```

### 18.7.8 Preparation

The trees that we read from file do not carry flavor information. This is set separately:

The flavor list must be unique for a unique set of masses; if a given particle can have different flavor, the mass must be degenerate, so we can choose one of the possible flavor combinations.

*(PHS forests: public)*+≡

```
public :: phs_forest_set_flavors
```

*(PHS forests: procedures)*+≡

```

subroutine phs_forest_set_flavors (forest, flv, reshuffle, flv_extra)
    type(phs_forest_t), intent(inout) :: forest
    type(flavor_t), dimension(:), intent(in) :: flv
    integer, intent(in), dimension(:), allocatable, optional :: reshuffle
    type(flavor_t), intent(in), optional :: flv_extra

  do g = 1, size (forest%grove)
    do t = 1, size (forest%grove(g)%tree)
      associate (tree => forest%grove(g)%tree(t))
        call phs_tree_set_momentum_links (tree, list)
      !!! call phs_tree_reshuffle_mappings (tree)
      end associate
    end do
  end do
end subroutine phs_forest_set_momentum_links

```

Once the parameter set is fixed, the masses and the widths of the particles are known and the `mass_sum` arrays as well as the mapping parameters can be computed. Note that order is important: we first compute the mass sums, then the ordinary mappings. The resonances obtained here determine the effective masses, which in turn are used to implement step mappings for resonance decay products that are not mapped otherwise.

*(PHS forests: public)*+≡

```
public :: phs_forest_set_parameters
```

*(PHS forests: procedures)*+≡

```

subroutine phs_forest_set_parameters &
  (forest, mapping_defaults, variable_limits)
  type(phs_forest_t), intent(inout) :: forest
  type(mapping_defaults_t), intent(in) :: mapping_defaults

        end if
    end do
end do
end do
end subroutine phs_forest_set_parameters

```

Generate the particle combination table. Scan all trees and merge their individual combination tables. At the end, valid entries are non-zero, and they indicate the indices of a pair of particles to be combined to a new particle. If a particle is accessible by more than one tree (this is usual), only keep the first possibility.

### 18.7.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

```

(PHS forests: procedures)+≡
    subroutine phs_grove_set_equivalences (grove, perm_array)

## 18.8 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should generate one.

The idea is to construct all Feynman diagrams subject to certain constraints which eliminate everything that is probably irrelevant for the integration. These Feynman diagrams (cascades) are grouped in groves by finding equivalence classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the integration.

This module may eventually disappear and be replaced by CAML code. In particular, we need here a set of Feynman rules (vertices with particle codes,

but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program only via the generated ASCII phase-space configuration file.

```

### 18.8.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

```

<Mapping modes>≡
  integer, parameter :: &
    & EXTERNAL_PRT = -1, &

```

```

& NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &
& RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &
& STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &
& ON_SHELL = 99

```

$\langle \text{Cascades: parameters} \rangle \equiv$   
 $\langle \text{Mapping modes} \rangle$

### 18.8.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascade has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a  $t$ -channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of  $t$ -channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

### 18.8.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry in the tree is set undefined because the cascade is not resonant. However, the flavor entry is set, so the cascade flavor is identified nevertheless.

*<Cascades: procedures>+≡*

```

subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
type(cascade_t), intent(out) :: cascade
type(flavor_t), intent(in) :: flv
integer, intent(in) :: pos
real(default), intent(in) :: m_thr
call cascade_init (cascade, 1)
cascade%bincode = ibset (0_TC, pos-1)
cascade%flv = flv
cascade%pdg = cascade%flv%get_pdg ()
cascade%is_vector = flv%get_spin_type () == VECTOR
cascade%m_min = flv%get_mass ()
cascade%m_rea = cascade%m_min
if (cascade%m_rea >= m_thr) then
cascade%m_eff = cascade%m_rea
end if
cascade%on_shell = .true.
cascade%multiplicity = 1
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_outgoing

```

The same for an incoming line:

*<Cascades: procedures>+≡*

```

subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
type(cascade_t), intent(out) :: cascade
type(flavor_t), intent(in) :: flv
integer, intent(in) :: pos

```

```

real(default), intent(in) :: m_thr
call cascade_init (cascade, 1)
cascade%incoming = .true.
cascade%bincode = ibset (0_TC, pos-1)
cascade%flv = flv%anti ()
cascade%pdg = cascade%flv%get_pdg ()
cascade%is_vector = flv%get_spin_type () == VECTOR
cascade%m_min = flv%get_mass ()
cascade%m_rea = cascade%m_min
if (cascade%m_rea >= m_thr) then
    cascade%m_eff = cascade%m_rea
end if
cascade%on_shell = .true.
cascade%n_t_channel = 0
cascade%n_off_shell = 0
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_incoming

```

#### 18.8.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

*<Cascades: interfaces>*≡

```

interface operator(.disjunct.)
    module procedure cascade_disjunct
end interface

```

*<Cascades: procedures>*+≡

```

function cascade_disjunct (cascade1, cascade2) result (flag)
    logical :: flag
    type(cascade_t), intent(in) :: cascade1, cascade2
    flag = iand (cascade1%bincode, cascade2%bincode) == 0
end function cascade_disjunct

```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to i8 integers, and compute the hash code from this byte stream.

For t/u-channel, we remove the sign for antiparticles since this is not well-defined.

*<Cascades: procedures>*+≡

```

subroutine cascade_assign_resonance_hash (cascade)
    type(cascade_t), intent(inout) :: cascade
    integer(i8), dimension(1) :: mold
    cascade%res_hash = hash (transfer &
        (concat (sort (pack (cascade%tree_pdg, &
            cascade%tree_resonant)), &

```

```

        sort (pack (abs (cascade%tree_pdg), &
                    cascade%tree_mapping == T_CHANNEL .or. &
                    cascade%tree_mapping == U_CHANNEL))), &
        mold))
end subroutine cascade_assign_resonance_hash

```

### 18.8.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

```

<Cascades: types>+≡
  type :: cascade_p
    type(cascade_t), pointer :: cascade => null ()
    type(cascade_p), pointer :: next => null ()
  end type cascade_p

```

Here is the bucket or hash entry type:

```

<Cascades: types>+≡
  type :: hash_entry_t
    integer(i32) :: hashval = 0
    integer(i8), dimension(:), allocatable :: key
    type(cascade_p), pointer :: first => null ()
    type(cascade_p), pointer :: last => null ()
  end type hash_entry_t

```

```

<Cascades: public>≡
  public :: hash_entry_init

```

```

<Cascades: procedures>+≡
  subroutine hash_entry_init (entry, entry_in)
    type(hash_entry_t), intent(out) :: entry
    type(hash_entry_t), intent(in) :: entry_in
    type(cascade_p), pointer :: casc_iter, casc_copy
    entry%hashval = entry_in%hashval
    entry%key = entry_in%key
    casc_iter => entry_in%first
    do while (associated (casc_iter))
      allocate (casc_copy)
      casc_copy = casc_iter
      casc_copy%next => null ()
      if (associated (entry%first)) then
        entry%last%next => casc_copy
      else
        entry%first => casc_copy
      end if
      entry%last => casc_copy
      casc_iter => casc_iter%next
    end do
  end subroutine hash_entry_init

```

Finalize: just deallocate the list; the contents are just pointers.

```

(Cascades: procedures)+=≡
  subroutine hash_entry_final (hash_entry)
    type(hash_entry_t), intent(inout) :: hash_entry
    type(cascade_p), pointer :: current
    do while (associated (hash_entry%first))
      current => hash_entry%first
      hash_entry%first => current%next
      deallocate (current)
    end do
  end subroutine hash_entry_final

```

Output: concise format for debugging, just list cascade indices.

```

(Cascades: procedures)+=≡
  subroutine hash_entry_write (hash_entry, unit)
    type(hash_entry_t), intent(in) :: hash_entry
    integer, intent(in), optional :: unit
    type(cascade_p), pointer :: current
    integer :: u, i
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(1x,A)", advance="no") "Entry:"
    do i = 1, size (hash_entry%key)
      write (u, "(1x,I0)", advance="no") hash_entry%key(i)
    end do
    write (u, "(1x,A)", advance="no") "->"
    current => hash_entry%first
    do while (associated (current))
      write (u, "(1x,I7)", advance="no") current%cascade%index
      current => current%next
    end do
    write (u, *)
  end subroutine hash_entry_write

```

This function adds a cascade pointer to the bucket. If ok is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

```

(Cascades: procedures)+=≡
  subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(inout) :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out), optional :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    if (present (ok)) then
      call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
      if (.not. ok) return
    end if
    allocate (current)
    current%cascade => cascade
    if (associated (hash_entry%last)) then
      hash_entry%last%next => current
    end if
  end subroutine hash_entry_add_cascade_ptr

```

```

else
    hash_entry%first => current
end if
hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr

```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguished only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

```

<Cascades: procedures>+=
subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(in), target :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    integer, dimension(:), allocatable :: tree_pdg
    ok = .true.
    allocate (tree_pdg (size (cascade%tree_pdg)))
    if (cascade%complete) then
        where (cascade%tree_mapping == INFRARED .or. &
             cascade%tree_mapping == COLLINEAR .or. &
             cascade%tree_mapping == T_CHANNEL .or. &
             cascade%tree_mapping == U_CHANNEL)
            tree_pdg = 0
        elsewhere
            tree_pdg = cascade%tree_pdg
        end where
    else
        tree_pdg = cascade%tree_pdg
    end if
    current => hash_entry%first
    do while (associated (current))
        if (current%cascade%depth == cascade%depth) then
            if (all (current%cascade%tree == cascade%tree)) then
                if (all (current%cascade%tree_mapping == cascade%tree_mapping)) &
                    then
                    if (all (current%cascade%tree_pdg .match. tree_pdg)) then
                        if (present (cascade_ptr)) cascade_ptr => current%cascade
                        ok = .false.; return
                    end if
                end if
            end if
        end if
    end if
end if
end if
end if

```

```

        current => current%next
    end do
    if (present (cascade_ptr)) cascade_ptr => cascade
end subroutine hash_entry_check_cascade

```

For PDG codes, we specify that the undefined code matches any code. This is already defined for flavor objects, but here we need it for the codes themselves.

```

<Cascades: interfaces>+≡
    interface operator(.match.)
        module procedure pdg_match
    end interface

<Cascades: procedures>+≡
    elemental function pdg_match (pdg1, pdg2) result (flag)
        logical :: flag
        integer(TC), intent(in) :: pdg1, pdg2
        select case (pdg1)
        case (0)
            flag = .true.
        case default
            select case (pdg2)
            case (0)
                flag = .true.
            case default
                flag = pdg1 == pdg2
            end select
        end select
    end function pdg_match

```

### 18.8.6 The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a linked list. In addition to the usual **first** and **last** pointers, there is a **first\_t** pointer which points to the first t-channel cascade (after all s-channel cascades), and a **first\_k** pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated parameters where an additional pointer is stored for each cascade. The keys are made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

```

<Cascades: public>+≡
    public :: cascade_set_t

<Cascades: types>+≡
    type :: cascade_set_t
        private
        class(model_data_t), pointer :: model

The initializer sets up the hash table with some initial size guessed by looking at the number of external particles. We choose 256 for 3 external particles and a factor of 4 for each additional particle, limited at  $2^{30}=1\text{G}$ .

Note: the explicit initialization loop might be avoided (ELEMENTAL), but a bug in nagfor 5.3.2 prevents this.

    call hash_entry_write (cascade_set%entry(i), u)
  end if
end do
end subroutine cascade_set_write

```

### 18.8.7 Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original, but the pointers are nullified. We do not care whether insertion was successful or not. The pointer argument, if present, is assigned to the input cascade, or to the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-copied and added to the cascade set before the current copy is added.

*(Cascades: procedures)*+≡

```

recursive subroutine cascade_set_add_copy &
  (cascade_set, cascade_in, cascade_ptr)
type(cascade_set_t), intent(inout), target :: cascade_set
type(cascade_t), intent(in) :: cascade_in
type(cascade_t), optional, pointer :: cascade_ptr
type(cascade_t), pointer :: cascade
logical :: ok
allocate (cascade)
cascade = cascade_in
if (associated (cascade_in%daughter1)) call cascade_set_add_copy &
  (cascade_set, cascade_in%daughter1, cascade%daughter1)
if (associated (cascade_in%daughter2)) call cascade_set_add_copy &
  (cascade_set, cascade_in%daughter2, cascade%daughter2)
if (associated (cascade_in%mother)) call cascade_set_add_copy &
  (cascade_set, cascade_in%mother, cascade%mother)
cascade%next => null ()
call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
if (.not. ok) deallocate (cascade)
end subroutine cascade_set_add_copy

```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

*(Cascades: procedures)*+≡

```

subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
type(cascade_set_t), intent(inout), target :: cascade_set
type(cascade_t), intent(in), target :: cascade

```

```

logical, intent(out) :: ok
type(cascade_t), optional, pointer :: cascade_ptr
integer(i8), dimension(1) :: mold
call cascade_set_hash_insert &
    (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
if (ok) call cascade_set_list_add (cascade_set, cascade)
end subroutine cascade_set_add

```

Add a new cascade to the list:

```

<Cascades: procedures>+=
subroutine cascade_set_list_add (cascade_set, cascade)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    if (associated (cascade_set%last)) then
        cascade_set%last%next => cascade
    else
        cascade_set%first => cascade
    end if
    cascade_set%last => cascade
end subroutine cascade_set_list_add

```

Add a cascade entry to the hash array:

```

<Cascades: procedures>+=
subroutine cascade_set_hash_insert &
    (cascade_set, key, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    integer(i8), dimension(:), intent(in) :: key
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    integer(i32) :: h
    if (cascade_set%n_entries >= cascade_set%n_entries_max) &
        call cascade_set_hash_expand (cascade_set)
    h = hash (key)
    call cascade_set_hash_insert_rec &
        (cascade_set, h, h, key, cascade, ok, cascade_ptr)
end subroutine cascade_set_hash_insert

```

Double the hashtable size when necessary:

```

<Cascades: procedures>+=
subroutine cascade_set_hash_expand (cascade_set)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
    type(cascade_p), pointer :: current
    integer :: i, s
    allocate (table_tmp (0:cascade_set%mask))
    table_tmp = cascade_set%entry
    deallocate (cascade_set%entry)
    s = 2 * size (table_tmp)
    cascade_set%n_entries = 0
    cascade_set%n_entries_max = s * cascade_set%fill_ratio
    cascade_set%mask = s - 1

```

```

allocate (cascade_set%entry (0:cascade_set%mask))
do i = 0, ubound (table_tmp, 1)
  current => table_tmp(i)%first
  do while (associated (current))
    call cascade_set_hash_insert_rec &
      (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
        table_tmp(i)%key, current%cascade)
    current => current%next
  end do
end do
end subroutine cascade_set_hash_expand

```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If ok is present, before insertion we check whether the cascade is already stored, and return failure if yes.

*(Cascades: procedures)*+≡

```

recursive subroutine cascade_set_hash_insert_rec &
  (cascade_set, h, hashval, key, cascade, ok, cascade_ptr)
type(cascade_set_t), intent(inout) :: cascade_set
integer(i32), intent(in) :: h, hashval
integer(i8), dimension(:), intent(in) :: key
type(cascade_t), intent(in), target :: cascade
logical, intent(out), optional :: ok
type(cascade_t), optional, pointer :: cascade_ptr
integer(i32) :: i
i = iand (h, cascade_set%mask)
if (allocated (cascade_set%entry(i)%key)) then
  if (size (cascade_set%entry(i)%key) /= size (key)) then
    call cascade_set_hash_insert_rec &
      (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
  else if (any (cascade_set%entry(i)%key /= key)) then
    call cascade_set_hash_insert_rec &
      (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
  else
    call hash_entry_add_cascade_ptr &
      (cascade_set%entry(i), cascade, ok, cascade_ptr)
  end if
else
  cascade_set%entry(i)%hashval = hashval
  allocate (cascade_set%entry(i)%key (size (key)))
  cascade_set%entry(i)%key = key
  call hash_entry_add_cascade_ptr &
    (cascade_set%entry(i), cascade, ok, cascade_ptr)
  cascade_set%n_entries = cascade_set%n_entries + 1
end if
end subroutine cascade_set_hash_insert_rec

```

### 18.8.8 External particles

We want to initialize the cascade set with the outgoing particles. In case of multiple processes, initial cascades are prepared for all of them. The hash array check ensures that no particle appears more than once at the same place.

```

<Cascades: interfaces>+=
  interface cascade_set_add_outgoing
    module procedure cascade_set_add_outgoing1
    module procedure cascade_set_add_outgoing2
  end interface

<Cascades: procedures>+=
  subroutine cascade_set_add_outgoing2 (cascade_set, flv)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(flavor_t), dimension(:,:), intent(in) :: flv
    integer :: pos, prc, n_out, n_prc
    type(cascade_t), pointer :: cascade
    logical :: ok
    n_out = size (flv, dim=1)
    n_prc = size (flv, dim=2)
    do prc = 1, n_prc
      do pos = 1, n_out
        allocate (cascade)
        call cascade_init_outgoing &
          (cascade, flv(pos,prc), pos, cascade_set%m_threshold_s)
        call cascade_set_add (cascade_set, cascade, ok)
        if (.not. ok) then
          deallocate (cascade)
        end if
      end do
    end do
  end subroutine cascade_set_add_outgoing2

  subroutine cascade_set_add_outgoing1 (cascade_set, flv)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(flavor_t), dimension(:), intent(in) :: flv
    integer :: pos, n_out
    type(cascade_t), pointer :: cascade
    logical :: ok
    n_out = size (flv, dim=1)
    do pos = 1, n_out
      allocate (cascade)
      call cascade_init_outgoing &
        (cascade, flv(pos), pos, cascade_set%m_threshold_s)
      call cascade_set_add (cascade_set, cascade, ok)
      if (.not. ok) then
        deallocate (cascade)
      end if
    end do
  end subroutine cascade_set_add_outgoing1

```

The incoming particles are added one at a time. Nevertheless, we may have several processes which are looped over. At the first opportunity, we set the

pointer `first_t` in the cascade set which should point to the first t-channel cascade.

Return the indices of the first and last cascade generated.

*(Cascades: interfaces)+≡*

```
interface cascade_set_add_incoming
  module procedure cascade_set_add_incoming0
  module procedure cascade_set_add_incoming1
end interface
```

*(Cascades: procedures)+≡*

```
subroutine cascade_set_add_incoming1 (cascade_set, n1, n2, pos, flv)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(out) :: n1, n2
  integer, intent(in) :: pos
  type(flavor_t), dimension(:), intent(in) :: flv
  integer :: prc, n_prc
  type(cascade_t), pointer :: cascade
  logical :: ok
  n1 = 0
  n2 = 0
  n_prc = size (flv)
  do prc = 1, n_prc
    allocate (cascade)
    call cascade_init_incoming &
      (cascade, flv(prc), pos, cascade_set%m_threshold_t)
    call cascade_set_add (cascade_set, cascade, ok)
    if (ok) then
      if (n1 == 0) n1 = cascade%index
      n2 = cascade%index
      if (.not. associated (cascade_set%first_t)) then
        cascade_set%first_t => cascade
      end if
    else
      deallocate (cascade)
    end if
  end do
end subroutine cascade_set_add_incoming1

subroutine cascade_set_add_incoming0 (cascade_set, n1, n2, pos, flv)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(out) :: n1, n2
  integer, intent(in) :: pos
  type(flavor_t), intent(in) :: flv
  type(cascade_t), pointer :: cascade
  logical :: ok
  n1 = 0
  n2 = 0
  allocate (cascade)
  call cascade_init_incoming &
    (cascade, flv, pos, cascade_set%m_threshold_t)
  call cascade_set_add (cascade_set, cascade, ok)
  if (ok) then
    if (n1 == 0) n1 = cascade%index
```

```

        n2 = cascade%index
        if (.not. associated (cascade_set%first_t)) then
            cascade_set%first_t => cascade
        end if
    else
        deallocate (cascade)
    end if
end subroutine cascade_set_add_incoming0

```

### 18.8.9 Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

```

<Cascades: procedures>+=
subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2
    logical, intent(in) :: s_channel
    integer, dimension(:), allocatable :: pdg3
    integer :: i, depth_max
    type(flavor_t) :: flv
    if (s_channel) then
        depth_max = cascade_set%depth_out
    else
        depth_max = cascade_set%depth_tot
    end if
    if (cascade1%depth + cascade2%depth < depth_max) then
        call cascade_set%model%match_vertex ( &
            cascade1%flv%get_pdg (), &
            cascade2%flv%get_pdg (), &
            pdg3)
        do i = 1, size (pdg3)
            call flv%init (pdg3(i), cascade_set%model)
            if (s_channel) then
                call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
            else
                call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
            end if
        end do
        deallocate (pdg3)
    end if
end subroutine cascade_match_pair

```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

```

<Cascades: procedures>+=
subroutine cascade_match_triplet &
    (cascade_set, cascade1, cascade2, cascade3, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set

```

```

type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
logical, intent(in) :: s_channel
integer :: depth_max
depth_max = cascade_set%depth_tot
if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
  if (cascade_set%model%check_vertex ( &
    cascade1%flv%get_pdg (), &
    cascade2%flv%get_pdg (), &
    cascade3%flv%get_pdg ())) then
    call cascade_combine_keystone &
      (cascade_set, cascade1, cascade2, cascade3, s_channel)
  end if
end if
end subroutine cascade_match_triplet

```

### 18.8.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

```

(Cascades: procedures)+≡
subroutine cascade_combine_s (cascade_set, cascade1, cascade2, flv)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in), target :: cascade1, cascade2

```

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a  $2 \rightarrow 1$  process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

### 18.8.11 Cascade combination III: node connections and tree fusion

Here we assign global tree properties. If the allowed number of off-shell lines is exceeded, discard the new cascade. Otherwise, assign the trees, sort them, and assign connections. Finally, append the cascade to the list. This may fail (because in the hash array there is already an equivalent cascade). On failure, discard the cascade.

```

    end if
end subroutine cascade_keystone

```

Sort a tree (array of binary codes) and particle code array simultaneously, by ascending binary codes. A convenient method is to use the `maxloc` function iteratively, to find and remove the largest entry in the tree array one by one.

(*Cascades: procedures*) +=

```

subroutine tree_sort (tree, pdg, mapping, resonant)
    integer(TC), dimension(:), intent(inout) :: tree
    integer, dimension(:), intent(inout) :: pdg, mapping
    logical, dimension(:), intent(inout) :: resonant
    integer(TC), dimension(size(tree)) :: tree_tmp

```

```

integer, dimension(size(pdg)) :: pdg_tmp, mapping_tmp
logical, dimension(size(resonant)) :: resonant_tmp
integer, dimension(1) :: pos
integer :: i
tree_tmp = tree
pdg_tmp = pdg
mapping_tmp = mapping
resonant_tmp = resonant
do i = size(tree),1,-1
  pos = maxloc (tree_tmp)
  tree(i) = tree_tmp (pos(1))
  pdg(i) = pdg_tmp (pos(1))
  mapping(i) = mapping_tmp (pos(1))
  resonant(i) = resonant_tmp (pos(1))
  tree_tmp(pos(1)) = 0
end do
end subroutine tree_sort

```

### 18.8.12 Cascade set generation

These procedures loop over cascades and build up the cascade set. After each iteration of the innermost loop, we set a breakpoint.

s-channel: We use a nested scan to combine all cascades with all other cascades.

```

(Cascades: procedures)+≡
subroutine cascade_set_generate_s (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  cascade1 => cascade_set%first
  LOOP1: do while (associated (cascade1))
    cascade2 => cascade_set%first
    LOOP2: do while (associated (cascade2))
      if (cascade2%index >= cascade1%index) exit LOOP2
      if (cascade1 .disjunct. cascade2) then
        call cascade_match_pair (cascade_set, cascade1, cascade2, .true.)
      end if
      call terminate_now_if_signal ()
      cascade2 => cascade2%next
    end do LOOP2
    cascade1 => cascade1%next
  end do LOOP1
end subroutine cascade_set_generate_s

```

The t-channel cascades are directed and have a seed (one of the incoming particles) and a target (the other one). We loop over all possible seeds and targets. Inside this, we loop over all t-channel cascades (*cascade1*) and s-channel cascades (*cascade2*) and try to combine them.

```

(Cascades: procedures)+≡
subroutine cascade_set_generate_t (cascade_set, pos_seed, pos_target)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(in) :: pos_seed, pos_target

```

```

type(cascade_t), pointer :: cascade_seed, cascade_target
type(cascade_t), pointer :: cascade1, cascade2
integer(TC) :: bc_seed, bc_target
bc_seed = ibset (0_TC, pos_seed-1)
bc_target = ibset (0_TC, pos_target-1)
cascade_seed => cascade_set%first_t

```

#### 18.8.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redundancies between flavor assignments.

```

<Cascades: public>+≡
  public :: cascade_set_generate

<Cascades: procedures>+≡
  subroutine cascade_set_generate &
    (cascade_set, model, n_in, n_out, flv, phs_par, fatal_beam_decay)
    type(cascade_set_t), intent(out) :: cascade_set
    class(model_data_t), intent(in), target :: model
    integer, intent(in) :: n_in, n_out

## 18.9 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and the `cascades` module for generating phase-space channels. As an extension of the `phs_base` abstract type, the phase-space configuration and instance implement the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD.  
For trivial two-particle phase space, there is `phs_wood` as an alternative.)

```

<phs_wood.f90>≡
  <File header>

  module phs_wood

    <Use kinds>
    <Use strings>
    use io_units
    use constants
    use numeric_utils
    use diagnostics
    use os_interface
    use md5
    use physics_defs
    use lorentz
    use model_data
    use flavors
    use process_constants
    use sf_mappings
    use sf_base
    use phs_base
    use mappings
    use resonances, only: resonance_history_set_t
    use phs_forests
    use cascades
    use cascades2

### 18.9.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

```

### 18.9.4 Kinematics implementation

We generate  $\cos\theta$  and  $\phi$  uniformly, covering the solid angle.

```
<PHS wood: public>+≡
    public :: phs_wood_t
<PHS wood: types>+≡
    type, extends (phs_t) :: phs_wood_t
        real(default) :: sqrts = 0
        type(phs_forest_t) :: forest
        real(default), dimension(3) :: r_real
        integer :: n_r_born = 0
    contains
        <PHS wood: phs wood: TBP>
    end type phs_wood_t
```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

```
<PHS wood: phs wood: TBP>≡
    procedure :: write => phs_wood_write
<PHS wood: procedures>+≡
    subroutine phs_wood_write (object, unit, verbose)
        class(phs_wood_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        u = given_output_unit (unit)
        call object%base_write (u)
    end subroutine phs_wood_write
```

Write the forest separately.

```
<PHS wood: phs wood: TBP>+≡
    procedure :: write_forest => phs_wood_write_forest
<PHS wood: procedures>+≡
    subroutine phs_wood_write_forest (object, unit)

      end select
    end select
  end subroutine phs_wood_init

```

### 18.9.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

```

<PHS wood: phs wood: TBP>+≡

The boost to the center-of-mass system only has a reasonable meaning above the threshold. Below the threshold, we do not apply boost at all, so that the top quarks stay in the rest frame. However, with top quarks exactly at rest, problems arise in the matrix elements (e.g. in the computation of angles). Therefore, we apply a boost which is not exactly 1, but has a tiny value differing from that.

This routine computes the bounds of the Dalitz region for massive emitters, see below. It is also used by Powheg, so the routine is public. The input parameter *m2* corresponds to the squared mass of the emitter and *p* is the four-momentum of the emitter.

The fks phase space type contains the wood phase space and separately the in- and outcoming momenta for the real process and the corresponding Born momenta. Additionally, there are the variables  $\xi, \xi_{max}, y$  and  $\phi$  which are used to create the real phase space, as well as the jacobian and its corresponding soft and collinear limit. Lastly, the array `ch_to_em` connects each channel with an emitter.

### 18.10.1 Creation of the real phase space - FSR

At this point, the Born phase space has been generated, as well as the three random variables  $\xi$ ,  $y$  and  $\phi$ . The question is how the real phase space is generated for a final-state emission configuration. We work with two different sets of momenta, the Born configuration  $\{\bar{k}_\oplus, \bar{k}_\ominus, \bar{k}_1, \dots, \bar{k}_n\}$  and the real configuration  $\{k_\oplus, k_\ominus, k_1, \dots, k_n, k_{n+1}\}$ . We define the momentum of the emitter to be on the  $n$ -th position and the momentum of the radiated particle to be at position  $n+1$ . The magnitude of the spatial component of  $\mathbf{k}$  is denoted by  $\underline{k}$ .

For final-state emissions, it is  $\bar{k}_\oplus = k_\oplus$  and  $\bar{k}_\ominus = k_\ominus$ . Thus, the center-of-mass systems coincide and it is

$$q = \sum_{i=1}^n \bar{k}_i = \sum_{i=1}^{n+1} k_i, \quad (18.65)$$

with  $\vec{q} = 0$  and  $q^2 = (q^0)^2$ .

We want to construct the real phase space from the Born phase space using three random numbers. They are defined as follows:

- $\xi = \frac{2k_{n+1}^0}{\sqrt{s}} \in [0, \xi_{max}]$ , where  $k_{n+1}$  denotes the four-momentum of the radiated particle.
- $y = \cos \theta = \frac{\vec{k}_n \cdot \vec{k}_{n+1}}{k_n k_{n+1}}$  is the splitting angle.
- The angle between the two splitting particles in the transversal plane,  $\phi \in [0, 2\pi]$ .

Further,  $k_{rec} = \sum_{i=1}^{n-1} k_i$  denotes the sum of all recoiling momenta.

The momentum of the radiated particle is computed according to

$$\underline{k}_n = \frac{q^2 - M_{\text{rec}}^2 - 2q^0 \underline{k}_{n+1}}{2(q^0 - \underline{k}_{n+1}(1 - y))}, \quad (18.66)$$

with  $k = k_n + k_{n+1}$  and  $M_{\text{rec}}^2 = k_{\text{rec}}^2 = (q - k)^2$ . Because of  $\bar{\mathbf{k}}_n \parallel \mathbf{k}_n + \mathbf{k}_{n+1}$

we find  $M_{\text{rec}}^2 = (q - \bar{k}_n)^2$ . Equation ?? follows from the fact that  $(\mathbf{k} - \mathbf{k}_n)^2 = \mathbf{k}_{n+1}^2$ , which is equivalent to  $\mathbf{k}_n \cdot \mathbf{k} = \frac{1}{2}(\underline{k}_n^2 + \underline{k}^2 - \underline{k}_{n+1}^2)$ .  $\mathbf{k}_n$  and  $\mathbf{k}_{n+1}$  are obtained by first setting up vectors parallel to  $\bar{\mathbf{k}}_n$ ,

$$\mathbf{k}'_n = \underline{k}_n \frac{\bar{\mathbf{k}}_n}{\underline{k}_n}, \quad \mathbf{k}'_{n+1} = \underline{k}_{n+1} \frac{\bar{\mathbf{k}}_n}{\underline{k}_n},$$

and then rotating these vectors by an amount of  $\cos \psi_n = \frac{\mathbf{k}_n \cdot \mathbf{k}}{\underline{k}_n \underline{k}}$ . The emitted particle cannot have more momentum than the emitter has in the Born phase space. Thus, there is an upper bound for  $\xi$ , determined by the condition  $k_{n+1}^0 = \bar{k}_n$ , which is equal to

$$\xi_{\text{max}} = \frac{2}{\bar{k}_n} q^0.$$

  integer, intent(in) :: emitter
  real(default) :: xi_max
  real(default) :: uk_n_born
  uk_n_born = space_part_norm (p_born(emitter))
  xi_max = two * uk_n_born / q0
end function get_xi_max_fsr_massless
```

The computation of  $\xi_{\text{max}}$  for massive emitters is described in arXiv:1202.0465. Let's recapitulate it here.

We consider the Dalitz-domain created by  $k_{n+1}^0$ ,  $k_n^0$  and  $k_{\text{rec}}^0$  and introduce the parameterization

$$k_n^0 = \bar{k}_n^0 - z k_{n+1}^0$$

Then, for each value of  $z$ , there exists a maximum value of  $\underline{k}_{n+1}$  from which  $\xi_{\text{max}}$  can be extracted via  $\xi_{\text{max}} = 2k_{n+1}^0/q$ . It is determined by the condition

$$\underline{k}_{n+1} \pm \underline{k}_n \pm \underline{k}_{\text{rec}} = 0.$$

This can be manipulated to yield

$$(\underline{k}_{n+1}^2 + \underline{k}_n^2 - \underline{k}_{\text{rec}}^2)^2 = 4\underline{k}_{n+1}^2 \underline{k}_n^2.$$

Here we can use  $\underline{k}_n^2 = (k_n^0)^2 - m^2$  and  $\underline{k}_{\text{rec}}^2 = (q - k_n^0 - k_{n+1}^0)^2 - M_{\text{rec}}^2$ , as well as the above parameterization of  $k_n^0$ , to obtain

$$4\underline{k}_{n+1}^2 (2\underline{k}_{n+1} q z (1 - z) + q^2 z^2 - 2q \bar{k}_{\text{rec}}^0 z + M_{\text{rec}}^2) = 0.$$

Solving for  $k_{n+1}^0$  gives

$$k_{n+1}^0 = \frac{2q \bar{k}_{\text{rec}}^0 z - q^2 z^2 - M_{\text{rec}}^2}{2q z (1 - z)}. \quad (18.67)$$

It is still open how to compute  $z$ . For this, consider that the right-hand-side of equation (18.67) vanishes for

$$z_{1,2} = \left( \bar{k}_{\text{rec}}^0 \pm \sqrt{(\bar{k}_{\text{rec}}^0)^2 - M_{\text{rec}}^2} \right) / q,$$

which corresponds to the borders of the Dalitz-region where the gluon momentum vanishes. Thus we define

$$z = z_2 - \frac{1}{2}(z_2 - z_1)(1 + y).$$

```

The real phase space for an initial-state emission involved in a decay process is generated by first setting the gluon momentum like in the scattering case by using its angular coordinates  $y$  and  $\phi$  and then adjusting the gluon energy with  $\xi$ . The emitter momentum is kept identical to the Born case, i.e.  $p_{\text{in}} = \bar{p}_{\text{in}}$ , so that after the emission it has momentum  $p_{\text{virt}} = p_{\text{in}} - p_{\text{g}}$  and invariant mass  $m^2 = p_{\text{virt}}^2$ . Note that the final state momenta have to remain on-shell, so that  $p_1^2 = \bar{p}_1^2 = m_1^2$  and  $p_2^2 = \bar{p}_2^2 = m_2^2$ . Let  $\Lambda$  be the boost from into the rest frame of the emitter after emission, i.e.  $\Lambda p_{\text{virt}} = (m, 0, 0, 0)$ . In this reference frame, the spatial components of the final-state momenta sum up to zero, and their magnitude is

$$p = \frac{\sqrt{\lambda(m^2, m_1^2, m_2^2)}}{2m},$$

a fact already used in the evaluation of the phase space trees of `phs_forest`. Obviously, from this, the final-state energies can be deferred via  $E_i^2 = m_i^2 - p^2$ . In the next step, the  $p_{1,2}$  are set up as vectors  $(E, 0, 0, \pm p)$  along the z-axis and then rotated about the same azimuthal and polar angles as in the Born system. Finally, the momenta are boosted out of the rest frame by multiplying with  $\Lambda$ .

```

Configure channel mappings, using some conditions from the phase space configuration. If there are no structure functions, we enable a default setup with a single (dummy) structure-function channel. Otherwise, we look at the chan-

nel collection that we got from the phase-space configuration step. Each entry should be translated into an independent structure-function channel, where typically there is one default entry, which could be mapped using a standard s-channel mapping if the structure function setup recommends this, and other entries with s-channel resonances. The latter need to be translated into global mappings from the structure-function chain.

## 18.12 An alternative cascades module

This module might replace the module `cascades`, which generates suitable phase space parametrizations and generates the phase space file. The mappings, as well as the criteria to determine these, do not change.

The advantage of this module is that it makes use of the `OMega` matrix element generator which provides the relevant Feynman diagrams (the ones which can be constructed only from 3-vertices). In principle, the construction of these diagrams is also one of the tasks of the existing `cascades` module, in which the diagrams would correspond to a set of cascades. It starts by creating cascades which correspond to the outgoing particles. These are combined to a new cascade using the vertices of the model. In this way, since each cascades knows the daughter cascades from which it is built, complete Feynman diagrams are represented by these cascades, as soon as the existing cascades can be recombined with the incoming particle(s).

In this module, the Feynman diagrams are represented by the type `feyngraph_t`, which represents the Feynman diagrams as a tree of nodes. The object which contains the necessary kinematical information to determine mappings, and hence sensible phase space parametrizations is of another type, called `kingraph_t`, which is built from a corresponding `feyngraph` object.

There are two types of output which can be produced by `OMega` and is potentially relevant here. The first type contains all tree diagrams for the process under consideration, where each line of the output corresponds to one Feynman diagram. This output is easy to read, but can be very large, depending on the number of particles involved in the process. Moreover, it repeats substructures of the diagrams which are part of more than one diagram. One could in principle work with this output and construct a `feyngraph` from each line, if allowed, i.e. if there are only 3-vertices.

The other output contains also all of these Feynman diagrams, but in a factorized form. This means that the substructures which appear in several Feynman diagrams, are written only once, if possible. This leads to a much shorter input file, which speeds up the parsing process. Furthermore it makes it possible to reconstruct the `feyngraphs` in such a way that the calculations concerning subdiagrams which reappear in other `feyngraphs` have to be performed only once. This is already the case in the existing `cascades` module

but can be exploited more efficiently here because the possible graphs are well known from the input file, whereas the `cascades` module would create a large number of `cascades` which do not lead to a complete Feynman diagram of the given process

```

    <Cascades2: types>

    <Cascades2: interfaces>

    contains

    <Cascades2: procedures>

  end module cascades2

```

### 18.12.1 Particle properties

We define a type holding the properties of the particles which are needed for parsing and finding the phase space parametrizations as well as the mappings. The properties of all particles which appear in the parsed Feynman diagrams for the given process will be stored in a central place, and only pointers to these objects are used.

```

<Cascades2: types>≡

```

```

type :: part_prop_t
  character (len=LABEL_LEN) :: particle_label
  integer :: pdg = 0
  real(default) :: mass = 0.
  real :: width = 0.
  integer :: spin_type = 0
  logical :: is_vector = .false.
  logical :: empty = .true.
  type (part_prop_t), pointer :: anti => null ()
  type (string_t) :: tex_name
contains
  <Cascades2: part prop: TBP>
end type part_prop_t

```

The `particle_label` in `part_prop_t` is simply the particle name (e.g. 'W+'). The corresponding variable in the type `f_node_t` contains some additional information (see below). The length of the `character` variable is fixed as:

```

<Cascades2: parameters>≡
  integer, parameter :: LABEL_LEN=30

<Cascades2: part prop: TBP>≡
  procedure :: final => part_prop_final

<Cascades2: procedures>≡
  subroutine part_prop_final (part)
    class(part_prop_t), intent(inout) :: part
    part%anti => null ()
  end subroutine part_prop_final

```

### 18.12.2 The mapping modes

The possible mappings are essentially the same as in `cascades`, but we introduce in addition the mapping constant `NON_RESONANT`, which does not refer to a new mapping; it corresponds to the nonresonant version of a potentially resonant particle (or `k_node`). This becomes relevant when we compare `k_nodes` to eliminate equivalences.

```

<Cascades2: parameters>+≡
  integer, parameter :: &
    & NONRESONANT = -2, EXTERNAL_PRT = -1, &
    & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &
    & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &
    & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &
    & ON_SHELL = 99

```

### 18.12.3 Grove properties

The channels or `kingraphs` will be grouped in groves, i.e. sets of channels, which share some characteristic numbers. These numbers are stored in the following type:

```

<Cascades2: types>+≡
  type :: grove_prop_t

```

```

integer :: multiplicity = 0
integer :: n_resonances = 0
integer :: n_log_enhanced = 0
integer :: n_off_shell = 0
integer :: n_t_channel = 0
integer :: res_hash = 0
end type grove_prop_t

```

#### 18.12.4 The tree type

This type describes contains all the information which is needed to reconstruct a `feyngraph` or `kingraph`. We store bincodes, pdg codes and mappings for all nodes of a valid `kingraph`. If we label the external particles, which are given in the process definition, with different integers, the bincode would be the number that one obtains by setting the bit at the position that is given by this number. If we combine two particle to a third one, the bincode is the number which one obtains by setting all the bits which are also set for the two particles. The `pdg` and `mapping` are simply the pdg-code and mapping at the position which is specified by the corresponding bincode. We use `tree_t` not only for completed `kingraphs`, but also for all `k_nodes`, which are a subtree of a `kingraph`.

```

<Cascades2: types>+≡
type :: tree_t
integer(TC), dimension(:), allocatable :: bc
integer, dimension(:), allocatable :: pdg
integer, dimension(:), allocatable :: mapping
integer :: n_entries = 0
logical :: keep = .true.
logical :: empty = .true.
contains
<Cascades2: tree: TBP>
end type tree_t

<Cascades2: interfaces>≡
interface assignment (=)
module procedure tree_assign
end interface assignment (=)

<Cascades2: procedures>+≡
subroutine tree_assign (tree1, tree2)
type (tree_t), intent (inout) :: tree1
type (tree_t), intent (in) :: tree2
if (allocated (tree2%bc)) then
allocate (tree1%bc(size(tree2%bc)))
tree1%bc = tree2%bc
endif
if (allocated (tree2%pdg)) then
allocate (tree1%pdg(size(tree2%pdg)))
tree1%pdg = tree2%pdg
endif
if (allocated (tree2%mapping)) then
allocate (tree1%mapping(size(tree2%mapping)))

```

```

        tree1%mapping = tree2%mapping
    endif
    tree1%n_entries = tree2%n_entries
    tree1%keep = tree2%keep
    tree1%empty = tree2%empty
end subroutine tree_assign

```

### 18.12.5 Add entries to the tree

The following procedures fill the arrays in `tree_t` with entries resulting from the bincode and mapping assignment.

*(Cascades2: tree: TBP)*≡

```

    procedure :: add_entry_from_numbers => tree_add_entry_from_numbers
    procedure :: add_entry_from_node => tree_add_entry_from_node
    generic :: add_entry => add_entry_from_numbers, add_entry_from_node

```

Here we add a single entry to each of the arrays. This will be used for external particles.

*(Cascades2: procedures)*+≡

```

subroutine tree_add_entry_from_numbers (tree, bincode, pdg, mapping)
    class (tree_t), intent (inout) :: tree
    integer(TC), intent (in) :: bincode
    integer, intent (in) :: pdg
    integer, intent (in) :: mapping
    integer :: pos
    if (tree%empty) then
        allocate (tree%bc(1))
        allocate (tree%pdg(1))
        allocate (tree%mapping(1))
        pos = tree%n_entries + 1
        tree%bc(pos) = bincode
        tree%pdg(pos) = pdg
        tree%mapping(pos) = mapping
        tree%n_entries = pos
        tree%empty = .false.
    endif
end subroutine tree_add_entry_from_numbers

```

Here we merge two existing subtrees and a single entry (bc, pdg and mapping).

*(Cascades2: procedures)*+≡

```

subroutine tree_merge (tree, tree1, tree2, bc, pdg, mapping)
    class (tree_t), intent (inout) :: tree
    type (tree_t), intent (in) :: tree1, tree2
    integer(TC), intent (in) :: bc
    integer, intent (in) :: pdg, mapping
    integer :: tree_size
    integer :: i1, i2
    if (tree%empty) then
        i1 = tree1%n_entries
        i2 = tree1%n_entries + tree2%n_entries
        tree_size = tree1%n_entries + tree2%n_entries + 1
        allocate (tree%bc (tree_size))

```

```

        allocate (tree%pdg (tree_size))
        allocate (tree%mapping (tree_size))
        tree%bc(:i1) = tree1%bc
        tree%pdg(:i1) = tree1%pdg
        tree%mapping(:i1) = tree1%mapping
        tree%bc(i1+1:i2) = tree2%bc
        tree%pdg(i1+1:i2) = tree2%pdg
        tree%mapping(i1+1:i2) = tree2%mapping
        tree%bc(tree_size) = bc
        tree%pdg(tree_size) = pdg
        tree%mapping(tree_size) = mapping
        tree%n_entries = tree_size
        tree%empty = .false.
    endif
end subroutine tree_merge

```

Here we add entries to a tree for a given `k_node`, which means that we first have to determine whether the node is external or internal. The arrays are sorted after the entries have been added (see below for details).

```

<Cascades2: procedures>+≡
subroutine tree_add_entry_from_node (tree, node)
    class (tree_t), intent (inout) :: tree
    type (k_node_t), intent (in) :: node
    integer :: pdg
    if (node%t_line) then
        pdg = abs (node%particle%pdg)
    else
        pdg = node%particle%pdg
    endif
    if (associated (node%daughter1) .and. &
        associated (node%daughter2)) then
        call tree_merge (tree, node%daughter1%subtree, &
            node%daughter2%subtree, node%bincode, &
            node%particle%pdg, node%mapping)
    else
        call tree_add_entry_from_numbers (tree, node%bincode, &
            node%particle%pdg, node%mapping)
    endif
    call tree%sort ()
end subroutine tree_add_entry_from_node

```

For a well-defined order of the elements of the arrays in `tree_t`, the elements can be sorted. The bincodes (entries of `bc`) are simply ordered by size, the `pdg` and `mapping` entries go to the positions of the corresponding `bc` values.

```

<Cascades2: tree: TBP>+≡
    procedure :: sort => tree_sort

<Cascades2: procedures>+≡
subroutine tree_sort (tree)
    class (tree_t), intent (inout) :: tree
    integer(TC), dimension(size(tree%bc)) :: bc_tmp
    integer, dimension(size(tree%pdg)) :: pdg_tmp, mapping_tmp
    integer, dimension(1) :: pos

```

```

integer :: i
bc_tmp = tree%bc
pdg_tmp = tree%pdg
mapping_tmp = tree%mapping
do i = size(tree%bc),1,-1
    pos = maxloc (bc_tmp)
    tree%bc(i) = bc_tmp (pos(1))
    tree%pdg(i) = pdg_tmp (pos(1))
    tree%mapping(i) = mapping_tmp (pos(1))
    bc_tmp(pos(1)) = 0
end do
end subroutine tree_sort

```

### 18.12.6 Graph types

We define an abstract type which will give rise to two different types: The type `feyngraph_t` contains the pure information of the corresponding Feynman diagram, but also a set of objects of the `kingraph` type which contain the kinematically relevant data for the mapping calculation as well as the mappings themselves. Every graph should have an index which is unique. Graphs which are not needed any more can be disabled by setting the `keep` variable to `false`.

*<Cascades2: types>+≡*

```

type, abstract :: graph_t
integer :: index = 0
integer :: n_nodes = 0
logical :: keep = .true.
end type graph_t

```

This is the type representing the Feynman diagrams which are read from an input file created by O'Mega. It is a tree of nodes, which we call `k_nodes`, so that `feyngraph_t` contains a pointer to the root of this tree, and each node can have two daughter nodes. The case of only one associated daughter should never appear, because in the method of phase space parametrization which is used here, we combine always two particle momenta to a third one. The `feyngraphs` will be arranged in a linked list. This is why we have a pointer to the next graph. The `kingraphs` on the other hand are arranged in linked lists which are attached to the corresponding `feyngraph`. In general, a `feyngraph` can give rise to more than one `kingraph` because we make a copy every time a particle can become resonant, so that in the copy we keep the particle nonresonant.

*<Cascades2: types>+≡*

```

type, extends (graph_t) :: feyngraph_t
character (len=FEYNGRAPH_LEN) :: omega_feyngraph_output
type (f_node_t), pointer :: root => null ()
type (feyngraph_t), pointer :: next => null ()
type (kingraph_t), pointer :: kin_first => null ()
type (kingraph_t), pointer :: kin_last => null ()
contains
<Cascades2: feyngraph: TBP>
end type feyngraph_t

```

A container for a pointer of type `feyngraph_t`. This is used to realize arrays of these pointers.

```

<Cascades2: types>+≡
  type :: feyngraph_ptr_t
  type (feyngraph_t), pointer :: graph => null ()
end type feyngraph_ptr_t

```

The length of a string describing a Feynman diagram which is produced by O'Mega is fixed by the parameter

```

<Cascades2: parameters>+≡
  integer, parameter :: FEYNGRAPH_LEN=300

<Cascades2: feyngraph: TBP>≡
  procedure :: final => feyngraph_final

<Cascades2: procedures>+≡
  subroutine feyngraph_final (graph)
    class(feyngraph_t), intent(inout) :: graph
    type (kingraph_t), pointer :: current
    graph%root => null ()
    graph%kin_last => null ()
    do while (associated (graph%kin_first))
      current => graph%kin_first
      graph%kin_first => graph%kin_first%next
      call current%final ()
      deallocate (current)
    enddo
  end subroutine feyngraph_final

```

This is the type of graph which is used to find the phase space channels, or in other words, each kingraph could correspond to a channel, if it is not eliminated for kinematical reasons or due to an equivalence. For the linked list which is attached to the corresponding `feyngraph`, we need the `next` pointer, whereas `grove_next` points to the next `kingraph` within a grove. The information which is relevant for the specification of a channel is stored in `tree`. We use `grove_prop` to sort the `kingraph` in a grove in which all `kingraphs` are characterized by the numbers contained in `grove_prop`. Later these groves are further subdivided using the resonance hash. A `kingraph` which is constructed directly from the output of O'Mega, is not `inverse`. In this case the first incoming particle is the root of the tree. In a scattering process, we can also construct a `kingraph` where the root of the tree is the second incoming particle. In this case the value of `inverse` is `.true.`.

```

<Cascades2: types>+≡
  type, extends (graph_t) :: kingraph_t
    type (k_node_t), pointer :: root => null ()
    type (kingraph_t), pointer :: next => null ()
    type (kingraph_t), pointer :: grove_next => null ()
    type (tree_t) :: tree
    type (grove_prop_t) :: grove_prop
    logical :: inverse = .false.
  contains
  <Cascades2: kingraph: TBP>

```

```
end type kingraph_t
```

Another container for a pointer to emulate arrays of pointers:

```
<Cascades2: types>+≡
  type :: kingraph_ptr_t
    type (kingraph_t), pointer :: graph => null ()
  end type kingraph_ptr_t
```

```
<Cascades2: kingraph: TBP>≡
  procedure :: final => kingraph_final
```

```
<Cascades2: procedures>+≡
  subroutine kingraph_final (graph)
    class(kingraph_t), intent(inout) :: graph
    graph%root => null ()
    graph%next => null ()
    graph%grove_next => null ()
  end subroutine kingraph_final
```

### 18.12.7 The node types

We define an abstract type containing variables which are needed for `f_node_t` as well as `k_node_t`. We say that a node is on the t-line if it lies between the two nodes which correspond to the two incoming particles. `incoming` and `tline` are used only for scattering processes and remain `.false.` in decay processes. The variable `n_subtree_nodes` is the number of nodes (including the node itself) of the subtree, where the node is the root.

```
<Cascades2: types>+≡
  type, abstract :: node_t
    type (part_prop_t), pointer :: particle => null ()
    logical :: incoming = .false.
    logical :: t_line = .false.
    integer :: index = 0
    logical :: keep = .true.
    integer :: n_subtree_nodes = 1
  end type node_t
```

We use two different list types for the different kinds of nodes. We therefore start with an abstract type:

```
<Cascades2: types>+≡
  type, abstract :: list_t
    integer :: n_entries = 0
  end type list_t
```

Since the contents of the lists are different, we introduce two different entry types. Since the trees of nodes use pointers, the nodes should only be allocated by a type-bound procedure of the corresponding list type, such that we can keep track of all nodes, eventually reuse and in the end deallocate nodes correctly, without forgetting any nodes. Here is the type for the `k_nodes`. The list is a

linked list. We want to reuse (recycle) the `k_nodes` which are neither incoming  
 nore `t_line`.

```

<Cascades2: types>+≡
  type :: k_node_entry_t
    type (k_node_t), pointer :: node => null ()
    type (k_node_entry_t), pointer :: next => null ()
    logical :: recycle = .false.
  contains
    <Cascades2: k node entry: TBP>
  end type k_node_entry_t

<Cascades2: k node entry: TBP>≡
  procedure :: final => k_node_entry_final

<Cascades2: procedures>+≡
  subroutine k_node_entry_final (entry)
    class(k_node_entry_t), intent(inout) :: entry
    if (associated (entry%node)) then
      call entry%node%final
      deallocate (entry%node)
    end if
    entry%next => null ()
  end subroutine k_node_entry_final

<Cascades2: k node entry: TBP>+≡
  procedure :: write => k_node_entry_write

<Cascades2: procedures>+≡
  subroutine k_node_entry_write (k_node_entry, u)
    class (k_node_entry_t), intent (in) :: k_node_entry
    integer, intent (in) :: u
  end subroutine k_node_entry_write

```

Here is the list type for `k_nodes`. A `k_node_list` can be declared to be an  
 observer. In this case it does not create any nodes by itself, but the entries set  
 their pointers to existing nodes. In this way we can use the list structure and  
 the type bound procedures for existing nodes.

```

<Cascades2: types>+≡
  type, extends (list_t) :: k_node_list_t
    type (k_node_entry_t), pointer :: first => null ()
    type (k_node_entry_t), pointer :: last => null ()
    integer :: n_recycle
    logical :: observer = .false.
  contains
    <Cascades2: k node list: TBP>
  end type k_node_list_t

<Cascades2: k node list: TBP>≡
  procedure :: final => k_node_list_final

<Cascades2: procedures>+≡
  subroutine k_node_list_final (list)
    class(k_node_list_t), intent(inout) :: list

```

```

    type (k_node_entry_t), pointer :: current
    do while (associated (list%first))
        current => list%first
        list%first => list%first%next
        if (list%observer) current%node => null ()
        call current%final ()
        deallocate (current)
    enddo
end subroutine k_node_list_final

```

The `f_node_t` type contains the `particle_label` variable which is extracted from the input file. It consists not only of the particle name, but also of some numbers in brackets. These numbers indicate which external particles are part of the subtree of this node. The `f_node` contains also a list of `k_nodes`. Therefore, if the nodes are not `incoming` or `t_line`, the mapping calculations for these `k_nodes` which can appear in several `kingraphs` have to be performed only once.

```

<Cascades2: types>+≡
    type, extends (node_t) :: f_node_t
        type (f_node_t), pointer :: daughter1 => null ()
        type (f_node_t), pointer :: daughter2 => null ()
        character (len=LABEL_LEN) :: particle_label
        type (k_node_list_t) :: k_node_list
    contains
        <Cascades2: f node: TBP>
    end type f_node_t

```

The finalizer nullifies the daughter pointers, since they are deallocated, like the `f_node` itself, with the finalizer of the `f_node_list`.

      counter = counter + 1
      f_node%index = counter
    endif
  end subroutine f_node_set_index
```

Type for the nodes of the tree (lines of the Feynman diagrams). We also need a type containing a pointer to a node, which is needed for creating arrays of pointers. This is needed for scattering processes where we can take either the first or the second particle to be the root of the tree. Since we need both cases for the calculations and O'Mega only gives us one of these, we have to perform a transformation of the graph in which some nodes (on the line which we hereafter call t-line) need to know their mother and sister nodes, which become their daughters within this transformation.

    allocate (list%last%node)
    call list%last%node%set_index ()
    ptr_to_node => list%last%node
  end subroutine k_node_list_add_entry

```

We need a similar subroutine for adding only a pointer to a list. This is needed for `k_node_list` which is only an observer, i.e. it does not create any nodes by itself.

```

<Cascades2: k node list: TBP>+≡
  procedure :: add_pointer => k_node_list_add_pointer

<Cascades2: procedures>+≡
  subroutine k_node_list_add_pointer (list, ptr_to_node, recycle)
    class (k_node_list_t), intent (inout) :: list
    type (k_node_t), pointer, intent (in) :: ptr_to_node
    logical, optional, intent (in) :: recycle
    logical :: rec
    if (present (recycle)) then
      rec = recycle
    endif
  end subroutine k_node_list_add_pointer

```

```

else
    rec = .false.
endif
if (list%n_entries == 0) then
    allocate (list%first)
    list%last => list%first
else
    allocate (list%last%next)
    list%last => list%last%next
endif
list%n_entries = list%n_entries + 1
list%last%recycle = rec
list%last%node => ptr_to_node
end subroutine k_node_list_add_pointer

```

The `k_node_list` can be used to collect `k_nodes` which belong to different `f_nodes` and compare these. This is done only for nodes which have the same number of subtree nodes. We compare all nodes of the list with each other (as long as the node is not deactivated, i.e. if the `keep` variable is set to `.false.`) using the subroutine `subtree_select`. If it turns out that two nodes are equivalent, we keep only one of them. The term equivalent in the context of subtrees will be explained in the description of `subtree_select`.

        enddo
        if (current%recycle .and. current%node%keep) then
            nodes(pos)%node => current%node
            pos = pos + 1
        endif
        current => current%next
    enddo
endif
end subroutine k_node_list_get_nodes

```

```

<Cascades2: f node list: TBP>+≡
    procedure :: final => f_node_list_final

```

```

<Cascades2: procedures>+≡
    subroutine f_node_list_final (list)
        class (f_node_list_t) :: list
        type (f_node_entry_t), pointer :: current
        list%k_node_list => null ()
        do while (associated (list%first))
            current => list%first
            list%first => list%first%next
            call current%final ()
            deallocate (current)
        enddo
    end subroutine f_node_list_final

```

### 18.12.8 The grove list

The grove to which a completed kingraph is added is determined by the entries of `grove_prop`. We use another list type (linked list) to arrange the groves. Each grove contains again a linked list of kingraphs.

```

<Cascades2: types>+≡
    type :: grove_t
        type (grove_prop_t) :: grove_prop
        type (grove_t), pointer :: next => null ()
        type (kingraph_t), pointer :: first => null ()
        !$ integer (OMP_lock_kind) :: lock
    contains
        <Cascades2: grove: TBP>
    end type grove_t

```

Container for a pointer of type `grove_t`:

```

<Cascades2: types>+≡
    type :: grove_ptr_t
        type (grove_t), pointer :: grove => null ()
    end type grove_ptr_t

```

```

<Cascades2: grove: TBP>≡
    procedure :: final => grove_final

```

```

<Cascades2: procedures>+≡
  subroutine grove_final (grove)
    class(grove_t), intent(inout) :: grove
    grove%first => null ()
    grove%next => null ()
  end subroutine grove_final

```

This is the list type:

```

<Cascades2: types>+≡
  type :: grove_list_t
    type (grove_t), pointer :: first => null ()
    !$ integer (OMP_lock_kind) :: lock
  contains
    <Cascades2: grove list: TBP>
  end type grove_list_t

```

```

<Cascades2: grove list: TBP>≡
  procedure :: final => grove_list_final

```

```

<Cascades2: procedures>+≡
  subroutine grove_list_final (list)
    class(grove_list_t), intent(inout) :: list
    class(grove_t), pointer :: current
    do while (associated (list%first))
      call list%first%final ()
      current => list%first
      list%first => list%first%next
      deallocate (current)
    end do
  end subroutine grove_list_final

```

### 18.12.9 The feyngraph set

The fundament of the module is the public type `feyngraph_set_t`. It is not only a linked list of all `feyngraphs` but contains an array of all particle properties (`particle`), an `f_node_list` and a pointer of the type `grove_list_t`, since several `feyngraph_sets` can share a common `grove_list`. In addition it keeps the data which unambiguously specifies the process, as well as the model which provides information which allows us to choose between equivalent subtrees or complete `kingraphs`.

```

<Cascades2: public>+≡
  public :: feyngraph_set_t
<Cascades2: types>+≡
  type :: feyngraph_set_t
    type (model_data_t), pointer :: model => null ()
    type(flavor_t), dimension(:,,:), allocatable :: flv
    integer :: n_in = 0
    integer :: n_out = 0
    integer :: process_type = DECAY
    type (phs_parameters_t) :: phs_par
    logical :: fatal_beam_decay = .true.

```

```

type (part_prop_t), dimension (:), pointer :: particle => null ()
type (f_node_list_t) :: f_node_list
type (feyngraph_t), pointer :: first => null ()
type (feyngraph_t), pointer :: last => null ()
integer :: n_graphs = 0
type (grove_list_t), pointer :: grove_list => null ()
logical :: use_dag = .true.
type (feyngraph_set_t), dimension (:), pointer :: fset => null ()
contains
  <Cascades2: feyngraph set: TBP>
end type feyngraph_set_t

```

This final procedure contains calls to all other necessary final procedures.

```

<Cascades2: feyngraph set: TBP>≡
  procedure :: final => feyngraph_set_final

<Cascades2: procedures>+≡
  subroutine feyngraph_set_final (set)
    class(feyngraph_set_t), intent(inout) :: set
    class(feyngraph_t), pointer :: current
    integer :: i
    if (associated (set%fset)) then
      do i=1, size (set%fset)
        do while (associated (set%fset(i)%first))
          current => set%fset(i)%first
          set%fset(i)%first => set%fset(i)%first%next
          call current%final ()
          deallocate (current)
        end do
        set%fset(i)%model => null ()
        if (allocated (set%fset(i)%flv)) deallocate (set%fset(i)%flv)
        set%fset(i)%particle => null ()
        set%fset(i)%last => null ()
        set%fset(i)%grove_list => null ()
        call msg_debug (D_PHASESPACE, "f_node_list: final")
        call set%fset(i)%f_node_list%final ()
      enddo
      deallocate (set%fset)
      set%model => null ()
      if (allocated (set%flv)) deallocate (set%flv)
      if (associated (set%particle)) then
        do i = 1, size (set%particle)
          call set%particle(i)%final ()
        end do
        deallocate (set%particle)
      endif
      call msg_debug (D_PHASESPACE, "grove_list: final")
      call set%grove_list%final ()
    endif
  end subroutine feyngraph_set_final

```

### 18.12.10 Construct the feyngraph set

We construct the `feyngraph_set` from an input file. Therefore we pass a unit to `feyngraph_set_build`. The parsing subroutines are chosen depending on the value of `use_dag`. In the DAG output, we have to work on a string of one line, where the length of this string becomes larger the more particles are involved in the process. The other output contains one Feynman diagram per line and each line starts with an open parenthesis so that we read the file line per line and create a `feyngraph` for every line. Only after this, nodes are created. In both cases the all processes will have the form of a decay process, i.e. in a scattering process one of the incoming particles appears as an outgoing particle.

*(Cascades2: feyngraph set: TBP)+≡*

```
procedure :: build => feyngraph_set_build
```

*(Cascades2: procedures)+≡*

```

endif
endif
end subroutine feyngraph_set_build

```

Read the string from the file produced by O'Mega which contains the DAG in a factorised form in one line. This line is not the first line, since a file can contain more than one of these strings. O'Mega's output for a given process consists of a line containing the process, followed by one or two strings representing the DAG. Two lines are written for scattering processes: one in which the first particle appears as the decaying one and the other with the second particle decaying.

*<Cascades2: dag: TBP>*≡

```

    procedure :: read_string => dag_read_string

```

*<Cascades2: procedures>*+≡

```

    subroutine dag_read_string (dag, u_in, flv)
        class (dag_t), intent (inout) :: dag
        integer, intent (in) :: u_in
        type(flavor_t), dimension(:), intent(in) :: flv
        type (string_t) :: string
        logical :: process_found
        logical :: rewound
    !!! find process string in file
        process_found = .false.
        rewound = .false.
        do while (.not. process_found)
            call fds_file_get_line (u_in, string)
            if (len_trim(string) /= 0) then
                if (index (string, "::") > 0) then
                    process_found = process_string_match (char (trim (string)), flv)
                endif
            else if (.not. rewound) then

            endif
        enddo
    end subroutine dag_read_string

```

```

endif
enddo
call fds_file_get_line (u_in, dag%string)
if (len_trim(dag%string) == 0) &
    call msg_bug ("Process string not found in O'Mega input file.")
end subroutine dag_read_string

```

The output of factorized Feynman diagrams which is created by O'Mega for a given process is written in a single line. This can lead to different problems with different compilers as soon as such lines become too long. This is the reason why right after the creation of the files which contain the diagrams, these are edited using `sed`. Whenever a line is longer than 1000 characters, a dollar sign is added after these 100 characters, followed by a newline character, and the same is done for the remaining part of the line. The dollar sign thus tells us that the rest of the original line can be found in the next line. On the other hand, if there is no dollar sign at the end of a line, we now that this is the end of the original line. This works under the assumption that the original input file does not contain any dollar signs, but dollar signs are rather unusual in particle names. The lines therefore have a maximum length of 1001 characters (excluding newline characters).

```

<Cascades2: parameters>+≡
integer, parameter :: BUFFER_LEN = 1000
integer, parameter :: STACK_SIZE = 100

<Cascades2: procedures>+≡
subroutine fds_file_get_line (u, string)

integer :: occurrence
integer :: i
pos = 1
match = .false.
do i=1, size (flv)
    occurrence = index (string(pos:), char(flv(i))%get_name())
    if (occurrence > 0) then
        pos = pos + occurrence
        match = .true.
    else
        match = .false.
        exit
    endif
enddo
end function process_string_match

```

### 18.12.11 Particle properties

This subroutine initializes a model instance with the Standard Model data. It is used only in the unit tests and may disappear if the processes chosen for the unit tests are simple enough that they can be tested with the subroutine `init_sm_test` of `model_data`. We do not have to care about the model initialization in this module because the model is passed to `feyngraph.set_generate` when it is called.

```

<Cascades2: public>+≡
public :: init_sm_full_test

<Cascades2: procedures>+≡

Initialize a `part_prop` object by passing a `particle_label`, which is simply the particle name. `part_prop` should be part of the `particle` array of `feyngraph_set`. We use the `model` of `feyngraph_set` to obtain the relevant data of the particle which is needed to find `phase_space` parametrizations. When a `part_prop` is initialized, we add and initialize also the corresponding anti- particle `part_prop` if it is not yet in the array.

```

        !!! Since the OMega output uses the anti-particles instead of the particles specified
        !!! in the process definition, we revert this here. An exception is the first particle
        !!! in the parsable DAG output
        node%particle => node%particle%anti
    end subroutine f_node_assign_particle_properties

```

From the output of a Feynman diagramgraph we need to find out how many daughter nodes are required to reconstruct it correctly. In particular, we want to make sure to keep only those `feyngraphs` which are constructed solely on the basis of the 3-vertices which are provided by the model. The number of daughter particles can easily be determined from the syntax of the O'Mega output: The particle which appears before the colon ':' is the mother particle. The particles or subtrees (i.e. whole parentheses) follow after the colon and are separated by commas.

```

<Cascades2: procedures>+≡

  end if
end if
end if
end function get_n_daughters

```

### 18.12.12 Reconstruction of trees

The reconstruction of a tree or subtree with the non-factorized input can be done recursively, i.e. we first find the root of the tree in the string and create a node. Then we look for daughters, which in the string appear either as single particles or subtrees (which are of the same form as the tree which we want to reconstruct. Therefore the and subroutine can simply be called again and again until there are no more daughter nodes to create. When we meet a vertex which requires more than two daughter particles, we stop the recursion and disable the node using the `keep` variable. Whenever a daughter node is not kept, we do not keep the mother node as well.

(*Cascades2: procedures*) +=

```

recursive subroutine node_construct_subtree_rec (feyngraph_set, &
  feyngraph, subtree_string, mother_node)
  type (feyngraph_set_t), intent (inout) :: feyngraph_set
  type (feyngraph_t), intent (inout) :: feyngraph

        endif
    endif
    if (associated (mother_node%daughter1) .and. &
        associated (mother_node%daughter2)) then
        mother_node%n_subtree_nodes = &
            mother_node%daughter1%n_subtree_nodes &
            + mother_node%daughter2%n_subtree_nodes + 1
    endif
end subroutine node_construct_subtree_rec_dag

```

When the non-factorized version of the O'Mega output is used, the `feyngraph` is reconstructed from the contents of its character variable `omega_feyngraph_output`. This can be used for the recursive reconstruction of the tree of `k_nodes` with `node_construct_subtree_rec`.

```

<Cascades2: procedures>+≡
subroutine feyngraph_construct (feyngraph_set, feyngraph)
    type (feyngraph_set_t), intent (inout) :: feyngraph_set
    type (feyngraph_t), pointer, intent (inout) :: feyngraph
    call node_construct_subtree_rec (feyngraph_set, feyngraph, &
        feyngraph%omega_feyngraph_output, feyngraph%root)
    feyngraph%n_nodes = feyngraph%root%n_subtree_nodes
end subroutine feyngraph_construct

```

We introduce another node type which could be used for another tree type. This type would however only be used to reconstruct all `feyngraphs`. This is the reason why we do not use pointers to allocate daughter nodes, but we rather work on a single array of these nodes. The daughter pointers are replaced by integers which are the indices for the nodes in the array. This is more sensible because a dag node can have many combinations of daughters. A `dag_node` can correspond to a large number of `f_nodes` and can contain many subtrees. It is called a leaf if there is only one possibility to reconstruct the subtree, or if it contains an external particle. In this case the `f_nodes` are created using `node_construct_subtree_rec_dag`.

```

<Cascades2: types>+≡
type :: dag_node_t
    integer :: string_len
    type (string_t) :: string
    logical :: leaf = .false.
    type (f_node_ptr_t), dimension (:), allocatable :: f_node
contains
    <Cascades2: dag node: TBP>
end type dag_node_t

```

Whenever there is more than one possibility to put a subtree or node or pair of daughter nodes, we use the type `dag_options_t`. In the syntax of the factorized output, options are listed in curlybrackets.

```

<Cascades2: types>+≡
  type :: dag_options_t
    integer :: string_len
    type (string_t) :: string
  contains
    <Cascades2: dag options: TBP>
  end type dag_options_t

```

A pair of two daughters (which can be `dag_nodes` or `dag_options`) is represented by the type `dag_combination_t`. A combination appears between parentheses.

```

<Cascades2: types>+≡
  type :: dag_combination_t
    integer :: string_len
    type (string_t) :: string
    integer, dimension (2) :: combination
  contains
    <Cascades2: dag combination: TBP>
  end type dag_combination_t

```

Here is the type representing the DAG.

```

<Cascades2: types>+≡
  type :: dag_t
    type (string_t) :: string
    type (dag_node_t), dimension (:), allocatable :: node
    type (dag_options_t), dimension (:), allocatable :: options
    type (dag_combination_t), dimension (:), allocatable :: combination
    integer :: n_nodes = 0
    integer :: n_options = 0
    integer :: n_combinations = 0
  contains
    <Cascades2: dag: TBP>
  end type dag_t

```

We construct the DAG from the given string which is modified several times so that in the end the remaining string corresponds to a simple `dag_node`. This means that we first identify the leaves, i.e. simple subtrees. Then we identify `dag_nodes`, `dag_combinations` and `options` until the number of these objects does not change any more. Identifying means that we add the object to the array, which can still be identified with the corresponding substring, and the substring in the original string by a place holder like `'O23i'` which corresponds to an option and can be found at the position 23 in the array.

```

<Cascades2: dag: TBP>+≡

```

For a given `dag_node` we want to create all `f_nodes`. If the node is not a leaf, it contains in its string placeholders for options or combinations. For these objects there are similar subroutines which are needed here to obtain the sets of daughter nodes. If the `dag_node` is a leaf, we can reconstruct the subtree in the same ways as for the non-factorized output.

*(Cascades2: dag node: TBP)*≡

```

We create all combinations of daughter `f_nodes` for a combination. In the combination each daughter can be either a single `dag_nodes` or `dag_options` which are a set of single `dag_nodes`. Therefore, we first create all possible `f_nodes` for daughter1, then all possible `f_nodes` for daughter2. In the end we combine all daughter1 nodes with all daughter2 nodes.

```

Here we create the `feyngraphs`. After the construction of the `dag` the remaining string should contain a single `dag_nodes` which corresponds to the roots of the `feyngraphs`. Therefore we make all `f_nodes` for this `dag_node` and create a `feyngraph` for each `f_node`. Note that only 3-vertices are accepted. All other vertices are rejected. The starting point is the last dag node which has been added to the list, since this corresponds to the root of the tree. It is important to understand that the structure of feyngraphs is not the same as the structure of the dag which is read from file, because for the calculations which are performed in this module we want to reuse the nodes for the outgoing particles, which means that they appear only once. The incoming particle(s) on the other hand should appear many times (due to copies of the graph when a node can be resonant or not). In O'Mega's output the first incoming particle appears only once and the outgoing particles appear many times. This transition is incorporated in the subroutines which create `f_nodes` from the different dag objects.

```

For a given `feyngraph` we create all possible `kingraphs`. Here we use existing `k_nodes` which have already been created when the mapping calculations of the pure s-channel subgraphs are performed. The nodes for the incoming particles or the nodes on the t-line will have to be created. To obtain the existing `k_nodes`, we use the subroutine `k_node_init_from_f_node` which itself uses `f_node_list_get_nodes` to obtain all `k_nodes` in the `k_node_list` of the `f_node` which will be kept. The created `kingraphs` are attached to the linked list of the `feyngraph`. For scattering processes we have to split up the t-line, because since all graphs are represented as a decay, different nodes can share daughter nodes. This happens also for the t-line or the incoming particle which appears as an outgoing particle. For the `t_line` or `incoming` nodes we do not want to recycle nodes but rather create a copy of this line for each `kingraph`.

```

```

The graphs resulting from `k_node_init_from_f_node` are fine if they are used only in one direction. This is however problematic when one wants to invert the graphs, i.e. take the other incoming particle of a scattering process as the decaying particle, because the outgoing `f_nodes` (and hence also the `k_nodes`) exist only once. This problem is solved here by creating a distinct t-line for

each of the graphs. The following subroutine disentangles the data structure by creating new nodes such that the different t-lines are not connected any more.

(*Cascades2: procedures*)+=

```

recursive subroutine split_up_t_lines (t_node)
  type (k_node_ptr_t), dimension(:), intent (inout) :: t_node
  type (k_node_t), pointer :: ref_node => null ()
  type (k_node_t), pointer :: ref_daughter => null ()
  type (k_node_t), pointer :: new_daughter => null ()
  type (k_node_ptr_t), dimension(:), allocatable :: t_daughter
  integer :: ref_daughter_index
  integer :: i, j
  allocate (t_daughter (size (t_node)))
  do i=1, size (t_node)
    ref_node => t_node(i)%node
    if (associated (ref_node%daughter1) .and. associated (ref_node%daughter2)) then
      ref_daughter => null ()
      if (ref_node%daughter1%incoming .or. ref_node%daughter1%t_line) then
        ref_daughter => ref_node%daughter1
        ref_daughter_index = 1
      else if (ref_node%daughter2%incoming .or. ref_node%daughter2%t_line) then
        ref_daughter => ref_node%daughter2
        ref_daughter_index = 2
      endif
    do j=1, size (t_daughter)
      if (.not. associated (t_daughter(j)%node)) then
        t_daughter(j)%node => ref_daughter
        exit
      else if (t_daughter(j)%node%index == ref_daughter%index) then
        new_daughter => null ()
        call ref_daughter%f_node%k_node_list%add_entry (new_daughter, recycle=.false.)
        new_daughter = ref_daughter
        new_daughter%daughter1 => ref_daughter%daughter1
        new_daughter%daughter2 => ref_daughter%daughter2
        if (ref_daughter_index == 1) then
          ref_node%daughter1 => new_daughter
        else if (ref_daughter_index == 2) then
          ref_node%daughter2 => new_daughter
        endif
        ref_daughter => new_daughter
      endif
    enddo
  else
    return
  endif
enddo
call split_up_t_lines (t_daughter)
deallocate (t_daughter)
end subroutine split_up_t_lines

```

This subroutine sets the `inverse_daughters` of a `k_node`. If we invert a `kingraph` such that not the first but the second incoming particle appears as the root of the tree, the `incoming` and `t_line` particles obtain other daughters. These are the former mother node and the sister node `s_daughter`. Here we set only the

pointers for the `inverse_daughters`. The inversion happens in another subroutine.

```

<Cascades2: procedures>+≡
subroutine kingraph_set_inverse_daughters (kingraph)
  type (kingraph_t), intent (inout) :: kingraph
  type (k_node_t), pointer :: mother => null ()
  type (k_node_t), pointer :: t_daughter => null ()
  type (k_node_t), pointer :: s_daughter => null ()
  mother => kingraph%root
  do while (associated (mother))
    if (associated (mother%daughter1) .and. &
        associated (mother%daughter2)) then
      if (mother%daughter1%t_line .or. mother%daughter1%incoming) then
        t_daughter => mother%daughter1; s_daughter => mother%daughter2
      else if (mother%daughter2%t_line .or. mother%daughter2%incoming) then
        t_daughter => mother%daughter2; s_daughter => mother%daughter1
      else
        exit
      endif
      t_daughter%inverse_daughter1 => mother
      t_daughter%inverse_daughter2 => s_daughter
      mother => t_daughter
    else
      exit
    endif
  enddo
end subroutine kingraph_set_inverse_daughters

```

Set the bincode of an `f_node` which corresponds to an external particle. This is done on the basis of the `particle_label` which is a substring of the input file. Here it is not the particle name which is important, but the number(s) in brackets which in general indicate the external particles which are connected to the current node. This function is however only used for external particles, so there can either be one or `n_out + 1` particles in the brackets (in the DAG input file always one, because also for the root there is only a single number). In all cases we check the number of particles (in the DAG input the numbers are separated by a slash).

```

<Cascades2: procedures>+≡
function f_node_get_external_bincode (feyngraph_set, f_node) result (bincode)
  type (feyngraph_set_t), intent (in) :: feyngraph_set
  type (f_node_t), intent (in) :: f_node
  integer (TC) :: bincode
  character (len=LABEL_LEN) :: particle_label
  integer :: start_pos, end_pos, n_out_decay
  integer :: n_prt ! for DAG
  integer :: i
  bincode = 0
  if (feyngraph_set%process_type == DECAY) then
    n_out_decay = feyngraph_set%n_out
  else
    n_out_decay = feyngraph_set%n_out + 1
  endif
  particle_label = f_node%particle_label

```

```

start_pos = index (particle_label, '[') + 1
end_pos = index (particle_label, ']') - 1
particle_label = particle_label(start_pos:end_pos)
!!! n_out_decay is the number of outgoing particles in the
!!! OMega output, which is always represented as a decay
if (feyngraph_set%use_dag) then
    n_prt = 1
    do i=1, len(particle_label)
        if (particle_label(i:i) == '/') n_prt = n_prt + 1
    enddo
else
    n_prt = end_pos - start_pos + 1
endif
if (n_prt == 1) then
    brcode = calculate_external_brcode (particle_label, &
        feyngraph_set%process_type, n_out_decay)
else if (n_prt == n_out_decay) then
    brcode = ibset (0, n_out_decay)
endif
end function f_node_get_external_brcode

```

Assign a brcode to an internal node, which is calculated from the brcodes of daughter1 and daughter2.

```

<Cascades2: procedures>+≡
subroutine node_assign_brcode (node)
    type (k_node_t), intent (inout) :: node
    if (associated (node%daughter1) .and. associated (node%daughter2) &
        .and. .not. node%incoming) then
        node%brcode = ior(node%daughter1%brcode, node%daughter2%brcode)
    endif
end subroutine node_assign_brcode

```

Calculate the brcode from the number in the brackets of the `particle_label`, if the node is external. For the root in the non-factorized output, this is calculated directly in `f_node_get_external_brcode` because in this case all the other external particle numbers appear between the brackets.

```

end function calculate_external_bincode

```

### 18.12.13 Mapping calculations

Once a `k_node` and its subtree nodes have been created, we can perform the kinematical calculations and assign mappings, depending on the particle properties and the result for the subtree nodes. This could in principle be done recursively, calling the procedure first for the daughter nodes and then perform the calculations for the actual node. But for parallization and comparing the nodes, this will be done for all nodes with the same number of subtree nodes, and the number of subtree nodes increases, starting from one, in steps of two. The actual mapping calculations are done in complete analogy to cascades.

(*Cascades2: procedures*) +=

```

end subroutine kinggraph_compute_mappings_t_line

```

Perform the kinematical calculations and mapping assignment for a node which is either `incoming` or `t_line`. This is done recursively, going first to the daughter node which has this property. Therefore we first set the pointer `t_node` to this daughter node and `s_node` to the other one. The mapping determination happens again in the same way as in `cascades`.

After all pure s-channel subdiagrams have already been created from the corresponding **f\_nodes** and mappings have been determined for their nodes, we complete the calculations here. In a first step, the **kingraphs** have to be created on the basis of the existing **k\_nodes**, which means in particular that a **feyngraph** can give rise to several **kingraphs** which will all be attached to the linked list of the **feyngraph**. The calculations which remain are of different kind for decay and scattering processes. In a scattering process the kinematical calculations have to be done for the **root** node. In a scattering process, after the creation of **kingraphs** in the first step, there will be only **kingraphs** with the first incoming particle as the **root** of the tree. For these graphs the **inverse** variable has the value **.false..** Before performing any calculations on these graphs we make a so-called inverse copy of the graph (see below), which will also be attached to the linked list. Since the s-channel subgraph calculations have already been completed, only the t-line computations have to be done here.

*<Cascades2: feyngraph: TBP>+≡*

```

Here we control the mapping calculations for the nodes of s-channel subgraphs. We start with the nodes with the smallest number of subtree nodes and always increase this number by two because nodes have exactly zero or two daughter nodes. We get create the **k\_nodes** using the **k\_node\_list** of each **f\_node**. The

number of nodes which have to be created depends of the number of existing daughter nodes, which means that we have to create a node for each combination of existing and valid (the ones which we **keep**) daughter nodes. If the node corresponds to an external particle, we create only one node, since because there are no daughter nodes. If the particle is not external and the daughter **f\_nodes** do not contain any valid **k\_nodes**, we do not create a new **k\_nodes** either. When the calculations for all nodes with the same number of subtree nodes have been completed, we compare the valid nodes to eliminate equivalences (see below).

#### 18.12.14 Fill the grove list

Find the **grove** within the **grove\_list** for a **feyngraph** for which the kinematical calculations have been completed. The **groves** are defined by the **grove\_prop** entries and the value of the resonance hash (**res\_hash**). Whenever a matching grove does not exist, we create one. In a first step we consider only part of the grove properties (see **grove\_prop\_match**) and the resonance hash is ignored, which leads to a preliminary grove list. In the end all numbers in **grove\_prop** as well as the resonance hash are compared, i.e. we create a new **grove\_list**.

```

      current_kin_graph => current_kin_graph%next
    enddo
  end subroutine grove_list_add_feyngraph

```

Compare two `grove_prop` objects. The `.match.` operator is used for preliminary groves in which the kingraphs share only the 3 numbers `n_resonances`, `n_log_enhanced` and `n_t_channel`. These groves are only used for comparing the kingraphs, because only graphs within these preliminary groves can be equivalent (the numbers which are compared here are unambiguously fixed by the combination of mappings in these channels).

```

<Cascades2: interfaces>+≡
  interface operator (.match.)
    module procedure grove_prop_match
  end interface operator (.match.)

<Cascades2: procedures>+≡
  function grove_prop_match (grove_prop1, grove_prop2) result (gp_match)

```

```

type (grove_prop_t), intent (in) :: grove_prop1
type (grove_prop_t), intent (in) :: grove_prop2
logical :: gp_match
gp_match = (grove_prop1%n_resonances == grove_prop2%n_resonances) &
    .and. (grove_prop1%n_log_enhanced == grove_prop2%n_log_enhanced) &
    .and. (grove_prop1%n_t_channel == grove_prop2%n_t_channel)
end function grove_prop_match

```

The equal operator on the other hand will be used when all valid **kingraphs** have been created and mappings have been determined, to split up the existing (preliminary) grove list, i.e. to create new groves which are determined by all entries in **grove\_prop\_t**.

```

<Cascades2: interfaces>+≡
interface operator (==)
module procedure grove_prop_equal
end interface operator (==)

<Cascades2: procedures>+≡
function grove_prop_equal (grove_prop1, grove_prop2) result (gp_equal)
type (grove_prop_t), intent (in) :: grove_prop1
type (grove_prop_t), intent (in) :: grove_prop2
logical :: gp_equal
gp_equal = (grove_prop1%res_hash == grove_prop2%res_hash) &
    .and. (grove_prop1%n_resonances == grove_prop2%n_resonances) &
    .and. (grove_prop1%n_log_enhanced == grove_prop2%n_log_enhanced) &
    .and. (grove_prop1%n_off_shell == grove_prop2%n_off_shell) &
    .and. (grove_prop1%multiplicity == grove_prop2%multiplicity) &
    .and. (grove_prop1%n_t_channel == grove_prop2%n_t_channel)
end function grove_prop_equal

```

### 18.12.15 Remove equivalent channels

Here we define the equivalence condition for completed **kingraphs**. The aim is to keep those **kingraphs** which describe the strongest peaks of the amplitude. The **bincodes** and **mappings** have to be the same for an equivalence, but the **pdgs** can be different. At the same time we check if the trees are exactly the same (up to the sign of **pdg** codes) in which case we do not keep both of them. This can be the case when the incoming particles are the same or their mutual anti-particles and there are no t-channel lines in the Feynman diagram to which the kingraph belongs.

```

<Cascades2: parameters>+≡
integer, parameter :: EMPTY = -999

<Cascades2: procedures>+≡
function kingraph_eqv (kingraph1, kingraph2) result (eqv)
type (kingraph_t), intent (in) :: kingraph1
type (kingraph_t), intent (inout) :: kingraph2
logical :: eqv
integer :: i
logical :: equal
eqv = .false.

```

```

do i = kingraph1%tree%n_entries, 1, -1
  if (kingraph1%tree%bc(i) /= kingraph2%tree%bc(i)) return
enddo
do i = kingraph1%tree%n_entries, 1, -1
  if ( .not. (kingraph1%tree%mapping(i) == kingraph2%tree%mapping(i) &
    .or. ((kingraph1%tree%mapping(i) == NO_MAPPING .or. &
      kingraph1%tree%mapping(i) == NONRESONANT) .and. &
      (kingraph2%tree%mapping(i) == NO_MAPPING .or. &
        kingraph2%tree%mapping(i) == NONRESONANT)))) return
enddo
equal = .true.
do i = kingraph1%tree%n_entries, 1, -1
  if (abs(kingraph1%tree%pdg(i)) /= abs(kingraph2%tree%pdg(i))) then
    equal = .false.;
    select case (kingraph1%tree%mapping(i))
    case (S_CHANNEL, RADIATION, EXTERNAL_PRT)
      select case (kingraph2%tree%mapping(i))
      case (S_CHANNEL, RADIATION, EXTERNAL_PRT)
        return
      end select
    end select
  endif
enddo
if (equal) then
  kingraph2%keep = .false.
else
  eqv = .true.
endif
end function kingraph_eqv

```

Select between two **kingraphs** which fulfill the equivalence condition above. This is done by comparing the **pdg** values of the **tree** for increasing bincode. If the particles are different at some place, we usually choose the only which would be return first by the subroutine **match\_vertex** of the model for the daughter **pdg** codes. Since we work here only on the basis of the the **trees** of the completed **kingraphs**, we have to use the **bc** array to determine the positions of the daughter nodes' entries in the array. The graph which has to be kept should correspond to the stronger peak at the place which is compared.

*(Cascades2: procedures)+≡*

```

endif
enddo
endif
end subroutine kingraph_select

```

At the beginning we do not care about the resonance hash, but only about part of the grove properties, which is defined in `grove_prop_match`. In these resulting preliminary groves the kingraphs can be equivalent, i.e. we do not have to compare all graphs with each other but only all graphs within each of these preliminary groves. In the end we create a new grove list where the grove properties of the `kingraphs` within a `grove` have to be exactly the same and in addition the groves are distinguished by the resonance hash values. Here the kingraphs are not compared any more, which means that the number of channels is not reduced any more.

### 18.12.17 Invert a graph

All Feynman diagrams given by O'Mega look like a decay. The `feyngraph` which is constructed from this output also looks like a decay, where one of the incoming particles is the decaying particle (or the root of the tree). The calculations can in principle be done on this data structure. However, it has also to be performed with the other incoming particle as the root. The first part of the calculation is the same for both cases. For the second part we need to transform/turn the graphs such that the other incoming particle becomes the root. This is done by identifying the incoming particles from the O'Mega output (the first one is simply the root of the existing tree, the second contains [2] in the `particle_label`) and the nodes/particles which connect both incoming particles (here we set `t_line = .true.`). At the same time we set the pointers `inverse_daughter1` and `inverse_daughter2` for the corresponding node, which point to the mother node and the other daughter of the mother node; these will be the daughters of the node in the inverted `feyngraph`.

```

### 18.12.18 Find phase-space parametrizations

Perform all mapping calculations for a single process and store valid `kingraphs` (channels) into the grove list, without caring for instance about the resonance hash values.

```

<Cascades2: public>+≡

```

```

public :: feyngraph_set_generate_single
<Cascades2: procedures>+≡
  subroutine feyngraph_set_generate_single (feyngraph_set, model, n_in, n_out, &
    phs_par, fatal_beam_decay, u_in)
    type(feyngraph_set_t), intent(inout) :: feyngraph_set
    type(model_data_t), target, intent(in) :: model
    integer, intent(in) :: n_in, n_out
    type(phs_parameters_t), intent(in) :: phs_par
    logical, intent(in) :: fatal_beam_decay
    integer, intent(in) :: u_in
    feyngraph_set%n_in = n_in
    feyngraph_set%n_out = n_out
    feyngraph_set%process_type = n_in
    feyngraph_set%phs_par = phs_par
    feyngraph_set%model => model
    call msg_debug (D_PHASESPACE, "Construct relevant Feynman diagrams from Omega output")
    call feyngraph_set%build (u_in)
    call msg_debug (D_PHASESPACE, "Find phase-space parametrizations")
    call feyngraph_set_find_phs_parametrizations(feyngraph_set)
  end subroutine feyngraph_set_generate_single

```

Find the phase space parametrizations. We start with the computation of pure s-channel subtrees, i.e. we determine mappings and compare subtrees in order to reduce the number of channels. This can be parallelized easily. When all s-channel k-nodes exist, the possible kingraphs are created using these nodes and we determine mappings for t-channel nodes. It turns out that the computation for the t-channel nodes (or t-line) are ways faster than for the s-channel nodes as soon as the diagrams become big enough. Therefore this part is not parallelized at all.

```

<Cascades2: procedures>+≡

### 18.12.19 Return the resonance histories for subtraction

The following procedures are copies of corresponding procedures in `cascades`, which only have been adapted to the new types used in this module.

Extract the resonance set from a valid `kingraph` which is kept in the final grove list.

```

<Cascades2: kingraph: TBP>+≡
    procedure :: extract_resonance_history => kingraph_extract_resonance_history

<Cascades2: procedures>+≡
    subroutine kingraph_extract_resonance_history &
        (kingraph, res_hist, model, n_out)
        class(kingraph_t), intent(in), target :: kingraph
        type(resonance_history_t), intent(out) :: res_hist
        class(model_data_t), intent(in), target :: model
        integer, intent(in) :: n_out
        type(resonance_info_t) :: resonance
        integer :: i, mom_id, pdg
        call msg_debug2 (D_PHASESPACE, "kingraph_extract_resonance_history")
        if (kingraph%grove_prop%n_resonances > 0) then
            if (associated (kingraph%root%daughter1) .or. &
                associated (kingraph%root%daughter2)) then
                call msg_debug2 (D_PHASESPACE, "kingraph has resonances, root has children")
                do i = 1, kingraph%tree%n_entries
                    if (kingraph%tree%mapping(i) == S_CHANNEL) then
                        mom_id = kingraph%tree%bc (i)
                        pdg = kingraph%tree%pdg (i)
                        call resonance%init (mom_id, pdg, model, n_out)
                        if (debug2_active (D_PHASESPACE)) then
                            print *, 'D: Adding resonance'

## Chapter 19

# VEGAS Integration

The backbone integrator of WHIZARD is a object-oriented implemetation of the VEGAS algorithm.

```
<vegas.f90>≡  
  <File header>  
  
  module vegas  
    <Use kinds>  
  
    <vegas: modules>  
  
    <Standard module head>  
  
    <vegas: public>  
  
    <vegas: parameters>  
  
    <vegas: types>  
  
    <vegas: interfaces>  
  
    contains  
  
    <vegas: procedures>  
  
  end module vegas  
<vegas: modules>≡  
  use diagnostics  
  use io_units  
  use format_utils, only: write_indent  
  use format_defs, only: FMT_17  
  use rng_base, only: rng_t  
  use rng_stream, only: rng_stream_t  
MPI Module.  
<MPI: vegas: modules>≡  
  use mpi_f08 !NODEP!
```

## 19.1 Integration modes

VEGAS operates in three different modes: `vegas_mode_importance_only`, `vegas_mode_importance` or `vegas_mode_stratified`. The default mode is `vegas_mode_importance`, where the algorithm decides whether if it is possible to use importance sampling or stratified sampling. In low dimensions VEGAS uses strict stratified sampling.

```
<vegas: parameters>≡  
  integer, parameter, public :: VEGAS_MODE_IMPORTANCE = 0, &  
    & VEGAS_MODE_STRATIFIED = 1, VEGAS_MODE_IMPORTANCE_ONLY = 2
```

## 19.2 Type: vegas\_func\_t

We define a abstract `func` type which only gives an interface to an `evaluate` procedure. The inside of implementation and also the optimization of are not a concern of the `vegas` implementation.

```
<vegas: public>≡  
  public :: vegas_func_t  
<vegas: types>≡  
  type, abstract :: vegas_func_t  
    !  
    contains  
    procedure(vegas_func_evaluate), deferred, pass, public :: evaluate  
  end type vegas_func_t
```

The only procedure called in `vegas` is `vegas_func_evaluate`. It takes a real value `x` and returns a real value `f`.

```
<vegas: interfaces>≡  
  abstract interface  
    real(default) function vegas_func_evaluate (self, x) result (f)  
      import :: default, vegas_func_t  
      class(vegas_func_t), intent(inout) :: self  
      real(default), dimension(:), intent(in) :: x  
    end function vegas_func_evaluate  
  end interface
```

## 19.3 Type: vegas\_config\_t

We store the complete configuration in a transparent container. The `vegas_config_t` object inside VEGAS must not be directly accesible. We provide a `get` method which returns a copy of the `vegas_config_t` object.

Apart from the options which can be set by the constructor of `vegas_t` object, we store the run-time configuration `n_calls`, `calls_per_box`, `n_bins` and `n_boxes`. Those are calculated and set accordingly by VEGAS.

```
<vegas: public>+≡  
  public :: vegas_config_t
```

```

<vegas: types>+≡
  type :: vegas_config_t
    integer :: n_dim = 0
    real(default) :: alpha = 1.5
    integer :: n_bins_max = 50
    integer :: iterations = 5
    integer :: mode = VEGAS_MODE_STRATIFIED
    integer :: calls_per_box = 0
    integer :: n_calls = 0
    integer :: n_calls_min = 20
    integer :: n_boxes = 1
    integer :: n_bins = 1
  contains
    <vegas: vegas config: TBP>
  end type vegas_config_t

```

Write out the configuration of the grid.

```

<vegas: vegas config: TBP>≡
  procedure, public :: write => vegas_config_write

<vegas: procedures>≡
  subroutine vegas_config_write (self, unit, indent)
    class(vegas_config_t), intent(in) :: self
    integer, intent(in), optional :: unit
    integer, intent(in), optional :: indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent

end subroutine vegas_config_write

```

## 19.4 Type: vegas\_grid\_t

We provide a simple and transparent grid container. The container can then later be used, to export the actual grid.

```

<vegas: public>+≡
    public :: vegas_grid_t

<vegas: types>+≡
    type :: vegas_grid_t
        integer :: n_dim = 1
        integer :: n_bins = 1
        real(default), dimension(:), allocatable :: x_lower
        real(default), dimension(:), allocatable :: x_upper
        real(default), dimension(:), allocatable :: delta_x
        real(default), dimension(:,:), allocatable :: xi
    contains
        <vegas: vegas_grid: TBP>
    end type vegas_grid_t

```

Initialise grid.

```

<vegas: interfaces>+≡
    interface vegas_grid_t
        module procedure vegas_grid_init
    end interface vegas_grid_t

<vegas: procedures>+≡
    type(vegas_grid_t) function vegas_grid_init (n_dim, n_bins_max) result (self)
        integer, intent(in) :: n_dim
        integer, intent(in) :: n_bins_max
        self%n_dim = n_dim
        self%n_bins = 1
        allocate (self%x_upper(n_dim), source=1.0_default)
        allocate (self%x_lower(n_dim), source=0.0_default)
        allocate (self%delta_x(n_dim), source=1.0_default)
        allocate (self%xi((n_bins_max + 1), n_dim), source=0.0_default)
    end function vegas_grid_init

```

end subroutine vegas_grid_write

```

Resize each bin accordingly to its corresponding weight  $w$ . Can be used to resize the grid to a new size of bins or refinement.

The procedure expects two arguments, firstly, `n_bins` and, secondly, the refinement weights  $w$ . If `n_bins` differs from the internally stored one, we resize the grid under consideration of  $w$ . If each element of  $w$  equals one, then the bins are resized preserving their original bin density.

Anytime else, we refine the grid accordingly to  $w$ .

```

    exit ndim
end if
end do ndim
end function vegas_grid_get_probability

```

Broadcast the grid information. As safety measure, we get the actual grid object from VEGAS (correctly allocated, but for non-root unfilled) and broadcast the root object. On success, we set grid into VEGAS.

We use the non-blocking broadcast routine, because we have to send quite a bunch of integers and reals.

We have to be very careful with `n_bins`, the number of bins can actually change during different iterations. If we reuse a grid, we have to take that, every grid uses the same `n_bins`. We expect, that the number of dimension does not change, which is in principle possible, but will be checked onto in `vegas_set_grid`.

*(MPI: vegas: vegas grid: TBP)*≡

```

    procedure, public :: broadcast => vegas_grid_broadcast

```

*(MPI: vegas: procedures)*≡

```

subroutine vegas_grid_broadcast (self)

## 19.6 Type: vegas\_t

The VEGAS object contains the methods for integration and grid resize- and refinement. We store the grid configuration and the (current) result in transparent containers alongside with the actual grid and the distribution.

The values of the distribution depend on the chosen mode whether the function value or the variance is stored. The distribution is used after each iteration to refine the grid.

```

<vegas: public>+≡
    public :: vegas_t

<vegas: types>+≡
    type :: vegas_t
    private
    type(vegas_config_t) :: config
    real(default) :: hypercube_volume = 0.
    real(default) :: jacobian = 0.
    real(default), dimension(:, :), allocatable :: d
    type(vegas_grid_t) :: grid
    integer, dimension(:), allocatable :: bin
    integer, dimension(:), allocatable :: box
    type(vegas_result_t) :: result
contains
    <vegas: vegas: TBP>
end type vegas_t

```

We overload the type constructor of `vegas_t` which initialises the mandatory argument `n_dim` and allocate memory for the grid.

```

<vegas: interfaces>+≡
    interface vegas_t
    module procedure vegas_init
    end interface vegas_t

```

```

<vegas: procedures>+≡

        deallocate (self%grid%xi)
        deallocate (self%box)
        deallocate (self%bin)
    end subroutine vegas_final

```

## 19.7 Get-/Set-methods

The VEGAS object prohibits direct access from outside. Communication is handle via get- or set-methods. Set the limits of integration. The defaults limits correspong the  $n$ -dimensionl unit hypercube.

*Remark:* After setting the limits, the grid is initialised, again. Previous results are lost due to recalculation of the overall jacobian.

```

<vegas: vegas: TBP>+≡
    procedure, public :: set_limits => vegas_set_limits

<vegas: procedures>+≡
    subroutine vegas_set_limits (self, x_lower, x_upper)
        class(vegas_t), intent(inout) :: self

```

```

real(default), dimension(:), intent(in) :: x_lower
real(default), dimension(:), intent(in) :: x_upper
if (size (x_lower) /= self%config%n_dim &
    & .or. size (x_upper) /= self%config%n_dim) then
    write (msg_buffer, "(A, I5, A, I5, A, I5)") &
        "VEGAS: [set_limits] n_dim of new lower/upper integration limit&
        & does not match previously set n_dim. ", self%config%n_dim, " /=&
        & ", size (x_lower), " /= ", size (x_upper)
    call msg_fatal ()
end if
if (any(x_upper < x_lower)) then
    call msg_fatal ("VEGAS: [set_limits] upper limits are smaller than lower limits.")
end if
if (any((x_upper - x_lower) > huge(0._default))) then
    call msg_fatal ("VEGAS: [set_limits] upper and lower limits exceed rendering.")
end if
self%grid%x_upper = x_upper
self%grid%x_lower = x_lower
self%grid%delta_x = self%grid%x_upper - self%grid%x_lower
self%hypercube_volume = product (self%grid%delta_x)
call self%reset_result ()
end subroutine vegas_set_limits

```

Set the number of calls. If the number of calls changed during different passes, we resize the grid preserving the probability density. We should reset the results after changing the number of calls which change the size of the grid and the running mode of VEGAS. But, this is a set method only for the number of calls.

*<vegas: vegas: TBP>+≡*

```

procedure, public :: set_calls => vegas_set_n_calls

```

*<vegas: procedures>+≡*

```

subroutine vegas_set_n_calls (self, n_calls)
    class(vegas_t), intent(inout) :: self
    integer, intent(in) :: n_calls
    if (.not. (n_calls > 0)) then
        write (msg_buffer, "(A, I5)") &
            "VEGAS: [set_calls] number of calls must be a positive number. Keep&

        if (self%config%n_calls /= n_calls) then
            write (msg_buffer, "(A,I5)") &
                "VEGAS: [set calls] number of calls is too few, reset to ", self%config%n_calls
            call msg_warning ()
        end if
        call self%init_grid ()
    end if
end subroutine vegas_set_n_calls

```

Get the grid object and set `n_bins`, `n_dim` inside grid container.

*<vegas: vegas: TBP>+≡*

```

    procedure, public :: get_grid => vegas_get_grid
<vegas: procedures>+≡
    type(vegas_grid_t) function vegas_get_grid (self) result (grid)
        class(vegas_t), intent(in) :: self
        grid = self%grid
        grid%n_dim = self%config%n_dim
        grid%n_bins = self%config%n_bins
    end function vegas_get_grid

```

Set grid. We need a set method for the parallelisation. We do some additional checks before copying the object. Be careful, we do not check on `n_bins`, because the number of bins can change after setting `n_calls`. We remind you, that you will loose all your current progress, if you use set the grid. Hence, it will only be used when compiled with MPI.

```

<MPI: vegas: vegas: TBP>≡
    procedure, public :: set_grid => vegas_set_grid
<MPI: vegas: procedures>+≡
    subroutine vegas_set_grid (self, grid)
        class(vegas_t), intent(inout) :: self

## 19.8 Grid resize- and refinement

Before integration the grid itself must be initialised. Given the number of `n_calls` and `n_dim` we prepare the grid for the integration.

The grid is binned according to the VEGAS mode and `n_calls`. If the mode is not set to `vegas_importance_only`, the grid is divided in to equal boxes. We try for 2 calls per box

$$boxes = \sqrt[n_{dim}]{\frac{calls}{2}}. \quad (19.1)$$

If the numbers of boxes exceeds the number of bins, which is the case for low dimensions, the algorithm switches to stratified sampling. Otherwise, we are still using importance sampling, but keep the boxes for book keeping. If the number of bins changes from the previous invocation, bins are expanded or contracted accordingly, while preserving bin density.

```

<vegas: vegas: TBP>+≡
  procedure, private :: init_grid => vegas_init_grid

end subroutine vegas_reset_result

```

Reset the grid. Purge the adapted grid and the distribution. Furthermore, reset the results. The maximal size of the grid remains.

Note: Handle `vegas_reset_grid` with great care! Instead of reusing an old object, create a new one.

```

<vegas: vegas: TBP>+≡
  procedure, public :: reset_grid => vegas_reset_grid

<vegas: procedures>+≡
  subroutine vegas_reset_grid (self)
    class(vegas_t), intent(inout) :: self
    self%config%n_bins = 1
    self%d = 0._default
    self%grid%xi = 0._default
    self%grid%xi(1, :) = 0._default
    self%grid%xi(2, :) = 1._default
    call self%reset_result ()
  end subroutine vegas_reset_grid

```

Refine the grid to match the distribution `d`.

Average the distribution over neighbouring bins, then contract or expand the bins. The averaging dampens high fluctuations among the integrand or the variance.

We make the type-bound procedure public accessible because the multi-channel integration refines each grid after integration over all grids.

```

<vegas: vegas: TBP>+≡
  procedure, public :: refine => vegas_refine_grid

<vegas: procedures>+≡
  subroutine vegas_refine_grid (self)
    class(vegas_t), intent(inout) :: self
    integer :: j
    real(default), dimension(self%config%n_bins, self%config%n_dim) :: w
    ndim: do j = 1, self%config%n_dim
      call average_distribution (self%config%n_bins, self%d(:self%config%
        &n_bins, j), self%config%alpha, w(:, j))
    end do ndim
    call self%grid%resize (self%config%n_bins, w)
  contains
    <vegas: vegas refine grid: procedures>

```

```
end subroutine vegas_refine_grid
```

We average the collected values  $d$  of the (sq.) weighted  $f$  over neighbouring bins. The averaged  $d$  are then again damped by a logarithm to enhance numerical stability. The results are then the refinement weights  $w$ .

We have to take care of the special case where we have a very low sampling rate. In those cases we can not be sure that the distribution is satisfying filled, although we have already averaged over neighbouring bins. This will lead to a squashing of the unfilled bins and such the boundaries of those will be pushed together. We circumvent this problem by setting those unfilled bins to the smallest representable value of a default real.

The problem becomes very annoying in the multi-channel formulae where have to look up via binary search the corresponding probability of  $x$  and if the width is zero, the point will be neglected.

*(vegas: vegas refine grid: procedures)≡*

```
subroutine average_distribution (n_bins, d, alpha, w)
  integer, intent(in) :: n_bins
  real(default), dimension(:), intent(inout) :: d
  real(default), intent(in) :: alpha
  real(default), dimension(n_bins), intent(out) :: w
  if (n_bins > 2) then
    d(1) = (d(1) + d(2)) / 2.0_default
    d(2:n_bins - 1) = (d(1:n_bins - 2) + d(2:n_bins - 1) + d(3:n_bins)) / &
      & 3.0_default
    d(n_bins) = d(n_bins - 1) + d(n_bins) / 2.0_default

    elsewhere
      ! Analytic limes for d -> 1
      w = 1.0_default
    end where
  end if
end subroutine average_distribution
```

## 19.9 Integration

Integrate `func`, in the previous set bounds `x_lower` to `x_upper`, with `n_calls`. Use results from previous invocations of `integrate` with `opt_reset_result = .false.` and better with subsequent calls.

Before we walk through the hypercube, we initialise the grid (at a central position).

We step through the (equidistant) boxes which ensure we do not miss any place in the  $n$ -dim. hypercube. In each box we sample `calls_per_box` random

points and transform them to bin coordinates. The total integral and the total (sample) variance over each box  $i$  is then calculated by

$$E(I)_i = \sum_j^{\text{calls per box}} I_{i,j},$$

$$V(I)_i = \text{calls per box} \frac{\sum_j^{\text{calls per box}} I_{i,j}^2}{I} - \left( \sum_j^{\text{calls per box}} I_{i,j} \right)^2 * 2 \frac{\text{calls per box}}{\text{calls per box} - 1}.$$

The stratification of the  $n$ -dimensional hybercube allows a simple parallelisation of the algorithm (R. Kreckel, "Parallelization of adaptive MC integrators", Computer Physics Communications, vol. 106, no. 3, pp. 258266, Nov. 1997.). We have to ensure that all boxes are sampled, but the number of boxes to distribute is too large. We allow each thread to sample a fraction  $r$  of all boxes  $k$  such that  $r \ll k$ . Furthermore, we constrain that the number of process  $p$  is much smaller than  $r$ .

The overall constraint is

$$p \ll r \ll k. \quad (19.2)$$

We divide the intgeration into a parallel and a perpendicular subspace. The number of parallel dimensions is  $D_{\parallel} = \lfloor \frac{D}{2} \rfloor$ .

  end subroutine increment_box_coord

```

We parallelize VEGAS in simple forward manner. The hyper-cube is dissambled in to equidistant boxes in which we sample the integrand **calls\_per\_box** times. The workload of calculating those boxes is distributed along the worker.

The number of dimensions which will be parallelised are  $\lfloor \frac{D}{2} \rfloor$ , such MPI Variables for **vegas\_integrate**. We have to duplicate all buffers for **MPI\_Ireduce**, because we cannot use the same send or receive buffer.

We temporarily store a (empty) grid, before communicating.

```

```

API: driver for the unit tests below.

```
<vegas: public test>≡
```

```
  public :: vegas_test
```

```
<vegas: test driver>≡
```

```
  subroutine vegas_test (u, results)  
    integer, intent(in) :: u  
    type(test_results_t), intent(inout) :: results  
    <vegas: execute tests>  
  end subroutine vegas_test
```

## Test function

We use the example from the Monte Carlo Examples of the GSL library

$$I = \int_{-pi}^{+pi} dk_x / (2pi) \int_{-pi}^{+pi} dk_y / (2pi) \int_{-pi}^{+pi} dk_z / (2pi) 1 / (1 - \cos(k_x) \cos(k_y) \cos(k_z)). \quad (19.5)$$

The integral is reduced to region  $(0,0,0) \rightarrow (\pi, \pi, \pi)$  and multiplied by 8.

```
<vegas: test types>≡
  type, extends (vegas_func_t) :: vegas_test_func_t
  !
  contains
    <vegas: vegas test func: TBP>
  end type vegas_test_func_t
```

Evaluate the integrand.

```
<vegas: vegas test func: TBP>≡
  procedure, public :: evaluate => vegas_test_func_evaluate

<vegas: tests>≡
  real(default) function vegas_test_func_evaluate (self, x) result (f)
    class(vegas_test_func_t), intent(inout) :: self
    real(default), dimension(:), intent(in) :: x
    f = 1.0 / (pi**3)
    f = f / ( 1.0 - cos (x(1)) * cos (x(2)) * cos (x(3)))
  end function vegas_test_func_evaluate
```

The second test function is the normalised n-dim. gaussian distribution.

```
<vegas: test types>+≡
  type, extends (vegas_func_t) :: vegas_gaussian_test_func_t
  !
  contains
    <vegas: vegas gaussian test func: TBP>
  end type vegas_gaussian_test_func_t
```

Evaluate the integrand.

```
<vegas: vegas gaussian test func: TBP>≡
  procedure, public :: evaluate => vegas_gaussian_evaluate

<vegas: tests>+≡
  real(default) function vegas_gaussian_evaluate (self, x) result (f)
    class(vegas_gaussian_test_func_t), intent(inout) :: self
    real(default), dimension(:), intent(in) :: x
    real(default), parameter :: inv_sqrt_pi = 1._default / sqrt(pi)
    f = inv_sqrt_pi**size (x)
    f = f * exp (- dot_product(x, x))
  end function vegas_gaussian_evaluate
```

The third test function is a three-dimensional polynomial function which factorises. The function is defined in such a way that the integral in the unit range is normalised to zero.

$$f(x) = -\frac{8}{3}(x+1)*(y-1)*z \quad (19.6)$$

```

<vegas: test types>+≡
  type, extends (vegas_func_t) :: vegas_polynomial_func_t
  !
  contains
  <vegas: vegas polynomial func: TBP>
  end type vegas_polynomial_func_t

<vegas: vegas polynomial func: TBP>≡
  procedure, public :: evaluate => vegas_polynomial_evaluate

<vegas: tests>+≡
  real(default) function vegas_polynomial_evaluate (self, x) result (f)
    class(vegas_polynomial_func_t), intent(inout) :: self
    real(default), dimension(:), intent(in) :: x
    f = - 8. / 3. * (x(1) + 1.) * (x(2) - 1.) * x(3)
  end function vegas_polynomial_evaluate

```

## MC Integrator check

Initialise the VEGAS MC integrator and call to `vegas_init_grid` for the initialisation of the grid.

```

### 19.12.1 Type: `vamp2_func_t`

We extend `vegas_func_t` with the multi-channel weights and the `vegas_grid_t`, such that, the overall multi-channel weight can be calculated by the function itself.

We add an additional logical `valid_x`, if it is set to `.false.`, we do not compute weighted function and just set the weighted integrand to zero. This behavior is in particular very useful, if a mapping is prohibited or fails. Or in the case of WHIZARD, a phase cut is applied.

## 19.12.2 Type: `vamp2_config_t`

This is a transparent container which incorporates and extends the definitions in `vegas_config`. The parent object can then be used to parametrise the VEGAS grids directly, where the new parameters are exclusively used in the multi-channel implementation of VAMP2. `n_calls_min` is calculated by `n_calls_min_per_channel` and `n_channel`. The channels weights (and the result `n_calls` for each channel) are calculated regarding `n_calls_threshold`.

```

<vamp2: public>+≡
    public :: vamp2_config_t

```

```

<vamp2: types>+≡

```

Adapt. We adapt the weights due the contribution of variances with  $\beta > 0$ .

$$\alpha_i = \frac{\alpha_i V_i^\beta}{\sum_i \alpha_i V_i^\beta} \quad (19.8)$$

If `n.calls.threshold` is set, we rescale the weights in such a way, that the `n.calls` for each channel are greater than `n.calls.threshold`. We calculate the distance of the weights to the `weight_min` and reset those weights which are less than `weight_mins` to this value. The other values are accordingly resized to fit the boundary condition of the partition of unity.

```

end subroutine vamp2_reset_result

```

Integrate. We integrate each channel separately and combine the results

$$I = \sum_i \alpha_i I_i, \quad (19.9)$$

$$\sigma^2 = \sum_i \alpha_i^2 \sigma_i^2. \quad (19.10)$$

Although, the (population) variance is given by

$$\begin{aligned}
\sigma^2 &= \frac{1}{N} \left( \sum_i \alpha_i I_i^2 - I^2 \right) \\
&= \frac{1}{N-1} \left( \sum_i (N_i \sigma_i^2 + I_i^2) - I^2 \right) \\
&= \frac{1}{N-1} \left( \sum_i \alpha_i \sigma_i^2 + \alpha_i I_i^2 - I^2 \right),
\end{aligned} \tag{19.11}$$

where we used  $\sigma_i^2 = \frac{1}{N} (\langle I_i^2 \rangle - \langle I_i \rangle^2)$ , we use the approximation for numeric stability. The population variance relates to sample variance

$$s^2 = \frac{n}{n-1} \sigma^2, \tag{19.12}$$

which gives an unbiased error estimate.

Beside those adaption to multichannel, the overall processing of `total_integral`, `total_sq_integral` and `total_variance` is the same as in `vegas_integrate`.

Broadcast all a-priori weights. After setting the weights, we have to update the number of calls in each channel. Afterwards, we can collect the number of channels, which are not parallelized by VEGAS itself, `n_channel_non_parallel`.

```
<MPI: vamp2: vamp2 integrate: pre sampling>≡
```

```
  call MPI_Ibcast (self%weight, self%config%n_channel, MPI_DOUBLE_PRECISION, 0, &
    & MPI_COMM_WORLD, status)
  do ch = 1, self%config%n_channel
    grid = self%integrator(ch)%get_grid ()
    call grid%broadcast ()
    call self%integrator(ch)%set_grid (grid)
  end do
  call MPI_Wait (status, MPI_STATUS_IGNORE)
  call self%set_calls (self%config%n_calls)
```

We check on the parallelization state of the current VEGAS integrator. If VEGAS can not be parallelized on lowest level, we map the current channel to a rank and calculate the channel on that rank. On all other worker we just enhance the random-generator (when supported), see `vegas_integrate` for the details on the random-generator handling.

```
<MPI: vamp2: vamp2 integrate: sampling>≡
```

```
  if (.not. self%integrator(ch)%is_parallelizable ()) then
    worker = map_channel_to_worker (ch, n_size)

```

Prepare event generation. We have to set the channel weights and the grids for the integrand's object.

We use an ansatz proposed by the T. Ohl in the original VAMP code where we do not have to accept on

$$\frac{w_i(x)}{\max_{i,x} w_i(x)},$$

after we have selected a channel by the weights  $\alpha_i$ . But rather, we use a more efficient way where we rescale the channel weights  $\alpha_i$

$$\alpha_i \rightarrow \alpha_i \frac{\max_x w_i(x)}{\max_{i,x} w_i(x)}.$$

The overall magic is to insert a "1" and to move the uneasy part into the channel selection, such that we can generate events likewise in the single channel mode. We generate an unweighted event by

$$\frac{w_i(x)}{\max_x w_i(x)},$$

after we have selected a channel by the rescaled event channel weights. The overall normalization  $\max_{i,x}$  is not needed because we normalize the event channel weights to one and therefore the overall normalization cancels.

## Chapter 20

# Multi-Channel Integration

The abstract representation of multi-channel Monte Carlo algorithms for integration and event generation.

**Module `mci_base`:** The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

**`iterations`** Container for defining integration call and pass settings.

**`integration_results`** This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

These are the implementations:

**Module `mci_midpoint`:** A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

**Module `mci_vamp`:** Interface for the VAMP package.

Figure 20.1: Module dependencies in `src/mci`.

## 20.1 Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

```
<mci_base.f90>≡  
  <File header>  
  
  module mci_base  
  
    use kinds  
    use io_units  
    use format_utils, only: pac_fmt  
    use format_defs, only: FMT_14, FMT_17  
    use diagnostics  
    use cputime  
    use phs_base  
    use rng_base  
  
    <Standard module head>  
  
    <MCI base: public>  
  
    <MCI base: types>  
  
    <MCI base: interfaces>  
  
    contains  
  
    <MCI base: procedures>  
  
  end module mci_base
```

### 20.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as `rng`. It may or may not be used for integration. It will be used for event generation.

```
<MCI base: public>≡  
  public :: mci_t  
  
<MCI base: types>≡  
  type, abstract :: mci_t  
    integer :: n_dim = 0
```

                "Integrator:", &
                mci%n_channel, "channels,", &
                mci%n_dim, "dimensions"
        end if
        call msg_message (unit = unit)
    end subroutine mci_startup_message

```

Dump type-specific info to a logfile.

```

<MCI base: mci: TBP>+≡
    procedure(mci_write_log_entry), deferred :: write_log_entry

<MCI base: interfaces>≡
    abstract interface

```

```

subroutine mci_write_log_entry (mci, u)
  import
  class(mci_t), intent(in) :: mci
  integer, intent(in) :: u
end subroutine mci_write_log_entry
end interface

```

In order to avoid dependencies on definite MCI implementations, we introduce a MD5 sum calculator.

```

⟨MCI base: mci: TBP⟩+≡
  procedure(mci_compute_md5sum), deferred :: compute_md5sum
⟨MCI base: interfaces⟩+≡
  abstract interface
    subroutine mci_compute_md5sum (mci, pacify)
      import
      class(mci_t), intent(inout) :: mci
      logical, intent(in), optional :: pacify
    end subroutine mci_compute_md5sum
  end interface

```

Record the index of the MCI object within a process. For multi-component processes with more than one integrator, the integrator should know about its own index, so file names can be unique, etc. The default implementation does nothing, however.

```

⟨MCI base: mci: TBP⟩+≡
  procedure :: record_index => mci_record_index
⟨MCI base: procedures⟩+≡
  subroutine mci_record_index (mci, i_mci)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: i_mci
  end subroutine mci_record_index

```

There is no Initializer for the abstract type, but a generic setter for the number of channels and dimensions. We make two aliases available, to be able to override it.

```

⟨MCI base: mci: TBP⟩+≡
  procedure :: set_dimensions => mci_set_dimensions
  procedure :: base_set_dimensions => mci_set_dimensions
⟨MCI base: procedures⟩+≡
  subroutine mci_set_dimensions (mci, n_dim, n_channel)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: n_dim
    integer, intent(in) :: n_channel
    mci%n_dim = n_dim
    mci%n_channel = n_channel
  end subroutine mci_set_dimensions

```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_flat_dimensions (mci, dim_flat)
      import
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_declare_flat_dimensions
  end interface

```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_equivalences), deferred :: declare_equivalences

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_equivalences (mci, channel, dim_offset)
      import
      class(mci_t), intent(inout) :: mci
      type(phs_channel_t), dimension(:), intent(in) :: channel
      integer, intent(in) :: dim_offset
    end subroutine mci_declare_equivalences
  end interface

```

Declare particular channels as chained together. The implementation may use this array for keeping their weights equal to each other, etc.

The chain array is an array sized by the number of channels. For each channel, there is an integer entry that indicates the corresponding chains. The total number of chains is the maximum value of this entry.

```

<MCI base: mci: TBP>+≡
  procedure :: declare_chains => mci_declare_chains

<MCI base: procedures>+≡
  subroutine mci_declare_chains (mci, chain)
    class(mci_t), intent(inout) :: mci
    integer, dimension(:), intent(in) :: chain
    allocate (mci%chain (size (chain)))
    mci%n_chain = maxval (chain)
    allocate (mci%chain_weights (mci%n_chain), source = 0._default)
    mci%chain = chain
  end subroutine mci_declare_chains

```

Collect channel weights according to chains and store them in the `chain_weights` for output. We sum up the weights for all channels that share the same `chain` index and store the results in the `chain_weights` array.

```

(MCI base: mci: TBP)+≡
  procedure :: collect_chain_weights => mci_collect_chain_weights

(MCI base: procedures)+≡
  subroutine mci_collect_chain_weights (mci, weight)
    class(mci_t), intent(inout) :: mci
    real(default), dimension(:), intent(in) :: weight
    integer :: i, c
    if (allocated (mci%chain)) then
      mci%chain_weights = 0
      do i = 1, size (mci%chain)
        c = mci%chain(i)
        mci%chain_weights(c) = mci%chain_weights(c) + weight(i)
      end do
    end if
  end subroutine mci_collect_chain_weights

```

Check if there are chains.

```

(MCI base: mci: TBP)+≡
  procedure :: has_chains => mci_has_chains

(MCI base: procedures)+≡
  function mci_has_chains (mci) result (flag)
    class(mci_t), intent(in) :: mci
    logical :: flag
    flag = allocated (mci%chain)
  end function mci_has_chains

```

Output of the chain weights, kept separate from the main `write` method.

    logical, intent(in), optional :: pacify
    class(mci_results_t), intent(inout), optional :: results
  end subroutine mci_integrate
end interface

```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box `simulate` method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has `intent(inout)` for the `mci` passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the `mci` record.

```

(MCI base: mci: TBP)+≡
  procedure (mci_prepare_simulation), deferred :: prepare_simulation

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_prepare_simulation (mci)
    import
    class(mci_t), intent(inout) :: mci
  end subroutine mci_prepare_simulation
end interface

```

The generated event will reside in in the `instance` object (overall results and weight) and in the `sampler` object (detailed data). In the real application, we can subsequently call methods of the `sampler` in order to further process the generated event.

The `target` attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

```

(MCI base: mci: TBP)+≡
  procedure (mci_generate), deferred :: generate_weighted_event
  procedure (mci_generate), deferred :: generate_unweighted_event

```

```

<MCI base: interfaces>+≡

### 20.1.2 MCI instance

The base type contains an array of channel weights. The value `mci_weight` is the combined MCI weight that corresponds to a particular sampling point.

For convenience, we also store the `x` and Jacobian values for this sampling point.

```

<MCI base: public>+≡

```

```

    public :: mci_instance_t
<MCI base: types>+≡
    type, abstract :: mci_instance_t
        logical :: valid = .false.
        real(default), dimension(:), allocatable :: w
        real(default), dimension(:), allocatable :: f
        real(default), dimension(:,:), allocatable :: x
        integer :: selected_channel = 0
        real(default) :: mci_weight = 0
        real(default) :: integrand = 0
        logical :: negative_weights = .false.
    contains
        <MCI base: mci instance: TBP>
    end type mci_instance_t

```

Output: deferred

```

<MCI base: mci instance: TBP>≡
    procedure (mci_instance_write), deferred :: write
<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_write (object, unit, pacify)
            import
            class(mci_instance_t), intent(in) :: object
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: pacify
        end subroutine mci_instance_write
    end interface

```

A finalizer, just in case.

```

<MCI base: mci instance: TBP>+≡
    procedure (mci_instance_final), deferred :: final
<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_instance_final (object)
            import
            class(mci_instance_t), intent(inout) :: object
        end subroutine mci_instance_final
    end interface

```

Init: basic initializer for the arrays, otherwise deferred. Assigning the mci object is also deferred, because it depends on the concrete type.

The weights are initialized with an uniform normalized value.

```

<MCI base: mci instance: TBP>+≡
    procedure (mci_instance_base_init), deferred :: init
    procedure :: base_init => mci_instance_base_init
<MCI base: procedures>+≡

        allocate (mci_instance%w (mci%n_channel))

```

```

allocate (mci_instance%f (mci%n_channel))
allocate (mci_instance%x (mci%n_dim, mci%n_channel))
if (mci%n_channel > 0) then
  call mci_instance%set_channel_weights &
    (spread (1._default, dim=1, ncopies=mci%n_channel))
end if
mci_instance%f = 0
mci_instance%x = 0
end subroutine mci_instance_base_init

```

Explicitly set the array of channel weights.

*<MCI base: mci instance: TBP>+≡*

```

procedure :: set_channel_weights => mci_instance_set_channel_weights

```

*<MCI base: procedures>+≡*

```

subroutine mci_instance_set_channel_weights (mci_instance, weights, sum_non_zero)
  class(mci_instance_t), intent(inout) :: mci_instance
  real(default), dimension(:), intent(in) :: weights
  logical, intent(out), optional :: sum_non_zero
  real(default) :: wsum
  wsum = sum (weights)
  if (wsum /= 0) then
    mci_instance%w = weights / wsum
    if (present (sum_non_zero)) sum_non_zero = .true.
  else
    if (present (sum_non_zero)) sum_non_zero = .false.
    call msg_warning ("MC sampler initialization:&
      & sum of channel weights is zero")
  end if
end subroutine mci_instance_set_channel_weights

```

Compute the overall weight factor for a configuration of  $x$  values and Jacobians  $f$ . The  $x$  values come in `n_channel` rows with `n_dim` entries each. The  $f$  factors constitute an array with `n_channel` entries.

We assume that the  $x$  and  $f$  arrays are already stored inside the MC instance. The result is also stored there.

*<MCI base: mci instance: TBP>+≡*

```

procedure (mci_instance_compute_weight), deferred :: compute_weight

```

*<MCI base: interfaces>+≡*

```

abstract interface
  subroutine mci_instance_compute_weight (mci, c)
    import
    class(mci_instance_t), intent(inout) :: mci
    integer, intent(in) :: c
  end subroutine mci_instance_compute_weight
end interface

```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

*<MCI base: mci instance: TBP>+≡*

```

    procedure (mci_instance_record_integrand), deferred :: record_integrand
  <MCI base: interfaces>+≡
    abstract interface
      subroutine mci_instance_record_integrand (mci, integrand)
        import
        class(mci_instance_t), intent(inout) :: mci
        real(default), intent(in) :: integrand
      end subroutine mci_instance_record_integrand
    end interface

```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

```

  <MCI base: mci instance: TBP>+≡
    procedure :: evaluate => mci_instance_evaluate
  <MCI base: procedures>+≡
    subroutine mci_instance_evaluate (mci, sampler, c, x)
      class(mci_instance_t), intent(inout) :: mci
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x
      real(default) :: val
      call sampler%evaluate (c, x, val, mci%x, mci%f)
      mci%valid = sampler%is_valid ()
      if (mci%valid) then
        call mci%compute_weight (c)
        call mci%record_integrand (val)
      end if
    end subroutine mci_instance_evaluate

```

Initiate and terminate simulation. In contrast to integration, we implement these as methods of the process instance, since the `mci` configuration object is unchanged.

The safety factor reduces the acceptance probability for unweighted events. The implementation of this feature depends on the concrete type.

```

  <MCI base: mci instance: TBP>+≡
    procedure (mci_instance_init_simulation), deferred :: init_simulation
    procedure (mci_instance_final_simulation), deferred :: final_simulation
  <MCI base: interfaces>+≡
    abstract interface
      subroutine mci_instance_init_simulation (instance, safety_factor)
        import
        class(mci_instance_t), intent(inout) :: instance
        real(default), intent(in), optional :: safety_factor
      end subroutine mci_instance_init_simulation
    end interface

```

```

abstract interface
  subroutine mci_instance_final_simulation (instance)
    import
    class(mci_instance_t), intent(inout) :: instance
  end subroutine mci_instance_final_simulation
end interface

```

Assuming that the sampler is in a completely defined state, just extract the data that `evaluate` would compute. Also record the integrand.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: fetch => mci_instance_fetch

⟨MCI base: procedures⟩+≡
  subroutine mci_instance_fetch (mci, sampler, c)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(in) :: sampler
    integer, intent(in) :: c
    real(default) :: val
    mci%valid = sampler%is_valid ()
    if (mci%valid) then
      call sampler%fetch (val, mci%x, mci%f)
      call mci%compute_weight (c)
      call mci%record_integrand (val)
    end if
  end subroutine mci_instance_fetch

```

The value, i.e., the weighted integrand, is the integrand (which should be taken as-is from the sampler) multiplied by the MCI weight.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_value => mci_instance_get_value

⟨MCI base: procedures⟩+≡
  function mci_instance_get_value (mci) result (value)
    class(mci_instance_t), intent(in) :: mci
    real(default) :: value
    if (mci%valid) then
      value = mci%integrand * mci%weight
    else
      value = 0
    end if
  end function mci_instance_get_value

```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_event_weight => mci_instance_get_value

```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized

in the same way as the event weight above (which for unweighted events becomes unity).

```

<MCI base: mci instance: TBP>+≡
  procedure (mci_instance_get_event_excess), deferred :: get_event_excess

<MCI base: interfaces>+≡
  abstract interface
    function mci_instance_get_event_excess (mci) result (excess)
      import
      class(mci_instance_t), intent(in) :: mci
      real(default) :: excess
    end function mci_instance_get_event_excess
  end interface

```

### 20.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

```

<MCI base: public>+≡
  public :: mci_state_t

<MCI base: types>+≡
  type :: mci_state_t
    integer :: selected_channel = 0
    real(default), dimension(:), allocatable :: x_in
    real(default) :: val
  contains
    <MCI base: mci state: TBP>
  end type mci_state_t

```

Output:

```

<MCI base: mci state: TBP>≡
  procedure :: write => mci_state_write

<MCI base: procedures>+≡
  subroutine mci_state_write (object, unit)
    class(mci_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "MCI state:"
    write (u, "(3x,A,I0)") "Channel   = ", object%selected_channel
    write (u, "(3x,A,999(1x,F12.10))") "x (in)   = ", object%x_in
    write (u, "(3x,A,ES19.12)") "Integrand = ", object%val
  end subroutine mci_state_write

```

```
end subroutine mci_state_write
```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

```
<MCI base: mci instance: TBP>+=
  procedure :: store => mci_instance_store

<MCI base: procedures>+=
  subroutine mci_instance_store (mci, state)
    class(mci_instance_t), intent(in) :: mci
    class(mci_state_t), intent(out) :: state
    state%selected_channel = mci%selected_channel
    allocate (state%x_in (size (mci%x, 1)))
    state%x_in = mci%x(:,mci%selected_channel)
    state%val = mci%integrand
  end subroutine mci_instance_store
```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

```
<MCI base: mci instance: TBP>+=
  procedure :: recall => mci_instance_recall

<MCI base: procedures>+=
  subroutine mci_instance_recall (mci, sampler, state)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    class(mci_state_t), intent(in) :: state
    if (size (state%x_in) == size (mci%x, 1) &
        .and. state%selected_channel <= size (mci%x, 2)) then
      call sampler%rebuild (state%selected_channel, &
        state%x_in, state%val, mci%x, mci%f)
      call mci%compute_weight (state%selected_channel)
      call mci%record_integrand (state%val)
    else
      call msg_fatal ("Recalling event: mismatch in channel or dimension")
    end if
  end subroutine mci_instance_recall
```

#### 20.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of  $x$  MC parameter values, a the complete set of  $x$  values and associated Jacobian factors  $f$  for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

```

<MCI base: public>+≡
  public :: mci_sampler_t
<MCI base: types>+≡
  type, abstract :: mci_sampler_t
  contains
    <MCI base: mci_sampler: TBP>
  end type mci_sampler_t

```

Output, deferred to the implementation.

```

<MCI base: mci_sampler: TBP>≡
  procedure (mci_sampler_write), deferred :: write
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_write (object, unit, testflag)
      import
        class(mci_sampler_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
    end subroutine mci_sampler_write
  end interface

```

The evaluation routine. Input is the channel index `c` and the one-dimensional parameter array `x_in`. Output are the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_evaluate), deferred :: evaluate
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
      import
        class(mci_sampler_t), intent(inout) :: sampler
        integer, intent(in) :: c
        real(default), dimension(:), intent(in) :: x_in
        real(default), intent(out) :: val
        real(default), dimension(:,:), intent(out) :: x
        real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_evaluate
  end interface

```

Query the validity of the sampling point. Can be called after `evaluate`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_is_valid), deferred :: is_valid
<MCI base: interfaces>+≡
  abstract interface
    function mci_sampler_is_valid (sampler) result (valid)
      import
        class(mci_sampler_t), intent(in) :: sampler
        logical :: valid

```

```

        end function mci_sampler_is_valid
    end interface

```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

```

⟨MCI base: mci_sampler: TBP⟩+≡
    procedure (mci_sampler_rebuild), deferred :: rebuild

⟨MCI base: interfaces⟩+≡
    abstract interface
        subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
            import
            class(mci_sampler_t), intent(inout) :: sampler
            integer, intent(in) :: c
            real(default), dimension(:), intent(in) :: x_in
            real(default), intent(in) :: val
            real(default), dimension(:,:), intent(out) :: x
            real(default), dimension(:), intent(out) :: f
        end subroutine mci_sampler_rebuild
    end interface

```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

⟨MCI base: mci_sampler: TBP⟩+≡
    procedure (mci_sampler_fetch), deferred :: fetch

⟨MCI base: interfaces⟩+≡
    abstract interface
        subroutine mci_sampler_fetch (sampler, val, x, f)
            import
            class(mci_sampler_t), intent(in) :: sampler
            real(default), intent(out) :: val
            real(default), dimension(:,:), intent(out) :: x
            real(default), dimension(:), intent(out) :: f
        end subroutine mci_sampler_fetch
    end interface

```

### 20.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

```

⟨MCI base: public⟩+≡
    public :: mci_results_t

⟨MCI base: types⟩+≡
    type, abstract :: mci_results_t
        contains
        ⟨MCI base: mci_results: TBP⟩

```

```
end type mci_results_t
```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

```
(MCI base: mci_results: TBP)≡
  procedure (mci_results_write), deferred :: write
  procedure (mci_results_write_verbose), deferred :: write_verbose

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_results_write (object, unit, suppress)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: suppress
    end subroutine mci_results_write

    subroutine mci_results_write_verbose (object, unit)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine mci_results_write_verbose
  end interface
```

This is the generic `record` method, which can be called directly from the integrator. The `record_extended` procedure store additionally the valid calls, positive and negative efficiency.

```
(MCI base: mci_results: TBP)+≡
  generic :: record => record_simple, record_extended
  procedure (mci_results_record_simple), deferred :: record_simple
  procedure (mci_results_record_extended), deferred :: record_extended

(MCI base: interfaces)+≡
  abstract interface
    subroutine mci_results_record_simple (object, n_it, &
      n_calls, integral, error, efficiency, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      real(default), intent(in) :: integral
      real(default), intent(in) :: error
      real(default), intent(in) :: efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      logical, intent(in), optional :: suppress
    end subroutine mci_results_record_simple

    subroutine mci_results_record_extended (object, n_it, n_calls,&
      & n_calls_valid, integral, error, efficiency, efficiency_pos,&
      & efficiency_neg, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
```

```

        integer, intent(in) :: n_calls_valid
        real(default), intent(in) :: integral
        real(default), intent(in) :: error
        real(default), intent(in) :: efficiency
        real(default), intent(in) :: efficiency_pos
        real(default), intent(in) :: efficiency_neg
        real(default), dimension(:), intent(in), optional :: chain_weights
        logical, intent(in), optional :: suppress
    end subroutine mci_results_record_extended
end interface

```

## Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

        call instance%recall (sampler, state)
      end select
  end subroutine mci_test_rebuild_event

```

### Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions  $g_i$  smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have  $n$  mappings of the unit hypercube

$$x = x(x^{(k)}) \quad \text{where } x = (x_1, \dots). \quad (20.1)$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \quad (20.2)$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \quad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \quad (20.3)$$

and weights

$$w_k \quad \text{with} \quad \sum_k w_k = 1 \quad (20.4)$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \quad (20.5)$$

which also satisfies

$$\int g(x) dx = 1. \quad (20.6)$$

The algorithm implements a resolution of unity as follows

$$\begin{aligned}
1 &= \int dx = \int \frac{g(x)}{g(x)} dx \\
&= \sum_k w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\
&= \sum_k w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x(x^{(k)}))}
\end{aligned} \quad (20.7)$$

where each of the integrals in the sum is evaluated using the channel-specific variables  $x^{(k)}$ .

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$\begin{aligned} x(x^{(1)}) &= (x_1^{(1)}, x_2^{(1)}) \\ x(x^{(2)}) &= (x_1^{(2)2}, x_2^{(2)}) \end{aligned} \quad (20.8)$$

hence

$$f^{(1)} \equiv 1, \quad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \quad (20.9)$$

The probability functions are

$$g^{(1)} \equiv 1, \quad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \quad (20.10)$$

In the concrete implementation of the integrator instance we store values for the channel probabilities  $g_i$  and the accumulated probability  $g$ .

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

    real(default) :: excess
    excess = 0
end function mci_test_instance_get_event_excess

```

## Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to  $x_1 = x_1^{(2)2}$ , so we have  $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$ .

For display purposes, we store the return values inside the object. This is not strictly necessary.

```

end subroutine mci_base_8

```

## 20.2 Iterations

This module defines a container for the list of iterations and calls, to be submitted to integration.

*<iterations.f90>*≡  
*<File header>*

```

module iterations

```

*<Use kinds>*

*<Use strings>*

```

  use io_units

```

```

  use diagnostics

```

*<Standard module head>*

*<Iterations: public>*

*<Iterations: types>*

```

contains

```

*<Iterations: procedures>*

```

end module iterations

```

### 20.2.1 The iterations list

Each integration pass has a number of iterations and a number of calls per iteration. The last pass produces the end result; the previous passes are used for adaptation.

The flags `adapt_grid` and `adapt_weight` are used only if `custom_adaptation` is set. Otherwise, default settings are used that depend on the integration pass.

*<Iterations: types>*≡

```

type :: iterations_spec_t
  private
  integer :: n_it = 0
  integer :: n_calls = 0
  logical :: custom_adaptation = .false.
  logical :: adapt_grids = .false.
  logical :: adapt_weights = .false.
end type iterations_spec_t

```

We build up a list of iterations.

```

<Iterations: public>≡
    public :: iterations_list_t

<Iterations: types>+≡
    type :: iterations_list_t
        private
            integer :: n_pass = 0
            type(iterations_spec_t), dimension(:), allocatable :: pass
        contains
            <Iterations: iterations list: TBP>
        end type iterations_list_t

```

Initialize an iterations list. For each pass, we have to specify the number of iterations and calls. We may provide the adaption conventions explicitly, either as character codes or as logicals.

For passes where the adaptation conventions are not specified, we use the following default setting: adapt weights and grids for all passes except the last one.

```

<Iterations: iterations list: TBP>≡
    procedure :: init => iterations_list_init

<Iterations: procedures>≡
    subroutine iterations_list_init &
        (it_list, n_it, n_calls, adapt, adapt_code, adapt_grids, adapt_weights)
        class(iterations_list_t), intent(inout) :: it_list
        integer, dimension(:), intent(in) :: n_it, n_calls
        logical, dimension(:), intent(in), optional :: adapt
        type(string_t), dimension(:), intent(in), optional :: adapt_code
        logical, dimension(:), intent(in), optional :: adapt_grids, adapt_weights
        integer :: i
        it_list%n_pass = size (n_it)
        if (allocated (it_list%pass)) deallocate (it_list%pass)
        allocate (it_list%pass (it_list%n_pass))
        it_list%pass%n_it = n_it
        it_list%pass%n_calls = n_calls
        if (present (adapt)) then
            it_list%pass%custom_adaptation = adapt

```

## 20.3 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

```

<integration_results.f90>≡
module integration_results

  <Use kinds>
  <Use strings>
  use io_units
  use format_utils, only: mp_format, pac_fmt
  use format_defs, only: FMT_10, FMT_14
  use diagnostics
  use md5
  use os_interface
  use mci_base

  <Standard module head>

  <Integration results: public>

  <Integration results: parameters>

  <Integration results: types>

  <Integration results: interfaces>

contains

```

*<Integration results: procedures>*

```
end module integration_results
```

### 20.3.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of PRC\_UNKNOWN.

The additional information `n_calls_valid`, `efficiency_pos` and `efficiency_neg` are stored, but only used in verbose mode.

*<Integration results: public>*≡

```
public :: integration_entry_t
```

*<Integration results: types>*≡

```
type :: integration_entry_t
  private
  integer :: process_type = PRC_UNKNOWN
  integer :: pass = 0
  integer :: it = 0
  integer :: n_it = 0
  integer :: n_calls = 0
  integer :: n_calls_valid = 0
  logical :: improved = .false.
  real(default) :: integral = 0
  real(default) :: error = 0
  real(default) :: efficiency = 0
  real(default) :: efficiency_pos = 0
  real(default) :: efficiency_neg = 0
  real(default) :: chi2 = 0
  real(default), dimension(:), allocatable :: chain_weights

### 20.3.2 Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily compute averages.

We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

```

<Integration results: public>+≡
  public :: integration_results_t

<Integration results: types>+≡
  type, extends (mci_results_t) :: integration_results_t
  private
  integer :: process_type = PRC_UNKNOWN
  integer :: current_pass = 0
  integer :: n_pass = 0
  integer :: n_it = 0
  logical :: screen = .false.
  integer :: unit = 0
  integer :: verbosity = 0
  real(default) :: error_threshold = 0
  type(integration_entry_t), dimension(:), allocatable :: entry
  type(integration_entry_t), dimension(:), allocatable :: average
  contains
  <Integration results: integration results: TBP>
end type integration_results_t

```

The array is extended in chunks of 10 entries.

```

<Integration results: parameters>+≡
  integer, parameter :: RESULTS_CHUNK_SIZE = 10

```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

```

<Integration results: integration results: TBP>≡
  procedure :: init => integration_results_init

```

```

<Integration results: procedures>+≡
  subroutine integration_results_init (results, process_type)
    class(integration_results_t), intent(out) :: results
    integer, intent(in) :: process_type
    results%process_type = process_type
    results%n_pass = 0
    results%n_it = 0
    allocate (results%entry (RESULTS_CHUNK_SIZE))
    allocate (results%average (RESULTS_CHUNK_SIZE))
  end subroutine integration_results_init

```

Set verbose output of the integration results. In verbose mode, valid calls, negative as positive efficiency will be printed.

```

<Integration results: integration results: TBP>+≡
  procedure :: set_verbosity => integration_results_set_verbosity

```

```

<Integration results: procedures>+≡
  subroutine integration_results_set_verbosity (results, verbosity)
    class(integration_results_t), intent(inout) :: results
    integer, intent(in) :: verbosity
    results%verbosity = verbosity
  end subroutine integration_results_set_verbosity

```

Set additional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

```

<Integration results: integration results: TBP>+≡
  procedure :: set_error_threshold => integration_results_set_error_threshold

<Integration results: procedures>+≡
  subroutine integration_results_set_error_threshold (results, error_threshold)

```

During integration, we do not want to print all results at once, but each intermediate result as soon as we get it. Thus, the previous procedure is chopped in pieces. First piece: store the output unit and a flag whether we want to print to standard output as well. Then write the header if the results are still empty, i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

    end subroutine integration_results_record_extended

```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the  $\chi^2$  value.

All error distributions are assumed Gaussian, of course. The  $\chi^2$  value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

```

    <MCI none: types>  
  
    contains  
  
    <MCI none: procedures>  
  
  end module mci_none
```

### 20.4.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This is required for event generation.

```
<MCI none: public>≡  
  public :: mci_none_t

call mci%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: mci_none_1"

end subroutine mci_none_1

```

## 20.5 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order  $h^2$ , where  $h$  is the bin width. Given that  $h = N^{-1/d}$ , where  $d$  is the integration dimension and  $N$  is the total number of sampling points, we get a relative error of order  $N^{-2/d}$ . This is superior to MC integration if  $d < 4$ , and equivalent if  $d = 4$ . It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

```
<mci_midpoint.f90>≡  
  <File header>  
  
  module mci_midpoint  
  
    <Use kinds>  
    use io_units  
    use diagnostics  
    use phs_base  
  
    use mci_base  
  
    <Standard module head>  
  
    <MCI midpoint: public>  
  
    <MCI midpoint: types>  
  
    contains  
  
    <MCI midpoint: procedures>  
  
  end module mci_midpoint
```

### 20.5.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This is required for event generation.

```
<MCI midpoint: public>≡  
  public :: mci_midpoint_t  
  
<MCI midpoint: types>≡  
  type, extends (mci_t) :: mci_midpoint_t

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

## Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function  $f(x) = 3x^2$  with integral  $\int_0^1 f(x) dx = 1$  and maximum  $f(1) = 3$ . If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can fetch results.

*<MCI midpoint: test types>*≡

type, extends (mci\_sampler\_t) :: test\_sampler\_1\_t

real(default), dimension(:), allocatable :: x

real(default) :: val

contains

*<MCI midpoint: test sampler 1: TBP>*

end type test\_sampler\_1\_t

Output: There is nothing stored inside, so just print an informative line.

*<MCI midpoint: test sampler 1: TBP>*≡

procedure :: write => test\_sampler\_1\_write

*<MCI midpoint: tests>*≡

subroutine test\_sampler\_1\_write (object, unit, testflag)

class(test\_sampler\_1\_t), intent(in) :: object

integer, intent(in), optional :: unit

logical, intent(in), optional :: testflag

integer :: u

u = given\_output\_unit (unit)

write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"

end subroutine test\_sampler\_1\_write

Evaluation: compute the function value. The output  $x$  parameter (only one channel) is identical to the input  $x$ , and the Jacobian is 1.

## 20.6 VAMP interface

The standard method for integration is **VAMP**: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic **VAMP** algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

Generate weighted event. Note that the event weight (`vamp_weight`) is not just the MCI weight. `vamp_next_event` selects a channel based on the channel weights multiplied by the (previously recorded) maximum integrand value of the channel. The MCI weight is renormalized accordingly, to cancel this effect on the result.

## 20.6.5 Sampler as Workspace

In the full setup, the sampling function requires the process instance object as workspace. We implement this by (i) implementing the process instance as a

type extension of the abstract `sampler_t` object used by the MCI implementation and (ii) providing such an object as an extra argument to the sampling function that VAMP can call. To minimize cross-package dependencies, we use an abstract type `vamp_workspace` that VAMP declares and extend this by including a pointer to the `sampler` and `instance` objects. In the body of the sampling function, we dereference this pointer and can then work with the contents.

```

<MCI vamp: types>+≡
  type, extends (vamp_data_t) :: mci_workspace_t
    class(mci_sampler_t), pointer :: sampler => null ()
    class(mci_vamp_instance_t), pointer :: instance => null ()
  end type mci_workspace_t

```

## 20.6.6 Integrator instance

The history entries should point to the corresponding history entry in the `pass_t` object. If there is none, we may allocate a local history, which is then just transient.

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set `reshape` if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together with the MCI instance object.

Integration: sample the VAMP grids. The number of calls etc. are already stored inside the grids. We provide the random-number generator, the sampling function, and a link to the workspace object, which happens to contain a pointer to the sampler object. The sampler object thus becomes the workspace of the sampling function.

Note: in the current implementation, the random-number generator must be the TAO generator. This explicit dependence should be removed from the VAMP implementation.

    end subroutine mci_vamp_instance_final_simulation

```

## 20.6.7 Sampling function

The VAMP sampling function has a well-defined interface which we have to implement. The `data` argument allows us to pass pointers to the `sampler` and `instance` objects, so we can access configuration data and fill point-dependent contents within these objects.

The `weights` and `channel` argument must be present in the call.

Note: we would normally declare the `instance` pointer with the concrete type, or just use the `data` component directly. Unfortunately, gfortran 4.6 forgets the inherited base-type methods in that case.

Note: this is the place where we must look for external signals, i.e., interrupt from the OS. We would like to raise a VAMP exception which is then caught by `vamp_sample_grids` as the caller, so it dumps its current state and returns (with the signal still pending). WHIZARD will then terminate gracefully. Of course, VAMP should be able to resume from the dump.

In the current implementation, we handle the exception in place and terminate immediately. The incomplete current integration pass is lost.

```

<MCI vamp: procedures>+≡
    function vamp_sampling_function &
        (xi, data, weights, channel, grids) result (f)
        real(default) :: f
        real(default), dimension(:), intent(in) :: xi
        class(vamp_data_t), intent(in) :: data
        real(default), dimension(:), intent(in), optional :: weights
        integer, intent(in), optional :: channel

```

```

type(vamp_grid), dimension(:), intent(in), optional :: grids
type(exception) :: exc
logical :: verbose
character(*), parameter :: FN = "WHIZARD sampling function"
class(mci_instance_t), pointer :: instance
select type (data)
type is (mci_workspace_t)
    instance => data%instance
    select type (instance)
    class is (mci_vamp_instance_t)
        verbose = instance%mci%verbose
        call instance%evaluate (data%sampler, channel, xi)
        if (signal_is_pending ()) then
            call raise_exception (exc, EXC_FATAL, FN, "signal received")
            call handle_vamp_exception (exc, verbose)
            call terminate_now_if_signal ()
        end if
        instance%calls = instance%calls + 1
        if (data%sampler%is_valid ()) &
            & instance%calls_valid = instance%calls_valid + 1
        f = instance%get_value ()
        call terminate_now_if_single_event ()
    class default
        call msg_bug("VAMP: " // FN // ": unknown MCI instance type")
    end select
end select
end function vamp_sampling_function

```

This is supposed to be the mapping between integration channels. The VAMP event generating procedures technically require it, but it is meaningless in our setup where all transformations happen inside the sampler object. So, this implementation is trivial:

```

⟨MCI vamp: procedures⟩+≡
pure function phi_trivial (xi, channel_dummy) result (x)
    real(default), dimension(:), intent(in) :: xi
    integer, intent(in) :: channel_dummy
    real(default), dimension(size(xi)) :: x
    x = xi
end function phi_trivial

```

## 20.6.8 Integrator instance: evaluation

Here, we compute the multi-channel reweighting factor for the current channel, that accounts for the Jacobians of the transformations from/to all other channels.

The computation of the VAMP probabilities may consume considerable time, therefore we enable parallel evaluation. (Collecting the contributions to `mci%g` is a reduction, which we should also implement via OpenMP.)

```

⟨MCI vamp: mci vamp instance: TBP⟩+≡
procedure :: compute_weight => mci_vamp_instance_compute_weight

```

```

<MCI vamp: procedures>+=
  subroutine mci_vamp_instance_compute_weight (mci, c)
    class(mci_vamp_instance_t), intent(inout) :: mci
    integer, intent(in) :: c
    integer :: i
    mci%selected_channel = c
    !$OMP PARALLEL PRIVATE(i) SHARED(mci)
    !$OMP DO
    do i = 1, mci%nc
      if (mci%w(i) /= 0) then
        mci%gi(i) = vamp_probability (mci%gids%gids(i), mci%x(:,i))
      else
        mci%gi(i) = 0
      end if
    end do
    !$OMP END DO
    !$OMP END PARALLEL
    mci%g = 0
    if (mci%gi(c) /= 0) then
      do i = 1, mci%nc
        if (mci%w(i) /= 0 .and. mci%f(i) /= 0) then
          mci%g = mci%g + mci%w(i) * mci%gi(i) / mci%f(i)
        end if
      end do
    end if
    if (mci%g /= 0) then
      mci%weight = mci%gi(c) / mci%g
    else
      mci%weight = 0
    end if
  end subroutine mci_vamp_instance_compute_weight

```

Record the integrand.

```

<MCI vamp: mci vamp instance: TBP>+=
  procedure :: record_integrand => mci_vamp_instance_record_integrand

<MCI vamp: procedures>+=
  subroutine mci_vamp_instance_record_integrand (mci, integrand)
    class(mci_vamp_instance_t), intent(inout) :: mci
    real(default), intent(in) :: integrand
    mci%integrand = integrand
  end subroutine mci_vamp_instance_record_integrand

```

Get the event weight. The default routine returns the same value that we would use for integration. This is correct if we select the integration channel according to the channel weight. `vamp_next_event` does differently, so we should rather rely on the weight that VAMP returns. This is the value stored in `vamp_weight`. We override the default TBP accordingly.

```

<MCI vamp: mci vamp instance: TBP>+=
  procedure :: get_event_weight => mci_vamp_instance_get_event_weight
  procedure :: get_event_excess => mci_vamp_instance_get_event_excess

<MCI vamp: procedures>+=

```

```

    value = mci%vamp_excess
  else
    call msg_bug ("VAMP: attempt to read undefined event excess weight")
  end if
end function mci_vamp_instance_get_event_excess

```

### 20.6.9 VAMP exceptions

A VAMP routine may have raised an exception. Turn this into a WHIZARD error message.

An external signal could raise a fatal exception, but this should be delayed and handled by the correct termination routine.

*(MCI vamp: procedures)+≡*

```

subroutine handle_vamp_exception (exc, verbose)
  type(exception), intent(in) :: exc
  logical, intent(in) :: verbose
  integer :: exc_level
  if (verbose) then
    exc_level = EXC_INFO
  else
    exc_level = EXC_ERROR
  end if
  if (exc%level >= exc_level) then
    write (msg_buffer, "(A,':',1x,A)" trim (exc%origin), trim (exc%message))
    select case (exc%level)
      case (EXC_INFO); call msg_message ()
      case (EXC_WARN); call msg_warning ()

```

## Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is  $f(x) = 3x^2$  with integral  $\int_0^1 f(x) dx = 1$  and maximum  $f(1) = 3$ . If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is  $11x^{10}$ , also with integral 1.

Mode 4 includes ranges of zero and negative function value, the integral is negative. The results should be identical to the results of `mci_midpoint_4`, where the same function is evaluated. The function is  $f(x) = (1 - 3x^2)\theta(x - 1/2)$  with integral  $\int_0^1 f(x) dx = -3/8$ , minimum  $f(1) = -2$  and maximum  $f(1/2) = 1/4$ .

```

<MCI vamp: test types>≡
type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
    integer :: mode = 1
contains
    <MCI vamp: test sampler 1: TBP>
end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI vamp: test sampler 1: TBP>≡

## Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \quad (20.11)$$

where

$$x = u^v \quad u = xy \quad (20.12)$$

$$y = u^{(1-v)} \quad v = \frac{1}{2} \left( 1 + \frac{\log(x/y)}{\log xy} \right) \quad (20.13)$$

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates  $x$  and  $y$ , while the second term is peaked along the diagonal  $x = y$ .

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \quad (20.14)$$

```

⟨MCI vamp: test types⟩+=

## Two-channel, one dimension test sampler

This sampler implements the function

$$f(x, y) = a * 5x^4 + b * 5(1 - x)^4 \quad (20.15)$$

Each term contributes 1 to the integral, multiplied by  $a$  or  $b$ , respectively. The first term is peaked at  $x = 1$ , the second one at  $x = 0$ .

We implement the two mappings

$$x = u^{1/5} \quad \text{and} \quad x = 1 - v^{1/5}, \quad (20.16)$$

with Jacobians

$$\frac{\partial(x)}{\partial(u)} = u^{-4/5}/5 \quad \text{and} \quad v^{-4/5}/5, \quad (20.17)$$

respectively. The first mapping concentrates points near  $x = 1$ , the second one near  $x = 0$ .

## 20.7 Multi-channel integration with VAMP2

The multi-channel integration uses VEGAS as backbone integrator. The base interface for the multi-channel integration is given by `mci_base` module.

We interface the VAMP2 interface given by `vamp2` module.

```

⟨mci_vamp2.f90⟩≡
  ⟨File header⟩

```

```

module mci_vamp2

```

```

  ⟨Use kinds⟩

```

```

  ⟨Use strings⟩

```

```

  use io_units

```

```

  use format_utils, only: pac_fmt

```

```

  use format_utils, only: write_separator, write_indent

```

```

  use format_defs, only: FMT_12, FMT_14, FMT_17, FMT_19

```

```

    use diagnostics
    use md5
    use phs_base
    use rng_base

    use mci_base

    use vegas, only: VEGAS_MODE_IMPORTANCE, VEGAS_MODE_IMPORTANCE_ONLY
    use vamp2

## 20.7.4 Integrator

We store the different passes of integration, adaptation and actual sampling, in a linked list.

We store the total number of calls `n_calls` and the minimal number of calls `n_calls_min`. The latter is calculated based on `n_channel` and `min_calls_per_channel`. If `n_calls` is smaller than `n_calls_min`, then we replace `n_calls` with `n_min_calls`.

Update the MCI record (i.e., the integration passes) by reading from input stream. The stream should contain a write output from a previous run. We first check the MD5 sum of the configuration parameters. If that matches, we proceed directly to the stored integration passes. If successful, we may continue to read the file; the position will be after a blank line that must follow the MCI record.

```

### Interface: VAMP2

We define the interfacing procedures, as such, initialising the VAMP2 integrator or resetting the results.

Initialise the VAMP2 integrator which is stored within the `mci` object, using the data of the current integration pass. Furthermore, reset the counters that track this set of integrator.

```

<MCI vamp2: mci vamp2: TBP>+≡
    procedure, public :: init_integrator => mci_vamp2_init_integrator

<MCI vamp2: procedures>+≡
    subroutine mci_vamp2_init_integrator (mci)

```

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations. We reinitialise the sampling new each time and set the workspace again. Note: we record the integral once per iteration. The integral stored in the mci record itself is the last integral of the current iteration, no averaging done. The results record may average results. Note: recording the efficiency is not supported yet.

## 20.7.6 Integrator instance

We store all information relevant for simulation. The event weight is stored, when a weighted event is generated, and the event excess, when a larger weight occurs than actual stored max. weight.

We give the possibility to rescale the `f_max` within the integrator object with `event_rescale_f_max`.

```

<MCI vamp2: public>+≡
  public :: mci_vamp2_instance_t

<MCI vamp2: types>+≡

    mci%integrand = integrand
    call mci%func%set_integrand (integrand)
  end subroutine mci_vamp2_instance_record_integrand

```

## Event simulation

In contrast to VAMP, we reset only counters and set the safety factor, which will then will be applied each time an event is generated. In that way we do not rescale the actual values in the integrator, but more the current value!

```

## Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is  $f(x) = 3x^2$  with integral  $\int_0^1 f(x) dx = 1$  and maximum  $f(1) = 3$ . If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is  $11x^{10}$ , also with integral 1.

Mode 4 includes ranges of zero and negative function value, the integral is negative. The results should be identical to the results of `mci_midpoint_4`, where the same function is evaluated. The function is  $f(x) = (1 - 3x^2)\theta(x - 1/2)$  with integral  $\int_0^1 f(x) dx = -3/8$ , minimum  $f(1) = -2$  and maximum  $f(1/2) = 1/4$ .

```

<MCI vamp2: test types>≡
type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
    integer :: mode = 1
contains
    <MCI vamp2: test sampler 1: TBP>
end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI vamp2: test sampler 1: TBP>≡
    procedure, public :: write => test_sampler_1_write

## Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \quad (20.19)$$

where

$$x = u^v \quad u = xy \quad (20.20)$$

$$y = u^{(1-v)} \quad v = \frac{1}{2} \left( 1 + \frac{\log(x/y)}{\log xy} \right) \quad (20.21)$$

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates  $x$  and  $y$ , while the second term is peaked along the diagonal  $x = y$ .

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \quad (20.22)$$

```

# Parton shower and interface to PYTHIA6

This is the code for the WHIZARD QCD parton shower for final state radiation (FSR) and initial state radiation (ISR) as well as the interface to the PYTHIA module for showering and hadronization.

### 21.1 Basics of the shower

```
<shower_base.f90>≡  
  <File header>  
  
  module shower_base  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use constants  
    use diagnostics  
    use format_utils, only: write_separator  
    use lorentz  
    use particles  
    use os_interface  
    use rng_base  
    use physics_defs  
    use sm_physics, only: running_as_lam  
    use particles  
    use variables  
    use model_data  
    use pdf  
    use tauola_interface  
  
    <Standard module head>  
  
    <Shower base: public>  
  
    <Shower base: parameters>
```

Figure 21.1: Module dependencies in `src/shower`.

```

    <Shower base: types>

    <Shower base: interfaces>

    contains

    <Shower base: procedures>

    end module shower_base

```

### 21.1.1 Shower implementations

```

    <Shower base: public>≡
        public :: PS_WHIZARD, PS_PYTHIA6, PS_PYTHIA8, PS_UNDEFINED

    <Shower base: parameters>≡
        integer, parameter :: PS_UNDEFINED = 0
        integer, parameter :: PS_WHIZARD = 1
        integer, parameter :: PS_PYTHIA6 = 2
        integer, parameter :: PS_PYTHIA8 = 3

    A dictionary

    <Shower base: public>+≡
        public :: shower_method_of_string

    <Shower base: procedures>≡
        elemental function shower_method_of_string (string) result (i)
            integer :: i
            type(string_t), intent(in) :: string
            select case (char(string))
            case ("WHIZARD")

```

        string = "PYTHIA8"
    case default
        string = "UNDEFINED"
    end select
end function shower_method_to_string

```

### 21.1.2 Shower settings

These the general shower settings, the settings and parameters for the matching are defined in the corresponding matching modules. The width and the cutoff of the Gaussian primordial  $k_t$  distribution, PARP(91) and PARP(93), in GeV, are called `isr_primordial_kt_width` and `isr_primordial_kt_cutoff` in WHIZARD. The parameter MSTJ(45) gives the maximum number of flavors in gluon decay to quarks, and is here called `max_n_flavors`.

The two parameters `isr_alphas_running` and `[fsr_alphas_running]` decide whether to use constant or running  $\alpha_s$  in the form of the function  $D_{\alpha_s}(t)$  for the FSR and ISR (MSTJ(44), MSTP(64)), respectively. The next parameter, `fixed_alpha_s` is the parameter PARU(111), which sets the value for constant  $\alpha_s$ , and the flag whether to use  $P_t$ -ordered ISR is `isr_pt_ordered`. From the entry `min_voirtuality` on, parameters have meanings both for the PYTHIA and WHIZARD parton shower(s), where PYTHIA values are denoted at the end of the line.

```

Mass and mass squared selection functions. All masses are in GeV. Light quarks are assumed to be ordered,  $m_1 < m_2 < m_3 \dots$ , and they get current masses, not elementary ones. Mesons and baryons other than proton and neutron are needed as beam-remnants. Particles with PDG number zero are taken massless, as well as proper beam remnants and any other particles.

```

### 21.2.1 The basic type definitions

The type `parton_t` defines a parton for the shower. The `x` value of the parton is only needed for spacelike showers. The pointer `initial` is only needed for partons in initial showers, it points to the hadron the parton is coming from. An auxiliary value for the  $P_t$ -ordered ISR is `aux_pt`. Then, there are two auxiliary entries for the clustering of CKKW pseudo weights and CKKW matching, `ckkwlabel` and `ckkwscale`. In order to make shower settings available to all operations on the shower partons, we endow the `parton_t` type with a pointer to `shower_settings_t`.

```

<Shower partons: public>≡
  public :: parton_t

<Shower partons: types>≡
  type :: parton_t
    integer :: nr = 0

The parameters of the shower module:

```

<Shower core: parameters>=
  real(default), save :: alphasxpdfmax = 12._default

```

In this routine,  $y$  and  $y_{\min}$  are the jet measures,  $w$  and  $w_{\max}$  are weights,  $s$  is the kinematic energy squared of the interaction. The flag `isr_is_possible_and_allowed` checks whether the initial parton is set, lepton-hadron collisions are not implemented (yet).

As a workaround: as WHIZARD can treat partons as massless, there might be partons with  $E < m$ : if such a parton is found, quarks will be treated massless.

    end if
  end do
end function shower_get_total_momentum

```

Count the number of partons by going through `shower%partons` whereby you can require a minimum energy `mine` and specify whether to `include_remnants`,

which is done if not given.

!C      KTCLUS: written by Mike Seymour, July 1992.
!C      Last modified November 2000.
!C      Please send comments or suggestions to Mike.Seymour@rl.ac.uk
!C
!C      This is a general-purpose kt clustering package.
!C      It can handle ee, ep and pp collisions.
!C      It is loosely based on the program of Siggi Bethke.
!C
!C      The time taken (on a 10MIP machine) is (0.2microsec)*N**3
!C      where N is the number of particles.
!C      Over 90 percent of this time is used in subroutine KTPMIN, which
!C      simply finds the minimum member of a one-dimensional array.
!C      It is well worth thinking about optimization: on the SPARCstation
!C      a factor of two increase was obtained simply by increasing the
!C      optimization level from its default value.
!C
!C      The approach is to separate the different stages of analysis.
!C      KTCLUS does all the clustering and records a merging history.
!C      It returns a simple list of the y values at which each merging
!C      occurred. Then the following routines can be called to give extra
!C      information on the most recently analysed event.
!C      KTCLUR is identical but includes an R parameter, see below.
!C      KTYCUT gives the number of jets at each given YCUT value.
!C      KTYSUB gives the number of sub-jets at each given YCUT value.
!C      KTBEAM gives same info as KTCLUS but only for merges with the beam
!C      KTJOIN gives same info as KTCLUS but for merges of sub-jets.
!C      KTRECO reconstructs the jet momenta at a given value of YCUT.
!C      It also gives information on which jets at scale YCUT belong to
!C      which macro-jets at scale YMAC, for studying sub-jet properties.
!C      KTINCL reconstructs the jet momenta according to the inclusive jet
!C      definition of Ellis and Soper.

```

```

!C      KTISUB, KTIJOI and KTIREC are like KTYSUB, KTJOIN and KTRECO,
!C      except that they only apply to one inclusive jet at a time,
!C      with the pt of that jet automatically used for ECUT.
!C      KTWICH gives a list of which particles ended up in which jets.
!C      KTWCHS gives the same thing, but only for subjets.
!C      Note that the numbering of jets used by these two routines is
!C      guaranteed to be the same as that used by KTRECO.
!C
!C      The collision type and analysis type are indicated by the first
!C      argument of KTCLUS. IMODE=<TYPE><ANGLE><MONO><RECOM> where
!C      TYPE: 1=>ee, 2=>ep with p in -z direction, 3=>pe, 4=>pp
!C      ANGLE: 1=>angular kt def., 2=>DeltaR, 3=>f(DeltaEta,DeltaPhi)
!C              where f() $=2(\cosh(\eta)-\cos(\phi))$  is the QCD emission metric
!C      MONO: 1=>derive relative pseudoparticle angles from jets
!C            2=>monotonic definitions of relative angles
!C      RECOM: 1=>E recombination scheme, 2=>pt scheme, 3=>pt**2 scheme
!C
!C      There are also abbreviated forms for the most common combinations:
!C      IMODE=1 => E scheme in e+e-           (=1111)
!C            2 => E scheme in ep             (=2111)
!C            3 => E scheme in pe             (=3111)
!C            4 => E scheme in pp             (=4111)
!C            5 => covariant E scheme in pp   (=4211)
!C            6 => covariant pt-scheme in pp  (=4212)
!C            7 => covariant monotonic pt**2-scheme in pp (=4223)
!C
!C      KTRECO no longer needs to reconstruct the momenta according to the
!C      same recombination scheme in which they were clustered. Its first
!C      argument gives the scheme, taking the same values as RECOM above.
!C
!C      Note that unlike previous versions, all variables which hold y
!C      values have been named in a consistent way:
!C      Y() is the output scale at which jets were merged,
!C      YCUT is the input scale at which jets should be counted, and
!C      jet-momenta reconstructed etc,
!C      YMAC is the input macro-jet scale, used in determining whether
!C      or not each jet is a sub-jet.
!C      The original scheme defined in our papers is equivalent to always
!C      setting YMAC=1.
!C      Whenever a YCUT or YMAC variable is used, it is rounded down
!C      infinitesimally, so that for example, setting YCUT=Y(2) refers
!C      to the scale where the event is 2-jet, even if rounding errors
!C      have shifted its value slightly.
!C
!C      An R parameter can be used in hadron-hadron collisions by
!C      calling KTCLUR instead of KTCLUS. This is as suggested by
!C      Ellis and Soper, but implemented slightly differently,
!C      as in M.H. Seymour, LU TP 94/2 (submitted to Nucl. Phys. B.).
!C      R**2 multiplies the single Kt everywhere it is used.
!C      Calling KTCLUR with R=1 is identical to calling KTCLUS.
!C      R plays a similar role to the jet radius in a cone-type algorithm,
!C      but is scaled up by about 40% (ie R=0.7 in a cone algorithm is
!C      similar to this algorithm with R=1).
!C      Note that R.EQ.1 must be used for the e+e- and ep versions,

```

```

!C      and is strongly recommended for the hadron-hadron version.
!C      However, R values smaller than 1 have been found to be useful for
!C      certain applications, particularly the mass reconstruction of
!C      highly-boosted colour-singlets such as high-pt hadronic Ws,
!C      as in M.H. Seymour, LU TP 93/8 (to appear in Z. Phys. C.).
!C      Situations in which  $R < 1$  is useful are likely to also be those in
!C      which the inclusive reconstruction method is more useful.
!C
!C      Also included is a set of routines for doing Lorentz boosts:
!C      KTLBST finds the boost matrix to/from the cm frame of a 4-vector
!C      KTRROT finds the rotation matrix from one vector to another
!C      KTMUL multiplies together two matrices
!C      KTMUL multiplies a vector by a matrix
!C      KTINVT inverts a transformation matrix (nb NOT a general 4 by 4)
!C      KITFRAM boosts a list of vectors between two arbitrary frames
!C      KTBREI boosts a list of vectors between the lab and Breit frames
!C      KTHADR boosts a list of vectors between the lab and hadronic cmf
!C      The last two need the momenta in the +z direction of the lepton
!C      and hadron beams, and the 4-momentum of the outgoing lepton.
!C
!C      The main reference is:
!C      S. Catani, Yu.L. Dokshitzer, M.H. Seymour and B.R. Webber,
!C      Nucl.Phys.B406(1993)187.
!C      The ep version was proposed in:
!C      S. Catani, Yu.L. Dokshitzer and B.R. Webber,
!C      Phys.Lett.285B(1992)291.
!C      The inclusive reconstruction method was proposed in:
!C      S.D. Ellis and D.E. Soper,
!C      Phys.Rev.D48(1993)3160.

## Chapter 22

# Multiple Interactions (MPI) Code

This is the code for the `WHIZARD` module for multiple interactions (MPI) in hadron collisions. It also provides the interleaved shower with together with the shower module.

### 22.1 Basic types

This file contains the module `multi.basic` which is included by all other modules of the MPI code. It's main purpose is serialization and deserialization, but it also contains some bitmodel parameters and some minor definitions common to all modules and types.

Serialization is implemented in three layers:

1. **I/O layer:** streamfile access and exact, retrievable and compiler independent representation of all intrinsic types
2. **Marking layer:** storing/restoring pointer association and better human readability
3. **Derived type layer:** abstract type as parent for all serializable derived types

**The I/O Layer** The I/O layer is implemented by `page.ring.t` and its type bound procedures. We chose not to use the standard formatted sequential I/O for several reasons:

- Sequential I/O is line orientated, but serialization is not.
- Formatted I/O of floating point numbers is inexact. There were problems in reading numbers like `1+epsilon(1)` or `huge(1)` including arithmetic exeptions and wrong results.
- Formatted reading is slow. This does matter, when you read files of  $\mathcal{O}(100)$  MB.

Figure 22.1: Module dependencies in `src/muli`.

`page_ring_t` is a ring buffer of default kind characters holding a region of the addressed file. All read and write procedures use the ring buffer, not the file. `page_ring` automatically reads more characters from the file when needed and writes and discards parts of the ring buffer when not any longer needed.

**Marking layer** Marking is done by `marking_t` and its type bound procedures. Files written by `marking_t` are regular XML files, so you can use your favorite XML editor to examine or edit serialized contents. The main purpose of this layer is to recover the type of polymorphic entities and to restore association of pointers, but it also assigns names to all contents, so it is much easier to read generated files.

Type recovery is done by a reference list. You must push a representative object to this reference list for each type that might get resolved before starting deserialization. `marker_t` will care for comparing these representatives to the contents of the files.

Association restoration is done by a heap list. It is technically equal to the reference list, but holds all targets that have been processed so far. Generation of this list is handled by `marking_t`, so you don't have to care for this aspect at all. Up to the present it is not possible to restore association, when a non-pointer target is serialized after its associated pointer is serialized. There is no trivial solution and this case does not appear here, so we will not take care of this.

**Derived type layer** Each instance that shall become serialized must extend `ser_class_t`. Essential for type recovery is the virtual type bound procedure `get_type`. Each non-virtual type shall override `get_type` and return the actual name of its type in lower-case letters. Each type which adds new, non-redundant components shall override `write_to_marker` and `read_from_marker`. These type-bound procedures define, what contents get serialized. While the marker cares about tagging the type and association of the instance, every instance still has to define what to serialize. The rule is to mark the begin of its contents, then its parents procedure, then mark all non-redundant components, then mark the end of its contents. Finally, each serializable type shall override `print_to_unit`. This procedure is called for an arbitrary human-readable output. It is quite similar to `write_to_ring`, but without strict format and ignoring machine-readability.

`ser_class_t` has strictly speaking two layers. `write_to_marker` and `read_from_marker` are only for internal usage. Serialization and deserialization are triggered by the TBPs `serialize` and `deserialize`. These procedures take care of initialization and finalization of the marker. A serializable type should override these procedures to push a representative of itself and any other references to the reference list of its marker before (de)serialization and to pop them from the list afterwards.

```
<multi_base.f90>≡
  <File header>
```

```

## 22.2 Transverse momenta

This file contains the module `muli_momentum`. Its purpose is to store the actual value of the evolution parameter  $p_t^2$  in a convenient way. We use the normalized value  $p_t^2/p_{t,\max}^2$  for generating the next value of the scale, also need the square root of both  $p_t^2$  and  $p_t^2/p_{t,\max}^2$  for other purposes. That's why I store all four combinations together with  $p_{t,\max}$  in an array.

## 22.3 Multi parton interactions

This file contains the module `muli_interactions`. The allowed interactions and their cross sections are defined here. Additionally, some coordinate transformations which annihilate divergencies of the cross sections are defined. Since the phase space border is hyperbolic, this transformations are also hyperbolic. That's why all interactions are named `x_cart` for cartesian or `x_hyp` for hyperbolic to avoid confusion.

```

## 22.4 VEGAS and CUBA integration routines

This file contains the module `muli_cuba`, a wrapper for the CUBA integration library. Different algorithms and settings have been tried out for the integration, including VEGAS, and this wrapper has been mainly written for that purpose.

```

## 22.5 Trapezoidal integration routines

This file contains the module "multi\_trapezium". The name is derived from the trapezoidal integration rule. The purpose of this module is to define a binary tree `multi_trapezium_tree_t` which holds a probability function in terms of trapezoidal segments. Its leaves of type `multi_trapezium_list_t` are connected to form a list, so you can either walk the root function back and forth or pick a certain segment in logarithmic time by walking down the tree. All nodes extend `multi_trapezium_t` which holds the actual values. Those are the values of the density function, the integral from this segment to the end of the integration area and a probability function calculated from these values. All values are taken at the upper "right" bound of the segment. Additionally the differences of these values to the values of the left neighbor is stored.

```

## 22.6 Fibonacci trees

This file contains the module `multi_fibonacci_tree`. A fibonacci tree is a self-balancing binary tree. "Balanced" means that the depth of the left successor may differ from the depth of the right successor in any node by maximally one. The maximally unbalanced tree is maximally unbalanced in every node. So the number of leaves of a maximally unbalanced fibonacci tree of depth  $n$  is precisely the  $n$ th fibonacci number.

We use this tree for the adaptive quadrature. In every iteration of the algorithm, we have to pick the segment with largest integration error, cut it into pieces and calculate the new integration error for the pieces. A binary tree is obviously a good choice for sorting these segments. The problem is, that we always pick leaves from the same side of the tree. So the tree must decline at one side and grow at the other side. Sorting gets less efficient and finally most of the overall CPU time gets wasted for sorting. This tree outperforms a naive binary tree significantly in this particular job.

## 22.7 Adaptive Quadrature

This file contains the module `muli_aq` which is an acronym for adaptive quadrature. The abstract type `aq_class` is extended and the deferred procedure `evaluate` is defined. `muli_aq` calls `evaluate` to evaluate the integrand at any point in the given range. We have tried to use a procedure pointer instead of the deferred type-bound procedure, but no compiler was able to handle procedure pointers plus `cuba` was not able to handle parameters, to wit dimensions of the integrand that should not get integrated. So we switched to this odd way of using inheritance. Meanwhile these problems got solved and we could go for a more straightforward solution, but it works fine as it is.

`aq_class` uses `muli_trapezium` to approximate the integral. It still has to do the subdivision of segments and has to check whether the precision goal is reached.

Finally, the result is written to disc using the serialization framework defined in `muli_base`. Since QCD is not expected to change frequently, the only reason to regenerate this function is a change of the used PDF set. Then you can read the integral from disc each time you run a simulation with the same PDF set.

```

<muli_aq.f90>=

```

```

<File header>

module multi_aq

  <Use kinds>
    use constants
    use diagnostics
    use multi_base
    use multi_cuba
    use multi_trapezium
    use multi_fibonacci_tree

  <Standard module head>

  <Multi aq: public>

  <Multi aq: types>

  <Multi aq: interfaces>

  contains

  <Multi aq: procedures>

end module multi_aq

```

The variables `error_goal`, `err_tree` and `int_list` must be initialised before the main loop can be called. Additionally, the nodes and segments should be preprocessed by `first_run` before the main loop is called.

```

Usually, the tree is sorted by the sum of errors. Now it shall be sorted by the right position. When at least one branch of the tree is itself a tree, i.e. each branch has got at least two leaves, then process each branch and merge the results. Now we got two sorted lists. Which one's leftmost node has got the lowest value of `r_position`? That one shall be the beginning of the merged list `lin_list`. Everything is prepared for the algorithm: `lin_list` is the beginning of the sorted list, `last_node` is its end. `left_node` and `right_node` are the leftmost nodes of the remainders of `left_list` and `right_list`. The latter will get stripped from left to right, until one of them ends. Then, either `left_list` or `right_list` is completely merged into `lin_list`. The other one gets appended to `lin_list`. In the second part of the big if clause, the tree has got two leaves at most. Is it more than one? There, `fib_tree` is a single leave with an allocated "content" component of type `multi_trapezium_t`. If "content" is not type-compatible with `multi_trapezium_t`, then this whole conversion cannot succeed. We allocate a new node of type `multi_trapezium_list_t`. This list does not contain the content of `fib_tree`, it *is* a copy of the content, for `multi_trapezium_list_t` is an extension of `multi_trapezium_t`. In the next step, each branch of `fib_tree` is a single leave. We could call this subroutine for each branch, but we do copy and paste for each branch instead. Finally we append one list to the other, the lowest value of `r_position` comes first.

## 22.8 Integrands for Multiple Interactions

This file contains the module `multi_dsigma`. Its only type `multi_dsigma_t` provides an integrand to `aq_class`. The actual integrand is the normalized differential cross section of a QCD  $2 \rightarrow 2$  process  $1/\sigma_0 \times d^3\sigma/(dp_T^2 dx_1 dx_2)$ . We need a root function of this integrand in terms of  $p_T$ , so we have to integrate out  $x_1$  and  $x_2$  and have to approximate the root function of the leftover variable  $p_T$ .

Integration of  $x_1$  and  $x_2$  is done by CUBA, the root function is approximated by multi\_aq.

## 22.9 MC Integrations for QCD $2 \rightarrow 2$ processes

This file contains the module `muli_mcint` which is the Monte Carlo generator for QCD  $2 \rightarrow 2$  interactions at given evolution parameter and given stratus. While `muli_t` takes care of generating the evolution parameter and the stratus, this module is about bookkeeping the strati and implementing a downstream importance sampling. The evolution parameter is a measure of transferred momentum and a “stratus” is a PDF category or, to be more precise, is whether the incoming partons are gluons or sea quarks or valence quarks.

The importance sampling then subdivides the phase space of variables  $\{x_1, x_2, p_T\}$  into  $n^3$  regions such that each region holds approximately  $n$  interactions. Thus, we can generate a phase space point very quickly just by randomly picking a region, randomly picking a point within this region and comparing its exact cross section with the mean cross section for this actual evolution parameter and the actual stratus times the area of the picked phase space region.

The mean values must be generated in the module `muli_dsigma` before and are given to the procedure `sample_inclusive_generate_hit`. Finally the generated subregions should be written to a file via `write_to_marker` and then reused for each later WHIZARD run.

The type `sample_inclusive_t` holds the 16 strati, while the type `sample_int_kind_t` represents a single stratus, `sample_3d_t` is the whole  $\{x_1, x_2, p_T\}$  phase space for each stratus, `sample_2d_t` is the  $\{x_1, x_2\}$  plane with a slice of  $p_T$  and `sample_region_t` finally is a phase space region.

## 22.10 Proton remnants

This file contains the module `muli_remnant`. All bookkeeping of the proton remnants and twin quarks is done here. Furthermore, reweighting of the PDFs

to derive remnant PDFs is done here.
