end subroutine test_sampler_1_write
```

Evaluation: compute the function value. The output  $x$  parameter (only one channel) is identical to the input  $x$ , and the Jacobian is 1.

*<MCI midpoint: test sampler 1: TBP>*+≡

```
procedure :: evaluate => test_sampler_1_evaluate

## 19.5 VAMP interface

The standard method for integration is **VAMP**: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic **VAMP** algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

### 19.5.1 Grid parameters

This is a transparent container. It holds the parameters that are stored in grid files, and are checked when grid files are read.

```
<MCI vamp: public>≡
  public :: grid_parameters_t

<MCI vamp: types>≡
  type :: grid_parameters_t
    integer :: threshold_calls = 0
    integer :: min_calls_per_channel = 10
    integer :: min_calls_per_bin = 10
    integer :: min_bins = 3
    integer :: max_bins = 20
    logical :: stratified = .true.
    logical :: use_vamp_equivalences = .true.
    real(default) :: channel_weights_power = 0.25_default
    real(default) :: accuracy_goal = 0
    real(default) :: error_goal = 0
    real(default) :: rel_error_goal = 0
  contains
    <MCI vamp: grid parameters: TBP>
  end type grid_parameters_t
```

I/O:

```
<MCI vamp: grid parameters: TBP>≡
  procedure :: write => grid_parameters_write

<MCI vamp: procedures>≡
  subroutine grid_parameters_write (object, unit)
    class(grid_parameters_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A,I0)") "threshold_calls      = ", &
      object%threshold_calls

```

Update the MCI record (i.e., the integration passes) by reading from input stream. The stream should contain a `write` output from a previous run. We first check the MD5 sum of the configuration parameters. If that matches, we proceed directly to the stored integration passes. If successful, we may continue to read the file; the position will be after a blank line that must follow the MCI record.

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

Prepare an event generation pass. Should be called before a sequence of events is generated, then we should call the corresponding finalizer.

The pass-specific data of the previous integration pass are retained, but we reset the number of iterations and calls to zero. The latter now counts the number of events (calls to the sampling function, actually).

```

end if
end subroutine mci_vamp_prepare_simulation

```

Generate weighted event. Note that the event weight (`vamp_weight`) is not just the MCI weight. `vamp_next_event` selects a channel based on the channel weights multiplied by the (previously recorded) maximum integrand value of the channel. The MCI weight is renormalized accordingly, to cancel this effect on the result.

### 19.5.5 Sampler as Workspace

In the full setup, the sampling function requires the process instance object as workspace. We implement this by (i) implementing the process instance as a type extension of the abstract `sampler_t` object used by the MCI implementation and (ii) providing such an object as an extra argument to the sampling function that VAMP can call. To minimize cross-package dependencies, we use an abstract type `vamp_workspace` that VAMP declares and extend this by including a pointer to the `sampler` and `instance` objects. In the body of the sampling function, we dereference this pointer and can then work with the contents.

```
<MCI vamp: types>+≡
  type, extends (vamp_data_t) :: mci_workspace_t
    class(mci_sampler_t), pointer :: sampler => null ()
    class(mci_vamp_instance_t), pointer :: instance => null ()
  end type mci_workspace_t
```

### 19.5.6 Integrator instance

The history entries should point to the corresponding history entry in the `pass_t` object. If there is none, we may allocate a local history, which is then just transient.

```

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set `reshape` if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together with the MCI instance object.

```
