## 22.11 The Multiple Interactions main module

This file contains the module `muli` which is the multiple parton interactions interface module to `WHIZARD`. `muli` is supposed to run together with initial state radiation. Both share a momentum evolution variable and compete for beam momentum, so the generation of this scale variable must be fully transparent to `WHIZARD`. That is why the corresponding procedures are here, while all other work like phase space integration, flavor generation and treatment of the beam remnant is put into `muli_dsigma`, `muli_mcint` and `muli_remnant`, respectively.

`qcd_2_2_t` is a container class for properties of QCD  $2 \rightarrow 2$  interactions. It holds a very condensed internal representation and offers a convenient set of TBP to query all aspects without the burden of the generator internals.

`muli_t` then is an extension of `qcd_2_2_t` that adds generator internals like random number generator, integrated cross-sections, the actual Monte Carlo generator for flavor generation and beam remnants in `tao_rnd`, `dsigma`, `samples` and `beam`, respectively.

        integer :: kind
        kind = valid_processes (6, this%process_id)
    end function qcd_2_2_get_diagram_kind

```

This is one more hack. Before merging into the interleaved algorithm, muli has only cared for summed cross sections, but not in specific color flows. So two different diagrams with equal cross sections were summed up to diagram kind 1. Now muli also generates color flows, so we must divide diagram kind 1 into diagram color kind 0 and diagram color kind 1.

## Chapter 23

# User Plugin Support

Here we collect interface code that enables the user to inject his own code into the WHIZARD workflow. The code uses data types defined elsewhere, and is referenced in the `eval_trees` module.

These are the modules:

**user\_code\_interface** Generic support and specific additions.

**sf\_user** Handle user-defined structure functions.

Figure 23.1: Module dependencies in `src/user`.

## 23.1 User Code Interface

```
<user_code_interface.f90>≡  
  <File header>  
  
  module user_code_interface  
  
    use iso_c_binding !NODEP!  
    <Use kinds>  
    <Use strings>  
    use diagnostics  
    use c_particles  
    use os_interface  
  
    <Standard module head>  
  
    <User Code: public>  
  
    <User Code: variables>  
  
    <User Code: interfaces>  
  
    contains  
  
    <User Code: procedures>  
  
  end module user_code_interface
```

### 23.1.1 User Code Management

This data structure globally holds the filehandle of the user-code library:

```
<User Code: public>≡  
  public :: has_user_lib  
  
<User Code: variables>≡  
  type(dlaccess_t), save :: user_lib_handle  
  logical, save :: has_user_lib = .false.  
  type(string_t), save :: user
```

Compile, link and load user code files. Dlopen all user-provided libraries, included the one just compiled (if any).

By default, we are looking for a library `user.so/dylib`. If this is not present, try `user.f90` and compile it. This can be overridden.

In detail: First, compile all sources explicitly specified on the command line. Then collect all libraries specified on the command line, including `user.so` if it was generated. If there is still no code, check for an existing `user.f90` and compile this. Link everything into a `user.la` libtool library. When done, dlopen all libraries that we have so far.

```

### 23.1.2 Interfaces for user-defined functions

The following functions represent user-defined real observables. There may be one or two particles as argument, the result is a real value.

```

<User Code: public>+≡
    public :: user_obs_int_unary
    public :: user_obs_int_binary
    public :: user_obs_real_unary
    public :: user_obs_real_binary

<User Code: interfaces>≡
    abstract interface
        function user_obs_int_unary (prt1) result (ival) bind(C)
            use iso_c_binding !NODEP!

```

```

        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        integer(c_int) :: ival
    end function user_obs_int_unary
end interface

abstract interface
    function user_obs_int_binary (prt1, prt2) result (ival) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        integer(c_int) :: ival
    end function user_obs_int_binary
end interface

abstract interface
    function user_obs_real_unary (prt1) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        real(c_double) :: rval
    end function user_obs_real_unary
end interface

abstract interface
    function user_obs_real_binary (prt1, prt2) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        real(c_double) :: rval
    end function user_obs_real_binary
end interface

```

The following function takes an array of C-compatible particles and return a single value. The particle array represents a subevent. For C interoperability, we have to use an assumed-size array, hence the array size has to be transferred explicitly.

The cut function returns an `int`, which we should interpret as a logical value (nonzero=true).

```

<User Code: public>+≡
    public :: user_cut_fun

<User Code: interfaces>+≡
    abstract interface
        function user_cut_fun (prt, n_prt) result (iflag) bind(C)
            use iso_c_binding !NODEP!
            use c_particles !NODEP!
            type(c_prt_t), dimension(*), intent(in) :: prt
            integer(c_int), intent(in) :: n_prt
            integer(c_int) :: iflag
        end function user_cut_fun
    end interface

```

The event-shape function returns a real value.

```

<User Code: public>+≡
    public :: user_event_shape_fun

<User Code: interfaces>+≡
    abstract interface
        function user_event_shape_fun (prt, n_prt) result (rval) bind(C)
            use iso_c_binding !NODEP!
            use c_particles !NODEP!
            type(c_prt_t), dimension(*), intent(in) :: prt
            integer(c_int), intent(in) :: n_prt
            real(c_double) :: rval
        end function user_event_shape_fun
    end interface

```

### 23.1.3 Interfaces for user-defined interactions

The following procedure interfaces pertain to user-defined interactions, e.g., spectra or structure functions.

This subroutine retrieves the basic information for setting up the interaction and event generation. All parameters are `intent(inout)`, so we can provide default values. `n_in` and `n_out` are the number of incoming and outgoing particles, respectively. `n_states` is the total number of distinct states that should be generated (counting all states of the incoming particles). `n_col` is the maximal number of color entries a particle can have. `n_dim` is the number of input parameters, i.e., integration dimensions, that the structure function call requires for computing kinematics and matrix elements. `n_var` is the number of variables (e.g., momentum fractions) that the structure function call has to transfer from the kinematics to the dynamics evaluation.

```

<User Code: public>+≡
    public :: user_int_info

<User Code: interfaces>+≡
    abstract interface
        subroutine user_int_info (n_in, n_out, n_states, n_col, n_dim, n_var) &
            bind(C)
            use iso_c_binding !NODEP!
            integer(c_int), intent(inout) :: n_in, n_out, n_states, n_col
            integer(c_int), intent(inout) :: n_dim, n_var
        end subroutine user_int_info
    end interface

```

This subroutine retrieves the settings for the quantum number mask of a given particle index in the interaction. A nonzero value indicates that the corresponding quantum number is to be ignored. The lock index is the index of a particle that the current particle is related to. The relation applies if quantum numbers of one of the locked particles are summed over. (This is intended for helicity.)

```

<User Code: public>+≡
    public :: user_int_mask

```

```

<User Code: interfaces>+≡
  abstract interface
    subroutine user_int_mask (i_prt, m_flv, m_hel, m_col, i_lock) bind(C)
      use iso_c_binding !NODEP!
      integer(c_int), intent(in) :: i_prt
      integer(c_int), intent(inout) :: m_flv, m_hel, m_col, i_lock
    end subroutine user_int_mask
  end interface

```

This subroutine retrieves the quantum numbers for the particle index `i_prt` in state `i_state`. The `flv` value is a PDG code. The `hel` value is an integer helicity (twice the helicity for fermions). The `col` array is an array which has at most `n_col` entries (see above). All parameters are `intent(inout)` since default values exist. In particular, if a mask entry is set by the previous procedure, the corresponding quantum number is ignored anyway.

```

<User Code: public>+≡
  public :: user_int_state

<User Code: interfaces>+≡
  abstract interface
    subroutine user_int_state (i_state, i_prt, flv, hel, col) bind(C)
      use iso_c_binding !NODEP!
      integer(c_int), intent(in) :: i_state, i_prt
      integer(c_int), intent(inout) :: flv, hel
      integer(c_int), dimension(*), intent(inout) :: col
    end subroutine user_int_state
  end interface

```

This subroutine takes an array of particle objects with array length `n_in` and an array of input parameters between 0 and 1 with array length `n_dim`. It returns an array of particle objects with array length `n_out`. In addition, it returns an array of internal variables (e.g., momentum fractions, Jacobian) with array length `n_var` that is used by the following subroutine for evaluating the dynamics, i.e., the matrix elements.

```

<User Code: public>+≡
  public :: user_int_kinematics

<User Code: interfaces>+≡
  abstract interface
    subroutine user_int_kinematics (prt_in, rval, prt_out, xval) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), dimension(*), intent(in) :: prt_in
      real(c_double), dimension(*), intent(in) :: rval
      type(c_prt_t), dimension(*), intent(inout) :: prt_out
      real(c_double), dimension(*), intent(out) :: xval
    end subroutine user_int_kinematics
  end interface

```

This subroutine takes the array of variables (e.g., momentum fractions) with length `n_var` which has been generated by the previous subroutine and a real variable, the energy scale of the event. It returns an array of matrix-element

values, one entry for each quantum state `n_states`. The ordering of matrix elements must correspond to the ordering of states.

```

<User Code: public>+≡
    public :: user_int_evaluate

<User Code: interfaces>+≡
    abstract interface
        subroutine user_int_evaluate (xval, scale, fval) bind(C)
            use iso_c_binding !NODEP!
            real(c_double), dimension(*), intent(in) :: xval
            real(c_double), intent(in) :: scale
            real(c_double), dimension(*), intent(out) :: fval
        end subroutine user_int_evaluate
    end interface

```

## 23.2 User Plugin for Structure Functions

This variant gives access to user-defined structure functions or spectra.

### 23.2.1 The module

```

<sf_user.f90>≡
    <File header>

    module sf_user

        use, intrinsic :: iso_c_binding !NODEP!
        <Use kinds>
        <Use strings>
        use io_units
        use format_defs, only: FMT_17
        use diagnostics
        use c_particles
        use lorentz
        use subevents
        use user_code_interface
        use pdg_arrays
        use model_data
        use flavors
        use helicities
        use colors
        use quantum_numbers
        use state_matrices
        use polarizations
        use interactions
        use sf_aux
        use sf_base

        <Standard module head>

        <SF user: public>

```

```

<SF user: types>

contains

<SF user: procedures>

end module sf_user

```

### 23.2.2 The user structure function data block

The data block holds the procedure pointers that are used for retrieving static information, as well as the actual evaluation.

```

<SF user: public>≡
    public :: user_data_t

<SF user: types>≡
    type, extends(sf_data_t) :: user_data_t
        private
            type(string_t) :: name
            integer :: n_in
            integer :: n_out
            integer :: n_tot
            integer :: n_states
            integer :: n_col
            integer :: n_dim
            integer :: n_var
            integer, dimension(2) :: pdg_in
            class(model_data_t), pointer :: model => null ()
            procedure(user_int_info), nopass, pointer :: info => null ()
            procedure(user_int_mask), nopass, pointer :: mask => null ()
            procedure(user_int_state), nopass, pointer :: state => null ()
            procedure(user_int_kinematics), nopass, pointer :: kinematics => null ()
            procedure(user_int_evaluate), nopass, pointer :: evaluate => null ()
        contains
            <SF user: user data: TBP>
        end type user_data_t

```

Assign procedure pointers from a dynamically loaded library, given the specified name.

We have to distinguish three cases: (1) Both beams are affected, and the user spectrum implements both beams. There is a single data object. (2) Both beams are affected, and the user spectrum applies to single beams. Fill two different objects. (3) A single beam is affected.

```

<SF User: public>≡
    public :: sf_user_data_init

<SF User: procedures>≡
    subroutine sf_user_data_init (data, name, flv, model)
        type(sf_user_data_t), intent(out) :: data

### 23.2.4 The user structure function

For maximal flexibility, user structure functions separate kinematics from dynamics just as the PDF interface does. (JRR: Ok, I guess this now done for all structure functions, right?) We create `c_prt_t` particle objects from the incoming momenta (all other quantum numbers are irrelevant) and call the user-supplied kinematics function to compute the outgoing momenta, along with other variables that will be needed for matrix element evaluation. If known, we use the mass squared computed above. !!! JRR: WK please check (#529) I don't know actually whether this really fits into the setup done by WK.

```
<SF user: types>+≡
  !!! JRR: WK please check (#529)
  type, extends (sf_int_t) :: user_t
    type(user_data_t), pointer :: data => null ()

```

### 23.2.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

<SF user: user: TBP>+≡
    procedure :: complete_kinematics => user_complete_kinematics

<SF user: procedures>+≡
    subroutine user_complete_kinematics (sf_int, x, xb, f, r, rb, map)
        !!! JRR: WK please check (#529)
        !!! This cannot be correct, as the CIRCE1 structure function has
        !!! twice the variables (2->4 instead of 1->2 splitting)
        class(user_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), dimension(:), intent(out) :: xb
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: r
        real(default), dimension(:), intent(in) :: rb
        logical, intent(in) :: map
        if (map) then
            call msg_fatal ("User structure function: map flag not supported")
        else
            x(1) = r(1)
            xb(1) = rb(1)
            f = 1
        end if
        call sf_int%split_momentum (x, xb)
        select case (sf_int%status)
        case (SF_DONE_KINEMATICS)
            sf_int%x = x(1)
        case (SF_FAILED_KINEMATICS)
            sf_int%x = 0
            f = 0
        end select
    end subroutine user_complete_kinematics

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

## Chapter 24

# BLHA Interface

The code in this chapter implements support for the BLHA record that communicates data for NLO processes.

These are the modules:

**blha\_config**

**blha\_interface**

**blha\_driver**

### 24.1 Module definition

These modules implement the communication with one loop matrix element providers according to the Binoth LesHouches Accord Interface. The actual matrix element(s) are loaded as a dynamic library.

This module defines the common OLP-interfaces defined through the Binoth Les-Houches accord.

```
<blha_olp_interfaces.f90>≡

Computes a virtual matrix element from an interface to an external one-loop provider. The output of `blha_olp_eval2` is an array of `dimension(4)`, corresponding to the  $\epsilon^2$ -,  $\epsilon^1$ - and  $\epsilon^0$ -poles of the virtual matrix element at position `r(1:3)` and the Born matrix element at position `r(4)`. The matrix element is rejected if its accuracy is larger than the maximal allowed accuracy. OpenLoops includes a factor of  $1 / n_{\text{hel}}$  in the amplitudes, which we have to undo if polarized matrix elements are requested (GoSam does not support polarized matrix

elements).

Computes a color-correlated matrix element from an interface to an external one-loop provider. The output of `blha.olp_eval2` is an array of dimension( $n * (n - 1) / 2$ ). The matrix element is rejected if its accuracy is larger than the maximal allowed accuracy. OpenLoops includes a factor of  $1 / n_{hel}$  in the amplitudes, which we have to undo if polarized matrix elements are requested (GoSam does not support polarized matrix elements).

In general, the BLHA consists of a virtual matrix element and  $n_{\text{sub}}$  subtraction terms. The subtraction terms can be pure Born matrix elements (to be used in collinear subtraction or in internal color-correlation), color-correlated matrix elements or spin-correlated matrix elements. The numbers should be ordered in such a way that  $\mathcal{V}_{\text{fin}}$  is first, followed by the pure Born, the color-correlated and the spin-correlated matrix elements. This repeats  $n_{\text{flv}}$  times. Let  $\nu_i$  be the position of the  $i$ th virtual matrix element. The next  $\mathcal{V}_{\text{fin}}$  is at position  $\nu_i = \nu_{i-1} + n_{\text{sub}} + 1$ . Obviously,  $\nu_1 = 1$ . This allows us to determine the virtual matrix element positions using the recursive function implemented below.

## Chapter 25

# GoSam Interface

The code in this chapter makes amplitudes accessible to **WHIZARD** that are generated and computed by the GoSam package.

These are the modules:

**loop\_archive** Provide some useful extra functionality.

**prc\_gosam** The actual interface, following the **WHIZARD** conventions for matrix-element generator methods.

No internal dependencies

Figure 25.1: Module dependencies in `src/gosam`.

## 25.1 Gosam Interface

```

The BLHA-interface conventions require the quantity  $S_{ij} = \langle M_{i,+} | T_i T_j | M_{i,-} \rangle$  to be produced, where  $i$  is the position of the splitting gluon. However,  $\tilde{M} = \langle M_{i,-} | M_{i,+} \rangle$  is needed. This can be obtained using color conservation,  $\sum_j T_j |M\rangle = 0$ , so that

$$\sum_{j \neq i} S_{ij} = -\langle M_{i,+} | T_i^2 | M_{i,-} \rangle = -C_A \langle M_{i,+} | M_{i,-} \rangle = -C_A \tilde{M}^*$$

According to BLHA conventions, the real part of  $S_{ij}$  is located at positions  $2i + 2nj$  in the output array, where  $n$  denotes the number of external particles and the enumeration of particles starts at zero. The subsequent position, i.e.  $2i + 2nj + 1$  is designated to the imaginary part of  $S_{ij}$ . Note that, since the first array position is 1, the implemented position association deviates from the above one in the addition of 1.

## Chapter 27

# FKS Subtraction Scheme

The code in this chapter implements the FKS subtraction scheme for use with WHIZARD.

These are the modules:

**fks\_regions** Given a process definition, identify singular regions in the associated phase space.

**virtual** Handle the virtual correction matrix element.

**real\_subtraction** Handle the real-subtraction matrix element.

**nlo\_data** Manage the subtraction objects.

This chapter deals with next-to-leading order contributions to cross sections. Basically, there are three major issues to be addressed: The creation of the  $N+1$ -particle flavor structure, the construction of the  $N+1$ -particle phase space and the actual calculation of the real- and virtual-subtracted matrix elements. The first is dealt with using the **auto\_components** class, and it will be shown that the second and third issue are connected in FKS subtraction.

### 27.1 Brief outline of FKS subtraction

*In the current state, this discussion is only concerned with lepton collisions. For hadron collisions, renormalization of parton distributions has to be taken into account. Further, for QCD corrections, initial-state radiation is necessarily present. However, most quantities have so far been only constructed for final-state emissions*

The aim is to calculate the next-to-leading order cross section according to

$$d\sigma_{\text{NLO}} = \mathcal{B} + \mathcal{V} + \mathcal{R}d\Phi_{\text{rad}}.$$

Analytically, the divergences, in terms of poles in the complex quantity  $\varepsilon = 2 - d/2$ , cancel. However, this is in general only valid in an arbitrary, complex number of dimensions. This is, roughly, the content of the KLN-theorem. WHIZARD, as any other numerical program, is confined to four dimensions. We will assume

Figure 27.1: Module dependencies in `src/fks`.

that the KLN-theorem is valid and that there exist subtraction terms  $\mathcal{C}$  such that

$$d\sigma_{\text{NLO}} = \mathcal{B} + \underbrace{\mathcal{V} + \mathcal{C}}_{\text{finite}} + \underbrace{\mathcal{R} - \mathcal{C}}_{\text{finite}},$$

i.e. the subtraction terms correspond to the divergent limits of the real and virtual matrix element.

Because  $\mathcal{C}$  subtracts the divergences of  $\mathcal{R}$  as well as those of  $\mathcal{V}$ , it suffices to consider one of them, so we focus on  $\mathcal{R}$ . For this purpose,  $\mathcal{R}$  is rewritten,

$$\mathcal{R} = \frac{1}{\xi^2} \frac{1}{1-y} (\xi^2(1-y)\mathcal{R}) = \frac{1}{\xi^2} \frac{1}{1-y} \tilde{\mathcal{R}},$$

with  $\xi = (2k_{\text{rad}}^0)/\sqrt{s}$  and  $y = \cos\theta$ , where  $k_{\text{rad}}^0$  denotes the energy of the radiated parton and  $\theta$  is the angle between emitter and radiated parton.  $\tilde{\mathcal{R}}$  is finite, therefore the whole singularity structure is contained in the prefactor  $\xi^{-2}(1-y)^{-1}$ . Combined with the  $d$ -dimensional phase space element,

$$\frac{d^{d-1}k}{2k^0(2\pi)^{d-1}} = \frac{s^{1-\varepsilon}}{(4\pi)^{d-1}} \xi^{1-2\varepsilon} (1-y^2)^{-\varepsilon} d\xi dy d\Omega^{d-2},$$

this yields

$$d\Phi_{\text{rad}} \mathcal{R} = dy(1-y)^{-1-\varepsilon} d\xi \xi^{-1-2\varepsilon} \tilde{\mathcal{R}}.$$

This can further be rewritten in terms of plus-distributions,

$$\begin{aligned} \xi^{-1-2\varepsilon} &= -\frac{1}{2\varepsilon} \delta(\xi) + \left(\frac{1}{\xi}\right)_+ - 2\varepsilon \left(\frac{\log \xi}{\xi}\right)_+ + \mathcal{O}(\varepsilon^2), \\ (1-y)^{-1-\varepsilon} &= -\frac{2^{-\varepsilon}}{\varepsilon} \delta(1-y) + \left(\frac{1}{1-y}\right)_+ - \varepsilon \left(\frac{1}{1-y}\right)_+ \log(1-y) + \mathcal{O}(\varepsilon^2), \end{aligned}$$

(imagine that all this is written inside of integrals, which are spared for ease of notation) such that

$$d\Phi_{\text{rad}}\mathcal{R} = -\frac{1}{2\varepsilon}dy(1-y)^{-1-\varepsilon}\tilde{R}(0,y) - d\xi \left[ \frac{2^{-\varepsilon}}{\varepsilon} \left(\frac{1}{\xi}\right)_+ - 2 \left(\frac{\log \xi}{\xi}\right)_+ \right] \tilde{R}(\xi,1) \\ + dyd\xi \left(\frac{1}{\xi}\right)_+ \left(\frac{1}{1-y}\right)_+ \tilde{R}(\xi,y) + \mathcal{O}(\varepsilon).$$

The summand in the second line is of order  $\mathcal{O}(1)$  and is the only one to reproduce  $\mathcal{R}_{\xi,y}$ . It thus constitutes the sum of the real matrix element and the corresponding counterterms. The first summand consequently consists of the subtraction terms to the virtual matrix elements. Above formula thus allows to calculate all quantities to render the matrix elements finite.

4	[-11,11,2,-2,2,-2]	5	(5,6)

Table 27.1: List of singular regions. The particles are represented by their PDG codes. The third column contains the emitter for the specific singular region. For the process involving an additional gluon, the gluon can either be emitted from one of the quarks or from the first gluon. Each emitter yields the same list of fundamental tuples, five in total. The last singular region corresponds to the process where the gluon splits up into two quarks. Here, there is only one fundamental tuple, corresponding to a singular configuration of the momenta of the additional quarks.

## 27.2 Identifying singular regions

In the FKS subtraction scheme, the phase space is decomposed into disjoint singular regions, such that

$$\sum_i \mathcal{S}_i + \sum_{ij} \mathcal{S}_{ij} = 1. \quad (27.1)$$

The quantities  $\mathcal{S}_i$  and  $\mathcal{S}_{ij}$  are functions of phase space corresponding to a pair of particles indices which can make up a divergent phase space region. We call such an index pair a fundamental tuple. For example, the process  $e^+ e^- \rightarrow u \bar{u} g$  has two singular regions, (3, 5) and (4, 5), indicating that the gluon can be soft or collinear with respect to either the quark or the anti-quark. Therefore, the functions  $\mathcal{S}_{ij}$  have to be chosen in such a way that their contribution makes up most of (27.1) in phase-space configurations where (final-state) particle  $j$  is collinear to particle  $i$  or/and particle  $j$  is soft. The functions  $\mathcal{S}_i$  is the corresponding quantity for initial-state divergences.

As a singular region we understand the collection of real flavor structures associated with an emitter and a list of all possible fundamental tuples. As an example, consider the process  $e^+ e^- \rightarrow u \bar{u} g$ . At next-to-leading order, processes with an additionally radiated particle have to be considered. In this case, these are  $e^+ e^- \rightarrow u \bar{u}, g g$ , and  $e^+ e^- \rightarrow u \bar{u} u \bar{u}$  (or the same process with any other quark). Table 27.2 sums up all possible singular regions for this problem.

Thus, during the preparation of a NLO-calculation, the possible singular regions have to be identified. `fkf_regions.f90` deals with this issue.

```

Returns `true` if the two particles at position `i` and `j` in the flavor array can originate from the same splitting. For this purpose, the function first checks whether the splitting is allowed at all. If this is the case, the emitter is removed from the flavor array. If the resulting array is equivalent to the Born flavor structure `flv_born`, the pair is accepted as a valid splitting. We first check whether the splitting is possible. The array `flv_orig` contains all particles which share a vertex with the particles at position `i` and `j`. If its size is equal to zero, no splitting is possible and the subroutine is exited. Otherwise, we loop over all possible underlying Born flavor structures and check if any of them equals the actual underlying Born flavor structure. For a quark emitting a gluon, `flv_orig` contains the PDG code of the anti-quark. To be on the safe side, a second array is created, which contains both the positively and negatively signed PDG codes. Then, the original tuple  $(i, j)$  is removed from the real flavor structure and the particles in `flv_orig2` are inserted. If the resulting Born configuration is equal to the underlying Born configuration, up to a permutation of final-state particles, the tuple  $(i, j)$  is accepted as valid.

A singular region is a partition of phase space which is associated with an individual emitter and, if relevant, resonance. It is associated with an  $\alpha_r$ - and resonance-index, with a real flavor structure and its underlying Born flavor structure. To compute the FKS weights, it is relevant to know all the other particle indices which can result in a divergent phase space configuration, which are collected in the **ftuples**-array.

Some singular regions might behave physically identical. E.g. a real flavor structure associated with three-jet production is  $[11, -11, 0, 2 - 2, 0]$ . Here, there are two possible **ftuples** which contribute to the same  $u \rightarrow ug$  splitting, namely (3, 4) and (4, 6). The resulting singular regions will be identical. To avoid this, one singular region is associated with the multiplicity factor **mult**. When computing the subtraction terms for each singular region, the result is then simply multiplied by this factor.

The **double\_fsr**-flag indicates whether the singular region should also be supplied by a symmetry factor, explained below.

In case of a  $g \rightarrow gg$  or  $g \rightarrow qq$  splitting, the factor

$$\frac{2E_{\text{em}}}{E_{\text{em}} + E_{\text{rad}}}$$

is multiplied to the real matrix element. This way, the symmetry of the splitting is used and only one singular region has to be taken into account. However, the factor ensures that there is only a soft singularity if the radiated parton becomes soft.

This subroutine splits up the ftuple-list of the singular regions into interference-free lists, i.e. lists which only contain the same emitter. This is relevant for factorized NLO calculations. In the current implementation, it is hand-tailored for the threshold computation, but should be generalized further in the future.

```

This subroutine starts with a specification of  $N$ - and  $N + 1$ -particle configurations, `flst_born` and `flst_real`, saved in `reg_data`. From these, it creates a list of fundamental tuples, a list of emitters and a list containing the  $N + 1$ -particle configuration, rearranged in such a way that the emitter-radiation pair is last (`flst_alr`). For the  $e^+ e^- \rightarrow u \bar{u} g$ - example, the generated objects are shown in table 27.2. Note that at this point, `flst_alr` is arranged in such a way that the emitter can only be equal to  $n_{legs} - 1$  for final-state radiation or 0, 1, or 2 for initial-state radiation. Further, it occurs that regions can be equivalent. For example in table 27.2 the regions corresponding to `alr = 1` and `alr = 3` as well as `alr = 2` and `alr = 4` describe the same physics and are therefore equivalent.

```

In the soft limit, our treatment of the divergences requires a modification of the mapping functions. Recall that there, the ratios of the  $d$ -functions must approach either 1 or 0. This means

$$\frac{d_{lm}}{d_{0m}} = \frac{(2k_l \cdot k_m) [E_l E_m / (E_l + E_m)^2]}{E_m^2 (1 - y^2)} \stackrel{k_m = E_m \hat{k}}{=} \frac{E_l E_m^2}{(E_l + E_m)^2} \frac{2k_l \cdot \hat{k}}{E_m^2 (1 - y^2)} \stackrel{E_m \rightarrow 0}{=} \frac{2}{k_l \cdot \hat{k}} (1 - y^2) E_l,$$

where we have written the gluon momentum in terms of the soft momentum  $\hat{k}$ . In the same limit

$$\frac{d_{lm}}{d_{nm}} = \frac{k_l \cdot \hat{k}}{k_n \cdot \hat{k}} \frac{E_n}{E_l}.$$

From these equations we can deduce the soft limit of  $d$ :

$$\begin{aligned} d_0^{\text{soft}} &= 1 - y^2, \\ d_1^{\text{soft}} &= 2(1 - y), \\ d_2^{\text{soft}} &= 2(1 + y), \\ d_i^{\text{soft}} &= \frac{2k_i \cdot \hat{k}}{E_i}. \end{aligned}$$

The  $d_{ij,k}$ -functions for the resonance mapping are basically the same as in the default case, but the kinematical values here must be evaluated in the resonance

frame of reference. The energy of parton  $i$  in a given resonance frame with momentum  $p_{res}$  is

$$E_i = \frac{p_i^0 \cdot p_{res}}{m_{res}}.$$

However, since the expressions only depend on ratios of four-momenta, we leave out the denominator because it will cancel out anyway.

```

The virtual subtraction terms contain Casimir operators and derived constants, listed below:

$$C(q) = C(\bar{q}) = C_F, \quad (27.2)$$

$$C(g) = C_A, \quad (27.3)$$

$$\gamma(q) = \gamma(\bar{q}) = \frac{3}{2}C_F, \quad (27.4)$$

$$\gamma(g) = \frac{11}{6}C_A - \frac{2}{3}T_F N_f, \quad (27.5)$$

$$\gamma'(q) = \gamma'(\bar{q}) = \left( \frac{13}{2} - \frac{2\pi^2}{3} \right) C_F, \quad (27.6)$$

$$\gamma'(g) = \left( \frac{67}{9} - \frac{2\pi^2}{3} \right) C_A - \frac{23}{9}T_F N_f. \quad (27.7)$$

For uncolored particles, `virtual_init_constants` sets  $C$ ,  $\gamma$  and  $\gamma'$  to zero.

The collinear limit of  $\tilde{\mathcal{R}}$  can be integrated over the radiation degrees of freedom, giving the collinear contribution to the virtual component. Its general structure is  $\mathcal{Q} \cdot \mathcal{B}$ . The initial-state contribution to  $\mathcal{Q}$  is simply given by

$$\mathcal{Q} = -\log \frac{\mu_F^2}{Q^2} (\gamma(\mathcal{I}_1) + \gamma(\mathcal{I}_2)), \quad (27.9)$$

where  $Q^2$  is the Ellis-Sexton scale and  $\gamma$  is as in eqns. 27.4 and 27.5. `virtual_evaluate_initial_state` computes this quantity. The loop over the initial-state particles is only executed if we are dealing with a scattering process, because for decays there are no virtual initial-initial interactions.

```

<virtual: virtual: TBP>+=
  procedure :: evaluate_initial_state => virtual_evaluate_initial_state
<virtual: procedures>+=
  subroutine virtual_evaluate_initial_state (virt, i_flv, i_virt, sqrts, reg_data, sqme, QB)

integer :: i, i_sqme
if (virt%n_in == 2) then
  i_sqme = virt%get_i_born_from_i_virt (i_virt)
  do i = 1, virt%n_in
    QB(i_flg) = QB(i_flg) - virt%gamma_0 (i, i_flg) * &
      log(virt%fac_scale**2 / virt%es_scale2) * sqme (i_sqme)
  end do
end if
end subroutine virtual_evaluate_initial_state

```

Same as above, but for final-state particles. The collinear limit for final-state particles follows from the integral

$$I_{+, \alpha_r} = \int d\Phi_{n+1} \frac{\xi_+^{-1-2\epsilon}}{\xi^{-1-2\epsilon}} \mathcal{R}_{\alpha_r}.$$

We can distinguish three situations:

1.  $\alpha_r$  contains a massive emitter. In this case, no collinear subtraction terms is required and the integral above irrelevant.
2.  $\alpha_r$  contains a massless emitter, but resonances are not taken into account in the subtraction. Here,  $\xi_{max} = \frac{2E_{em}}{\sqrt{s}}$  is the upper bound on  $\xi$ .
3.  $\alpha_r$  contains a massless emitter and resonance-aware subtraction is used. Here,  $\xi_{max} = \frac{2E_{em}}{\sqrt{k_{res}^2}}$ .

Before version 2.4, only situations 1 and 2 were covered. The difference between situation 2 and 3 comes from the expansion of the plus-distribution in the integral above,

$$\xi_+^{-1-2\epsilon} = \xi^{-1-2\epsilon} + \frac{1}{2\epsilon} \delta(\xi) = \xi_{max}^{-1-2\epsilon} \left[ (1-z)^{-1-2\epsilon} + \frac{\xi_{max}^{2\epsilon}}{2\epsilon} \delta(1-z) \right].$$

The expression from the standard FKS literature is given by  $\mathcal{Q}$  is given by

$$\begin{aligned} \mathcal{Q} = \sum_{k=n_{in}}^{n_L^{(B)}} & \left[ \gamma'(\mathcal{I}_k) - \log \frac{s}{2Q^2} \left( \gamma(\mathcal{I}_k) - 2C(\mathcal{I}_k) \log \frac{2E_k}{\sqrt{s}} \right) \right. \\ & \left. + 2C(\mathcal{I}_k) \log^2 \frac{2E_k}{\sqrt{s}} - 2\gamma(\mathcal{I}_k) \log \frac{2E_k}{\sqrt{s}} \right]. \end{aligned} \quad (27.10)$$

$n_L^{(B)}$  is the number of legs at Born level. Here,  $\xi_{max}$  is implicitly present in the ratios in the logarithms. Using the resonance-aware  $\xi_{max}$  yields

$$\begin{aligned} \mathcal{Q} = \sum_{k=n_{in}}^{n_L^{(B)}} & \left[ \gamma'(\mathcal{I}_k) + \left( \log \frac{\sqrt{s}}{2E_{em}} + \log \xi_{max} \right) \left( \log \frac{\sqrt{s}}{2E_{em}} + \log \xi_{max} + \log \frac{Q^2}{s} \right) C(\mathcal{I}_k) \right. \\ & \left. + 2 \log \xi_{max} \left( \log \xi_{max} - \log \frac{Q^2}{k_{res}^2} \right) C(\mathcal{I}_k) + \left( \frac{Q^2}{k_{res}^2} - 2 \log \xi_{max} \right) \gamma(\mathcal{I}_k) \right]. \end{aligned} \quad (27.11)$$

Equation 27.11 leads to 27.10 with the substitutions  $\xi_{max} \rightarrow \frac{2E_{em}}{\sqrt{s}}$  and  $k_{res}^2 \rightarrow s$ .  
`virtual_compute_collinear_contribution` only implements the second one.

```

The following code implements the  $\mathcal{I}_{ij}$ -function appearing in eq. blub. They are defined as follows:

Massless-Massless Case

$$\begin{aligned}
 \mathcal{I}_{ij} = & \frac{1}{2} \log^2 \frac{s}{Q^2} + \log \frac{s}{Q^2} \log \frac{k_i k_j}{2E_i E_j} - \text{Li}_2 \left( \frac{k_i k_j}{2E_i E_j} \right) \\
 & + \frac{1}{2} \log^2 \frac{k_i k_j}{2E_i E_j} - \log \left( 1 - \frac{k_i k_j}{2E_i E_j} \right) \log \frac{k_i k_j}{2E_i E_j}.
 \end{aligned} \tag{27.12}$$

Massive-Massive Case

$$\mathcal{I}_{ij} = -\frac{1}{2}I_0(k_i, k_j) \log \frac{Q^2}{s} - \frac{1}{2}I_\epsilon(k_i, k_j) \quad (27.13)$$

with

$$I_0(k_i, k_j) = \frac{1}{\beta} \log \frac{1+\beta}{1-\beta}, \quad \beta = \sqrt{1 - \frac{k_i^2 k_j^2}{(k_i \cdot k_j)^2}}$$

and a rather involved expression for  $I_\epsilon$ :

$$\begin{aligned} I_\epsilon(k_i, k_j) &= (K(z_j) - K(z_i)) \frac{1 - \vec{\beta}_i \cdot \vec{\beta}_j}{\sqrt{a(1-b)}}, \\ \vec{\beta}_i &= \frac{\vec{k}_i}{k_i^0}, \\ a &= \beta_i^2 + \beta_j^2 - 2\vec{\beta}_i \cdot \vec{\beta}_j, \\ x_i &= \frac{\beta_i^2 - \vec{\beta}_i \cdot \vec{\beta}_j}{a}, \\ x_j &= \frac{\beta_j^2 - \vec{\beta}_i \cdot \vec{\beta}_j}{a} = 1 - x_i, \\ b &= \frac{\beta_i^2 \beta_j^2 - (\vec{\beta}_i \cdot \vec{\beta}_j)^2}{a}, \\ c &= \sqrt{\frac{b}{4a}}, \\ z_+ &= \frac{1 + \sqrt{1-b}}{\sqrt{b}}, \\ z_- &= \frac{1 - \sqrt{1-b}}{\sqrt{b}}, \\ z_i &= \frac{\sqrt{x_i^2 + 4c^2} - x_i}{2c}, \\ z_j &= \frac{\sqrt{x_j^2 + 4c^2} + x_j}{2c}, \\ K(z) &= -\frac{1}{2} \log^2 \frac{(z - z_-)(z_+ - z)}{(z_+ + z)(z_- + z)} - 2Li_2 \left( \frac{2z_-(z_+ - z)}{(z_+ - z_-)(z_- + z)} \right) \\ &\quad - 2Li_2 \left( -\frac{2z_+(z_- + z)}{(z_+ - z_-)(z_+ - z)} \right) \end{aligned}$$

Massive-Massless Case

$$\mathcal{I}_{ij} = \frac{1}{2} \left[ \log^2 \frac{Q}{s} - \frac{\pi^2}{6} \right] - \frac{1}{2}I_0(k_i, k_j) \log \frac{Q^2}{s} - \frac{1}{2}I_\epsilon(k_i, k_j) \quad (27.14)$$

with

$$\begin{aligned} I_0(p, k) &= \log \frac{(\hat{p} \cdot \hat{k})^2}{\hat{k}^2}, \\ I_\epsilon(p, k) &= -2 \left[ \frac{1}{4} \log^2 \frac{1-\beta}{1+\beta} + \log \frac{\hat{p} \cdot \hat{k}}{1+\beta} \log \frac{\hat{p} \cdot \hat{k}}{1-\beta} + Li_2 \left( 1 - \frac{\hat{p} \cdot \hat{k}}{1+\beta} \right) + Li_2 \left( 1 - \frac{\hat{p} \cdot \hat{k}}{1-\beta} \right) \right] \end{aligned}$$

using

$$\hat{p} = \frac{p}{p^0}, \quad \hat{k} = \frac{k}{k^0}, \quad \beta = \frac{|\vec{k}|}{k_0}.$$

In the soft limit, the real matrix element behaves as

$$\mathcal{R}_{\text{soft}} = 4\pi\alpha_s \left[ \sum_{i \neq j} \mathcal{B}_{ij} \frac{k_i \cdot k_j}{(k_i \cdot k)(k_j \cdot k)} - \mathcal{B} \sum_i \frac{k_i^2}{(k_i \cdot k)^2} C_i \right],$$

where  $k$  denotes the momentum of the emitted parton. The quantity  $\mathcal{B}_{ij}$  is called the color-correlated Born matrix element defined as

$$\mathcal{B}_{ij} = \frac{1}{2s} \sum_{\substack{\text{colors} \\ \text{spins}}} \mathcal{M}_{\{c_k\}} \left( \mathcal{M}_{\{c_k\}}^\dagger \right)_{\substack{c_i \rightarrow c'_i \\ c_j \rightarrow c'_j}} T_{c_i, c'_i}^a T_{c_j, c'_j}^a.$$

The treatment of the momentum  $k$  follows the discussion about the soft limit of the partition functions (ref????). The parton momentum is pulled out,  $k = E\hat{k}$ . In fact, we will substitute  $\hat{k}$  for  $k$  throughout the code, because the energy will factor out of the equation when the soft  $\mathcal{S}$ -function is multiplied. The soft momentum is a unit vector, because  $k^2 = (k^0)^2 - (\hat{k})^2 = 0$ .

The soft momentum is constructed by first creating a unit vector parallel to the emitter's Born momentum. This unit vector is then rotated about the corresponding angles  $y$  and  $\phi$ .

The soft vector for the real mismatch is basically the same as for usual FSR, except for the scaling with the total gluon energy. Moreover, the resulting vector is rotated into the frame where the 3-axis points along the direction of the emitter. This is necessary because in the collinear limit, the approximation

$$k_i = \frac{k_i^0}{\bar{k}_j^0} \bar{k}_j = \frac{\xi \sqrt{s}}{2\bar{k}_j^0} \bar{k}_j$$

is used. The collinear limit is not included in the soft mismatch yet, but we keep the rotation for future usage here already (the performance loss is negligible).

```

```

Computation of the soft limit of  $R_\alpha$ . Note that what we are actually integrating (in the case of final-state radiation) is the quantity  $f(0, y)/\xi$ , where

$$f(\xi, y) = \frac{J(\xi, y, \phi)}{\xi} \xi^2 R_\alpha.$$

$J/\xi$  is computed by the phase space generator. The additional factor of  $\xi^{-1}$  is supplied in the `evaluate_region_fsr`-routine. Thus, we are left with a factor of  $\xi^2$ . A look on the expression for the soft limit of  $R_\alpha$  below reveals that we are factoring out the gluon energy  $E_i$  in the denominator. Therefore, we have a factor  $\xi^2/E_i^2 = q^2/4$ .

Note that the same routine is used also for the computation of the soft mismatch. There, the gluon energy is not factored out from the soft vector, so that we are left with the  $\xi^2$ -factor, which will eventually be cancelled out again. So, we just multiply with 1. Both cases are distinguished by the flag `xi2_expanded`.

We have to multiply this with  $\xi^2(1-y)$ . Further, when applying the soft  $\mathcal{S}$ -function, the energy of the radiated particle is factored out. Thus we have  $\xi^2/E_{em}^2(1-y) = 4/q_0^2(1-y)$ . Computes the quantity  $\mathcal{K}_{ij} = \frac{k_i \cdot k_j}{(k_i \cdot k)(k_j \cdot k)}$ .

## 27.5.2 Collinear and soft-collinear subtraction terms

This data type deals with the calculation of the collinear and soft-collinear contribution to the cross section.

```

<real subtraction: types>+=
  type :: coll_subtraction_t
    integer :: n_in, n_alr
    logical :: use_resonance_mappings = .false.
  contains
    <real subtraction: coll sub: TBP>
    end type coll_subtraction_t

<real subtraction: coll sub: TBP>=
  procedure :: init => coll_subtraction_init

<real subtraction: procedures>+=
  subroutine coll_subtraction_init (coll_sub, n_alr, n_in)
    class(coll_subtraction_t), intent(inout) :: coll_sub

```

```

integer, intent(in) :: n_alr, n_in
coll_sub%n_in = n_in
coll_sub%n_alr = n_alr
end subroutine coll_subtraction_init

```

This subroutine computes the collinear limit of  $g^\alpha(\xi, y)$  introduced in eq. 27.15. Care is given to also enable the usage for the soft-collinear limit. This, we write all formulas in terms of soft-finite quantities.

We have to compute

$$\frac{J(\Phi_n, \xi, y, \phi)}{\xi} [(1-y)\xi^2 \mathcal{R}^\alpha(\Phi_{n+1})] |_{y=1}.$$

The Jacobian  $j$  is proportional to  $\xi$ , due to the  $d^3k_{n+1}/k_{n+1}^0$  factor in the integration measure. It cancels the factor of  $\xi$  in the denominator. The remaining part of the Jacobian is multiplied in `evaluate_region_fsr` and is not relevant here. Inserting the splitting functions exemplarily for  $q \rightarrow qg$  yields

$$g^\alpha = \frac{8\pi\alpha_s}{k_{\text{em}}^2} C_F (1-y) \xi^2 \frac{1+(1-z)^2}{z} \mathcal{B},$$

where we have chosen  $z = E_{\text{rad}}/\bar{E}_{\text{em}}$ .  $\bar{E}_{\text{em}}$  denotes the emitter energy in the Born frame. Consequently,  $1-z = E_{\text{em}}/\bar{E}_{\text{em}}$ . The denominator can be rewritten to

$$k_{\text{em}}^2 = 2E_{\text{rad}}E_{\text{em}}(1-y)$$

which cancels the  $(1-y)$  factor in the numerator, thus showing that the whole expression is indeed collinear-finite. We can further transform

$$E_{\text{rad}}E_{\text{em}} = z(1-z)\bar{E}_{\text{em}}^2$$

so that in total we have

$$g^\alpha = \frac{4\pi\alpha_s}{1-z} C_F \left(\frac{\xi}{z}\right)^2 (1+(1-z)^2) \mathcal{B}$$

The ratio  $z/\xi$  is finite in the soft limit

$$\frac{z}{\xi} = \frac{q^0}{2\bar{E}_{\text{em}}}$$

so that  $\xi$  does not appear explicitly in the computation.

The argumentation above is valid for  $q \rightarrow qg$ -splittings, but the general factorization is valid for general splittings, also for those involving spin correlations and QED splittings. Note that care has to be given to the definition of  $z$ . Further, we have factored out a factor of  $z$  to include in the ratio  $z/\xi$ , which has to be taken into account in the implementation of the splitting functions.

    CF_factor = sregion%flst_real%charge(emitter)**2
    TR_factor = sregion%flst_real%charge(emitter)**2
  end if
  if (is_gluon (flv_em) .and. is_gluon (flv_rad)) then
    pggz = two * CA_factor * (xi * z / onemz + onemz / z_o_xi)
    sqme = pggz * sqme_born + four * CA_factor * z * onemz * xi * mom_times_sqme_born_spin_c
  else if (is_fermion (flv_em) .and. is_fermion (flv_rad)) then
    sqme = TR_factor * xi * (sqme_born - four * z * onemz * mom_times_sqme_born_spin_c)
  else if (is_fermion (flv_em) .and. is_massless_vector (flv_rad)) then
    sqme = sqme_born * CF_factor * (one + onemz**2) / z_o_xi
  else
    sqme = zero
  end if
  sqme = sqme / (p0**2 * onemz * z_o_xi)
  sqme = sqme * four * pi * alpha_coupling
  if (double_fsr) sqme = sqme * onemz

end function coll_subtraction_compute_fsr

```

Like in the context of `coll_subtraction_compute_fsr` we compute the quantity

$$\frac{J(\Phi_n, \xi, y, \phi)}{\xi} [(1-y)\xi^2 \mathcal{R}^\alpha(\Phi_{n+1})] |_{y=1},$$

and, additionally the anti-collinear case with  $y = +1$ , which, however, is completely analogous. Again, the Jacobian is proportional to  $\xi$ , so we drop the  $J/\xi$  factor. Note that it is important to take into account this missing factor of  $\xi$  in the computation of the Jacobian during phase-space generation both for fixed-beam and structure ISR. We consider only a  $q \rightarrow qg$  splitting arguing that other splittings are identical in terms of the factors which cancel. It is given by

$$g^\alpha = \frac{8\pi\alpha_s}{-k_{\text{em}}^2} C_F (1-y) \xi^2 \frac{1+z^2}{1-z} \mathcal{B}.$$

Note the negative sign of  $k_{\text{em}}^2$  to compensate the negative virtuality of the initial-state emitter. For ISR,  $z$  is defined with respect to the emitter energy entering the hard interaction, i.e.

$$z = \frac{E_{\text{beam}} - E_{\text{rad}}}{E_{\text{beam}}} = 1 - \frac{E_{\text{rad}}}{E_{\text{beam}}}.$$

Because  $E_{\text{rad}} = E_{\text{beam}} \cdot \xi$ , it is  $z = 1 - \xi$ . The factor  $k_{\text{em}}^2$  in the denominator is rewritten as

$$k_{\text{em}}^2 = (p_{\text{beam}} - p_{\text{rad}})^2 = -2p_{\text{beam}} \cdot p_{\text{rad}} = -2E_{\text{beam}} E_{\text{rad}} (1-y) = -2E_{\text{beam}}^2 (1-z)(1-y).$$

This leads to the cancellation of the  $(1-y)$  factors and one of the two factors of  $\xi$  in the numerator. Further rewriting to

$$E_{\text{beam}} E_{\text{rad}} = E_{\text{beam}}^2 (1-z)$$

cancels another factor of  $\xi$ . We thus end up with

$$g^\alpha = \frac{4\pi\alpha_s}{E_{\text{beam}}^2} C_F (1+z^2) \mathcal{B},$$

which is soft-finite. Now what about this boosting to the other beam?

### 27.5.4 The real contribution to the cross section

In each singular region  $\alpha$ , the real contribution to  $\sigma$  is given by the second summand of eqn. ??,

$$\sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2\pi} d\phi \int_{-1}^1 dy \int_0^{\xi_{\text{max}}} d\xi \left( \frac{1}{\xi} \right)_+ \left( \frac{1}{1-y} \right)_+ \underbrace{\frac{J(\Phi_n, \xi, y, \phi)}{\xi} [(1-y)\xi^2 \mathcal{R}^{\alpha}(\Phi_{n+1})]}_{g^{\alpha}(\xi, y)} \quad (27.15)$$

Writing out the plus-distribution and introducing  $\tilde{\xi} = \xi/\xi_{\text{max}}$  to set the upper integration limit to 1, this turns out to be equal to

$$\begin{aligned} \sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2\pi} d\phi \int_{-1}^1 \frac{dy}{1-y} \left\{ \int_0^1 d\tilde{\xi} \left[ \frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, y)}{\tilde{\xi}} - \underbrace{\frac{g^{\alpha}(0, y)}{\tilde{\xi}}}_{\text{soft}} - \underbrace{\frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, 1)}{\tilde{\xi}}}_{\text{coll.}} + \underbrace{\frac{g^{\alpha}(0, 1)}{\tilde{\xi}}}_{\text{coll.+soft}} \right] \right. \\ \left. + [\log \xi_{\text{max}}(y)g^{\alpha}(0, y) - \log \xi_{\text{max}}(1)g^{\alpha}(0, 1)] \right\}. \end{aligned} \quad (27.16)$$

This formula is implemented in `compute_sqme_real_fin`

```

```

This subroutine computes the finite part of the real matrix element in an individual singular region. First, the radiation variables are fetched and  $\mathcal{R}$  is multiplied by the appropriate  $S_\alpha$ -factors, region multiplicities and double-FSR factors. Then, it computes the soft, collinear, soft-collinear and remnant matrix elements and supplies the corresponding factor  $1/\xi/(1-y)$  as well as the corresponding jacobians.

## 27.7 Contribution of divergencies due to PDF Evolution

The origin of these contributions is a bit tricky to understand, because we cannot understand the initial-state real collinear contributions without also taking into account the evolution of parton density functions at  $\mathcal{O}(\alpha_s)$ . The NLO PDF evolution is given by

$$f(\bar{x}) = \int_0^1 \int_0^1 dx dz f(x) \Gamma(z) \delta(\bar{x} - xz), \quad (27.18)$$

where  $\Gamma$  are the DGLAP evolution kernels for an  $a \rightarrow d$  splitting,

$$\Gamma_a^{(d)} = \delta_{ad} \delta(1-x) - \frac{\alpha_s}{2\pi} \left( \frac{1}{\epsilon} P_{ad}(x, 0) - K_{ad}(x) \right) + \mathcal{O}(\alpha_s). \quad (27.19)$$

$K_{ad}$  is a renormalization scheme matching factor, which is exactly zero in  $\bar{M}S$ . Let the leading-order hadronic cross section be given by

$$d\sigma^{(0)}(s) = \int dx_{\oplus} dx_{\ominus} f_{\oplus}(x_{\oplus}) f_{\ominus}(x_{\ominus}) d\tilde{\sigma}^{(0)}(x_{\oplus} x_{\ominus} s), \quad (27.20)$$

then the NLO hadronic cross section is

$$d\sigma^{(1)}(s) = \int dx_{\oplus} dx_{\ominus} dz_{\oplus} dz_{\ominus} f_{\oplus}(x_{\oplus}) f_{\ominus}(x_{\ominus}) \underbrace{\Gamma_{\oplus}(z_{\oplus}) \Gamma_{\ominus}(z_{\ominus})}_{d\hat{\sigma}^{(1)}} d\tilde{\sigma}^{(1)}(z_{\oplus} z_{\ominus} s). \quad (27.21)$$

$d\hat{\sigma}$  is called the subtracted partonic cross section. Expanding in  $\alpha_s$  we find

$$d\hat{\sigma}_{ab}^{(0)}(k_1, k_2) = d\tilde{\sigma}_{ab}^{(0)}(k_1, k_2), \quad (27.22)$$

$$d\hat{\sigma}_{ab}^{(1)}(k_1, k_2) = d\tilde{\sigma}_{ab}^{(1)}(k_1, k_2) \quad (27.23)$$

$$+ \frac{\alpha_s}{2\pi} \sum_d \int dx \left( \frac{1}{\epsilon} P_{da}(x, 0) - K_{da}(x) \right) d\tilde{\sigma}_{db}^{(0)}(xk_1, k_2) \quad (27.24)$$

$$+ \frac{\alpha_s}{2\pi} \sum_d \int \left( \frac{1}{\epsilon} P_{db}(x, 0) - K_{db}(x) \right) d\tilde{\sigma}_{ad}^{(0)}(k_1, xk_2). \quad (27.25)$$

$$= d\tilde{\sigma}_{ab}^{(1)} + d\tilde{\sigma}_{ab}^{(cnt,+)} + d\tilde{\sigma}_{ab}^{(cnt,-)} \quad (27.26)$$

Let us now turn the soft-subtracted real part of the cross section. For ease of notation, it is constrained to one singular region,

$$d\sigma_{\alpha}^{(in)} = \left[ \left( \frac{1}{\xi} \right)_+ - 2\epsilon \left( \frac{\log \xi}{\xi} \right)_+ \right] (1-y^2) \xi^2 \mathcal{R}_{\alpha} \mathcal{S}_{\alpha} \\ \times \frac{1}{2(2\pi)^{3-2\epsilon}} \left( \frac{\sqrt{s}}{2} \right)^{2-2\epsilon} (1-y^2)^{-1-\epsilon} d\phi d\xi dy d\Omega^{2-2\epsilon},$$

where we regularize collinear divergencies using the identity

$$(1-y^2)^{-1-\epsilon} = -\frac{2^{-\epsilon}}{\epsilon} (\delta(1-y) + \delta(1+y)) + \underbrace{\frac{1}{2} \left[ \left( \frac{1}{1-y} \right)_+ + \left( \frac{1}{1+y} \right)_+ \right]}_{\mathcal{P}(y)}.$$

This enables us to split the cross section into a finite and a singular part. The latter can further be separated into a contribution of the incoming and of the outgoing particles,

$$d\sigma_\alpha^{(in)} = d\sigma_\alpha^{(in,+)} + d\sigma_\alpha^{(in,-)} + d\sigma_\alpha^{(in,f)}.$$

They are given by

$$d\sigma_\alpha^{(in,f)} = \mathcal{P}(y) \left[ \left( \frac{1}{\xi} \right)_+ - 2\epsilon \left( \frac{\log \xi}{\xi} \right)_+ \right] \frac{1}{2(2\pi)^{3-2\epsilon}} \left( \frac{\sqrt{s}}{2} \right)^{2-2\epsilon} \quad (27.27)$$

$$\times (1-y^2)\xi^2 \mathcal{R}_\alpha \mathcal{S}_\alpha d\phi d\xi dy d\Omega^{2-2\epsilon} \quad (27.28)$$

and

$$d\sigma_\alpha^{(in,\pm)} = -\frac{2^{-\epsilon}}{\epsilon} \delta(1 \mp y) \left[ \left( \frac{1}{\xi} \right)_+ - 2\epsilon \left( \frac{\log \xi}{\xi} \right)_+ \right] \quad (27.29)$$

$$\times \frac{1}{2(2\pi)^{3-2\epsilon}} \left( \frac{\sqrt{s}}{2} \right)^{2-2\epsilon} (1-y^2)\xi^2 \mathcal{R}_\alpha \mathcal{S}_\alpha d\phi d\xi dy d\Omega^{2-2\epsilon}. \quad (27.30)$$

Equation 27.27 is the contribution to the real cross section which is computed in `evaluate_region_isr`. It is regularized both in the soft and collinear limit via the plus distributions. Equation 27.29 is a different contribution. It is only present exactly in the collinear limit, due to the delta function. The divergences present in this term do not completely cancel out divergences in the virtual matrix element, because the beam axis is distinguished. Thus, the conditions in which the KLM theorem applies are not met. To see this, we carry out the collinear limit, obtaining

$$\lim_{y \rightarrow 1} (1-y^2)\xi^2 \mathcal{R}_\alpha = 8\pi\alpha_s \mu^{2\epsilon} \left( \frac{2}{\sqrt{s}} \right)^2 \xi P^<(1-\xi, \epsilon) \mathcal{R}_\alpha,$$

with the Altarelli-Parisi splitting kernel for  $z < 1$ ,  $P^<(z, \epsilon)$ . Moreover,  $\lim_{\vec{k} \parallel \vec{k}_1} d\phi = d\phi_3$  violates spatial averaging. The integration over the spherical angle  $d\Omega$  can be carried out easily, yielding a factor of  $2\pi^{1-\epsilon}/\Gamma(1-\epsilon)$ . This allows us to redefine  $\epsilon$ ,

$$\frac{1}{\epsilon} - \gamma_E + \log(4\pi) \rightarrow \frac{1}{\epsilon}. \quad (27.31)$$

In order to make a connection to  $d\tilde{\sigma}^{(cnt,\pm)}$ , we relate  $P_{ab}(z, 0)$  to  $P_{ab}^<(z, 0)$  via the equation

$$P_{ab}(z, 0) = (1-z)P_{ab}^<(z, 0) \left( \frac{1}{1-z} \right)_+ + \gamma(a)\delta_{ab}\delta(1-z),$$

which yields

$$d\tilde{\sigma}^{(cnt,+)} = \frac{\alpha_s}{2\pi} \sum_d \left\{ -K_{da}(1-\xi) + \frac{1}{\epsilon} \left[ \left( \frac{1}{\xi} \right)_+ \xi P_{da}^<(1-\xi, 0) + \delta_{da}\delta(\xi)\gamma(d) \right] \right\} \mathcal{R}_\alpha \mathcal{S}_\alpha. \quad (27.32)$$

This term has the same pole structure as eqn. 27.29. This makes clear that the quantity

$$d\hat{\sigma}^{(in,+)} = d\tilde{\sigma}^{(in,+)} + \frac{1}{4}d\tilde{\sigma}^{(cnt,+)} \quad (27.33)$$

has no collinear poles. Therefore, our task is to add up eqns. 27.29 and ?? in order to compute the finite remainder. This is the integrand which is evaluated in the `dglap_remnant` component.

So, we have to perform an expansion of  $d\hat{\sigma}^{(in,+)}$  in  $\epsilon$ . Hereby, we must not neglect the implicit  $\epsilon$ -dependence of  $P^<$ , which leads to additional terms involving the first derivative,

$$P_{ab}^<(z, \epsilon) = P_{ab}^<(z, 0) + \epsilon \frac{\partial P_{ab}^<(z, \epsilon)}{\partial \epsilon} \Big|_{\epsilon=0} + \mathcal{O}(\alpha_s^2).$$

This finally gives us the equation for the collinear remnant. Note that there is still one soft  $1/\epsilon$ -pole, which cancels out with the corresponding expression in the soft-virtual terms.

$$d\hat{\sigma}^{(in,+)} = \frac{\alpha_s}{2\pi} \frac{1}{\epsilon} \gamma(a) \mathcal{R}_\alpha \mathcal{S}_\alpha \quad (27.34)$$

$$+ \frac{\alpha_s}{2\pi} \sum_d \left\{ (1-z) P_{da}^<(z, 0) \left[ \left( \frac{1}{1-z} \right)_+ \log \frac{s}{\mu^2} + 2 \left( \frac{\log(1-z)}{1-z} \right)_+ \right] \right. \quad (27.35)$$

$$\left. - (1-z) \frac{\partial P_{da}^<(z, \epsilon)}{\partial \epsilon} \left( \frac{1}{1-z} \right)_+ - K_{da}(z) \right\} \mathcal{R}_\alpha \mathcal{S}_\alpha \quad (27.36)$$

Evaluates formula (...). Note that, as also is the case for the real subtraction, we have to take into account an additional term, occurring because the integral the plus distribution is evaluated over is not constrained on the interval  $[0, 1]$ . Explicitly, this means

$$\int_{\bar{x}_{\oplus}}^1 dz \left( \frac{1}{1-z} \right)_+ = \log(1 - \bar{x}_{\oplus}) f(1) + \int_{\bar{x}_{\oplus}}^1 \frac{f(z) - f(1)}{1-z}, \quad (27.37)$$

and

$$\int_{\bar{x}_{\oplus}}^1 dz \left( \frac{\log(1-z)}{1-z} \right)_+ f(z) = \frac{1}{2} \log^2(1 - \bar{x}_{\oplus}) f(1) + \int_{\bar{x}_{\oplus}}^1 \frac{\log(1-z)[f(z) - f(1)]}{1-z}, \quad (27.38)$$

and the same of course for  $\bar{x}_{\ominus}$ . These two terms are stored in the `plus_dist_remnant` variable below.

```

## Chapter 28

# Model Handling and Features

These modules deal with process definitions and physics models.

These modules use the `model_data` methods to automatically generate process definitions.

**auto\_components** Generic process-definition generator. We can specify a basic process or initial particle(s) and some rules to extend this process, given a model definition with particle names and vertex structures.

**radiation\_generator** Applies the generic generator to the specific problem of generating NLO corrections in a restricted setup.

Model construction:

**eval\_trees** Implementation of the generic `expr_t` type for the concrete evaluation of expressions that access user variables.

This module is actually part of the Sindarin language implementation, and should be moved elsewhere. Currently, the `models` module relies on it.

**models** Extends the `model_data.t` structure by user-variable objects for easy access, and provides the means to read a model definition from file.

**slha\_interface** Read/write a SUSY model in the standardized SLHA format. The format defines fields and parameters, but no vertices.

Figure 28.1: Module dependencies in `src/model_features`.

## 28.1 Automatic generation of process components

This module provides the functionality for automatically generating radiation corrections or decays, provided as lists of PDG codes.

```
<auto_components.f90>≡  
  <File header>  
  
  module auto_components  
  
    <Use kinds>  
    <Use strings>  
    use io_units

    use numeric_utils, only: extend_integer_array  
  
    <Standard module head>  
  
    <Auto components: public>  
  
    <Auto components: parameters>  
  
    <Auto components: types>  
  
    <Auto components: interfaces>  
  
    contains  
  
    <Auto components: procedures>  
  
  end module auto_components
```

### 28.1.1 Constraints: Abstract types

An abstract type that denotes a constraint on the automatically generated states. The concrete objects are applied as visitor objects at certain hooks during the splitting algorithm.

```
<Auto components: types>≡  
  type, abstract :: split_constraint_t  
    contains  
    <Auto components: split constraint: TBP>  
  end type split_constraint_t
```

By default, all checks return true.

```
<Auto components: split constraint: TBP>≡  
  procedure :: check_before_split => split_constraint_check_before_split  
  procedure :: check_before_insert => split_constraint_check_before_insert  
  procedure :: check_before_record => split_constraint_check_before_record
```

```

<Auto components: procedures>≡
  subroutine split_constraint_check_before_split (c, table, pl, k, passed)
    class(split_constraint_t), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: k
    logical, intent(out) :: passed
    passed = .true.
  end subroutine split_constraint_check_before_split

  subroutine split_constraint_check_before_insert (c, table, pa, pl, passed)
    class(split_constraint_t), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_array_t), intent(in) :: pa
    type(pdg_list_t), intent(inout) :: pl
    logical, intent(out) :: passed
    passed = .true.
  end subroutine split_constraint_check_before_insert

  subroutine split_constraint_check_before_record (c, table, pl, n_loop, passed)
    class(split_constraint_t), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    passed = .true.
  end subroutine split_constraint_check_before_record

```

A transparent wrapper, so we can collect constraints of different type.

```

<Auto components: types>+≡
  type :: split_constraint_wrap_t
    class(split_constraint_t), allocatable :: c
  end type split_constraint_wrap_t

```

A collection of constraints.

```

<Auto components: public>≡
  public :: split_constraints_t

<Auto components: types>+≡
  type :: split_constraints_t
    class(split_constraint_wrap_t), dimension(:), allocatable :: cc
  contains
    <Auto components: split constraints: TBP>
  end type split_constraints_t

```

Initialize the constraints set with a specific number of elements.

```

<Auto components: split constraints: TBP>≡
  procedure :: init => split_constraints_init

<Auto components: procedures>+≡
  subroutine split_constraints_init (constraints, n)
    class(split_constraints_t), intent(out) :: constraints
    integer, intent(in) :: n

```

```

        allocate (constraints%cc (n))
    end subroutine split_constraints_init

```

Set a constraint.

```

<Auto components: split constraints: TBP>+≡
    procedure :: set => split_constraints_set

```

```

<Auto components: procedures>+≡
    subroutine split_constraints_set (constraints, i, c)
        class(split_constraints_t), intent(inout) :: constraints
        integer, intent(in) :: i
        class(split_constraint_t), intent(in) :: c
        allocate (constraints%cc(i)%c, source = c)
    end subroutine split_constraints_set

```

Apply checks.

`check_before_split` is applied to the particle list that we want to split.

`check_before_insert` is applied to the particle list `pl` that is to replace the particle `pa` that is split. This check may transform the particle list.

`check_before_record` is applied to the complete new particle list that results from splitting before it is recorded.

```

<Auto components: split constraints: TBP>+≡
    procedure :: check_before_split => split_constraints_check_before_split
    procedure :: check_before_insert => split_constraints_check_before_insert
    procedure :: check_before_record => split_constraints_check_before_record

```

```

<Auto components: procedures>+≡
    subroutine split_constraints_check_before_split &
        (constraints, table, pl, k, passed)
        class(split_constraints_t), intent(in) :: constraints
        class(ps_table_t), intent(in) :: table
        type(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: k
        logical, intent(out) :: passed
        integer :: i
        passed = .true.
        do i = 1, size (constraints%cc)
            call constraints%cc(i)%c%check_before_split (table, pl, k, passed)
            if (.not. passed) return
        end do
    end subroutine split_constraints_check_before_split

    subroutine split_constraints_check_before_insert &
        (constraints, table, pa, pl, passed)
        class(split_constraints_t), intent(in) :: constraints
        class(ps_table_t), intent(in) :: table
        type(pdg_array_t), intent(in) :: pa
        type(pdg_list_t), intent(inout) :: pl
        logical, intent(out) :: passed
        integer :: i
        passed = .true.
        do i = 1, size (constraints%cc)
            call constraints%cc(i)%c%check_before_insert (table, pa, pl, passed)

```

```

        if (.not. passed) return
    end do
end subroutine split_constraints_check_before_insert

subroutine split_constraints_check_before_record &
    (constraints, table, pl, n_loop, passed)
    class(split_constraints_t), intent(in) :: constraints
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    integer :: i
    passed = .true.
    do i = 1, size (constraints%cc)
        call constraints%cc(i)%check_before_record (table, pl, n_loop, passed)
        if (.not. passed) return
    end do
end subroutine split_constraints_check_before_record

```

## 28.1.2 Specific constraints

### Number of particles

Specific constraint: The number of particles plus the number of loops, if any, must remain less than the given limit. Note that the number of loops is defined only when we are recording the entry.

```

<Auto components: types>+≡
    type, extends (split_constraint_t) :: constraint_n_tot
    private
    integer :: n_max = 0
    contains
    procedure :: check_before_split => constraint_n_tot_check_before_split
    procedure :: check_before_record => constraint_n_tot_check_before_record
    end type constraint_n_tot

<Auto components: public>+≡
    public :: constrain_n_tot

<Auto components: procedures>+≡
    function constrain_n_tot (n_max) result (c)
    integer, intent(in) :: n_max
    type(constraint_n_tot) :: c
    c%n_max = n_max
    end function constrain_n_tot

subroutine constraint_n_tot_check_before_split (c, table, pl, k, passed)
    class(constraint_n_tot), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: k
    logical, intent(out) :: passed
    passed = pl%get_size () < c%n_max
end subroutine constraint_n_tot_check_before_split

```

```

subroutine constraint_n_tot_check_before_record (c, table, pl, n_loop, passed)
  class(constraint_n_tot), intent(in) :: c
  class(ps_table_t), intent(in) :: table
  type(pdg_list_t), intent(in) :: pl
  integer, intent(in) :: n_loop
  logical, intent(out) :: passed
  passed = pl%get_size () + n_loop <= c%n_max
end subroutine constraint_n_tot_check_before_record

```

## Number of loops

Specific constraint: The number of loops is limited, independent of the total number of particles.

```

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraint_n_loop
  private
  integer :: n_loop_max = 0
  contains
  procedure :: check_before_record => constraint_n_loop_check_before_record
end type constraint_n_loop

<Auto components: public>+≡
  public :: constrain_n_loop

<Auto components: procedures>+≡
  function constrain_n_loop (n_loop_max) result (c)
    integer, intent(in) :: n_loop_max
    type(constraint_n_loop) :: c
    c%n_loop_max = n_loop_max
  end function constrain_n_loop

  subroutine constraint_n_loop_check_before_record &
    (c, table, pl, n_loop, passed)
    class(constraint_n_loop), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    passed = n_loop <= c%n_loop_max
  end subroutine constraint_n_loop_check_before_record

```

## Particles allowed in splitting

Specific constraint: The entries in the particle list ready for insertion are matched to a given list of particle patterns. If a match occurs, the entry is replaced by the corresponding pattern. If there is no match, the check fails. If a massless gauge boson splitting is detected, the splitting partners are checked against a list of excluded particles. If a match occurs, the check fails.

```

<Auto components: types>+≡

```

```

type, extends (split_constraint_t) :: constraintSplittings
  private
    type(pdg_list_t) :: pl_match, pl_excluded_gaugeSplittings
  contains
    procedure :: check_before_insert => constraintSplittings_check_before_insert
end type constraintSplittings

<Auto components: public>+≡
  public :: constrainSplittings

<Auto components: procedures>+≡
  function constrainSplittings (pl_match, pl_excluded_gaugeSplittings) result (c)
    type(pdg_list_t), intent(in) :: pl_match
    type(pdg_list_t), intent(in) :: pl_excluded_gaugeSplittings
    type(constraintSplittings) :: c
    c%pl_match = pl_match
    c%pl_excluded_gaugeSplittings = pl_excluded_gaugeSplittings
  end function constrainSplittings

  subroutine constraintSplittings_check_before_insert (c, table, pa, pl, passed)
    class(constraintSplittings), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_array_t), intent(in) :: pa
    type(pdg_list_t), intent(inout) :: pl
    logical, intent(out) :: passed
    logical :: has_massless_vector
    integer :: i
    has_massless_vector = .false.
    do i = 1, pa%get_length ()
      if (is_massless_vector(pa%get(i))) then
        has_massless_vector = .true.
        exit
      end if
    end do
    passed = .false.
    if (has_massless_vector .and. count (is_fermion(pl%a%get ())) == 2) then
      do i = 1, c%pl_excluded_gaugeSplittings%get_size ()
        if (pl .match. c%pl_excluded_gaugeSplittings%a(i)) return
      end do
      call pl%match_replace (c%pl_match, passed)
      passed = .true.
    else
      call pl%match_replace (c%pl_match, passed)
    end if
  end subroutine constraintSplittings_check_before_insert

```

Specific constraint: The entries in the particle list ready for insertion are matched to a given list of particle patterns. If a match occurs, the entry is replaced by the corresponding pattern. If there is no match, the check fails.

```

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraintInsert
  private
    type(pdg_list_t) :: pl_match

```

```

contains
  procedure :: check_before_insert => constraint_insert_check_before_insert
end type constraint_insert

<Auto components: public>+≡
  public :: constrain_insert

<Auto components: procedures>+≡
  function constrain_insert (pl_match) result (c)
    type(pdg_list_t), intent(in) :: pl_match
    type(constraint_insert) :: c
    c%pl_match = pl_match
  end function constrain_insert

  subroutine constraint_insert_check_before_insert (c, table, pa, pl, passed)
    class(constraint_insert), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_array_t), intent(in) :: pa
    type(pdg_list_t), intent(inout) :: pl
    logical, intent(out) :: passed
    call pl%match_replace (c%pl_match, passed)
  end subroutine constraint_insert_check_before_insert

```

## Particles required in final state

Specific constraint: The entries in the recorded state must be a superset of the entries in the given list (for instance, the lowest-order state).

```

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraint_require
  private
  type(pdg_list_t) :: pl
  contains
  procedure :: check_before_record => constraint_require_check_before_record
end type constraint_require

```

We check the current state by matching all particle entries against the stored particle list, and crossing out the particles in the latter list when a match is found. The constraint passed if all entries have been crossed out.

For an `if_table` in particular, we check the final state only.

```

<Auto components: public>+≡
  public :: constrain_require

<Auto components: procedures>+≡
  function constrain_require (pl) result (c)
    type(pdg_list_t), intent(in) :: pl
    type(constraint_require) :: c
    c%pl = pl
  end function constrain_require

  subroutine constraint_require_check_before_record &
    (c, table, pl, n_loop, passed)
    class(constraint_require), intent(in) :: c

```

```

class(ps_table_t), intent(in) :: table
type(pdg_list_t), intent(in) :: pl
integer, intent(in) :: n_loop
logical, intent(out) :: passed
logical, dimension(:), allocatable :: mask
integer :: i, k, n_in
select type (table)
type is (if_table_t)
  if (table%proc_type > 0) then
    select case (table%proc_type)
    case (PROC_DECAY)
      n_in = 1
    case (PROC_SCATTER)
      n_in = 2
    end select
  else
    call msg_fatal ("Neither a decay nor a scattering process")
  end if
class default
  n_in = 0
end select
allocate (mask (c%pl%get_size ()), source = .true.)
do i = n_in + 1, pl%get_size ()
  k = c%pl%find_match (pl%get (i), mask)
  if (k /= 0) mask(k) = .false.
end do
passed = .not. any (mask)
end subroutine constraint_require_check_before_record

```

## Radiation

Specific constraint: We have radiation pattern if the original particle matches an entry in the list of particles that should replace it. The constraint prohibits this situation.

```

<Auto components: public>+≡
  public :: constrain_radiation

```

```

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraint_radiation
  private
  contains
  procedure :: check_before_insert => &
    constraint_radiation_check_before_insert
  end type constraint_radiation

```

```

<Auto components: procedures>+≡
  function constrain_radiation () result (c)
    type(constraint_radiation) :: c
  end function constrain_radiation

```

```

subroutine constraint_radiation_check_before_insert (c, table, pa, pl, passed)
  class(constraint_radiation), intent(in) :: c

```

```

class(ps_table_t), intent(in) :: table
type(pdg_array_t), intent(in) :: pa
type(pdg_list_t), intent(inout) :: pl
logical, intent(out) :: passed
passed = .not. (pl .match. pa)
end subroutine constraint_radiation_check_before_insert

```

## Mass sum

Specific constraint: The sum of masses within the particle list must be smaller than a given limit. For in/out state combinations, we check initial and final state separately.

If we specify `margin` in the initialization, the sum must be strictly less than the limit minus the given margin (which may be zero). If not, equality is allowed.

```

<Auto components: public>+≡
public :: constrain_mass_sum

<Auto components: types>+≡
type, extends (split_constraint_t) :: constraint_mass_sum
private
real(default) :: mass_limit = 0
logical :: strictly_less = .false.
real(default) :: margin = 0
contains
procedure :: check_before_record => constraint_mass_sum_check_before_record
end type constraint_mass_sum

<Auto components: procedures>+≡
function constrain_mass_sum (mass_limit, margin) result (c)
real(default), intent(in) :: mass_limit
real(default), intent(in), optional :: margin
type(constraint_mass_sum) :: c
c%mass_limit = mass_limit
if (present (margin)) then
c%strictly_less = .true.
c%margin = margin
end if
end function constrain_mass_sum

subroutine constraint_mass_sum_check_before_record &
(c, table, pl, n_loop, passed)
class(constraint_mass_sum), intent(in) :: c
class(ps_table_t), intent(in) :: table
type(pdg_list_t), intent(in) :: pl
integer, intent(in) :: n_loop
logical, intent(out) :: passed
real(default) :: limit
if (c%strictly_less) then
limit = c%mass_limit - c%margin
select type (table)
type is (if_table_t)
passed = mass_sum (pl, 1, 2, table%model) < limit &

```

```

        .and. mass_sum (pl, 3, pl%get_size (), table%model) < limit
class default
    passed = mass_sum (pl, 1, pl%get_size (), table%model) < limit
end select
else
    limit = c%mass_limit
    select type (table)
    type is (if_table_t)
        passed = mass_sum (pl, 1, 2, table%model) <= limit &
        .and. mass_sum (pl, 3, pl%get_size (), table%model) <= limit
    class default
        passed = mass_sum (pl, 1, pl%get_size (), table%model) <= limit
    end select
end if
end subroutine constraint_mass_sum_check_before_record

```

### Initial state particles

Specific constraint: The two incoming particles must both match the given particle list. This is checked for the generated particle list, just before it is recorded.

```

<Auto components: public>+≡
    public :: constrain_in_state

<Auto components: types>+≡
    type, extends (split_constraint_t) :: constraint_in_state
    private
    type(pdg_list_t) :: pl
    contains
    procedure :: check_before_record => constraint_in_state_check_before_record
end type constraint_in_state

### 28.1.3 Tables of states

Automatically generate a list of possible process components for a given initial set (a single massive particle or a preset list of states).

The set of process components are generated by recursive splitting, applying constraints on the fly that control and limit the process. The generated states are accumulated in a table that we can read out after completion.

```

<Auto components: types>+≡
type, extends (pdg_list_t) :: ps_entry_t
  integer :: n_loop = 0
  integer :: n_rad = 0
  type(ps_entry_t), pointer :: previous => null ()
  type(ps_entry_t), pointer :: next => null ()
end type ps_entry_t

```

```

<Auto components: parameters>≡
integer, parameter :: PROC_UNDEFINED = 0
integer, parameter :: PROC_DECAY = 1
integer, parameter :: PROC_SCATTER = 2

```

This is the wrapper type for the decay tree for the list of final states and the final array. First, an abstract base type:

```

<Auto components: public>+≡
public :: ps_table_t

<Auto components: types>+≡
type, abstract :: ps_table_t
  private
  class(model_data_t), pointer :: model => null ()
  logical :: loops = .false.
  type(ps_entry_t), pointer :: first => null ()
  type(ps_entry_t), pointer :: last => null ()
  integer :: proc_type
contains
  <Auto components: ps table: TBP>
end type ps_table_t

```

The extensions: one for decay, one for generic final states. The decay-state table stores the initial particle. The final-state table is indifferent, and the initial/final state table treats the first two particles in its list as incoming antiparticles.

```

<Auto components: public>+≡
  public :: ds_table_t
  public :: fs_table_t
  public :: if_table_t

<Auto components: types>+≡
  type, extends (ps_table_t) :: ds_table_t
    private
      integer :: pdg_in = 0
    contains
      <Auto components: ds table: TBP>
    end type ds_table_t

  type, extends (ps_table_t) :: fs_table_t
    contains
      <Auto components: fs table: TBP>
    end type fs_table_t

  type, extends (fs_table_t) :: if_table_t
    contains
      <Auto components: if table: TBP>
    end type if_table_t

```

Finalizer: we must deallocate the embedded list.

```

<Auto components: ps table: TBP>≡

type(ps_entry_t), pointer :: current
current => table%first
do while (associated (current))
    call table%split (current, 0, constraints, record = .true., &
        do_not_check_regular = do_not_check_regular)
    current => current%next
end do
end subroutine fs_table_radiate

```

### 28.1.5 Splitting algorithm

Recursive splitting. First of all, we record the current `pdg_list` in the table, subject to `constraints`, if requested. We also record copies of the list marked as loop corrections.

When we record a particle list, we sort it first.

If there is room for splitting, We take a PDG array list and the index of an element, and split this element in all possible ways. The split entry is inserted into the list, which we split further.

The recursion terminates whenever the split array would have a length greater than  $n_{\max}$ .

*(Auto components: ps table: TBP)+≡*

```

procedure :: split => ps_table_split

```

*(Auto components: procedures)+≡*

```

end subroutine ps_table_split

```

The worker part: insert the list of particles found by vertex matching in place of entry *i* in the PDG list. Then split/record further.

The *n\_in* parameter tells the replacement routine to insert the new particles after entry *n\_in*. Otherwise, they follow index *i*.

*(Auto components: ps table: TBP)+≡*

```

procedure :: insert => ps_table_insert

```

*(Auto components: procedures)+≡*

```

recursive subroutine ps_table_insert &

      end associate
    end if
  end if
end if
end function is_colored_isr
end subroutine ps_table_insert

```

Special case: If we are splitting an initial particle, there is slightly more to do. We loop over the particles from the vertex match and replace the initial particle by each of them in turn. The remaining particles must be appended after the second initial particle, so they will end up in the out state. This is done by providing the `n_in` argument to the base method as an optional argument.

Note that we must call the base-method procedure explicitly, so the `table` argument keeps its dynamic type as `if_table` inside this procedure.

```

### 28.1.6 Tools

Compute the mass sum for a PDG list object, counting the entries with indices between (including) `n1` and `n2`. Rely on the requirement that if an entry is a PDG array, this array must be degenerate in mass.

```

⟨Auto components: procedures⟩+≡
function mass_sum (pl, n1, n2, model) result (m)
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n1, n2
    class(model_data_t), intent(in), target :: model
    integer, dimension(:), allocatable :: pdg
    real(default) :: m
    type(field_data_t), pointer :: prt
    integer :: i
    m = 0
    do i = n1, n2
        pdg = pl%get (i)
        prt => model%get_field_ptr (pdg(1))
        m = m + prt%get_mass ()
    end do
end function mass_sum

```

Invert a PDG array, replacing particles by antiparticles. This depends on the model.

```

⟨Auto components: procedures⟩+≡
function invert_pdg_array (pa, model) result (pa_inv)
    type(pdg_array_t), intent(in) :: pa
    class(model_data_t), intent(in), target :: model
    type(pdg_array_t) :: pa_inv
    type(field_data_t), pointer :: prt
    integer :: i, pdg
    pa_inv = pa
    do i = 1, pa_inv%get_length ()
        pdg = pa_inv%get (i)
        prt => model%get_field_ptr (pdg)
        if (prt%has_antiparticle ()) call pa_inv%set (i, -pdg)
    end do
end function invert_pdg_array

```

### 28.1.7 Access results

Return the number of generated decays.

```

end function reshuffle_list_get

```

We need to reset the `reshuffle_list` in order to deal with subsequent usages of the `radiation_generator`. Below is obviously the lazy and dirty solution. Otherwise, we would have to equip this auxiliary type with additional information about `last` and `previous` pointers. Considering that at most  $n_{\text{legs}}$  integers are saved in the lists, and that the subroutine is only called during the initialization phase (more precisely: at the moment only in the `radiation_generator` unit tests), I think this quick fix is justified.

## 28.3 Sindarin Expression Implementation

This module defines expressions of all kinds, represented in a tree structure, for repeated evaluation. This provides an implementation of the `expr_base` abstract type.

We have two flavors of expressions: one with particles and one without particles. The latter version is used for defining cut/selection criteria and for online analysis.

```
<eval_trees.f90>≡

```

### 28.3.1 Tree nodes

The evaluation tree consists of branch nodes (unary and binary) and of leaf nodes, originating from a common root. The node object should be polymorphic. For the time being, polymorphism is emulated here. This means that we have to maintain all possibilities that the node may hold, including associated procedures as pointers.

The following parameter values characterize the node. Unary and binary operators have sub-nodes. The other are leaf nodes. Possible leafs are literal constants or named-parameter references.

*(Eval trees: types)*≡

```
integer, parameter :: EN_UNKNOWN = 0, EN_UNARY = 1, EN_BINARY = 2
integer, parameter :: EN_CONSTANT = 3, EN_VARIABLE = 4
integer, parameter :: EN_CONDITIONAL = 5, EN_BLOCK = 6
integer, parameter :: EN_RECORD_CMD = 7
integer, parameter :: EN_OBS1_INT = 11, EN_OBS2_INT = 12
integer, parameter :: EN_OBS1_REAL = 21, EN_OBS2_REAL = 22
integer, parameter :: EN_UOBS1_INT = 31, EN_UOBS2_INT = 32
integer, parameter :: EN_UOBS1_REAL = 41, EN_UOBS2_REAL = 42
integer, parameter :: EN_PRT_FUN_UNARY = 101, EN_PRT_FUN_BINARY = 102
integer, parameter :: EN_EVAL_FUN_UNARY = 111, EN_EVAL_FUN_BINARY = 112
integer, parameter :: EN_LOG_FUN_UNARY = 121, EN_LOG_FUN_BINARY = 122
integer, parameter :: EN_INT_FUN_UNARY = 131, EN_INT_FUN_BINARY = 132
integer, parameter :: EN_REAL_FUN_UNARY = 141, EN_REAL_FUN_BINARY = 142
integer, parameter :: EN_FORMAT_STR = 161
```

This is exported only for use within unit tests.

## Branch nodes

Initialize a branch node, sub-nodes are given.

```

<Eval trees: procedures>+≡

```

```

subroutine eval_node_init_branch (node, tag, result_type, arg1, arg2)
  type(eval_node_t), intent(out) :: node
  type(string_t), intent(in) :: tag
  integer, intent(in) :: result_type
  type(eval_node_t), intent(in), target :: arg1
  type(eval_node_t), intent(in), target, optional :: arg2
  if (present (arg2)) then
    node%type = EN_BINARY
  else
    node%type = EN_UNARY
  end if
  node%tag = tag
  node%result_type = result_type
  call eval_node_allocate_value (node)
  node%arg1 => arg1
  if (present (arg2)) node%arg2 => arg2
end subroutine eval_node_init_branch

```

Allocate the node value according to the result type.

*<Eval trees: procedures>+≡*

```

subroutine eval_node_allocate_value (node)
  type(eval_node_t), intent(inout) :: node
  select case (node%result_type)
    case (V_LOG); allocate (node%lval)
    case (V_INT); allocate (node%ival)
    case (V_REAL); allocate (node%rval)
    case (V_CMPLX); allocate (node%cval)
    case (V_PDG); allocate (node%aval)
    case (V_SEV); allocate (node%pval)
    call subevt_init (node%pval)
    case (V_STR); allocate (node%sval)
  end select
  allocate (node%value_is_known)
  node%value_is_known = .false.
end subroutine eval_node_allocate_value

```

Initialize a block node which contains, in addition to the expression to be evaluated, a variable definition. The result type is not yet assigned, because we can compile the enclosed expression only after the var list is set up.

Note that the node always allocates a new variable list and appends it to the current one. Thus, if the variable redefines an existing one, it only shadows it but does not reset it. Any side-effects are therefore absent and need not be undone outside the block.

If the flag **new** is set, a variable is (re)declared. This must not be done for intrinsic variables. Vice versa, if the variable is not existent, the **new** flag is required.

*<Eval trees: procedures>+≡*

```

subroutine eval_node_init_block (node, name, type, var_def, var_list)
  type(eval_node_t), intent(out), target :: node
  type(string_t), intent(in) :: name
  integer, intent(in) :: type
  type(eval_node_t), intent(in), target :: var_def

```

```

type(var_list_t), intent(in), target :: var_list

  end select
end if
end subroutine eval_node_init_block

```

Complete block initialization by assigning the expression to evaluate to `arg0`.

*(Eval trees: procedures)*+≡

```

subroutine eval_node_set_expr (node, arg, result_type)
  type(eval_node_t), intent(inout) :: node
  type(eval_node_t), intent(in), target :: arg
  integer, intent(in), optional :: result_type
  if (present (result_type)) then
    node%result_type = result_type
  end if
end subroutine eval_node_set_expr

```

```

else
  node%result_type = arg%result_type
end if
call eval_node_allocate_value (node)
node%arg0 => arg
end subroutine eval_node_set_expr

```

Initialize a conditional. There are three branches: the condition (evaluates to logical) and the two alternatives (evaluate both to the same arbitrary type).

*(Eval trees: procedures)*+≡

```

subroutine eval_node_init_conditional (node, result_type, cond, arg1, arg2)
  type(eval_node_t), intent(out) :: node
  integer, intent(in) :: result_type
  type(eval_node_t), intent(in), target :: cond, arg1, arg2
  node%type = EN_CONDITIONAL
  node%tag = "cond"
  node%result_type = result_type
  call eval_node_allocate_value (node)
  node%arg0 => cond
  node%arg1 => arg1
  node%arg2 => arg2
end subroutine eval_node_init_conditional

```

Initialize a recording command (which evaluates to a logical constant). The first branch is the ID of the analysis object to be filled, the optional branches 1 to 4 are the values to be recorded.

If the event-weight pointer is null, we record values with unit weight. Otherwise, we use the value pointed to as event weight.

There can be up to four arguments which represent  $x, y, \Delta y, \Delta x$ . Therefore, this is the only node type that may fill four sub-nodes.

*(Eval trees: procedures)*+≡

```

subroutine eval_node_init_record_cmd &
  (node, event_weight, id, arg1, arg2, arg3, arg4)
  type(eval_node_t), intent(out) :: node
  real(default), pointer :: event_weight
  type(eval_node_t), intent(in), target :: id
  type(eval_node_t), intent(in), optional, target :: arg1, arg2, arg3, arg4
  call eval_node_init_log (node, .true.)
  node%type = EN_RECORD_CMD
  node%rval => event_weight
  node%tag = "record_cmd"
  node%arg0 => id
  if (present (arg1)) then
    node%arg1 => arg1
    if (present (arg2)) then
      node%arg2 => arg2
      if (present (arg3)) then
        node%arg3 => arg3
        if (present (arg4)) then
          node%arg4 => arg4
        end if
      end if
    end if
  end if
end if

```

```

        end if
    end if
end subroutine eval_node_init_record_cmd

```

Initialize a node for operations on subevents. The particle lists (one or two) are inserted as `arg1` and `arg2`. We allocated particle pointers as temporaries for iterating over particle lists. The procedure pointer which holds the function to evaluate for the subevents (e.g., combine, select) is also initialized.

*(Eval trees: procedures)*+≡

```

subroutine eval_node_init_prt_fun_unary (node, arg1, name, proc)
    type(eval_node_t), intent(out) :: node
    type(eval_node_t), intent(in), target :: arg1

call eval_node_allocate_value (node)
node%arg0 => fmt
node%arg1 => arg
allocate (node%ival)
node%ival = n_args
end subroutine eval_node_init_format_string

```

If particle functions depend upon a condition (or an expression is evaluated), the observables that can be evaluated for the given particles have to be thrown on the local variable stack. This is done here. Each observable is initialized with the particle pointers which have been allocated for the node.

The integer variable that is referred to by the `Index` pseudo-observable is always known when it is referred to.

*(Eval trees: procedures)*+≡

```

subroutine eval_node_set_observables (node, var_list)
type(eval_node_t), intent(inout) :: node
type(var_list_t), intent(in), target :: var_list
logical, save, target :: known = .true.
allocate (node%var_list)
call node%var_list%link (var_list)
allocate (node%index, source = 0)
call var_list_append_int_ptr &
    (node%var_list, var_str ("Index"), node%index, known, intrinsic=.true.)
if (.not. associated (node%prt2)) then
    call var_list_set_observables_unary &
        (node%var_list, node%prt1)
else
    call var_list_set_observables_binary &
        (node%var_list, node%prt1, node%prt2)
end if

```

```
end subroutine eval_node_set_observables
```

### 28.3.2 Operation types

For the operations associated to evaluation tree nodes, we define abstract interfaces for all cases.

Particles/subevents are transferred by-reference, to avoid unnecessary copying. Therefore, subroutines instead of functions. (Furthermore, the function version of `unary_prt` triggers an obscure bug in nagfor 5.2(649) [invalid C code].)

*(Eval trees: interfaces)*≡

```

abstract interface
  logical function unary_log (arg)
    import eval_node_t
    type(eval_node_t), intent(in) :: arg
  end function unary_log

### 28.3.3 Specific operators

Our expression syntax contains all Fortran functions that make sense. These functions have to be provided in a form that they can be used in procedures pointers, and have the abstract interfaces above. For some intrinsic functions, we could use specific versions provided by Fortran directly. However, this has two drawbacks: (i) We should work with the values instead of the eval-nodes as argument, which complicates the interface; (ii) more importantly, the **default** real type need not be equivalent to double precision. This would, at least, introduce system dependencies. Finally, for operators there are no specific versions.

Therefore, we write wrappers for all possible functions, at the expense of some overhead.

#### Binary numerical functions

```

<Eval trees: procedures>+≡

        lval = .not. en0%lval
        if (lval) exit
    end do
end function no_p

```

This is the interface to user-supplied observables. The node `en0` evaluates to a string that indicates the procedure name. We search for the procedure in the dynamic library and load it into the procedure pointer which is then called. `en1` is the subevent on which the external code operates. The external function returns a `c_int`, which we translate into a real value.

*(Eval trees: procedures)+≡*

```

function user_obs_int_p (en0, prt1) result (ival)
    integer :: ival
    type(eval_node_t), intent(inout) :: en0
    type(prt_t), intent(in) :: prt1

    call c_f_procpointer (user_code_find_proc (name), user_cut)
    lval = user_cut (c_prt (en1%pval), &
                    int (subevt_get_length (en1%pval), kind=c_int)) &
        /= 0
end function user_cut_p

```

The following function returns an integer value, namely the number of particles for which the condition is true. If there is no condition, it returns simply the length of the subevent.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `unary_evi`.)

*(Eval trees: procedures)+≡*

```
subroutine count_a (ival, en1, en0)
  integer, intent(out) :: ival
  type(eval_node_t), intent(in) :: en1
  type(eval_node_t), intent(inout), optional :: en0
  integer :: i, n, count
  n = subevt_get_length (en1%pval)
  if (present (en0)) then
    count = 0
    do i = 1, n
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      call eval_node_evaluate (en0)
      if (en0%lval) count = count + 1
    end do
    ival = count
  else
    ival = n
  end if
end subroutine count_a
```

This evaluates a user-defined event-shape observable for the current subevent.

*(Eval trees: procedures)+≡*

```
subroutine user_event_shape_a (rval, en1, en0)
  real(default), intent(out) :: rval
  type(eval_node_t), intent(in) :: en1
  type(eval_node_t), intent(inout), optional :: en0
  type(string_t) :: name
  procedure(user_event_shape_fun), pointer :: user_event_shape
  if (.not. present (en0)) call msg_bug &
    ("user_event_shape called without procedure name")
  call eval_node_evaluate (en0)
  select case (en0%result_type)
  case (V_STR); name = en0%sval
  case default
    call msg_bug ("user_event_shape: procedure name must be a string")
    name = ""
  end select
  call c_f_procpointer (user_code_find_proc (name), user_event_shape)
  rval = user_event_shape (c_prt (en1%pval), &
    int (subevt_get_length (en1%pval), kind=c_int))
end subroutine user_event_shape_a
```

## Binary particle-list functions

This joins two subevents, stored in the evaluation nodes **en1** and **en2**. If **en0** is also present, it amounts to a logical test returning true or false for every pair of particles. A particle of the second list gets a mask entry only if it passes the test for all particles of the first list.

*(Eval trees: procedures)+≡*

```
subroutine join_pp (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  logical, dimension(:), allocatable :: mask2
  integer :: i, j, n1, n2
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  allocate (mask2 (n2))
  mask2 = .true.
  if (present (en0)) then
    do i = 1, n1
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      do j = 1, n2
        en0%prt2 = subevt_get_prt (en2%pval, j)
        call eval_node_evaluate (en0)
        mask2(j) = mask2(j) .and. en0%lval
      end do
    end do
  end if
  call subevt_join (subevt, en1%pval, en2%pval, mask2)
end subroutine join_pp
```

Combine two subevents, i.e., make a list of composite particles built from all possible particle pairs from the two lists. If **en0** is present, create a mask which is true only for those pairs that pass the test.

*(Eval trees: procedures)+≡*

```
subroutine combine_pp (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  logical, dimension(:,:), allocatable :: mask12
  integer :: i, j, n1, n2
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  if (present (en0)) then
    allocate (mask12 (n1, n2))
    do i = 1, n1
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      do j = 1, n2
        en0%prt2 = subevt_get_prt (en2%pval, j)
        call eval_node_evaluate (en0)
        mask12(i,j) = en0%lval
      end do
    end do
  end if
end subroutine combine_pp
```

```

        end do
        call subevt_combine (subevt, en1%pval, en2%pval, mask12)
    else
        call subevt_combine (subevt, en1%pval, en2%pval)
    end if
end subroutine combine_pp

```

Combine all particles of the first argument. If `en0` is present, create a mask which is true only for those particles that pass the test w.r.t. all particles in the second argument. If `en0` is absent, the second argument is ignored.

*(Eval trees: procedures)+≡*

```

subroutine collect_pp (subevt, en1, en2, en0)
    type(subevt_t), intent(inout) :: subevt
    type(eval_node_t), intent(in) :: en1, en2
    type(eval_node_t), intent(inout), optional :: en0
    logical, dimension(:), allocatable :: mask1
    integer :: i, j, n1, n2
    n1 = subevt_get_length (en1%pval)
    n2 = subevt_get_length (en2%pval)
    allocate (mask1 (n1))
    mask1 = .true.
    if (present (en0)) then
        do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
                en0%prt2 = subevt_get_prt (en2%pval, j)
                call eval_node_evaluate (en0)
                mask1(i) = mask1(i) .and. en0%lval
            end do
        end do
    end if
    call subevt_collect (subevt, en1%pval, mask1)
end subroutine collect_pp

```

Select all particles of the first argument. If `en0` is present, create a mask which is true only for those particles that pass the test w.r.t. all particles in the second argument. If `en0` is absent, the second argument is ignored, and the first argument is transferred unchanged. (This case is not very useful, of course.)

*(Eval trees: procedures)+≡*

```

subroutine select_pp (subevt, en1, en2, en0)
    type(subevt_t), intent(inout) :: subevt
    type(eval_node_t), intent(in) :: en1, en2
    type(eval_node_t), intent(inout), optional :: en0
    logical, dimension(:), allocatable :: mask1
    integer :: i, j, n1, n2
    n1 = subevt_get_length (en1%pval)
    n2 = subevt_get_length (en2%pval)
    allocate (mask1 (n1))
    mask1 = .true.
    if (present (en0)) then
        do i = 1, n1
            en0%index = i

```

```

        en0%prt1 = subevt_get_prt (en1%pval, i)

        call eval_node_evaluate (en0)
        rval = en0%rval
        is_known = .true.
        exit LOOP1
      end if
    end do
  end do LOOP1
end subroutine eval_pp

```

This is the interface to user-supplied observables. The node `en0` evaluates to a string that indicates the procedure name. We search for the procedure in the dynamic library and load it into the procedure pointer which is then called. `en1` is the subevent on which the external code operates. The external function returns a `c_int`, which we translate into a real value.

*<Eval trees: procedures>+≡*

```

function user_obs_int_pp (en0, prt1, prt2) result (ival)
  integer :: ival
  type(eval_node_t), intent(inout) :: en0
  type(prt_t), intent(in) :: prt1, prt2
  type(string_t) :: name
  procedure(user_obs_int_binary), pointer :: user_obs

```

```

call eval_node_evaluate (en0)
if (en0%value_is_known) then
  select case (en0%result_type)
  case (V_STR); name = en0% sval
  case default
    call msg_bug ("user_obs: procedure name must be a string")
    name = ""
  end select
  call c_f_procpointer (user_code_find_proc (name), user_obs)
  ival = user_obs (c_prt (prt1), c_prt (prt2))
else
  call eval_node_write_rec (en0)
  call msg_fatal ("User observable name is undefined")
end if
end function user_obs_int_pp

function user_obs_real_pp (en0, prt1, prt2) result (rval)

    end select
    call c_f_procpointer (user_code_find_proc (name), user_obs)
    rval = user_obs (c_prt (prt1), c_prt (prt2))
  else
    call eval_node_write_rec (en0)
    call msg_fatal ("User observable name is undefined")
  end if
end function user_obs_real_pp

```

The following function returns an integer value, namely the number of valid particle-pairs from both lists for which the condition is true. Invalid pairs (with common `src` entry) are ignored. If there is no condition, it returns the number of valid particle pairs.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `binary_num`.)

*(Eval trees: procedures)*+≡

```

subroutine count_pp (ival, en1, en2, en0)
  integer, intent(out) :: ival
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0

  else
    call subevt_select_pdg_code (subevt, en1%aval, en2%pval)
  end if
end subroutine select_pdg_ca

```

## Binary string functions

Currently, the only string operation is concatenation.

*(Eval trees: procedures)+≡*

```

subroutine concat_ss (string, en1, en2)
  type(string_t), intent(out) :: string
  type(eval_node_t), intent(in) :: en1, en2
  string = en1%sval // en2%sval
end subroutine concat_ss

```

### 28.3.4 Compiling the parse tree

The evaluation tree is built recursively by following a parse tree. Evaluate an expression. The requested type is given as an optional argument; default is numeric (integer or real).

*(Eval trees: procedures)+≡*

```
recursive subroutine eval_node_compile_genexpr &
  (en, pn, var_list, result_type)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  integer, intent(in), optional :: result_type
  if (debug_active (D_MODEL_F)) then
    print *, "read genexpr"; call parse_node_write (pn)
  end if
  if (present (result_type)) then
    select case (result_type)
    case (V_INT, V_REAL, V_CMPLX)
      call eval_node_compile_expr (en, pn, var_list)
    case (V_LOG)
      call eval_node_compile_lexpr (en, pn, var_list)
    case (V_SEV)
      call eval_node_compile_pexpr (en, pn, var_list)
    case (V_PDG)
      call eval_node_compile_cexpr (en, pn, var_list)
    case (V_STR)
      call eval_node_compile_sexpr (en, pn, var_list)
    end select
  else
    call eval_node_compile_expr (en, pn, var_list)
  end if
  if (debug_active (D_MODEL_F)) then
    call eval_node_write (en)
    print *, "done genexpr"
  end if
end subroutine eval_node_compile_genexpr
```

### Numeric expressions

This procedure compiles a numerical expression. This is a single term or a sum or difference of terms. We have to account for all combinations of integer and real arguments. If both are constant, we immediately do the calculation and allocate a constant node.

*(Eval trees: procedures)+≡*

```
recursive subroutine eval_node_compile_expr (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn

Real, complex and integer values are numeric literals with an optional unit attached. In case of an integer, the unit actually makes it a real value in disguise. The signed version of real values is not possible in generic expressions; it is a special case for numeric constants in model files (see below). We do not introduce signed versions of complex values.

```

Compile a variable, with or without a specified type. Take the list of variables, look for the name and make a node with a pointer to the value. If no type is provided, the variable is numeric, and the stored value determines whether it is real or integer.

We explicitly demand that the variable is defined, so we do not accidentally point to variables that are declared only later in the script but have come into existence in a previous compilation pass.

Variables may actually be anonymous, these are expressions in disguise. In that case, the expression replaces the variable name in the parse tree, and we allocate an ordinary expression node in the eval tree.

Variables of type V.PDG (pdg-code array) are not treated here. They are

handled by `eval_node_compile_cvariable`.

Retrieve the result of an integration. If the requested process has been integrated, the results are available as special variables. (The variables cannot be accessed in the usual way since they contain brackets in their names.)

Since this compilation step may occur before the processes have been loaded, we have to initialize the required variables before they are used.

```

This user observable behaves like a variable. We link the node to the generic user-observable entry in the variable list. The syntax element has an argument which provides the name of the user variable, this is stored as an eval-node alongside with the variable. When the variable value is used, the user-supplied external function is called and provides the (real) result value.

## Variable definition

A block expression contains a variable definition (first argument) and an expression where the definition can be used (second argument). The **result\_type** decides which type of expression is expected for the second argument. For numeric variables, if there is a mismatch between real and integer type, insert an extra node for type conversion.

## Conditionals

A conditional has the structure `if lexpr then expr else expr`. So we first evaluate the logical expression, then depending on the result the first or second expression. Note that the second expression is mandatory.

The `result_type`, if present, defines the requested type of the `then` and `else` clauses. Default is numeric (int/real). If there is a mismatch between real and integer result types, insert conversion nodes.

## Comparisons

Up to the loop, this is easy. There is always at least one comparison. This is evaluated, and the result is the logical node `en`. If it is constant, we keep its second sub-node as `en2`. (Thus, at the very end `en2` has to be deleted if `en` is (still) constant.)

If there is another comparison, we first check if the first comparison was constant. In that case, there are two possibilities: (i) it was true. Then, its right-hand side is compared with the new right-hand side, and the result replaces the previous one which is deleted. (ii) it was false. In this case, the result of the whole comparison is false, and we can exit the loop without evaluating anything else.

Now assume that the first comparison results in a valid branch, its second sub-node kept as `en2`. We first need a copy of this, which becomes the new

left-hand side. If `en2` is constant, we make an identical constant node `en1`. Otherwise, we make `en1` an appropriate pointer node. Next, the first branch is saved as `en0` and we evaluate the comparison between `en1` and the a right-hand side. If this turns out to be constant, there are again two possibilities: (i) true, then we revert to the previous result. (ii) false, then the wh

end if
end subroutine eval_node_compile_compared_expr

```

This takes two extra arguments: **en1**, the left-hand-side of the comparison, is already allocated and evaluated. **en2** (the right-hand side) and **en** (the result) are allocated by the routine. **pn** is the parse node which contains the operator and the right-hand side as subnodes.

If the result of the comparison is constant, **en1** is deleted but **en2** is kept, because it may be used in a subsequent comparison. **en** then becomes a constant. If the result is variable, **en** becomes a branch node which refers to **en1** and **en2**.

    print *, "done pterm"
  end if
end subroutine eval_node_compile_pterm
```

A particle-list value is a PDG-code array, a particle identifier, a variable, a (grouped) pexpr, a block pexpr, a conditional, or a particle-list function.

The **cexpr** node is responsible for transforming a constant PDG-code array into a subevent. It takes the code array as its first argument, the event subevent as its second argument, and the requested particle type (incoming/outgoing) as its zero-th argument. The result is the list of particles in the event that match the code array.

## Particle functions

This combines the treatment of 'join', 'combine', 'collect', 'cluster', 'select', and 'extract' which all have the same syntax. The one or two argument nodes are allocated. If there is a condition, the condition node is also allocated as a logical expression, for which the variable list is augmented by the appropriate (unary/binary) observables.

*(Eval trees: procedures)+≡*

```

### 28.3.5 Auxiliary functions for the compiler

Issue an error that the current node could not be compiled because of type mismatch:

```

<Eval trees: procedures>+≡
subroutine eval_type_error (pn, string, t)
  type(parse_node_t), intent(in) :: pn
  character(*), intent(in) :: string
  integer, intent(in) :: t
  type(string_t) :: type
  select case (t)
    case (V_NONE); type = "(none)"
    case (V_LOG); type = "'logical'"
    case (V_INT); type = "'integer'"
    case (V_REAL); type = "'real'"
    case (V_CMPLX); type = "'complex'"
    case default; type = "(unknown)"
  end select
  call parse_node_write (pn)
  call msg_fatal (" The " // string // &
    " operation is not defined for the given argument type " // &
    char (type))
end subroutine eval_type_error

```

If two numerics are combined, the result is integer if both arguments are integer, if one is integer and the other real or both are real, than its argument is real, otherwise complex.

```

<Eval trees: procedures>+≡
function numeric_result_type (t1, t2) result (t)
  integer, intent(in) :: t1, t2
  integer :: t
  if (t1 == V_INT .and. t2 == V_INT) then
    t = V_INT
  else if (t1 == V_INT .and. t2 == V_REAL) then
    t = V_REAL
  else if (t1 == V_REAL .and. t2 == V_INT) then
    t = V_REAL
  else if (t1 == V_REAL .and. t2 == V_REAL) then
    t = V_REAL
  else
    t = V_CMPLX
  end if
end function numeric_result_type

```

### 28.3.6 Evaluation

Evaluation is done recursively. For leaf nodes nothing is to be done.

Evaluating particle-list functions: First, we evaluate the particle lists. If a condition is present, we assign the particle pointers of the condition node to the allocated particle entries in the parent node, keeping in mind that the observables in the variable stack used for the evaluation of the condition also contain pointers to these entries. Then, the assigned procedure is evaluated, which sets the subevent in the parent node. If required, the procedure evaluates the condition node once for each (pair of) particles to determine the result.

```

<Eval trees: procedures>+≡

```

```

## Test method

This is called from a unit test: initialize a particular observable.

*(Eval trees: eval node: TBP)+≡*

```

procedure :: test_obs => eval_node_test_obs
<Eval trees: procedures>+≡
subroutine eval_node_test_obs (node, var_list, var_name)
  class(eval_node_t), intent(inout) :: node
  type(var_list_t), intent(in) :: var_list
  type(string_t), intent(in) :: var_name
  procedure(obs_unary_int), pointer :: obs1_iptr
  type(prt_t), pointer :: p1
  call var_list%get_obs1_iptr (var_name, obs1_iptr, p1)
  call eval_node_init_obs1_int_ptr (node, var_name, obs1_iptr, p1)
end subroutine eval_node_test_obs

```

### 28.3.7 Evaluation syntax

We have two different flavors of the syntax: with and without particles.

```

<Eval trees: public>+≡
  public :: syntax_expr
  public :: syntax_pexpr

<Eval trees: variables>≡
  type(syntax_t), target, save :: syntax_expr
  type(syntax_t), target, save :: syntax_pexpr

```

These are for testing only and may be removed:

```

<Eval trees: public>+≡
  public :: syntax_expr_init
  public :: syntax_pexpr_init

<Eval trees: procedures>+≡
subroutine syntax_expr_init ()
  type(ifile_t) :: ifile
  call define_expr_syntax (ifile, particles=.false., analysis=.false.)
  call syntax_init (syntax_expr, ifile)
  call ifile_final (ifile)
end subroutine syntax_expr_init

subroutine syntax_pexpr_init ()
  type(ifile_t) :: ifile
  call define_expr_syntax (ifile, particles=.true., analysis=.false.)
  call syntax_init (syntax_pexpr, ifile)
  call ifile_final (ifile)
end subroutine syntax_pexpr_init

<Eval trees: public>+≡
  public :: syntax_expr_final
  public :: syntax_pexpr_final

<Eval trees: procedures>+≡
subroutine syntax_expr_final ()
  call syntax_final (syntax_expr)
end subroutine syntax_expr_final

```

```

subroutine syntax_pexpr_final ()
  call syntax_final (syntax_pexpr)
end subroutine syntax_pexpr_final

```

*<Eval trees: public>+≡*

```

public :: syntax_pexpr_write

```

*<Eval trees: procedures>+≡*

```

subroutine syntax_pexpr_write (unit)
  integer, intent(in), optional :: unit
  call syntax_write (syntax_pexpr, unit)
end subroutine syntax_pexpr_write

```

*<Eval trees: public>+≡*

```

public :: define_expr_syntax

```

Numeric expressions.

*<Eval trees: procedures>+≡*

```

end subroutine eval_tree_unknown

```

### 28.3.11 Factory Type

Since `eval_tree_t` is an implementation of `expr_t`, we also need a matching factory type and build method.

```

<Eval trees: public>+≡
  public :: eval_tree_factory_t

<Eval trees: types>+≡
  type, extends (expr_factory_t) :: eval_tree_factory_t
  private
    type(parse_node_t), pointer :: pn => null ()
  contains
    <Eval trees: eval tree factory: TBP>
  end type eval_tree_factory_t

```

Output: delegate to the output of the embedded parse node.

```

<Eval trees: eval tree factory: TBP>≡
  procedure :: write => eval_tree_factory_write

<Eval trees: procedures>+≡
  subroutine eval_tree_factory_write (expr_factory, unit)
    class(eval_tree_factory_t), intent(in) :: expr_factory
    integer, intent(in), optional :: unit
    if (associated (expr_factory%pn)) then
      call parse_node_write_rec (expr_factory%pn, unit)
    end if
  end subroutine eval_tree_factory_write

```

Initializer: take a parse node and hide it thus from the environment.

```
<Eval trees: eval tree factory: TBP>+≡
  procedure :: init => eval_tree_factory_init

<Eval trees: procedures>+≡
  subroutine eval_tree_factory_init (expr_factory, pn)
    class(eval_tree_factory_t), intent(out) :: expr_factory
    type(parse_node_t), intent(in), pointer :: pn
    expr_factory%pn => pn
  end subroutine eval_tree_factory_init
```

Factory method: allocate expression with correct eval tree type. If the stored parse node is not associate, don't allocate.

```
<Eval trees: eval tree factory: TBP>+≡
  procedure :: build => eval_tree_factory_build

<Eval trees: procedures>+≡
  subroutine eval_tree_factory_build (expr_factory, expr)
    class(eval_tree_factory_t), intent(in) :: expr_factory
    class(expr_t), intent(out), allocatable :: expr
    if (associated (expr_factory%pn)) then
      allocate (eval_tree_t :: expr)
      select type (expr)
        type is (eval_tree_t)
          expr%pn => expr_factory%pn
        end select
      end if
    end if
  end subroutine eval_tree_factory_build
```

## 28.4 Physics Models

A model object represents a physics model. It contains a table of particle data, a list of parameters, and a vertex table. The list of parameters is a variable list which includes the real parameters (which are pointers to the particle data table) and PDG array variables for the particles themselves. The vertex list is used for phase-space generation, not for calculating the matrix element.

The actual numeric model data are in the base type `model_data_t`, as part of the `qft` section. We implement the `model_t` as an extension of this, for convenient direct access to the base-type methods via inheritance. (Alternatively, we could delegate these calls explicitly.) The extension contains administrative additions, such as the methods for recalculating derived data and keeping the parameter set consistent. It thus acts as a proxy of the actual model-data object towards the WHIZARD package. There are further proxy objects, such as the `parameter_t` array which provides the interface to the actual numeric parameters.

Model definitions are read from model files. Therefore, this module contains a parser for model files. The parameter definitions (derived parameters) are Sindarin expressions.

The models, as read from file, are stored in a model library which is a simple list of model definitions. For setting up a process object we should make a copy (an instance) of a model, which gets the current parameter values from the global variable list.

### 28.4.1 Module

```
<models.f90>≡  
<File header>  
  
module models  
  
    use, intrinsic :: iso_c_binding !NODEP!

    <Models: types>

    <Models: interfaces>

    <Models: variables>

contains

    <Models: procedures>

end module models

```

## 28.4.2 Physics Parameters

A parameter has a name, a value. Derived parameters also have a definition in terms of other parameters, which is stored as an `eval_tree`. External parameters are set by an external program.

This parameter object should be considered as a proxy object. The parameter name and value are stored in a corresponding `modelpar_data_t` object which is located in a `model_data_t` object. The latter is a component of the `model_t` handler. Methods of `parameter_t` can be delegated to the `par_data_t` component.

The `pn` component is a pointer to the parameter definition inside the model parse tree. It allows us to recreate the `eval_tree` when making copies (instances) of the parameter object.

```

<Models: parameters>≡
    integer, parameter :: PAR_NONE = 0, PAR_UNUSED = -1
    integer, parameter :: PAR_INDEPENDENT = 1, PAR_DERIVED = 2
    integer, parameter :: PAR_EXTERNAL = 3

<Models: types>≡
    type :: parameter_t
    private
    integer :: type = PAR_NONE
    class(modelpar_data_t), pointer :: data => null ()
    type(parse_node_t), pointer :: pn => null ()
    class(expr_t), allocatable :: expr
contains
    <Models: parameter: TBP>
end type parameter_t

```

Initialization depends on parameter type. Independent parameters are initialized by a constant value or a constant numerical expression (which may contain

a unit). Derived parameters are initialized by an arbitrary numerical expression, which makes use of the current variable list. The expression is evaluated by the function `parameter_reset`.

This implementation supports only real parameters and real values.

*(Models: parameter: TBP)*≡

```

### 28.4.3 Model Object

A model object holds all information about parameters, particles, and vertices. For models that require an external program for parameter calculation, there is

the pointer to a function that does this calculation, given the set of independent and derived parameters.

As explained above, the type inherits from `model_data_t`, which is the actual storage for the model data.

When reading a model, we create a parse tree. Parameter definitions are available via parse nodes. Since we may need those later when making model instances, we keep the whole parse tree in the model definition (but not in the instances).

```

<Models: public>≡
    public :: model_t

<Models: types>+≡
    type, extends (model_data_t) :: model_t
        private
        character(32) :: md5sum = ""
        logical :: ufo_model = .false.
        type(string_t) :: ufo_path
        type(string_t), dimension(:), allocatable :: schemes
        type(string_t), allocatable :: selected_scheme
        type(parameter_t), dimension(:), allocatable :: par
        integer :: max_par_name_length = 0
        integer :: max_field_name_length = 0
        type(var_list_t) :: var_list
        type(string_t) :: dlname
        procedure(model_init_external_parameters), nopass, pointer :: &
            init_external_parameters => null ()
        type(dlaccess_t) :: dlaccess
        type(parse_tree_t) :: parse_tree
    contains
        <Models: model: TBP>
    end type model_t

```

This is the interface for a procedure that initializes the calculation of external parameters, given the array of all parameters.

```

<Models: interfaces>≡
    abstract interface
        subroutine model_init_external_parameters (par) bind (C)
            import
            real(c_default_float), dimension(*), intent(inout) :: par
        end subroutine model_init_external_parameters
    end interface

```

Initialization: Specify the number of parameters, particles, vertices and allocate memory. If an associated DL library is specified, load this library.

The model may already carry scheme information, so we have to save and restore the scheme number when actually initializing the `model_data_t` base.

```

<Models: model: TBP>≡
    generic :: init => model_init
    procedure, private :: model_init

<Models: procedures>+≡
    subroutine model_init &
        (model, name, libname, os_data, n_par, n_prt, n_vtx, ufo)

```

```

class(model_t), intent(inout) :: model

      return
    end if
    call c_f_procpointer (c_fptr, model% init_external_parameters)
  end if
end if
end subroutine model_init

```

For a model instance, we do not attempt to load a DL library. This is the core of the full initializer above.

```

<Models: model: TBP>+≡
  procedure, private :: basic_init => model_basic_init

<Models: procedures>+≡
  subroutine model_basic_init (model, name, n_par, n_prt, n_vtx)
    class(model_t), intent(inout) :: model
    type(string_t), intent(in) :: name
    integer, intent(in) :: n_par, n_prt, n_vtx
    allocate (model%par (n_par))
    call model%model_data_t%init (name, n_par, 0, n_prt, n_vtx)
  end subroutine model_basic_init

```

Finalization: The variable list contains allocated pointers, also the parse tree. We also close the DL access object, if any, that enables external parameter calculation.

```

<Models: model: TBP>+≡
  procedure :: final => model_final

<Models: procedures>+≡
  subroutine model_final (model)
    class(model_t), intent(inout) :: model
    integer :: i
    if (allocated (model%par)) then
      do i = 1, size (model%par)
        call model%par(i)%final ()
      end do
    end if
    call model%var_list%final (follow_link=.false.)

end subroutine model_set_parameter_unused

```

Make a copy of a parameter. We assume that the `model_data_t` parameter arrays have already been copied, so names and values are available in the current model, and can be used as targets. The eval tree should not be copied, since it should refer to the new variable list. The safe solution is to make use of the above initializers, which also take care of the building a new variable list.

        class(model_t), intent(in), target :: model

```

```

    var_list => model%var_list
end function model_get_var_list_ptr

```

### 28.4.5 UFO models

A single flag identifies a model as a UFO model. There is no other distinction, but the flag allows us to handle built-in and UFO models with the same name in parallel.

```

<Models: model: TBP>+≡
    procedure :: is_ufo_model => model_is_ufo_model

<Models: procedures>+≡
    function model_is_ufo_model (model) result (flag)
        class(model_t), intent(in) :: model
        logical :: flag
        flag = model%ufo_model
    end function model_is_ufo_model

```

Return the UFO path used for fetching the UFO source.

```

<Models: model: TBP>+≡
    procedure :: get_ufo_path => model_get_ufo_path

<Models: procedures>+≡
    function model_get_ufo_path (model) result (path)
        class(model_t), intent(in) :: model
        type(string_t) :: path
        if (model%ufo_model) then
            path = model%ufo_path
        else
            path = ""
        end if
    end function model_get_ufo_path

```

Call OMega and generate a model file from an UFO source file. We start with a file name; the model name is expected to be the base name, stripping extensions.

The path search either takes `ufo_path_requested`, or searches first in the working directory, then in a hard-coded UFO model directory.

```

<Models: procedures>+≡
    subroutine model_generate_ufo (filename, os_data, ufo_path, &
        ufo_path_requested)
        type(string_t), intent(in) :: filename
        type(os_data_t), intent(in) :: os_data
        type(string_t), intent(out) :: ufo_path
        type(string_t), intent(in), optional :: ufo_path_requested
        type(string_t) :: model_name, omega_path, ufo_dir, ufo_init
        logical :: exist
        call get_model_name (filename, model_name)

        string = filename
        call split (string, model_name, ".")
    end subroutine get_model_name
end subroutine model_generate_ufo

```

## 28.4.6 Scheme handling

A model can specify a set of allowed schemes that steer the setup of model variables. The model file can contain scheme-specific declarations that are selected by a `select scheme` clause. Scheme support is optional.

If enabled, the model object contains a list of allowed schemes, and the model reader takes the active scheme as an argument. After the model has been read, the scheme is fixed and can no longer be modified.

The model supports schemes if the scheme array is allocated.

```
<Models: model: TBP>+≡
    procedure :: has_schemes => model_has_schemes

<Models: procedures>+≡
    function model_has_schemes (model) result (flag)
        logical :: flag
        class(model_t), intent(in) :: model
        flag = allocated (model%schemes)
    end function model_has_schemes
```

Enable schemes: fix the list of allowed schemes.

```
<Models: model: TBP>+≡
    procedure :: enable_schemes => model_enable_schemes

<Models: procedures>+≡
    subroutine model_enable_schemes (model, scheme)
        class(model_t), intent(inout) :: model
        type(string_t), dimension(:), intent(in) :: scheme
        allocate (model%schemes (size (scheme)), source = scheme)
    end subroutine model_enable_schemes
```

Find the scheme. Check if the scheme is allowed. The numeric index of the selected scheme is stored in the `model_data_t` base object.

If no argument is given, select the first scheme. The numeric scheme ID will then be 1, while a model without schemes retains 0.

```
<Models: model: TBP>+≡
    procedure :: set_scheme => model_set_scheme

<Models: procedures>+≡
    subroutine model_set_scheme (model, scheme)
        class(model_t), intent(inout) :: model
        type(string_t), intent(in), optional :: scheme
        logical :: ok
        integer :: i
        if (model%has_schemes ()) then
            if (present (scheme)) then
                ok = .false.
                CHECK_SCHEME: do i = 1, size (model%schemes)
                    if (scheme == model%schemes(i)) then
                        allocate (model%selected_scheme, source = scheme)
                        call model%set_scheme_num (i)
                        ok = .true.
                        exit CHECK_SCHEME
                    end if
                end do CHECK_SCHEME
            end if
        end if
```

```

        if (.not. ok) then
            call msg_fatal &
                ("Model '" // char (model%get_name ()) &
                 // "' : scheme '" // char (scheme) // "' not supported")
        end if
    else
        allocate (model%selected_scheme, source = model%schemes(1))
        call model%set_scheme_num (1)
    end if
else
    if (present (scheme)) then
        call msg_error &
            ("Model '" // char (model%get_name ()) &
             // "' does not support schemes")
    end if
end if
end subroutine model_set_scheme

```

Get the scheme. Note that the base `model_data_t` provides a `get_scheme_num` getter function.

```

<Models: model: TBP>+≡
    procedure :: get_scheme => model_get_scheme

<Models: procedures>+≡
    function model_get_scheme (model) result (scheme)
        class(model_t), intent(in) :: model
        type(string_t) :: scheme
        if (allocated (model%selected_scheme)) then
            scheme = model%selected_scheme
        else
            scheme = ""
        end if
    end function model_get_scheme

```

Check if a model has been set up with a specific name and (if applicable) scheme. This helps in determining whether we need a new model object.

A UFO model is considered to be distinct from a non-UFO model. We assume that if `ufo` is asked for, there is no scheme argument. Furthermore, if there is an `ufo_path` requested, it must coincide with the `ufo_path` of the model. If not, the model `ufo_path` is not checked.

```

<Models: model: TBP>+≡
    procedure :: matches => model_matches

<Models: procedures>+≡
    function model_matches (model, name, scheme, ufo, ufo_path) result (flag)
        logical :: flag

        type(string_t), intent(in) :: name
        type(string_t), intent(in), optional :: scheme
        logical, intent(in), optional :: ufo
        type(string_t), intent(in), optional :: ufo_path
        logical :: ufo_model
        ufo_model = .false.; if (present (ufo)) ufo_model = ufo
    end function model_matches

```

```

if (name /= model%get_name ()) then
    flag = .false.
else if (ufo_model .neqv. model%is_ufo_model ()) then
    flag = .false.
else if (ufo_model) then
    if (present (ufo_path)) then
        flag = model%get_ufo_path () == ufo_path
    else
        flag = .true.
    end if
else if (model%has_schemes ()) then
    if (present (scheme)) then
        flag = model%get_scheme () == scheme
    else
        flag = model%get_scheme_num () == 1
    end if
else if (present (scheme)) then
    flag = .false.
else
    flag = .true.
end if
end function model_matches

```

### 28.4.7 Reading models from file

This procedure defines the model-file syntax for the parser, returning an internal file (ifile).

Note that arithmetic operators are defined as keywords in the expression syntax, so we exclude them here.

*(Models: procedures)+≡*

```

subroutine define_model_file_syntax (ifile)
    type(ifile_t), intent(inout) :: ifile

```

Read a model from file. Handle all syntax and respect the provided scheme.

The ufo flag just says that the model object should be tagged as being derived from an UFO model. The UFO model path may be requested by the caller. If not, we use a standard path search for UFO models. There is no difference in the contents of the file or the generated model object.

```

### 28.4.9 Model list

List of currently active models

```
<Models: types>+≡
    type, extends (model_t) :: model_entry_t
        type(model_entry_t), pointer :: next => null ()
    end type model_entry_t

<Models: public>+≡
    public :: model_list_t

<Models: types>+≡
    type :: model_list_t
        type(model_entry_t), pointer :: first => null ()
        type(model_entry_t), pointer :: last => null ()
        type(model_list_t), pointer :: context => null ()
    contains
        <Models: model list: TBP>
    end type model_list_t
```

Write an account of the model list. We write linked lists first, starting from the global context.

```
<Models: model list: TBP>≡
    procedure :: write => model_list_write

<Models: procedures>+≡
    recursive subroutine model_list_write (object, unit, verbose, follow_link)
        class(model_list_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        logical, intent(in), optional :: follow_link
        type(model_entry_t), pointer :: current
        logical :: rec
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        rec = .true.; if (present (follow_link)) rec = follow_link
        if (rec .and. associated (object%context)) then
            call object%context%write (unit, verbose, follow_link)
        end if
        current => object%first
        if (associated (current)) then
            do while (associated (current))
                call current%write (unit, verbose)
                current => current%next
                if (associated (current)) write (u, *)
            end do
        end if
    end subroutine model_list_write
```

Link this list to another one.

```
<Models: model list: TBP>+≡
    procedure :: link => model_list_link
```

```

<Models: procedures>+≡
  subroutine model_list_link (model_list, context)
    class(model_list_t), intent(inout) :: model_list
    type(model_list_t), intent(in), target :: context
    model_list%context => context
  end subroutine model_list_link

```

(Private, used below:) Append an existing model, for which we have allocated a pointer entry, to the model list. The original pointer becomes disassociated, and the model should now be considered as part of the list. We assume that this model is not yet part of the list.

If we provide a `model` argument, this returns a pointer to the new entry.

```

<Models: model list: TBP>+≡
  procedure, private :: import => model_list_import

<Models: procedures>+≡
  subroutine model_list_import (model_list, current, model)
    class(model_list_t), intent(inout) :: model_list
    type(model_entry_t), pointer, intent(inout) :: current
    type(model_t), optional, pointer, intent(out) :: model
    if (associated (current)) then
      if (associated (model_list%first)) then
        model_list%last%next => current
      else
        model_list%first => current
      end if
      model_list%last => current
      if (present (model)) model => current%model_t
      current => null ()
    end if
  end subroutine model_list_import

```

Currently test only:

Add a new model with given `name` to the list, if it does not yet exist. If successful, return a pointer to the new model.

```

<Models: model list: TBP>+≡
  procedure :: add => model_list_add

<Models: procedures>+≡
  subroutine model_list_add (model_list, &
    name, os_data, n_par, n_prt, n_vtx, model)
    class(model_list_t), intent(inout) :: model_list
    type(string_t), intent(in) :: name
    type(os_data_t), intent(in) :: os_data
    integer, intent(in) :: n_par, n_prt, n_vtx
    type(model_t), pointer :: model
    type(model_entry_t), pointer :: current
    if (model_list%model_exists (name, follow_link=.false.)) then
      model => null ()
    else
      allocate (current)
      call current%init (name, var_str (""), os_data, &
        n_par, n_prt, n_vtx)
    end if
  end subroutine model_list_add

```

```

        call model_list%import (current, model)
    end if
end subroutine model_list_add

```

Read a new model from file and add to the list, if it does not yet exist. Finalize the model by allocating the vertex table. Return a pointer to the new model. If unsuccessful, return the original pointer.

The model is always inserted in the last link of a chain of model lists. This way, we avoid loading models twice from different contexts. When a model is modified, we should first allocate a local copy.

*(Models: model list: TBP)+≡*

```

    procedure :: read_model => model_list_read_model

```

## 28.4.10 Model instances

A model instance is a copy of a model object. The parameters are true copies. The particle data and the variable list pointers should point to the copy, so modifying the parameters has only a local effect. Hence, we build them up

explicitly. The vertex array is also rebuilt, it contains particle pointers. Finally, the vertex hash table can be copied directly since it contains no pointers.

The `multiplicity` entry depends on the association of the `mass_data` entry and therefore has to be set at the end.

The instance must carry the `target` attribute.

Parameters: the `copy_parameter` method essentially copies the parameter decorations (parse node, expression etc.). The current parameter values are part of the `model_data_t` base type and are copied afterwards via its `copy_from` method.

```

<Models: model: TBP>+≡
  procedure :: init_instance => model_copy

<Models: procedures>+≡
  subroutine model_copy (model, orig)
    class(model_t), intent(out), target :: model
    type(model_t), intent(in) :: orig

### 28.5.1 Preprocessor

SLHA is a mixed-format standard. It should be read in assuming free format (but line-oriented), but it has some fixed-format elements.

To overcome this difficulty, we implement a preprocessing step which transforms the SLHA into a format that can be swallowed by our generic free-format lexer and parser. Each line with a blank first character is assumed to be a data line. We prepend a 'DATA' keyword to these lines. Furthermore, to enforce line-orientation, each line is appended a '\$' key which is recognized by the

parser. To do this properly, we first remove trailing comments, and skip lines consisting only of comments.

The preprocessor reads from a stream and puts out an `ifile`. Blocks that are not recognized are skipped. For some blocks, data items are quoted, so they can be read as strings if necessary.

*<SLHA: parameters>*≡

```
integer, parameter :: MODE_SKIP = 0, MODE_DATA = 1, MODE_INFO = 2
```

*<SLHA: procedures>*≡

```
subroutine slha_preprocess (stream, ifile)
  type(stream_t), intent(inout), target :: stream
  type(ifile_t), intent(out) :: ifile
  type(string_t) :: buffer, line, item
  integer :: iostat
  integer :: mode
  mode = MODE
  SCAN_FILE: do
    call stream_get_record (stream, buffer, iostat)
    select case (iostat)
    case (0)
      call split (buffer, line, "#")
      if (len_trim (line) == 0) cycle SCAN_FILE
      select case (char (extract (line, 1, 1)))
      case ("B", "b")
        mode = check_block_handling (line)
        call ifile_append (ifile, line // "$")
      case ("D", "d")
        mode = MODE_DATA
        call ifile_append (ifile, line // "$")
      case (" ")
        select case (mode)
        case (MODE_DATA)
          call ifile_append (ifile, "DATA" // line // "$")
        case (MODE_INFO)
          line = adjustl (line)
          call split (line, item, " ")
          call ifile_append (ifile, "INFO" // " " // item // " " &
            // ' ' // trim (adjustl (line)) // ' ' $)
        end select
      case default
        call msg_message (char (line))
        call msg_fatal ("SLHA: Incomprehensible line")
      end select

        call ifile_append (ifile, "SEQ decay_line = data_item integer pdg_code+")
    end subroutine define_slha_syntax

```

The SLHA specification allows for string data items in certain places. Currently, we do not interpret them, but the strings, which are not quoted, must be parsed somehow. The hack for this problem is to allow essentially all characters as special characters, so the string can be read before it is discarded.

```

<SLHA: public>+=

```

```

public :: lexer_init_slha
<SLHA: procedures>+=
subroutine lexer_init_slha (lexer)
  type(lexer_t), intent(out) :: lexer

    quote_chars = "'", &
    quote_match = "'", &
    single_chars = "+-=$", &
    special_class = [ " " ], &
    keyword_list = syntax_get_keyword_list_ptr (syntax_slha), &
    upper_case_keywords = .true.) ! $
end subroutine lexer_init_slha

```

### 28.5.3 Interpreter

#### Find blocks

From the parse tree, find the node that represents a particular block. If `required` is true, issue an error if not found. Since `block_name` is always invoked with capital letters, we have to capitalize `pn_block_name`.

```

<SLHA: procedures>+=
function slha_get_block_ptr &
  (parse_tree, block_name, required) result (pn_block)
  type(parse_node_t), pointer :: pn_block
  type(parse_tree_t), intent(in) :: parse_tree
  type(string_t), intent(in) :: block_name
  logical, intent(in) :: required
  type(parse_node_t), pointer :: pn_root, pn_block_spec, pn_block_name
  pn_root => parse_tree%get_root_ptr ()
  pn_block => parse_node_get_sub_ptr (pn_root)
  do while (associated (pn_block))
    select case (char (parse_node_get_rule_key (pn_block)))
    case ("block_def")
      pn_block_spec => parse_node_get_sub_ptr (pn_block, 2)
      pn_block_name => parse_node_get_sub_ptr (pn_block_spec)
      if (trim (adjustl (upper_case (parse_node_get_string &
        (pn_block_name)))) == block_name) then
        return
      end if
    end select
    pn_block => parse_node_get_next_ptr (pn_block)
  end do
  if (required) then
    call msg_fatal ("SLHA: block '" // char (block_name) // "' not found")
  end if
end function slha_get_block_ptr

```

Scan the file for the first/next DECAY block.

```

<SLHA: procedures>+=
function slha_get_first_decay_ptr (parse_tree) result (pn_decay)

```

```

type(parse_node_t), pointer :: pn_decay

  call slha_find_index_pair_ptr (pn_block, pn_data, pn_item, code1, code2)
  if (associated (pn_item)) then
    call var_list%set_real (name, get_real_parameter (pn_item), &
      is_known=.true., ignore=.true.)
  end if
end subroutine set_matrix_element
```

## Transfer data from variables to SLHA

Get a real/integer parameter with index *i* from the variable list and write it to the current output file. In the integer case, we account for the fact that the variable is type real. If it does not exist, do nothing.

*(SLHA: procedures)*+≡

```
subroutine write_integer_data_item (u, code, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  integer :: item
  if (var_list%contains (name)) then
    item = nint (var_list%get_rval (name))
    call write_integer_parameter (u, code, item, comment)
  end if
end subroutine write_integer_data_item

subroutine write_real_data_item (u, code, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  real(default) :: item
  if (var_list%contains (name)) then
    item = var_list%get_rval (name)
    call write_real_parameter (u, code, item, comment)
  end if
end subroutine write_real_data_item
```

Get a real data item with two integer indices from the variable list and write it to the current output file. If it does not exist, do nothing.

*(SLHA: procedures)*+≡

```
subroutine write_matrix_element (u, code1, code2, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code1, code2
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  real(default) :: item
  if (var_list%contains (name)) then
    item = var_list%get_rval (name)
    call write_real_matrix_element (u, code1, code2, item, comment)
  end if
end subroutine write_matrix_element
```

## 28.5.4 Auxiliary function

Write a block header.

```
(SLHA: procedures)+≡
subroutine write_block_header (u, name, comment)
  integer, intent(in) :: u
  character(*), intent(in) :: name, comment
  write (u, "(A,1x,A,3x,'#',1x,A)") "BLOCK", name, comment
end subroutine write_block_header
```

Extract a real parameter that may be defined real or integer, signed or unsigned.

```
(SLHA: procedures)+≡
function get_real_parameter (pn_item) result (var)
  real(default) :: var
  type(parse_node_t), intent(in), target :: pn_item
  type(parse_node_t), pointer :: pn_sign, pn_var
  integer :: sign
  select case (char (parse_node_get_rule_key (pn_item)))
  case ("signed_number")

```

## SMINPUTS

Read SM parameters and update the variable list accordingly. If a parameter is not defined in the block, we use the previous value from the model variable list. For the basic parameters we have to do a small recalculation, since SLHA uses the  $G_F$ - $\alpha$ - $m_Z$  scheme, while WHIZARD derives them from  $G_F$ ,  $m_W$ , and  $m_Z$ .

*(SLHA: procedures)*+≡

    width = get_real_parameter (pn_width)
    call model%set_field_width (pdg, width)
    pn_decay => slha_get_next_decay_ptr (pn_decay)
end do
end subroutine slha_handle_decays

```

## Mixing matrices

Read mixing matrices. We can treat all matrices by a single procedure if we just know the block name, variable prefix, and matrix dimension. The matrix dimension must be less than 10. For the pseudoscalar Higgses in NMSSM-type models we need off-diagonal matrices, so we generalize the definition.

*(SLHA: procedures)* +=

```

subroutine slha_handle_matrix_block &
    (parse_tree, block_name, var_prefix, dim1, dim2, model)
type(parse_tree_t), intent(in) :: parse_tree
character(*), intent(in) :: block_name, var_prefix
integer, intent(in) :: dim1, dim2
type(model_t), intent(inout), target :: model
type(parse_node_t), pointer :: pn_block
type(var_list_t), pointer :: var_list
integer :: i, j
character(len=len(var_prefix)+2) :: var_name
var_list => model%get_var_list_ptr ()
pn_block => slha_get_block_ptr &
    (parse_tree, var_str (block_name), required=.false.)
if (.not. (associated (pn_block))) return
do i = 1, dim1
    do j = 1, dim2
        write (var_name, "(A,I1,I1)") var_prefix, i, j
        call set_matrix_element (pn_block, i, j, var_str (var_name), var_list)
    end do
end do
end subroutine slha_handle_matrix_block

```

## Higgs data

Read the block ALPHA which holds just the Higgs mixing angle.

*(SLHA: procedures)* +=

```

subroutine slha_handle_ALPHA (parse_tree, model)
type(parse_tree_t), intent(in) :: parse_tree
type(model_t), intent(inout), target :: model
type(parse_node_t), pointer :: pn_block, pn_line, pn_data, pn_item

```

```

type(var_list_t), pointer :: var_list
real(default) :: al_h
var_list => model%get_var_list_ptr ()
pn_block => slha_get_block_ptr &
    (parse_tree, var_str ("ALPHA"), required=.false.)
if (.not. (associated (pn_block))) return
pn_data => parse_node_get_sub_ptr (pn_block, 4)
pn_line => parse_node_get_sub_ptr (pn_data, 2)
pn_item => parse_node_get_sub_ptr (pn_line)
if (associated (pn_item)) then
    al_h = get_real_parameter (pn_item)
    call var_list%set_real (var_str ("al_h"), al_h, &
        is_known=.true., ignore=.true.)
end if
end subroutine slha_handle_ALPHA

```

Read the block H MIX for the Higgs mixing parameters

*(SLHA: procedures)*+≡

```

subroutine slha_handle_HMIX (parse_tree, model)
type(parse_tree_t), intent(in) :: parse_tree
type(model_t), intent(inout), target :: model
type(parse_node_t), pointer :: pn_block
type(var_list_t), pointer :: var_list
var_list => model%get_var_list_ptr ()
pn_block => slha_get_block_ptr &
    (parse_tree, var_str ("H MIX"), required=.false.)
if (.not. (associated (pn_block))) return

call set_data_item (pn_block, 5, var_str ("nmu"), var_list)
end subroutine slha_handle_NMSSMRUN

```

### 28.5.5 Parser

Read a SLHA file from stream, including preprocessing, and make up a parse tree.

*(SLHA: procedures)*+≡

```
subroutine slha_parse_stream (stream, parse_tree)
  type(stream_t), intent(inout), target :: stream
  type(parse_tree_t), intent(out) :: parse_tree
  type(ifile_t) :: ifile
  type(lexer_t) :: lexer
  type(stream_t), target :: stream_tmp
  call slha_preprocess (stream, ifile)
  call stream_init (stream_tmp, ifile)
  call lexer_init_slha (lexer)
  call lexer_assign_stream (lexer, stream_tmp)
  call parse_tree_init (parse_tree, syntax_slha, lexer)
  call lexer_final (lexer)
  call stream_final (stream_tmp)
  call ifile_final (ifile)
end subroutine slha_parse_stream
```

Read a SLHA file chosen by name. Check first the current directory, then the directory where SUSY input files should be located.

Required for test:

*(SLHA: public)*+≡

```
public :: slha_parse_file
```

*(SLHA: procedures)*+≡

```
subroutine slha_parse_file (file, os_data, parse_tree)
  type(string_t), intent(in) :: file
  type(os_data_t), intent(in) :: os_data
  type(parse_tree_t), intent(out) :: parse_tree
  logical :: exist
  type(string_t) :: filename
  type(stream_t), target :: stream
  call msg_message ("Reading SLHA input file '" // char (file) // "'")
  filename = file
  inquire (file=char(filename), exist=exist)
  if (.not. exist) then
    filename = os_data%whizard_susypath // "/" // file
    inquire (file=char(filename), exist=exist)
    if (.not. exist) then
      call msg_fatal ("SLHA input file '" // char (file) // "' not found")
      return
    end if
  end if
  call stream_init (stream, char (filename))
  call slha_parse_stream (stream, parse_tree)
  call stream_final (stream)
end subroutine slha_parse_file
```

## 28.5.6 API

Read the SLHA file, parse it, and interpret the parse tree. The model parameters retrieved from the file will be inserted into the appropriate model, which is loaded and modified in the background. The pointer to this model is returned as the last argument.

```

<SLHA: public>+=
  public :: slha_read_file

<SLHA: procedures>+=
  subroutine slha_read_file &
    (file, os_data, model, input, spectrum, decays)
    type(string_t), intent(in) :: file
    type(os_data_t), intent(in) :: os_data
    type(model_t), intent(inout), target :: model
    logical, intent(in) :: input, spectrum, decays
    type(parse_tree_t) :: parse_tree
    call slha_parse_file (file, os_data, parse_tree)
    if (associated (parse_tree%get_root_ptr ())) then
      call slha_interpret_parse_tree &
        (parse_tree, model, input, spectrum, decays)
      call parse_tree_final (parse_tree)
      call model%update_parameters ()
    end if
  end subroutine slha_read_file

```

Write the SLHA contents, as far as possible, to external file.

```

<SLHA: public>+=
  public :: slha_write_file

<SLHA: procedures>+=
  subroutine slha_write_file (file, model, input, spectrum, decays)
    type(string_t), intent(in) :: file
    type(model_t), target, intent(in) :: model
    logical, intent(in) :: input, spectrum, decays
    integer :: mssm_type
    integer :: u
    u = free_unit ()
    call msg_message ("Writing SLHA output file '" // char (file) // "'")
    open (unit=u, file=char(file), action="write", status="replace")
    write (u, "(A)")  "# SUSY Les Houches Accord"
    write (u, "(A)")  "# Output generated by " // trim (VERSION_STRING)
    call slha_write_MODSEL (u, model, mssm_type)
    if (input) then
      call slha_write_SMINPUTS (u, model)
      call slha_write_MINPAR (u, model, mssm_type)
    end if
    if (spectrum) then
      call msg_bug ("SLHA: spectrum output not supported yet")
    end if
    if (decays) then
      call msg_bug ("SLHA: decays output not supported yet")
    end if
    close (u)
  end subroutine slha_write_file

```

```
end subroutine slha_write_file
```

### 28.5.7 Dispatch

```

<SLHA: public>+≡
  public :: dispatch_slha

<SLHA: procedures>+≡
  subroutine dispatch_slha (var_list, input, spectrum, decays)
    type(var_list_t), intent(inout), target :: var_list
    logical, intent(out) :: input, spectrum, decays
    input = var_list%get_lval (var_str ("?slha_read_input"))
    spectrum = var_list%get_lval (var_str ("?slha_read_spectrum"))
    decays = var_list%get_lval (var_str ("?slha_read_decays"))
  end subroutine dispatch_slha

```

### 28.5.8 Unit tests

```

c   xkincv   : additional kinematic vertexcorrection in G_0, see below:
c   jvflg    : flag for the additional vertexcorrection xkincv in the
c               'zeroth order' G_0(p) in the LS-equation:
c               0 : no correction, means  $G = G_0 + G_0 \int V G$ 
c                   with  $G_0 = 1/[E + i\Gamma_t - p^2/m_t] * (1 + xkincm) + xkinca$ 
c               1 : apply the correction in the LS equation as
c                    $G = G_0 + xkincv * p^2/m_t^2 / [E + i\Gamma_t - p^2/m_t] +$ 
c                    $G_0 \int V G$ 
c                   and correct the integral over  $\text{Im}[G(p)]$  to get  $\sigma_{\text{tot}}$ 
c                   from the optical theorem by the same factor.
c                   The cutoff xcutv is applied for these corrections.
c
c -- Output:
c
c   xim       :  $R_{\text{ttbar}}$  from the imaginary part of the green
c               function
c   xdi       :  $R_{\text{ttbar}}$  from the integral over the momentum
c               distribution (no cutoff but the numerical one here!!)
c   np        : number of points used for the grid; fixed in tttoppik
c   xpp       : 1-dim array (max. 900 elements) giving the momenta of
c               the Gauss-Legendre grid (pp(i) in the code)
c   xww       : 1-dim array (max. 900 elements) giving the corresponding
c               Gauss-Legendre weights for the grid
c   xdsdp     : 1-dim array (max. 900 elements) giving the
c               momentum distribution of top:  $d\sigma/dp$ ,
c               normalized to R,
c               at the momenta of the Gauss-Legendre grid xpp(i)
c   zvfct     : 1-dim array (max. 900 elements) of COMPLEX*16 numbers
c               giving the vertex function  $K(p)$ ,  $G(p) = K(p) * G_0(p)$ 
c               at the momenta of the grid

c
c Not needed for the fixed order potentials:
        alamb5=0.2d0
c
        WRITE(*,*) 'INPUT TGAMMA=',TGAMMA
c Needed in subroutine GAMMAT:
        GFERMI=1.16637d-5
c
        CALL GAMMAT
c
        WRITE(*,*) 'CALCULATED TGAMMA=',TGAMMA
c
        etot=2.d0*tmass+energy
c
        if ((npot.eq.1).or.(npot.eq.3).or.(npot.eq.4).or.
            u      (npot.eq.5)) then
c For pure coulomb and fixed order potentials there is no delta-part:
            consde = 0.d0
            else if (npot.eq.2) then
c Initialize QCD-potential common-blocks and calculate constant multiplying
c the delta-part of the 'qcutted' potential in momentum-space:
                call iniphc(1)
                call vqdelt(consde)
            else
                write (*,*) ' Potential not implemented! Stop.'
                stop
            endif
c Delta-part of potential is absorbed by subtracting vzero from the
c original energy (shift from the potential to the free Hamiltonian):
            vzero = consde / (2.d0*pi)**3
c
            write (*,*) 'vzero=', vzero
c
c Find x-values pp(i) and weights w1(i) for the gaussian quadrature;
c care about large number of points in the important intervals:
c
            if (energy-vzero.le.0.d0) then
cc                call gauleg(0.d0, 1.d0, pp, w1, n/3)
cc                call gauleg(1.d0, 5.d0, pp(n/3+1), w1(n/3+1), n/3)
cc                call gauleg(0.d0, 0.2d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c                call gauleg(0.d0, 5.d0, pp, w1, n/3)
c                call gauleg(5.d0, 20.d0, pp(n/3+1), w1(n/3+1), n/3)
c                call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c            else

```

```

cc Avoid numerical singular points in the inner of the intervals:
c      critp = dsqrt((energy-vzero)*tmass)
c      if (critp.le.1.d0) then
cc Gauss-Legendre is symmetric => automatically principal-value prescription:
c          call gauleg(0.d0, 2.d0*critp, pp, w1, n/3)
c          call gauleg(2.d0*critp, 20.d0, pp(n/3+1),
c      u          w1(n/3+1), n/3)
c          call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c      else
cc Better behaviour at the border of the intervals:
c          call gauleg(0.d0, critp, pp, w1, n/3)
c          call gauleg(critp, 2.d0*critp, pp(n/3+1),
c      u          w1(n/3+1), n/3)
c          call gauleg(0.d0, 1.d0/(2.d0*critp), pp(2*n/3+1),
c      u          w1(2*n/3+1), n/3)
c      endif
c  endif
c
c Or different (simpler) method, good for V_JKT:
c      if (energy.le.0.d0) then
c          critp=tmass/3.d0
c      else
c          critp=max(tmass/3.d0,2.d0*dsqrt(energy*tmass))
c      endif
c      call gauleg(0.d0, critp, pp, w1, 2*n/3)
c      call gauleg(1.d0/xpmax, 1.d0/critp, pp(2*n/3+1),
c  u          w1(2*n/3+1), n/3)
c
c Do substitution p => 1/p for the last interval explicitly:
c      do 10 i=2*n/3+1,n
c          pp(i) = 1.d0/pp(i)
10      continue
c
c Reorder the arrays for the third interval:
c      do 20 i=1,n/3
c          xx(i) = pp(2*n/3+i)
c          w2(i) = w1(2*n/3+i)
20      continue
c      do 30 i=1,n/3
c          pp(n-i+1) = xx(i)
c          w1(n-i+1) = w2(i)
30      continue
c
c Calculate the integrals a(p) for the given momenta pp(i)
c and store weights and momenta for the output arrays:
c      do 40 i=1,n
c          a1(i) = a(pp(i)) !!! FB: can get stuck in original Toppik!
c          !!! FB: abuse 'np' as a flag to communicate unstable runs
c          if ( abs(a1(i)) .gt. 1d10 ) then
c              np = -1
c              return
c          endif
c          xpp(i)=pp(i)
c          xww(i)=w1(i)

```

```

40      continue
      do 41 i=n+1,nmax
          xpp(i)=0.d0
          xww(i)=0.d0
41      continue
c
c
c Solve the integral-equation by solving a system of algebraic equations:
      call sae(pp, w1, bb, a1, n)
c
c (The substitution for the integration to infinity pp => 1/pp
c is done already.)
      do 50 i=1,n
          zvfct(i)=bb(i)
          gg(i) = bb(i)*g0c(pp(i))
cc      gg(i) = (1.d0 + bb(i))*g0c(pp(i))
cc Urspruenglich anderes (Minus) VZ hier, dafuer kein Minus mehr bei der
cc Definition des WQs ueber Im G, 2.6.1998, tt.
cc      gg(i) = - (1.d0 + bb(i))*g0c(pp(i))

c Correction function for non-constant (energy and momentum dependent) width:
      FUNCTION GTPCOR1(TOPP,ETOT)
c
c      TOPP - momentum of t quark = - momentum of tbar
c      ETOT - total energy of t-tbar system
c      calls: GENWDS, RAN2
c
c      Evaluates a correction factor to the width of t-tbar system.
c      in future has to be replaced by a function evaluating
c      width including radiative corrections and GTPCOR.
c      I include two factors reducing the width:
c      a - time dilatation: for decay in flight lifetime
c          increased accordingly to relativistic kinematics
c      b - overall energy-momentum conservation: I assume that
c          t and tbar decay in flight and in this decays energies
c          of Ws follow from 2-body kinematics. Then I calculate
c          effective mass squared of b-bar system (it may be
c          negative!) from en-momentum conservation.
c          If effective mass is < 2*Mb + 2 GeV configuration
c          is rejected. The weight is acceptance.

!      -commented out many routines identically defined in 'toppik.f'
!      -modified 'tttoppikaxial' to catch unstable runs.
!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

C *****
C      Version tuned to provide 0(1%) relative accuracy for Coulomb axial
C      vertex function at first and second order (search for 'cctt'):
C      - integrals A(p), Vhat, Vhhat provided analytically w/out cut-off
C      - grid range fixed to 0.1 ... 10**6 absolut
C      - and grid size enhanced to 600 points (900 foreseen in arrays).
C
C      This provides a compromise between stability and accuracy:
C      We need a relatively high momentum resolution and large maximal
C      momenta to achieve a ~1 percent accuracy, but the method of
C      direct inversion of the discretised integral equation for objects
C      whose integral is divergent induces instabilities at small
C      momenta. As the behaviour there is known, they can be cut off and
C      the vertex function fixed by hand; but limiting the grid
C      further would impact on the accuracy.
C      22.3.2017, tt

C
C -- Calculation of the Green function in momentum space by solving the
C      Lippmann-Schwinger equation
C      
$$F(p) = G_0(p) + G_0(p) \int_0^{\text{xcutn}} V(p,q) q.p/p^2 F(q) dq$$

C
C -- Written by Thomas Teubner, Hamburg, November 1998
C      * Based on TOPPIK Version 1.1
C      from M. Jezabek and TT, Karlsruhe, June 1992
C      * Version originally for non-constant top-width

```

```

c      * Constant width supplied here
c      * No generator included
c
c -- Use of double precision everywhere
c
c -- All masses, momenta, energies, widths in GeV
c
c -- Input parameters:
c
c   xenergy  :  $E = \sqrt{s} - 2 \cdot \text{topmass}$ 
c   xtm      : topmass (in the Pole scheme)
c   xtg      : top-width
c   xalphas  :  $\alpha_s^{\{\text{MSbar}, n_f=5\}}$  (xscale)
c   xscale   : soft scale  $\mu_{\{\text{soft}\}}$ 
c   xcutn    : numerical UV cutoff on all momenta
c              (UV cutoff of the Gauss-Legendre grid)
c   xcutv    : renormalization cutoff on the
c              delta-, the  $(p^2+q^2)/(p-q)^2$ -, and the
c               $1/r^2 - [1/|p-q|]$ -potential:
c              if  $(\max(p,q).ge.xcutv)$  then the three potentials
c              are set to zero in the Lippmann-Schwinger equation
c   xc0      : 0th order coefficient for the Coulomb potential,
c              see calling example above
c   xc1      : 1st order coefficient for the Coulomb potential
c   xc2      : 2nd order coefficient for the Coulomb potential
c   xcdeltc  : constant of the delta(r)-
c              [= constant in momentum space-] potential
c   xcdeltl  : constant for the additional  $\log(q^2/\mu^2)$ -part of the
c              delta-potential:
c               $xcdeltc * 1 + xcdeltl * \log(q^2/\mu^2)$ 
c   xcfullc  : constant of the  $(p^2+q^2)/(p-q)^2$ -potential
c   xcfulll  : constant for the additional  $\log(q^2/\mu^2)$ -part of the
c               $(p^2+q^2)/(p-q)^2$ -potential
c   xcrm2    : constant of the  $1/r^2 - [1/|p-q|]$ -potential
c   xkincm   : } kinetic corrections in the 0th order Green function:
c   xkinca   : }  $G_0(p) = 1/[E + i\Gamma_t - p^2/m_t] * (1 + xkincm) + xkinca$ 
c              !!! WATCH THE SIGN IN G_0 !!!
c   jknflg   : flag for these kinetic corrections:
c              0 : no kinetic corrections applied
c              1 : kinetic corrections applied with cutoff xcutv
c                  for xkinca only
c              2 : kinetic corrections applied with cutoff xcutv
c                  for xkinca AND xkincm
c   jgcflg   : flag for  $G_0(p)$  in the LS equation:
c              0 (standard choice) :  $G_0(p)$  as given above
c              1 (for TIPT)         :  $G_0(p) = G_c^{\{0\}}(p)$  the 0th
c                                      order Coulomb Green function
c                                      in analytical form; not for
c                                      momenta  $p > 1000 \cdot \text{topmass}$ 
c   xkincv   : additional kinematic vertexcorrection in  $G_0$ , see below:
c   jvflg    : flag for the additional vertexcorrection xkincv in the
c              'zeroth order'  $G_0(p)$  in the LS-equation:
c              0 : no correction, means  $G = G_0 + G_0 \text{ int } V G$ 
c                  with  $G_0 = 1/[E + i\Gamma_t - p^2/m_t] * (1 + xkincm) + xkinca$ 

```

```

c          1 : apply the correction in the LS equation as
c          G = G_0 + xkincv*p^2/m_t^2/[E+iGamma_t-p^2/m_t] +
c          G_0 int V G
c          and correct the integral over Im[G(p)] to get sigma_tot
c          from the optical theorem by the same factor.
c          The cutoff xcutv is applied for these corrections.
c
c -- Output:
c
c xim      : R^{P wave}_{ttbar} from the imaginary part of the Green
c           function
c xdi      : R^{P wave}_{ttbar} from the integral over the momentum
c           distribution: int_0^xcutv dp p^3/m_t*|F(p,E)|^2
c np       : number of points used for the grid; fixed in tttoppik
c xpp      : 1-dim array (max. 900 elements) giving the momenta of
c           the Gauss-Legendre grid (pp(i) in the code)
c xww      : 1-dim array (max. 900 elements) giving the corresponding
c           Gauss-Legendre weights for the grid
c xdsdp    : 1-dim array (max. 900 elements) giving the
c           momentum distribution of top: d\sigma^{P wave}/dp,
c           normalized to R,
c           at the momenta of the Gauss-Legendre grid xpp(i)
c zftild   : 1-dim array (max. 900 elements) of COMPLEX*16 numbers
c           giving the vertex function K_A for the P-wave
c           at the momenta of the grid.
c           Then F(p)=K_A (p)*G_0(p) corresponding to G=K_V*G_0.

c      call gauleg(5.d0, 20.d0, pp(n/3+1), w1(n/3+1), n/3)
c      call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c      else
cc Avoid numerical singular points in the inner of the intervals:
c      critp = sqrt((energy-vzero)*tmass)

```

```

c          if (critp.le.1.d0) then
cc Gauss-Legendre is symmetric => automatically principal-value prescription:
c          call gauleg(0.d0, 2.d0*critp, pp, w1, n/3)
c          call gauleg(2.d0*critp, 20.d0, pp(n/3+1),
c      u          w1(n/3+1), n/3)
c          call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c          else
cc Better behaviour at the border of the intervals:
c          call gauleg(0.d0, critp, pp, w1, n/3)
c          call gauleg(critp, 2.d0*critp, pp(n/3+1),
c      u          w1(n/3+1), n/3)
c          call gauleg(0.d0, 1.d0/(2.d0*critp), pp(2*n/3+1),
c      u          w1(2*n/3+1), n/3)
c          endif
c      endif
c
c Or different (simpler) method, good for V_JKT:
c          if (energy.le.0.d0) then
c              critp=tmass/3.d0
c          else
c              critp=max(tmass/3.d0,2.d0*sqrt(energy*tmass))
c          endif
c          call gauleg(0.d0, critp, pp, w1, 2*n/3)
c          call gauleg(1.d0/xpmax, 1.d0/critp, pp(2*n/3+1),
c      u          w1(2*n/3+1), n/3)
cctt Tuned March 2017 for best possible numerical behaviour of P-wave
c          call gauleg(0.1d0, 2.d0, pp, w1, 10)
c          call gauleg(2.d0, critp, pp(11), w1(11), 2*n/3-10)
c          call gauleg(1.d-6, 1.d0/critp, pp(2*n/3+1),
c      u          w1(2*n/3+1), n/3)
c
c Do substitution  $p \Rightarrow 1/p$  for the last interval explicitly:
c          do 10 i=2*n/3+1,n
c              pp(i) = 1.d0/pp(i)
10          continue
c
c Reorder the arrays for the third interval:
c          do 20 i=1,n/3
c              xx(i) = pp(2*n/3+i)
c              w2(i) = w1(2*n/3+i)
20          continue
c          do 30 i=1,n/3
c              pp(n-i+1) = xx(i)
c              w1(n-i+1) = w2(i)
30          continue
c
c Calculate the integrals aax(p) for the given momenta pp(i)
c and store weights and momenta for the output arrays:
c          do 40 i=1,n
c              a1(i) = aax(pp(i)) !!! FB: can get stuck in original Toppik!
c              !!! FB: abuse 'np' as a flag to communicate unstable runs
c              if ( abs(a1(i)) .gt. 1d10 ) then
c                  np = -1
c                  return

```

```

        endif
        xpp(i)=pp(i)
        xww(i)=w1(i)
40      continue
        do 41 i=n+1,nmax
            xpp(i)=0.d0
            xww(i)=0.d0
41      continue
c
c Solve the integral-equation by solving a system of algebraic equations:
        call saeax(pp, w1, bb, vec, a1, n)
c
c (The substitution for the integration to infinity pp => 1/pp
c is done already.)
        do 50 i=1,n
            zvfct(i)=bb(i)
            zftild(i)=vec(i)

## Chapter 30

# Integration and Process Objects

This is the central part of the WHIZARD package. It provides the functionality for evaluating structure functions, kinematics and matrix elements, integration and event generation. It combines the various parts that deal with those tasks individually and organizes the data transfer between them.

**subevt\_expr** This enables process observables as (abstract) expressions, to be evaluated for each process call.

**parton\_states** A `parton_state_t` object represents an elementary partonic interaction. There are two versions: one for the isolated elementary process, one for the elementary process convoluted with the structure-function chain. The parton state is an effective state. It needs not coincide with the seed-kinematics state which is used in evaluating phase space.

**process** Here, all pieces are combined for the purpose of evaluating the elementary processes. The whole algorithm is coded in terms of abstract data types as defined in the appropriate modules: `prc_core` for matrix-element evaluation, `prc_core_def` for the associated configuration and driver, `sf_base` for beams and structure-functions, `phs_base` for phase space, and `mci_base` for integration and event generation.

**process\_config**

**process\_counter** Very simple object for statistics

**process\_mci**

**pcm**

**kinematics**

**instances** While the above modules set up all static information, the instances have the changing event data. There are term and process instances but no component instances.

**process\_stacks** Process stacks collect process objects.

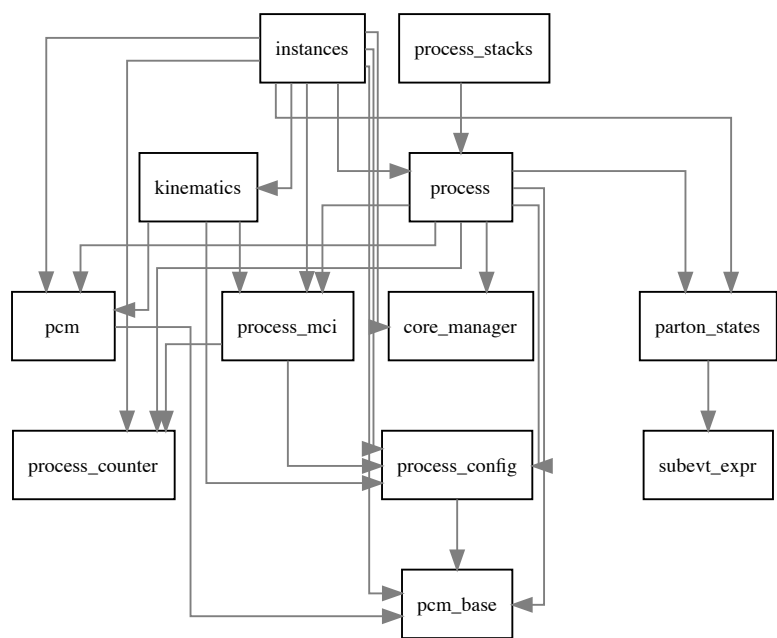

Figure 30.1: Module dependencies in `src/process_integration`.

We combine here hard interactions, phase space, and (for scatterings) structure functions and interfaces them to the integration module.

The process object implements the combination of a fixed beam and structure-function setup with a number of elementary processes. The latter are called process components. The process object represents an entity which is supposedly observable. It should be meaningful to talk about the cross section of a process.

The individual components of a process are, technically, processes themselves, but they may have unphysical cross sections which have to be added for a physical result. Process components may be exclusive tree-level elementary processes, dipole subtraction term, loop corrections, etc.

The beam and structure function setup is common to all process components. Thus, there is only one instance of this part.

The process may be a scattering process or a decay process. In the latter case, there are no structure functions, and the beam setup consists of a single particle. Otherwise, the two classes are treated on the same footing.

Once a sampling point has been chosen, a process determines a set of partons with a correlated density matrix of quantum numbers. In general, each sampling point will generate, for each process component, one or more distinct parton configurations. This is the **computed** state. The computed state is the subject of the multi-channel integration algorithm.

For NLO computations, it is necessary to project the computed states onto another set of parton configurations (e.g., by recombining certain pairs). This is the **observed** state. When computing partonic observables, the information is taken from the observed state.

For the purpose of event generation, we will later select one parton configuration from the observed state and collapse the correlated quantum state. This configuration is then dressed by applying parton shower, decays and hadronization. The decay chain, in particular, combines a scattering process with possible subsequent decay processes on the parton level, which are full-fledged process objects themselves.

## 30.1 Process observables

We define an abstract **subevt\_expr\_t** object as an extension of the **subevt\_t** type. The object contains a local variable list, variable instances (as targets for pointers in the variable list), and evaluation trees. The evaluation trees reference both the variables and the **subevt**.

There are two instances of the abstract type: one for process instances, one for physical events. Both have a common logical expression **selection** which determines whether the object passes user-defined cuts.

The intention is that we fill the **subevt\_t** base object and compute the variables once we have evaluated a kinematical phase space point (or a complete event). We then evaluate the expressions and can use the results in further calculations.

The **process\_expr\_t** extension contains furthermore scale and weight expressions. The **event\_expr\_t** extension contains a reweighting-factor expression and a logical expression for event analysis. In practice, we will link the

variable list of the `event_obs` object to the variable list of the currently active `process_obs` object, such that the process variables are available to both objects. Event variables are meaningful only for physical events.

Note that there are unit tests, but they are deferred to the `expr_tests` module.

```

  end module subvt_expr

```

### 30.1.1 Abstract base type

```

<Subvt expr: types>≡
  type, extends (subvt_t), abstract :: subvt_expr_t
    logical :: subvt_filled = .false.
    type(var_list_t) :: var_list
    real(default) :: sqrts_hat = 0
    integer :: n_in = 0
    integer :: n_out = 0
    integer :: n_tot = 0
    logical :: has_selection = .false.
    class(expr_t), allocatable :: selection
  contains
    <Subvt expr: subvt expr: TBP>
  end type subvt_expr_t

```

Output: Base and extended version. We already have a `write` routine for the `subevt_t` parent type.

```

<Subevt expr: subevt expr: TBP>≡
  procedure :: base_write => subevt_expr_write

<Subevt expr: procedures>≡
  subroutine subevt_expr_write (object, unit, pacified)
    class(subevt_expr_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: pacified
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Local variables:"
    call write_separator (u)
    call var_list_write (object%var_list, u, follow_link=.false., &
      pacified = pacified)
    call write_separator (u)
    if (object%subevt_filled) then
      call object%subevt_t%write (u, pacified = pacified)
      if (object%has_selection) then
        call write_separator (u)
        write (u, "(1x,A)") "Selection expression:"
        call write_separator (u)
        call object%selection%write (u)
      end if
    else
      write (u, "(1x,A)") "subevt: [undefined]"
    end if
  end subroutine subevt_expr_write

```

Finalizer.

```

<Subevt expr: subevt expr: TBP>+≡
  procedure (subevt_expr_final), deferred :: final
  procedure :: base_final => subevt_expr_final

<Subevt expr: procedures>+≡
  subroutine subevt_expr_final (object)
    class(subevt_expr_t), intent(inout) :: object
    call object%var_list%final ()
    if (object%has_selection) then
      call object%selection%final ()
    end if
  end subroutine subevt_expr_final

```

### 30.1.2 Initialization

Initialization: define local variables and establish pointers.

The common variables are `sqrts` (the nominal beam energy, fixed), `sqrts_hat` (the actual energy), `n_in`, `n_out`, and `n_tot` for the `subevt`. With the exception of `sqrts`, all are implemented as pointers to subobjects.

```

<Subevt expr: subevt expr: TBP>+≡

```

```

    procedure (subevt_expr_setup_vars), deferred :: setup_vars
    procedure :: base_setup_vars => subevt_expr_setup_vars
  <Subevt expr: procedures>+≡
    subroutine subevt_expr_setup_vars (expr, sqrts)
      class(subevt_expr_t), intent(inout), target :: expr
      real(default), intent(in) :: sqrts
      call expr%var_list%final ()
      call var_list_append_real (expr%var_list, &
        var_str ("sqrts"), sqrts, &
        locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_real_ptr (expr%var_list, &
        var_str ("sqrts_hat"), expr%sqrts_hat, &
        is_known = expr%subevt_filled, &
        locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
        var_str ("n_in"), expr%n_in, &
        is_known = expr%subevt_filled, &
        locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
        var_str ("n_out"), expr%n_out, &
        is_known = expr%subevt_filled, &
        locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
        var_str ("n_tot"), expr%n_tot, &
        is_known = expr%subevt_filled, &
        locked = .true., verbose = .false., intrinsic = .true.)
    end subroutine subevt_expr_setup_vars

```

Append the subevent expr (its base-type core) itself to the variable list, if it is not yet present.

```

  <Subevt expr: subevt expr: TBP>+≡
    procedure :: setup_var_self => subevt_expr_setup_var_self
  <Subevt expr: procedures>+≡
    subroutine subevt_expr_setup_var_self (expr)
      class(subevt_expr_t), intent(inout), target :: expr
      if (.not. expr%var_list%contains (var_str ("@evt"))) then
        call var_list_append_subevt_ptr &
          (expr%var_list, &
            var_str ("@evt"), expr%subevt_t, &
            is_known = expr%subevt_filled, &
            locked = .true., verbose = .false., intrinsic=.true.)
      end if
    end subroutine subevt_expr_setup_var_self

```

Link a variable list to the local one. This could be done event by event, but before evaluating expressions.

```

  <Subevt expr: subevt expr: TBP>+≡
    procedure :: link_var_list => subevt_expr_link_var_list
  <Subevt expr: procedures>+≡
    subroutine subevt_expr_link_var_list (expr, var_list)
      class(subevt_expr_t), intent(inout) :: expr

```

```

        type(var_list_t), intent(in), target :: var_list
        call expr%var_list%link (var_list)
    end subroutine subevt_expr_link_var_list

```

Compile the selection expression. If there is no expression, the build method won't allocate the expression object.

```

<Subevt expr: subevt expr: TBP>+≡
    procedure :: setup_selection => subevt_expr_setup_selection

<Subevt expr: procedures>+≡
    subroutine subevt_expr_setup_selection (expr, ef_cuts)
        class(subevt_expr_t), intent(inout), target :: expr
        class(expr_factory_t), intent(in) :: ef_cuts
        call ef_cuts%build (expr%selection)
        if (allocated (expr%selection)) then
            call expr%setup_var_self ()
            call expr%selection%setup_lexpr (expr%var_list)
            expr%has_selection = .true.
        end if
    end subroutine subevt_expr_setup_selection

```

### 30.1.3 Evaluation

Reset to initial state, i.e., mark the subevt as invalid.

```

<Subevt expr: subevt expr: TBP>+≡
    procedure :: reset => subevt_expr_reset
    procedure :: base_reset => subevt_expr_reset

<Subevt expr: procedures>+≡
    subroutine subevt_expr_reset (expr)
        class(subevt_expr_t), intent(inout) :: expr
        expr%subevt_filled = .false.
    end subroutine subevt_expr_reset

```

Evaluate the selection expression and return the result. There is also a deferred version: this should evaluate the remaining expressions if the event has passed.

```

<Subevt expr: subevt expr: TBP>+≡
    procedure :: base_evaluate => subevt_expr_evaluate

<Subevt expr: procedures>+≡
    subroutine subevt_expr_evaluate (expr, passed)
        class(subevt_expr_t), intent(inout) :: expr
        logical, intent(out) :: passed
        if (expr%has_selection) then
            call expr%selection%evaluate ()
            if (expr%selection%is_known ()) then
                passed = expr%selection%get_log ()
            else
                call msg_error ("Evaluate selection expression: result undefined")
                passed = .false.
            end if
        else

```

```

        passed = .true.
    end if
end subroutine subevt_expr_evaluate

```

### 30.1.4 Implementation for partonic events

This implementation contains the expressions that we can evaluate for the partonic process during integration.

```

<Subevt expr: public>≡
    public :: parton_expr_t

<Subevt expr: types>+≡
    type, extends (subevt_expr_t) :: parton_expr_t
        integer, dimension(:), allocatable :: i_beam
        integer, dimension(:), allocatable :: i_in
        integer, dimension(:), allocatable :: i_out
        logical :: has_scale = .false.
        logical :: has_fac_scale = .false.
        logical :: has_ren_scale = .false.
        logical :: has_weight = .false.
        class(expr_t), allocatable :: scale
        class(expr_t), allocatable :: fac_scale
        class(expr_t), allocatable :: ren_scale
        class(expr_t), allocatable :: weight
    contains
        <Subevt expr: parton expr: TBP>
    end type parton_expr_t

```

Finalizer.

```

<Subevt expr: parton expr: TBP>≡
    procedure :: final => parton_expr_final

<Subevt expr: procedures>+≡
    subroutine parton_expr_final (object)
        class(parton_expr_t), intent(inout) :: object
        call object%base_final ()
        if (object%has_scale) then
            call object%scale%final ()
        end if

### 30.1.5 Implementation for full events

This implementation contains the expressions that we can evaluate for the full event. It also contains data that pertain to the event, suitable for communication with external event formats. These data simultaneously serve as pointer targets for the variable lists hidden in the expressions (eval trees).

Squared matrix element and weight values: when reading events from file, the `ref` value is the number in the file, while the `prc` value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of `alt` values is copied from an array of alternative event records. These values should represent calculated values.

```

## 30.2 Parton states

A `parton_state_t` object contains the effective kinematics and dynamics of an elementary partonic interaction, with or without the beam/structure function state included. The type is abstract and has two distinct extensions. The `isolated_state_t` extension describes the isolated elementary interaction where the `int_eff` subobject contains the complex transition amplitude, exclusive in all quantum numbers. The particle content and kinematics describe the effective partonic state. The `connected_state_t` extension contains the partonic `subevt` and the expressions for cuts and scales which use it.

In the isolated state, the effective partonic interaction may either be identical to the hard interaction, in which case it is just a pointer to the latter. Or it may involve a rearrangement of partons, in which case we allocate it explicitly and flag this by `int_is_allocated`.

The `trace` evaluator contains the absolute square of the effective transition amplitude matrix, summed over final states. It is also summed over initial states, depending on the the beam setup allows. The result is used for integration.

The `matrix` evaluator is the counterpart of `trace` which is kept exclusive in all observable quantum numbers. The `flows` evaluator is furthermore exclusive in colors, but neglecting all color interference. The `matrix` and `flows` evaluators are filled only for sampling points that become part of physical events.

Note: It would be natural to make the evaluators allocatable. However, this causes memory corruption in gfortran 4.6.3. The extra `has_XXX` flags indicate whether evaluators are active, instead.

This module contains no unit tests. The tests are covered by the `processes` module below.

### 30.2.1 Abstract base type

The common part are the evaluators, one for the trace (summed over all quantum numbers), one for the transition matrix (summed only over unobservable quantum numbers), and one for the flow distribution (transition matrix without interferences, exclusive in color flow).

```

⟨Parton states: types⟩≡
  type, abstract :: parton_state_t
    logical :: has_trace = .false.
    logical :: has_matrix = .false.
    logical :: has_flows = .false.
    type(evaluator_t) :: trace
    type(evaluator_t) :: matrix
    type(evaluator_t) :: flows
  contains
    ⟨Parton states: parton state: TBP⟩
  end type parton_state_t

```

The `isolated_state_t` extension contains the `sf_chain_eff` object and the (hard) effective interaction `int_eff`, separately, both implemented as a pointer. The evaluators (trace, matrix, flows) apply to the hard interaction only.

If the effective interaction differs from the hard interaction, the pointer is allocated explicitly. Analogously for `sf_chain_eff`.

```

(Parton states: public)≡
    public :: isolated_state_t

(Parton states: types)+≡
    type, extends (parton_state_t) :: isolated_state_t
        logical :: sf_chain_is_allocated = .false.
        type(sf_chain_instance_t), pointer :: sf_chain_eff => null ()
        logical :: int_is_allocated = .false.
        type(interaction_t), pointer :: int_eff => null ()
    contains
        (Parton states: isolated state: TBP)
    end type isolated_state_t

```

The `connected_state_t` extension contains all data that enable the evaluation of observables for the effective connected state. The evaluators connect the (effective) structure-function chain and hard interaction that were kept separate in the `isolated_state_t`.

The `flows_sf` evaluator is an extended copy of the structure-function

The `expr` subobject consists of the `subevt`, a simple event record, expressions for cuts etc. which refer to this record, and a `var_list` which contains event-specific variables, linked to the process variable list. Variables used within the expressions are looked up in `var_list`.

```

(Parton states: public)+≡
    public :: connected_state_t

(Parton states: types)+≡
    type, extends (parton_state_t) :: connected_state_t
        type(state_flv_content_t) :: state_flv
        logical :: has_flows_sf = .false.
        type(evaluator_t) :: flows_sf
        logical :: has_expr = .false.
        type(parton_expr_t) :: expr
    contains
        (Parton states: connected state: TBP)
    end type connected_state_t

```

Output: each evaluator is written only when it is active. The `sf_chain` is only written if it is explicitly allocated.

### 30.2.2 Common Initialization

Initialize the isolated parton state. In this version, the effective structure-function chain `sf_chain_eff` and the effective interaction `int_eff` both are trivial pointers to the seed structure-function chain and to the hard interaction, respectively.

```

(Parton states: isolated state: TBP) =
  procedure :: init => isolated_state_init

(Parton states: procedures) +=
  subroutine isolated_state_init (state, sf_chain, int)
    class(isolated_state_t), intent(out) :: state
    type(sf_chain_instance_t), intent(in), target :: sf_chain
    type(interaction_t), intent(in), target :: int
    state%sf_chain_eff => sf_chain
    state%int_eff => int
  end subroutine isolated_state_init

```

### 30.2.3 Evaluator initialization: isolated state

Create an evaluator for the trace of the squared transition matrix. The trace goes over all outgoing quantum numbers. Whether we trace over incoming quantum numbers other than color, depends on the given `qn_mask_in`.

There are two options: explicitly computing the color factor table (`use_cf` false; `nc` defined), or taking the color factor table from the hard matrix element data.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_trace => isolated_state_setup_square_trace

(Parton states: procedures)+≡
  subroutine isolated_state_setup_square_trace (state, core, &
    qn_mask_in, col, keep_fs_flavor)
    class(isolated_state_t), intent(inout), target :: state
    class(prc_core_t), intent(in) :: core
    type(quantum_numbers_mask_t), intent(in), dimension(:) :: qn_mask_in
    !!! Actually need allocatable attribute here fore once because col might
    !!! enter the subroutine non-allocated.
    integer, intent(in), dimension(:), allocatable :: col
    logical, intent(in) :: keep_fs_flavor
    type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
    associate (data => core%data)
      allocate (qn_mask (data%n_in + data%n_out))
      qn_mask( : data%n_in) = &
        quantum_numbers_mask (.false., .true., .false.) &
        .or. qn_mask_in
      qn_mask(data%n_in + 1 : ) = &
        quantum_numbers_mask (.not. keep_fs_flavor, .true., .true.)
      if (core%use_color_factors) then
        call state%trace%init_square (state%int_eff, qn_mask, &
          col_flow_index = data%cf_index, &
          col_factor = data%color_factors, &
          col_index_hi = col, &
          nc = core%nc)
      else
        call state%trace%init_square (state%int_eff, qn_mask, nc = core%nc)
      end if
    end associate
    state%has_trace = .true.
  end subroutine isolated_state_setup_square_trace

```

Setup an identity-evaluator for the trace. This implies that `me` is considered to be a squared amplitude, as for example for BLHA matrix elements.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_identity_trace => isolated_state_setup_identity_trace

(Parton states: procedures)+≡
  subroutine isolated_state_setup_identity_trace (state, core, qn_mask_in, &
    keep_fs_flavors, keep_colors)
    class(isolated_state_t), intent(inout), target :: state
    class(prc_core_t), intent(in) :: core
    type(quantum_numbers_mask_t), intent(in), dimension(:) :: qn_mask_in
    logical, intent(in), optional :: keep_fs_flavors, keep_colors

```

```

type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
logical :: fs_flv_flag, col_flag
fs_flv_flag = .true.; col_flag = .true.
if (present(keep_fs_flavors)) fs_flv_flag = .not. keep_fs_flavors

    quantum_numbers_mask (.false., col_flag, .false.) .or. qn_mask_in
  qn_mask(data%n_in + 1 : ) = &
    quantum_numbers_mask (fs_flv_flag, col_flag, .true.)
end associate
call state%int_eff%set_mask (qn_mask)
call state%trace%init_identity (state%int_eff)
state%has_trace = .true.
end subroutine isolated_state_setup_identity_trace

```

Setup the evaluator for the transition matrix, exclusive in helicities where this is requested.

For all unstable final-state particles we keep polarization according to the applicable decay options. If the process is a decay itself, this applies also to the initial state.

For all polarized final-state particles, we keep polarization including off-diagonal entries. We drop helicity completely for unpolarized final-state particles.

For the initial state, if the particle has not been handled yet, we apply the provided `qn_mask_in` which communicates the beam properties.

*(Parton states: isolated state: TBP)+≡*

```

procedure :: setup_square_matrix => isolated_state_setup_square_matrix

```

*(Parton states: procedures)+≡*

```

subroutine isolated_state_setup_square_matrix &

### 30.2.4 Evaluator initialization: connected state

Setup a trace evaluator as a product of two evaluators (incoming state, effective interaction). In the result, all quantum numbers are summed over.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`.

The `resonant` flag applies if we want to construct a decay chain. The resonance property can propagate to the final event output.

*(Parton states: connected state: TBP)*≡

```

    procedure :: setup_connected_trace => connected_state_setup_connected_trace

end function connected_state_get_state_flv

```

### 30.2.5 Cuts and expressions

Set up the `subevt` that corresponds to the connected interaction. The index arrays refer to the interaction.

We assign the particles as follows: the beam particles are the first two (decay process: one) entries in the trace evaluator. The incoming partons are identified by their link to the outgoing partons of the structure-function chain. The outgoing partons are those of the trace evaluator, which include radiated partons during the structure-function chain.

```

(Parton states: connected state: TBP)+≡
procedure :: setup_subevt => connected_state_setup_subevt

(Parton states: procedures)+≡
subroutine connected_state_setup_subevt (state, sf_chain, f_beam, f_in, f_out)
  class (connected_state_t), intent(inout), target :: state
  type (sf_chain_instance_t), intent(in), target :: sf_chain

(Parton states: procedures)+≡
subroutine connected_state_reset_expressions (state)

```

```

class (connected_state_t), intent (inout) :: state
if (state%has_expr) call state%expr%reset ()
end subroutine connected_state_reset_expressions

```

### 30.2.6 Evaluation

Transfer momenta to the trace evaluator and fill the `subevt` with this effective kinematics, if applicable.

Note: we may want to apply a boost for the `subevt`.

```

(Parton states: parton state: TBP)+≡
  procedure :: receive_kinematics => parton_state_receive_kinematics
(Parton states: procedures)+≡
  subroutine parton_state_receive_kinematics (state)
    class (parton_state_t), intent (inout), target :: state
    if (state%has_trace) then
      call state%trace%receive_momenta ()
      select type (state)
      class is (connected_state_t)
        if (state%has_expr) then
          call state%expr%fill_subevt (state%trace%interaction_t)
        end if
      end select
    end if
  end subroutine parton_state_receive_kinematics

```

Recover kinematics: We assume that the trace evaluator is filled with momenta. Send those momenta back to the sources, then fill the variables and subevent as above.

The incoming momenta of the connected state are not connected to the isolated state but to the beam interaction. Therefore, the incoming momenta within the isolated state do not become defined, yet. Instead, we reconstruct the beam (and ISR) momentum configuration.

```

(Parton states: parton state: TBP)+≡
  procedure :: send_kinematics => parton_state_send_kinematics
(Parton states: procedures)+≡
  subroutine parton_state_send_kinematics (state)
    class (parton_state_t), intent (inout), target :: state
    if (state%has_trace) then
      call interaction_send_momenta (state%trace%interaction_t)
      select type (state)
      class is (connected_state_t)
        call state%expr%fill_subevt (state%trace%interaction_t)
      end select
    end if
  end subroutine parton_state_send_kinematics

```

Evaluate the expressions. The routine evaluates first the cut expression. If the event passes, it evaluates the other expressions. Where no expressions are defined, default values are inserted.

```

(Parton states: connected state: TBP)+≡

```

```

    procedure :: evaluate_expressions => connected_state_evaluate_expressions
  <Parton states: procedures>+≡
    subroutine connected_state_evaluate_expressions (state, passed, &
      scale, fac_scale, ren_scale, weight, scale_forced, force_evaluation)
      class(connected_state_t), intent(inout) :: state
      logical, intent(out) :: passed
      real(default), intent(out) :: scale, fac_scale, ren_scale, weight

## 30.3 Process component management

This module contains tools for managing and combining process components and matrix-element code and values, acting at a level below the actual process definition.

### 30.3.1 Abstract base type

The types introduced here are abstract base types.

```

⟨pcm_base.f90⟩≡
  ⟨File header⟩

  module pcm_base

    use diagnostics

    use prc_core_def
    use prc_core

    ⟨Standard module head⟩

    ⟨PCM base: public⟩

    ⟨PCM base: types⟩

    ⟨PCM base: interfaces⟩

    contains

    ⟨PCM base: procedures⟩

```

```
end module pcm_base
```

This object may hold process and method-specific data, and it should allocate the corresponding manager instance.

```
<PCM base: public>≡
  public :: pcm_t

<PCM base: types>≡
  type, abstract :: pcm_t
    logical :: initialized = .false.
    logical :: has_pdfs = .false.
  contains
    <PCM base: pcm: TBP>
  end type pcm_t
```

The factory method. We use the `inout` intent, so calling this again is an error.

```
<PCM base: pcm: TBP>≡
  procedure(pcm_allocate_instance), deferred :: allocate_instance

<PCM base: interfaces>≡
  abstract interface
    subroutine pcm_allocate_instance (pcm, instance)
      import
      class(pcm_t), intent(in) :: pcm
      class(pcm_instance_t), intent(inout), allocatable :: instance
    end subroutine pcm_allocate_instance
  end interface
```

```
<PCM base: pcm: TBP>+≡
  procedure(pcm_is_nlo), deferred :: is_nlo
```

```
<PCM base: interfaces>+≡
  abstract interface
    function pcm_is_nlo (pcm) result (is_nlo)
      import
      logical :: is_nlo
      class(pcm_t), intent(in) :: pcm
    end function pcm_is_nlo
  end interface
```

```
<PCM base: pcm: TBP>+≡
  procedure(pcm_final), deferred :: final
```

```
<PCM base: interfaces>+≡
  abstract interface
    subroutine pcm_final (pcm)
      import
      class(pcm_t), intent(inout) :: pcm
    end subroutine pcm_final
  end interface
```

### 30.3.2 Manager instance

This object deals with the actual (squared) matrix element values.

```
<PCM base: public>+≡
    public :: pcm_instance_t

<PCM base: types>+≡
    type, abstract :: pcm_instance_t
    class(pcm_t), pointer :: config => null ()
    logical :: bad_point = .false.
contains
    <PCM base: pcm instance: TBP>
    end type pcm_instance_t

<PCM base: pcm instance: TBP>≡
    procedure(pcm_instance_final), deferred :: final

<PCM base: interfaces>+≡
    abstract interface
        subroutine pcm_instance_final (pcm_instance)
            import
            class(pcm_instance_t), intent(inout) :: pcm_instance
        end subroutine pcm_instance_final
    end interface

<PCM base: pcm instance: TBP>+≡
    procedure :: link_config => pcm_instance_link_config

<PCM base: procedures>≡
    subroutine pcm_instance_link_config (pcm_instance, config)
        class(pcm_instance_t), intent(inout) :: pcm_instance
        class(pcm_t), intent(in), target :: config
        pcm_instance%config => config
    end subroutine pcm_instance_link_config

<PCM base: pcm instance: TBP>+≡
    procedure :: is_valid => pcm_instance_is_valid

<PCM base: procedures>+≡
    function pcm_instance_is_valid (pcm_instance) result (valid)
        logical :: valid
        class(pcm_instance_t), intent(in) :: pcm_instance
        valid = .not. pcm_instance%bad_point
    end function pcm_instance_is_valid

<PCM base: pcm instance: TBP>+≡
    procedure :: set_bad_point => pcm_instance_set_bad_point

<PCM base: procedures>+≡
    pure subroutine pcm_instance_set_bad_point (pcm_instance, bad_point)
        class(pcm_instance_t), intent(inout) :: pcm_instance
        logical, intent(in) :: bad_point
        pcm_instance%bad_point = pcm_instance%bad_point .or. bad_point
    end subroutine pcm_instance_set_bad_point
```

## 30.4 Manager configuration

This object holds information about the cores used by the components and allocates the corresponding manager instance.

```

<core_manager.f90>≡

```

A process object is the workspace for the process instance. After initialization, its contents are filled by integration passes which shape the integration grids and compute cross sections. Processes are set up initially from user-level configuration data. After calculating integrals and thus developing integration grid data, the program may use a process object or a copy of it for the purpose of generating events.

The process object consists of several subobjects with their specific purposes. The corresponding types are defined below. (Technically, the subobject type definitions have to come before the process type definition, but with NOWEB magic we reverse this order here.)

The **type** determines whether we are considering a decay or a scattering process.

The **meta** object describes the process and its environment. All contents become fixed when the object is initialized.

The **config** object holds physical and technical configuration data that have been obtained during process initialization, and which are common to all process components.

The individual process components are configured in the **component** objects. These objects contain more configuration parameters and workspace, as needed for the specific process variant.

The **term** objects describe parton configurations which are technically used as phase-space points. Each process component may split into several terms with distinct kinematics and particle content. Furthermore, each term may project on a different physical state, e.g., by particle recombination. The **term** object provides the framework for this projection, for applying cuts, weight, and thus completing the process calculation.

The **beam\_config** object describes the incoming particles, either the decay mother or the scattering beams. It also contains the structure-function information.

The **mci\_entry** objects configure a MC input parameter set and integrator, each. The number of parameters depends on the process component and on the beam and structure-function setup.

The **pcm** component is the process-component manager. This polymorphic object manages and hides the details of dealing with NLO processes where several components have to be combined in a non-trivial way. It also acts as an abstract factory for the corresponding object in **process\_instance**, which does the actual work for this matter.

*⟨Process: public⟩*≡

```

### 30.5.1 Set of resonant subprocesses

Wrapper type for storing pointers to process objects in arrays.

```

<Process: public>+≡
    public :: process_ptr_t

<Process: types>+≡
    type :: process_ptr_t
        type(process_t), pointer :: p => null ()
    end type process_ptr_t

```

This procedure is an important debugging and inspection tool; it is not used during normal operation. The process object is written to a file (identified by unit, which may also be standard output). Optional flags determine whether we show everything or just the interesting parts.

```

<Process: process: TBP>≡

Initialize the beam setup. This is the trivial version where the incoming state of the matrix element coincides with the initial state of the process. For a scattering process, we need the c.m. energy, all other variables are set to their default values (no polarization, lab frame and c.m. frame coincide, etc.)

We assume that all components consistently describe a scattering process, i.e., two incoming particles.

Note: The current layout of the `beam.data.t` record requires that the flavor for each beam is unique. For processes with multiple flavors in the initial state, one has to set up beams explicitly. This restriction could be removed by extending the code in the `beams` module.

We complete the kinematics configuration after the beam setup, but before we configure the chain of structure functions. The reason is that we need the

total energy `sqrts` for the kinematics, but the structure-function setup requires the number of channels, which depends on the kinematics configuration. For instance, the kinematics module may return the need for parameterizing an s-channel resonance.

Insert the structure-function configuration data. First allocate the storage, then insert data one by one. The third procedure declares a mapping (of the MC input parameters) for a specific channel and structure-function combination.

We take the number of channels from the corresponding entry in the `config_data` section.

Otherwise, these are simple wrapper routines. The extra level in the call tree may allow for simple addressing of multiple concurrent beam configurations, not implemented currently.

If we do not want structure functions, we simply do not call those procedures.

## MD5 sum

The MD5 sum of the process object should reflect the state completely, including integration results. It is used for checking the integrity of event files. This global checksum includes checksums for the various parts. In particular, the MCI object receives a checksum that includes the configuration of all configuration parts relevant for an individual integration. This checksum is used for checking the integrity of integration grids.

We do not need MD5 sums for the process terms, since these are generated from the component definitions.

```

Let us call the ratio of the LO and the NLO result  $\iota = I_{LO}/I_{NLO}$ . Then usual error propagation gives

$$\sigma_{\iota}^2 = \left( \frac{\partial \iota}{\partial I_{LO}} \right)^2 \sigma_{I_{LO}}^2 + \left( \frac{\partial \iota}{\partial I_{NLO}} \right)^2 \sigma_{I_{NLO}}^2 = \frac{I_{NLO}^2 \sigma_{I_{LO}}^2}{I_{LO}^4} + \frac{\sigma_{I_{NLO}}^2}{I_{LO}^2}.$$

### 30.5.2 Default iterations

If the user does not specify the passes and iterations for integration, we should be able to give reasonable defaults. These depend on the process, therefore we implement the following procedures as methods of the process object. The algorithm is not very sophisticated yet, it may be improved by looking at the process in more detail.

We investigate only the first process component, assuming that it characterizes the complexity of the process reasonable well.

The number of passes is limited to two: one for adaption, one for integration.

```

(Process: process: TBP)+≡

```

```

procedure :: get_n_pass_default => process_get_n_pass_default
procedure :: adapt_grids_default => process_adapt_grids_default
procedure :: adapt_weights_default => process_adapt_weights_default

### 30.5.4 Compute an amplitude

Each process variant should allow for computing an amplitude value directly, without generating a process instance.

The process component is selected by the index *i*. The term within the process component is selected by *j*. The momentum combination is transferred as the array *p*. The function sets the specific quantum state via the indices of a flavor *f*, helicity *h*, and color *c* combination. Each index refers to the list of flavor, helicity, and color states, respectively, as stored in the process data.

Optionally, we may set factorization and renormalization scale. If unset, the partonic c.m. energy is inserted.

The function checks arguments for validity. For invalid arguments (quantum states), we return zero.

```

(Process: process: TBP)+≡

```

```

procedure :: compute_amplitude => process_compute_amplitude

### 30.6.1 Generic configuration data

This information concerns physical and technical properties of the process. It is fixed upon initialization, using data from the process specification and the variable list.

The number **n\_in** is the number of incoming beam particles, simultaneously the number of incoming partons, 1 for a decay and 2 for a scattering process. (The number of outgoing partons may depend on the process component.)

The number **n\_components** is the number of components that constitute the current process.

The number **n\_terms** is the number of distinct contributions to the scattering matrix that constitute the current process. Each component may generate several terms.

The number **n\_mci** is the number of independent MC integration configurations that this process uses. Distinct process components that share a MCI configuration may be combined pointwise. (Nevertheless, a given MC variable set may correspond to several “nearby” kinematical configurations.) This is also the number of distinct sampling-function results that this process can generate. Process components that use distinct variable sets are added only once after an integration pass has completed.

The **model** pointer identifies the physics model and its parameters. This is a pointer to an external object.

The **rng\_factory** component spawns independent random-number generators for use in integration, event generation, and event postprocessing.

Various **parse\_node\_t** objects are taken from the SINDARIN input. They encode expressions for evaluating cuts and scales. The workspaces for evaluating those expressions are set up in the **effective\_state** subobjects. Note that these are really pointers, so the actual nodes are not stored inside the process object.

The **md5sum** is taken and used to verify the process configuration when re-reading data from file.

```

    write (u, "(3x,A,A,A)") "MD5 sum (config) = '", config%md5sum, "'"
end if
end subroutine process_config_data_write

```

Initialize. We use information from the process metadata and from the process library, given the process ID. We also store the currently active OS data set.

The model that we import here should be an instance of the global model. If we create the instance outside, we can make it an extension of the basic `model_data_t`. This will allow us to synchronize the variable list with the model. Using a pointer instead of an allocatable, we can guarantee the `target` attribute.

The RNG factory object is imported by moving the allocation.

```

<Process config: process config data: TBP>+≡
    procedure :: init => process_config_data_init

<Process config: procedures>+≡
    subroutine process_config_data_init &

```

```

        (config, meta, os_data, qcd, rng_factory, model)
class(process_config_data_t), intent(out) :: config
type(process_metadata_t), intent(in) :: meta
type(os_data_t), intent(in) :: os_data
type(qcd_t), intent(in) :: qcd
class(rng_factory_t), intent(inout), allocatable :: rng_factory
class(model_data_t), intent(inout), pointer :: model
config%n_in = meta%lib%get_n_in (meta%id)
config%n_components = size (meta%component_id)
config%os_data = os_data
config%qcd = qcd
call move_alloc (from = rng_factory, to = config%rng_factory)
config%model_name = model%get_name ()
config%model => model
model => null ()
end subroutine process_config_data_init

```

Since the captured model is a separate object allocated via a pointer, we need a finalizer.

```

(Process config: process config data: TBP)+≡
  procedure :: final => process_config_data_final

(Process config: procedures)+≡
  subroutine process_config_data_final (config)
    class(process_config_data_t), intent(inout) :: config
    if (associated (config%model)) then
      call config%model%final ()
      deallocate (config%model)
    end if
  end subroutine process_config_data_final

```

Compute the MD5 sum of the configuration data. This encodes, in particular, the model and the expressions for cut, scales, weight, etc. It should not contain the IDs and number of components, etc., since the MD5 sum should be useful for integrating individual components.

This is done only once. If the MD5 sum is nonempty, the calculation is skipped.

```

### 30.6.2 Metadata

This information describes the process and its environment. It is fixed upon initialization.

The `id` string is the name of the process object, as given by the user. The matrix element generator will use this string for naming Fortran procedures and types, so it should qualify as a Fortran name.

The `num_id` is meaningful if nonzero. It is used for communication with external programs or file standards which do not support string IDs.

The `run_id` string distinguishes among several runs for the same process. It identifies process instances with respect to adapted integration grids and similar run-specific data. The run ID is kept when copying processes for creating instances, however, so it does not distinguish event samples.

The `var_list` is a snapshot of the variable list, taken at the point where the process was initialized.

The `lib` pointer accesses the process library where the process definition and the process driver are located.

The `lib_index` is the index of entry in the process library that corresponds to the current process.

The `component_id` array identifies the individual process components.

The `component_description` is an array of human-readable strings that characterize the process components, for instance `a, b => c, d`.

The `active` mask array marks those components which are active. The others are skipped.

### 30.6.3 Beam configuration

The object `data` holds all details about the initial beam configuration. The allocatable array `sf` holds the structure-function configuration blocks. There are `n_strfun` entries in the structure-function chain (not counting the initial beam object). We maintain `n_channel` independent parameterizations of this chain. If this is greater than zero, we need a multi-channel sampling algorithm, where for each point one channel is selected to generate kinematics.

The number of parameters that are required for generating a structure-function chain is `n_sfpar`.

The flag `azimuthal_dependence` tells whether the process setup is symmetric about the beam axis in the c.m. system. This implies that there is no transversal beam polarization. The flag `lab_is_cm_frame` is obvious.

```

(Process config: public)+≡
    public :: process_beam_config_t

(Process config: types)+≡
    type :: process_beam_config_t
        type (beam_data_t) :: data

### 30.6.4 Process components

A process component is an individual contribution to a process (scattering or decay) which needs not be physical. The sum over all components should be physical.

The `index` identifies this component within its parent process.

The actual process component is stored in the `core` subobject. We use a polymorphic subobject instead of an extension of `process_component_t`, because the individual entries in the array of process components can have different types. In short, `process_component_t` is a wrapper for the actual process variants.

If the `active` flag is false, we should skip this component. This happens if the associated process has vanishing matrix element.

The index array `i_term` points to the individual terms generated by this component. The indices refer to the parent process.

The index `i_mci` is the index of the MC integrator and parameter set which are associated to this process component.

```

<Process config: public>+≡
  public :: process_component_t

<Process config: types>+≡
  type :: process_component_t
    type(process_component_def_t), pointer :: config => null ()
    integer :: index = 0
    logical :: active = .false.

### 30.6.5 Process terms

For straightforward tree-level calculations, each process component corresponds to a unique elementary interaction. However, in the case of NLO calculations with subtraction terms, a process component may split into several separate contributions to the scattering, which are qualified by interactions with distinct kinematics and particle content. We represent their configuration as `process_term_t` objects, the actual instances will be introduced below as `term_instance_t`. In any case, the process term contains an elementary interaction with a definite quantum-number and momentum content.

The index `i_term_global` identifies the term relative to the process.

The index `i_component` identifies the process component which generates this term, relative to the parent process.

The index `i_term` identifies the term relative to the process component (not the process).

The `data` subobject holds all process constants.

The number of allowed flavor/helicity/color combinations is stored as `n_allowed`. This is the total number of independent entries in the density matrix. For each

combination, the index of the flavor, helicity, and color state is stored in the arrays `flv`, `hel`, and `col`, respectively.

The flag `rearrange` is true if we need to rearrange the particles of the hard interaction, to obtain the effective parton state.

The interaction `int` holds the quantum state for the (resolved) hard interaction, the parent-child relations of the particles, and their momenta. The momenta are not filled yet; this is postponed to copies of `int` which go into the process instances.

If recombination is in effect, we should allocate `int_eff` to describe the rearranged partonic state.

This type is public only for use in a unit test.

```

<Process config: public>+≡
  public :: process_term_t
<Process config: types>+≡
  type :: process_term_t
    integer :: i_term_global = 0
    integer :: i_component = 0
    integer :: i_term = 0
    integer :: i_sub = 0
    integer :: i_core = 0
    integer :: n_allowed = 0
    type(process_constants_t) :: data
    real(default) :: alpha_s = 0
    integer, dimension(:), allocatable :: flv, hel, col
    type(interaction_t) :: int
    type(interaction_t), pointer :: int_eff => null ()
    class(pcm_t), pointer :: pcm => null ()
  contains
    <Process config: process term: TBP>
  end type process_term_t

```

For the output, we skip the process constants and the tables of allowed quantum numbers. Those can also be read off from the interaction object.

```

<Process config: process term: TBP>≡

      pol_beams = use_beam_pol, use_internal_color = use_internal_color)
  end subroutine process_term_init

```

We fetch the process constants which determine the quantum numbers and use those to create the interaction. The interaction contains incoming and outgoing particles, no virtuals. The incoming particles are parents of the outgoing ones.

Keeping previous **WHIZARD** conventions, we invert the color assignment (but not flavor or helicity) for the incoming particles. When the color-flow square matrix is evaluated, this inversion is done again, so in the color-flow sequence we get the color assignments of the matrix element.

```

    prc_constants = term%data
  end subroutine process_term_get_process_constants

```

## 30.7 Process call statistics

Very simple object for statistics. Could be moved to a more basic chapter.

```
<process_counter.f90>≡  
  <File header>  
  
  module process_counter  
  
    use io_units  
  
    <Standard module head>  
  
    <Process counter: public>  
  
    <Process counter: parameters>  
  
    <Process counter: types>  
  
    contains  
  
    <Process counter: procedures>  
  
  end module process_counter
```

This object can record process calls, categorized by evaluation status. It is a part of the `mci_entry` component below.

```
<Process counter: public>≡  
  public :: process_counter_t  
  
<Process counter: types>≡  
  type :: process_counter_t  
    integer :: total = 0  
    integer :: failed_kinematics = 0  
    integer :: failed_cuts = 0  
    integer :: has_passed = 0  
    integer :: evaluated = 0  
    integer :: complete = 0  
    contains  
    <Process counter: process counter: TBP>  
  end type process_counter_t
```

Here are the corresponding numeric codes:

```
<Process counter: parameters>≡  
  integer, parameter, public :: STAT_UNDEFINED = 0  
  integer, parameter, public :: STAT_INITIAL = 1  
  integer, parameter, public :: STAT_ACTIVATED = 2  
  integer, parameter, public :: STAT_BEAM_MOMENTA = 3  
  integer, parameter, public :: STAT_FAILED_KINEMATICS = 4  
  integer, parameter, public :: STAT_SEED_KINEMATICS = 5  
  integer, parameter, public :: STAT_HARD_KINEMATICS = 6  
  integer, parameter, public :: STAT_EFF_KINEMATICS = 7  
  integer, parameter, public :: STAT_FAILED_CUTS = 8  
  integer, parameter, public :: STAT_PASSED_CUTS = 9  
  integer, parameter, public :: STAT_EVALUATED_TRACE = 10
```

```
integer, parameter, public :: STAT_EVENT_COMPLETE = 11
```

Output.

```
(Process counter: process counter: TBP)≡
  procedure :: write => process_counter_write

(Process counter: procedures)≡
  subroutine process_counter_write (object, unit)
    class(process_counter_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%total > 0) then
      write (u, "(1x,A)") "Call statistics (current run):"
      write (u, "(3x,A,I0)") "total          = ", object%total
      write (u, "(3x,A,I0)") "failed kin. = ", object%failed_kinematics
      write (u, "(3x,A,I0)") "failed cuts = ", object%failed_cuts
      write (u, "(3x,A,I0)") "passed cuts = ", object%has_passed
      write (u, "(3x,A,I0)") "evaluated   = ", object%evaluated
    else
      write (u, "(1x,A)") "Call statistics (current run): [no calls]"
    end if
  end subroutine process_counter_write
```

Reset. Just enforce default initialization.

```
(Process counter: process counter: TBP)+≡
  procedure :: reset => process_counter_reset

(Process counter: procedures)+≡
  subroutine process_counter_reset (counter)
    class(process_counter_t), intent(out) :: counter
    counter%total = 0
    counter%failed_kinematics = 0
    counter%failed_cuts = 0
    counter%has_passed = 0
    counter%evaluated = 0
    counter%complete = 0
  end subroutine process_counter_reset
```

We record an event according to the lowest status code greater or equal to the actual status. This is actually done by the process instance; the process object just copies the instance counter.

```
(Process counter: process counter: TBP)+≡
  procedure :: record => process_counter_record

(Process counter: procedures)+≡
  subroutine process_counter_record (counter, status)
    class(process_counter_t), intent(inout) :: counter
    integer, intent(in) :: status
    if (status <= STAT_FAILED_KINEMATICS) then
      counter%failed_kinematics = counter%failed_kinematics + 1
    else if (status <= STAT_FAILED_CUTS) then
      counter%failed_cuts = counter%failed_cuts + 1
    else if (status <= STAT_PASSED_CUTS) then
```

```

        counter%has_passed = counter%has_passed + 1
    else
        counter%evaluated = counter%evaluated + 1
    end if
    counter%total = counter%total + 1
end subroutine process_counter_record

```

## 30.8 Multi-channel integration

    ⟨Process mci: public⟩

    ⟨Process mci: parameters⟩

    ⟨Process mci: types⟩

    contains

    ⟨Process mci: procedures⟩

  end module process_mci

```

### 30.8.1 Process MCI entry

The `process_mci_entry_t` block contains, for each process component that is integrated independently, the configuration data for its MC input parameters. Each input parameter set is handled by a `mci_t` integrator.

The MC input parameter set is broken down into the parameters required by the structure-function chain and the parameters required by the phase space of the elementary process.

The MD5 sum collects all information about the associated processes that may affect the integration. It does not contain the MCI object itself or integration results.

MC integration is organized in passes. Each pass may consist of several iterations, and for each iteration there is a number of calls. We store explicitly the values that apply to the current pass. Previous values are archived in the **results** object.

The **counter** receives the counter statistics from the associated process instance, for diagnostics.

The **results** object records results, broken down in passes and iterations.

```

(Process mci: public)≡
    public :: process_mci_entry_t

```

Initialize. From the existing configuration, we obtain the number of channels and the number of parameters, separately for the structure-function chain and for the associated process component. We assume that the phase-space object has already been configured.

The allocation of the MCI integrator with the appropriate concrete type is the duty of the process core.

We assume that there is only one component associated with a MCI entry. This restriction should be relaxed.

```

Integrate.

The `integrate` method counts as an integration pass; the pass count is increased by one. We transfer the pass parameters (number of iterations and number of calls) to the actual integration routine.

The `mci_entry` is `intent(inout)` because the integrator contains the random-number state.

Note: The results are written to screen and to logfile. This behavior is hardcoded.

```

Generate an event. The instance should be initialized, otherwise event generation is directed by the mci integrator subobject. The integrator instance is contained in a mci\_work subobject of the process instance, which simultaneously serves as the sampler object. (We avoid the anti-aliasing rules if we assume that the sampling itself does not involve the integrator instance contained in the process instance.)

Regarding weighted events, we only take events which are valid, which means that they have valid kinematics and have passed cuts. Therefore, we have a rejection loop. For unweighted events, the unweighting routine should already take care of this.

## 30.10 Kinematics instance

In this data type we combine all objects (instances) necessary for generating (or recovering) a kinematical configuration. The components work together as an implementation of multi-channel phase space.

**sf\_chain** is an instance of the structure-function chain. It is used both for generating kinematics and, after the proper scale has been determined, evaluating the structure function entries.

**phs** is an instance of the phase space for the elementary process.

The array **f** contains the products of the Jacobians that originate from parameter mappings in the structure-function chain or in the phase space. We allocate this explicitly if either **sf\_chain** or **phs** are explicitly allocated, otherwise we can take over a pointer.

All components are implemented as pointers to (anonymous) targets. For each component, there is a flag that tells whether this component is to be regarded as a proper component ('owned' by the object) or as a pointer.

    end do
end subroutine kinematics_compute_other_channels

```

Just fetch the outgoing momenta of the `sf_chain` subobject, which become the incoming (seed) momenta of the hard interaction.

This is a stripped down-version of the above which we use when recovering kinematics. Momenta are known, but no MC parameters yet.

(We do not use the `get_out_momenta` method of the chain, since this relies on the structure-function interactions, which are not necessary filled here. We do rely on the momenta of the last evaluator in the chain, however.)

```

(Kinematics: kinematics: TBP)+≡
  procedure :: get_incoming_momenta => kinematics_get_incoming_momenta

(Kinematics: procedures)+≡
  subroutine kinematics_get_incoming_momenta (k, p)
    class(kinematics_t), intent(in) :: k
    type(vector4_t), dimension(:), intent(out) :: p
    type(interaction_t), pointer :: int
    integer :: i
    int => k%sf_chain%get_out_int_ptr ()
    do i = 1, k%n_in
      p(i) = int%get_momentum (k%sf_chain%get_out_i (i))
    end do
  end subroutine kinematics_get_incoming_momenta

```

This inverts the remainder of the above `compute` method. We know the momenta and recover the rest, as far as needed. If we select a channel, we can complete the inversion and reconstruct the MC parameter set.

```

### 30.11.1 Term instance

A **term\_instance\_t** object contains all data that describe a term. Each process component consists of one or more distinct terms which may differ in kinematics, but whose squared transition matrices have to be added pointwise.

The **active** flag is set when this term is connected to an active process component. Inactive terms are skipped for kinematics and evaluation.

The **k\_term** object is the instance of the kinematics setup (structure-function chain, phase space, etc.) that applies specifically to this term. In ordinary cases, it consists of straight pointers to the seed kinematics.

The **amp** array stores the amplitude values when we get them from evaluating the associated matrix-element code.

The **int\_hard** interaction describes the elementary hard process. It receives the momenta and the amplitude entries for each sampling point.

The **isolated** object holds the effective parton state for the elementary interaction. The amplitude entries are computed from **int\_hard**.

The **connected** evaluator set convolutes this scattering matrix with the beam (and possibly structure-function) density matrix.

The **checked** flag is set once we have applied cuts on this term. The result of this is stored in the **passed** flag. Once the term has passed cuts, we calculate the various scale and weight expressions.

    end subroutine term_instance_final

```

For initialization, we make use of defined assignment for the `interaction_t` type. This creates a deep copy.

The hard interaction (incoming momenta) is linked to the structure function instance. In the isolated state, we either set pointers to both, or we create modified copies (`rearrange`) as effective structure-function chain and interaction, respectively.

Finally, we set up the `subevt` component that will be used for evaluating observables, collecting particles from the trace evaluator in the effective connected state. Their quantum numbers must be determined by following back source links and set explicitly, since they are already eliminated in that trace.

The `rearrange` parts are still commented out; they could become relevant for a NLO algorithm.
