## INTRODUCTION

### 1.1   Complexity

There are

$$P(n) = \frac{2^n - 2}{2} - n = 2^{n-1} - n - 1 \tag{1.1}$$

independent internal momenta in a $n$-particle scattering amplitude [1]. This grows much slower than the number

$$F(n) = (2n - 5)!! = (2n - 5) \cdot (2n - 7) \cdot \ldots \cdot 3 \cdot 1 \tag{1.2}$$

of tree Feynman diagrams in vanilla $\phi^3$ (see table 1.1). There are no known corresponding expressions for theories with more than one particle type. However, empirical evidence from numerical studies [1, 2] as well as explicit counting results from O'Mega suggest

$$P^*(n) \propto 10^{n/2} \tag{1.3}$$

while he factorial growth of the number of Feynman diagrams remains unchecked, of course.

The number of independent momenta in an amplitude is a better measure for the complexity of the amplitude than the number of Feynman diagrams, since there can be substantial cancellations among the latter. Therefore it should be possible to express the scattering amplitude more compactly than by a sum over Feynman diagrams.

### 1.2   Ancestors

Some of the ideas that O'Mega is based on can be traced back to HELAS [5]. HELAS builts Feynman amplitudes by recursively forming off-shell 'wave functions' from joining external lines with other external lines or off-shell 'wave functions'.

The program Madgraph [6] automatically generates Feynman diagrams and writes a Fortran program corresponding to their sum. The amplitudes are calculated by calls to HELAS [5]. Madgraph uses one straightforward optimization: no statement is written more than once. Since each statement corresponds to a collection of trees, this optimization is very effective for up to four particles in the final state. However, since the amplitudes are

| $n$ | $P(n)$ | $F(n)$ |
|---|---|---|
| 4 | 3 | 3 |
| 5 | 10 | 15 |
| 6 | 25 | 105 |
| 7 | 56 | 945 |
| 8 | 119 | 10395 |
| 9 | 246 | 135135 |
| 10 | 501 | 2027025 |
| 11 | 1012 | 34459425 |
| 12 | 2035 | 654729075 |
| 13 | 4082 | 13749310575 |
| 14 | 8177 | 316234143225 |
| 15 | 16368 | 7905853580625 |
| 16 | 32751 | 213458046676875 |

Table 1.1:   The number of $\phi^3$ Feynman diagrams $F(n)$ and independent poles $P(n)$.

given as a sum of Feynman diagrams, this optimization can, by design, *not* remove the factorial growth and is substantially weaker than the algorithms of [1, 2] and the algorithm of O'Mega for more particles in the final state.

Then ALPHA [1] (see also the slightly modified variant [2]) provided a numerical algorithm for calculating scattering amplitudes and it could be shown empirically, that the calculational costs are rising with a power instead of factorially.

## 1.3   Architecture

### 1.3.1   General purpose libraries

Functions that are not specific to O'Mega and could be part of the O'Caml standard library

*ThoList* : (mostly) simple convenience functions for lists that are missing from the standard library module *List* (section F, p. 586)

*Product* : effcient tensor products for lists and sets (section K, p. 626)

*Combinatorics* : combinatorical formulae, sets of subsets, etc. (section N, p. 636)

### 1.3.2   O'Mega

The non-trivial algorithms that constitute O'Mega:

*DAG* : Directed Acyclical Graphs (section 4, p. 28)

*Topology* : unusual enumerations of unflavored tree diagrams (section 3, p. 15)

*Momentum* : finite sums of external momenta (section 5, p. 40)

*Fusion* : off shell wave functions (section 8, p. 102)

*Omega* : functor constructing an application from a model and a target (section 18, p. 560)

### 1.3.3   Abstract interfaces

The domains and co-domains of functors (section 9, p. 157)

*Coupling* : all possible couplings (not comprensive yet)

*Model* : physical models

*Target* : target programming languages

### 1.3.4   Models

(section **??**, p. **??**)

*Modellib$_S$M.QED* : Quantum Electrodynamics

*Modellib$_S$M.QCD* : Quantum Chromodynamics (not complete yet)

*Modellib$_S$M.SM* : Minimal Standard Model (not complete yet)

etc.

### 1.3.5   Targets

Any programming language that supports arithmetic and a textual representation of programs can be targeted by O'Caml. The implementations translate the abstract expressions derived by *Fusion* to expressions in the target (section 15, p. 409).

*Targets.Fortran* : Fortran95 language implementation, calling subroutines

Other targets could come in the future: `C`, `C++`, O'Caml itself, symbolic manipulation languages, etc.
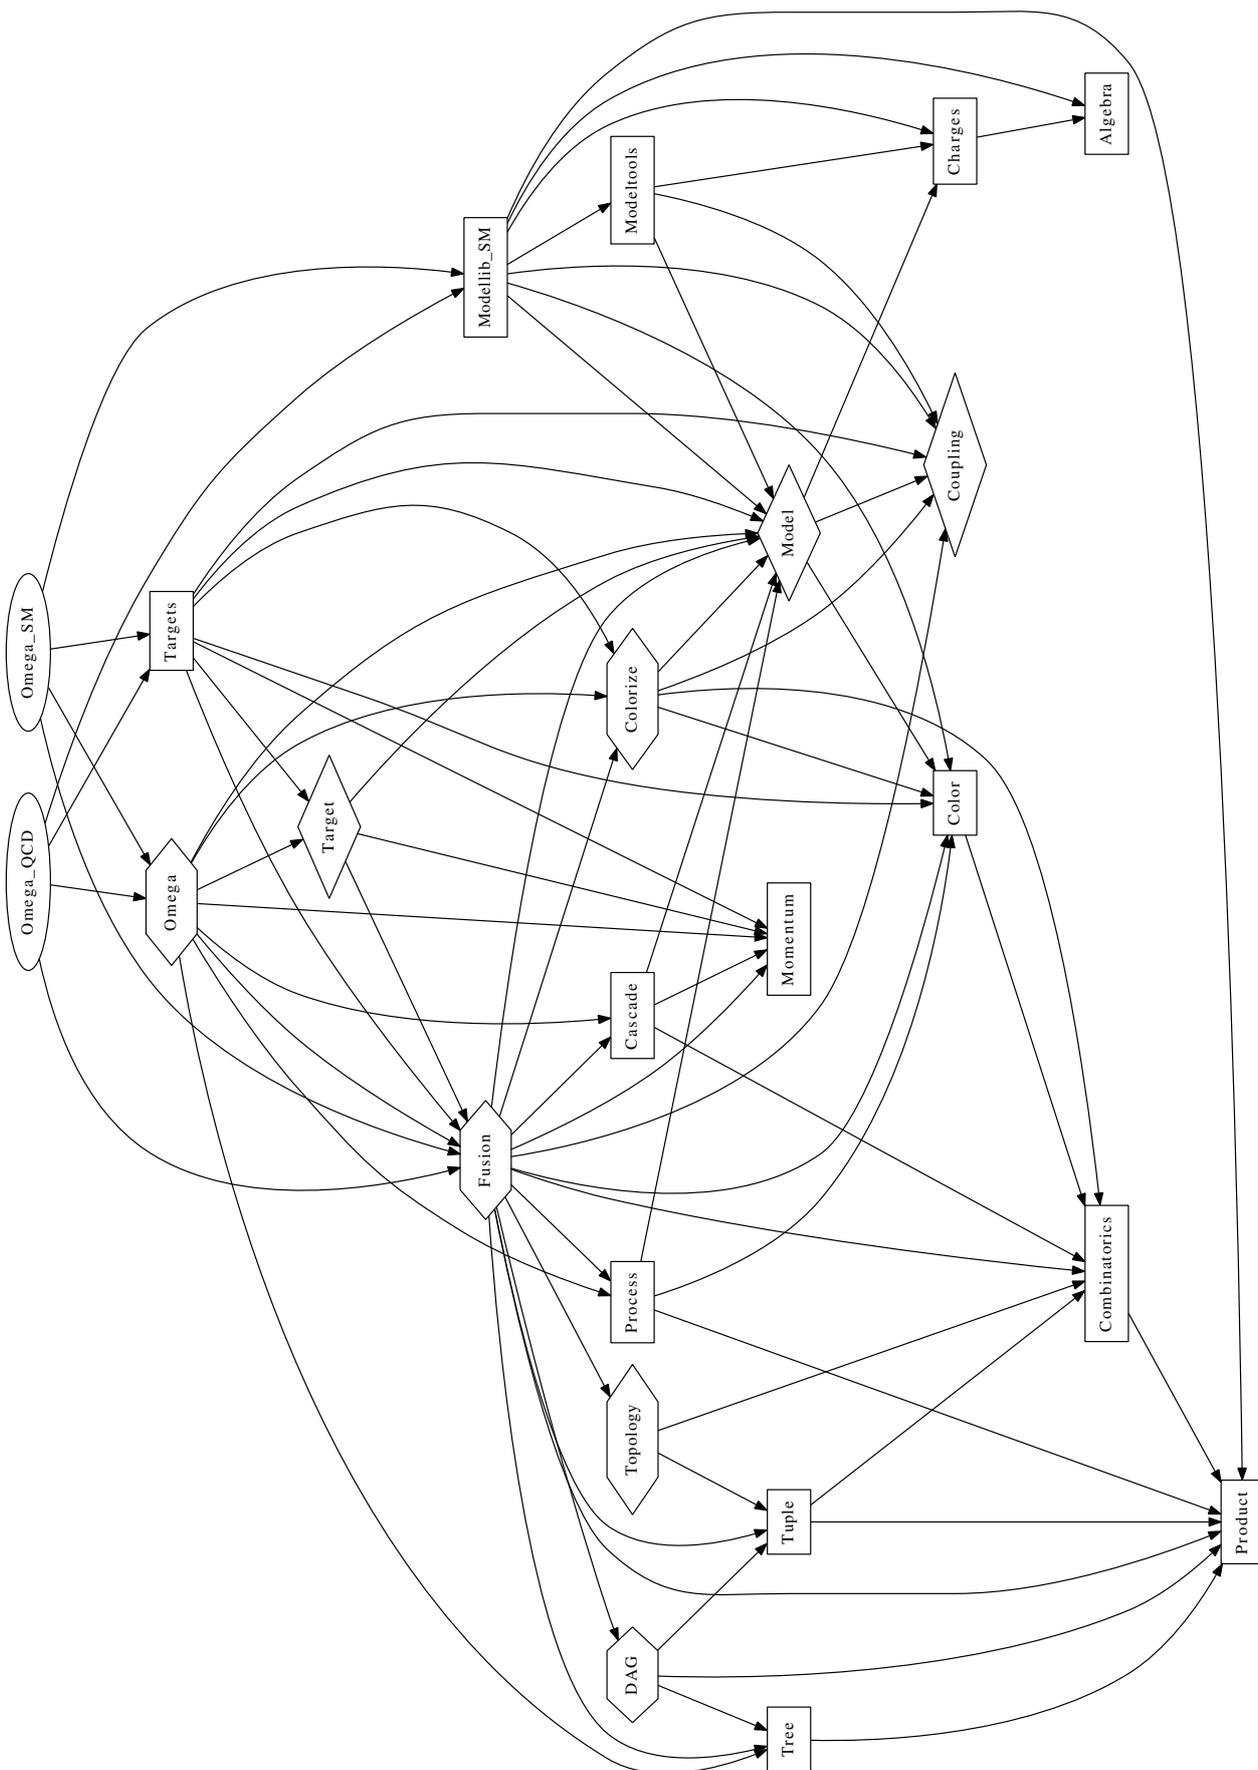

Figure 1.1: Module dependencies in O'Mega.

### 1.3.6   Applications

(section 18, p. 560)

## 1.4   The Big To Do Lists

### 1.4.1   Required

All features required for leading order physics applications are in place.

### 1.4.2   Useful

1. select allowed helicity combinations for massless fermions

2. Weyl-Van der Waerden spinors

3. speed up helicity sums by using discrete symmetries

4. general triple and quartic vector couplings

5. diagnostics: count corresponding Feynman diagrams more efficiently for more than ten external lines

6. recognize potential cascade decays ($\tau$, $b$, etc.)

   - warn the user to add additional
   - kill fusions (at runtime), that contribute to a cascade

7. complete standard model in $R_\xi$-gauge

8. groves (the simple method of cloned generations works)

### 1.4.3   Future Features

1. investigate if unpolarized squared matrix elements can be calculated faster as traces of densitiy matrices. Unfortunately, the answer apears to be *no* for fermions and *up to a constant factor* for massive vectors. Since the number of fusions in the amplitude grows like $10^{n/2}$, the number of fusions in the squared matrix element grows like $10^n$. On the other hand, there are $2^{\#\text{fermions}+\#\text{massless vectors}} \cdot 3^{\#\text{massive vectors}}$ terms in the helicity sum, which grows *slower* than $10^{n/2}$. The constant factor is probably also not favorable. However, there will certainly be asymptotic gains for sums over gauge (and other) multiplets, like color sums.

2. compile Feynman rules from Lagrangians

3. evaluate amplitues in O'Caml by compiling it to three address code for a virtual machine

   ```
   type mem  =  scalar array × spinor array × spinor array × vector array
   type instr  =
       — VSS of int × int × int
       — SVS of int × int × int
       — AVA of int × int × int
       . . .
   ```

   this could be as fast as [1] or [2].

4. a virtual machine will be useful for for other target as well, because native code appears to become to large for most compilers for more than ten external particles. Bytecode might even be faster due to improved cache locality.

5. use the virtual machine in O'Giga

### 1.4.4   Science Fiction

1. numerical and symbolical loop calculations with O'TERA: O'MEGA TOOL FOR EVALUATING RENORMALIZED AMPLITUDES

# —2—
## TUPLES AND POLYTUPLES

### *2.1   Interface of Tuple*

The *Tuple.Poly* interface abstracts the notion of tuples with variable arity. Simple cases are binary polytuples, which are simply pairs and indefinite polytuples, which are nothing but lists. Another example is the union of pairs and triples. The interface is very similar to *List* from the O'Caml standard library, but the *Tuple.Poly* signature allows a more fine grained control of arities. The latter provides typesafe linking of models, targets and topologies.

module type *Mono* =
  sig
    type $\alpha$ *t*

    val *arity* : $\alpha$ *t* $\rightarrow$ *int*
    val *max_arity* : *unit* $\rightarrow$ *int*

    val *compare* : $(\alpha \rightarrow \alpha \rightarrow int) \rightarrow \alpha\ t \rightarrow \alpha\ t \rightarrow int$

    val *for_all* : $(\alpha \rightarrow bool) \rightarrow \alpha\ t \rightarrow bool$

    val *map* : $(\alpha \rightarrow \beta) \rightarrow \alpha\ t \rightarrow \beta\ t$
    val *iter* : $(\alpha \rightarrow unit) \rightarrow \alpha\ t \rightarrow unit$
    val *fold_left* : $(\alpha \rightarrow \beta \rightarrow \alpha) \rightarrow \alpha \rightarrow \beta\ t \rightarrow \alpha$
    val *fold_right* : $(\alpha \rightarrow \beta \rightarrow \beta) \rightarrow \alpha\ t \rightarrow \beta \rightarrow \beta$

We have applications, where no sensible intial value can be defined:

    val *fold_left_internal* : $(\alpha \rightarrow \alpha \rightarrow \alpha) \rightarrow \alpha\ t \rightarrow \alpha$
    val *fold_right_internal* : $(\alpha \rightarrow \alpha \rightarrow \alpha) \rightarrow \alpha\ t \rightarrow \alpha$

    val *map2* : $(\alpha \rightarrow \beta \rightarrow \gamma) \rightarrow \alpha\ t \rightarrow \beta\ t \rightarrow \gamma\ t$

    val *split* : $(\alpha \times \beta)\ t \rightarrow \alpha\ t \times \beta\ t$

The distributive tensor product expands a tuple of lists into list of tuples, e.g. for binary tuples:

$$product\,([x_1; x_2], [y_1; y_2]) = [(x_1, y_1); (x_1, y_2); (x_2, y_1); (x_2, y_2)] \tag{2.1}$$

NB: *product_fold* is usually much more memory efficient than the combination of *product* and *List.fold_right* for large sets.

    val *product* : $\alpha\ list\ t \rightarrow \alpha\ t\ list$
    val *product_fold* : $(\alpha\ t \rightarrow \beta \rightarrow \beta) \rightarrow \alpha\ list\ t \rightarrow \beta \rightarrow \beta$

For homogeneous tuples the *power* function could trivially be built from *product*, e.g.:

$$power\,[x_1; x_2] = product\,([x_1; x_2], [x_1; x_2]) = [(x_1, x_1); (x_1, x_2); (x_2, x_1); (x_2, x_2)] \tag{2.2}$$

but it is also well defined for polytuples, e.g. for pairs and triples

$$power\,[x_1; x_2] = product\,([x_1; x_2], [x_1; x_2]) \cup product\,([x_1; x_2], [x_1; x_2], [x_1; x_2]) \tag{2.3}$$

For tuples and polytuples with bounded arity, the *power* and *power_fold* functions terminate. In polytuples with unbounded arity, the the *power* function always raises *No_termination*. *power_fold* also raises *No_termination*, but could be changed to run until the argument function raises an exception. However, if we need this behaviour, we should implemente *power_iter* instead.

val *power* : $\alpha$ *list* $\to$ $\alpha$ *t list*
val *power_fold* : $(\alpha\ t\ \to\ \beta\ \to\ \beta)\ \to\ \alpha\ list\ \to\ \beta\ \to\ \beta$

We can also identify all (poly)tuples with permuted elements and return only one representative, e. g.:

$$sym\_power\ [x_1; x_2] = [(x_1, x_1); (x_1, x_2); (x_2, x_2)] \tag{2.4}$$

NB: this function has not yet been implemented, because O'Mega only needs the more efficient special case *graded_sym_power*.
If a set $X$ is graded (i.e. there is a map $\phi : X \to \mathbf{N}$, called *rank* below), the results of *power* or *sym_power* can canonically be filtered by requiring that the sum of the ranks in each (poly)tuple has one chosen value. Implementing such a function directly is much more efficient than constructing and subsequently disregarding many (poly)tuples. The elements of rank $n$ are at offset $(n-1)$ in the array. The array is assumed to be *immutable*, even if O'Caml doesn't support immutable arrays. NB: *graded_power* has not yet been implemented, because O'Mega only needs *graded_sym_power*.

type $\alpha$ *graded* $=$ $\alpha$ *list array*
val *graded_sym_power* : *int* $\to$ $\alpha$ *graded* $\to$ $\alpha$ *t list*
val *graded_sym_power_fold* : *int* $\to$ $(\alpha\ t\ \to\ \beta\ \to\ \beta)\ \to\ \alpha\ graded\ \to$
    $\beta\ \to\ \beta$

We hope to be able to avoid the next one in the long run, because it mildly breaks typesafety for arities. Unfortunately, we're still working on it . . .

val *to_list* : $\alpha\ t\ \to\ \alpha\ list$

The next one is only used for Fermi statistics in the obsolescent *Fusion_vintage* module below, but can not be implemented if there are no binary tuples. It must be retired as soon as possible.

val *of2_kludge* : $\alpha\ \to\ \alpha\ \to\ \alpha\ t$

  end
module type *Poly* $=$
  sig
    include *Mono*
    exception *Mismatched_arity*
    exception *No_termination*
  end

module type *Binary* $=$
    sig
      include *Poly* ($*$ should become *Mono*! $*$)
      val *of2* : $\alpha\ \to\ \alpha\ \to\ \alpha\ t$
    end
module *Binary* : *Binary*

module type *Ternary* $=$
    sig
      include *Mono*
      val *of3* : $\alpha\ \to\ \alpha\ \to\ \alpha\ \to\ \alpha\ t$
    end
module *Ternary* : *Ternary*

type $\alpha$ *pair_or_triple* $=$ *T2* of $\alpha\ \times\ \alpha$ | *T3* of $\alpha\ \times\ \alpha\ \times \alpha$

module type *Mixed23* $=$
    sig
      include *Poly*
      val *of2* : $\alpha\ \to\ \alpha\ \to\ \alpha\ t$
      val *of3* : $\alpha\ \to\ \alpha\ \to\ \alpha\ \to\ \alpha\ t$
    end
module *Mixed23* : *Mixed23*

module type *Nary* $=$
    sig

```
      include Poly
      val of2  :  α  →  α  →  α t
      val of3  :  α  →  α  →  α  →  α t
      val of_list  :  α list →  α t
    end
module Unbounded_Nary  :  Nary
```

module type *Bound*  =  sig val *max_arity*  :  *unit* → *int* end
module *Nary* (*B* : *Bound*)  :  *Nary*

For compleneteness sake, we could add most of the *List* signature

- val *length*  :  α *t*  →  *int*
- val *hd*  :  α *t*  →  α
- val *nth*  :  α *t*  →  *int* → α
- val *rev*  :  α *t*  →  α *t*
- val *rev_map*  :  (α  →  β)  →  α *t*  →  β *t*
- val *iter2*  :  (α  →  β  →  *unit*)  →  α *t*  →  β *t*  →  *unit*
- val *rev_map2*  :  (α  →  β  →  γ)  →  α *t*  →  β *t*  →  γ *t*
- val *fold_left2*  :  (α  →  β  →  γ  →  α)  →  α  →  β *t*  →  γ *t*  →  α
- val *fold_right2*  :  (α  →  β  →  γ  →  γ)  →  α *t*  →  β *t*  →  γ  →  γ
- val *exists*  :  (α  →  *bool*)  →  α *t*  →  *bool*
- val *for_all2*  :  (α  →  β  →  *bool*)  →  α *t*  →  β *t*  →  *bool*
- val *exists2*  :  (α  →  β  →  *bool*)  →  α *t*  →  β *t*  →  *bool*
- val *mem*  :  α  →  α *t*  →  *bool*
- val *memq*  :  α  →  α *t*  →  *bool*
- val *find*  :  (α  →  *bool*)  →  α *t*  →  α
- val *find_all*  :  (α  →  *bool*)  →  α *t*  →  α *list*
- val *assoc*  :  α  →  (α  ×  β) *t*  →  β
- val *assq*  :  α  →  (α  ×  β) *t*  →  β
- val *mem_assoc*  :  α  →  (α  ×  β) *t*  →  *bool*
- val *mem_assq*  :  α  →  (α  ×  β) *t*  →  *bool*
- val *combine*  :  α *t*  →  β *t*  →  (α  ×  β) *t*
- val *sort*  :  (α  →  α  →  *int*)  →  α *t*  →  α *t*
- val *stable_sort*  :  (α  →  α  →  *int*)  →  α *t*  →  α *t*

but only if we ever have too much time on our hand . . .

## *2.2   Implementation of Tuple*

```
module type Mono  =
  sig
    type α t
    val arity  :  α t  →  int
    val max_arity  :  unit →  int
    val compare  :  (α  →  α  →  int)  →  α t  →  α t  →  int
    val for_all  :  (α  →  bool)  →  α t  →  bool
    val map  :  (α  →  β)  →  α t  →  β t
    val iter  :  (α  →  unit)  →  α t  →  unit
    val fold_left  :  (α  →  β  →  α)  →  α  →  β t  →  α
    val fold_right  :  (α  →  β  →  β)  →  α t  →  β  →  β
    val fold_left_internal  :  (α  →  α  →  α)  →  α t  →  α
    val fold_right_internal  :  (α  →  α  →  α)  →  α t  →  α
    val map2  :  (α  →  β  →  γ)  →  α t  →  β t  →  γ t
```

```
      val split  :  (α × β) t  →  α t × β t
      val product  :  α list t  →  α t list
      val product_fold  :  (α t  →  β  →  β)  →  α list t  →  β  →  β
      val power  :  α list  →  α t list
      val power_fold  :  (α t  →  β  →  β)  →  α list  →  β  →  β
      type α graded  =  α list array
      val graded_sym_power  :  int →  α graded  →  α t list
      val graded_sym_power_fold  :  int →  (α t  →  β  →  β)  →  α graded  →
         β  →  β
      val to_list  :  α t  →  α list
      val of2_kludge  :  α  →  α  →  α t
   end

module type Poly  =
   sig
      include Mono
      exception Mismatched_arity
      exception No_termination
   end
```

### 2.2.1  Typesafe Combinatorics

Wrap the combinatorical functions with varying arities into typesafe functions with fixed arities. We could provide specialized implementations, but since we *know* that *Impossible* is *never* raised, the present approach is just as good (except for a tiny inefficiency).

```
exception Impossible of string
let impossible name  =  raise (Impossible name)

let choose2 set  =
   List.map (function [x; y]  →  (x, y)  |  _  →  impossible "choose2")
      (Combinatorics.choose 2 set)

let choose3 set  =
   List.map (function [x; y; z]  →  (x, y, z)  |  _  →  impossible "choose3")
      (Combinatorics.choose 3 set)
```

### 2.2.2   Pairs

```
module type Binary  =
   sig
      include Poly (∗ should become Mono! ∗)
      val of2  :  α  →  α  →  α t
   end

module Binary  =
   struct

      type α t  =  α × α

      let arity _  =  2
      let max_arity ()  =  2

      let of2 x y  =  (x, y)

      let compare cmp (x1, y1) (x2, y2)  =
         let cx  =  cmp x1 x2 in
         if cx  ≠  0 then
            cx
         else
            cmp y1 y2

      let for_all p (x, y)  =  p x  ∧  p y

      let map f (x, y)  =  (f x, f y)
```

```
let iter f (x, y) = f x; f y
let fold_left f init (x, y) = f (f init x) y
let fold_right f (x, y) init = f x (f y init)
let fold_left_internal f (x, y) = f x y
let fold_right_internal f (x, y) = f x y

exception Mismatched_arity
let map2 f (x1, y1) (x2, y2) = (f x1 x2, f y1 y2)

let split ((x1, x2), (y1, y2)) = ((x1, y1), (x2, y2))

let product (lx, ly) =
    Product.list2 (fun x y → (x, y)) lx ly
let product_fold f (lx, ly) init =
    Product.fold2 (fun x y → f (x, y)) lx ly init

let power l = product (l, l)
let power_fold f l = product_fold f (l, l)
```

In the special case of binary fusions, the implementation is very concise.

```
type α graded = α list array

let fuse2 f set (i, j) acc =
    if i = j then
        List.fold_right (fun (x, y) → f x y) (choose2 set.(pred i)) acc
    else
        Product.fold2 f set.(pred i) set.(pred j) acc

let graded_sym_power_fold rank f set acc =
    let max_rank = Array.length set in
    List.fold_right (fuse2 (fun x y → f (of2 x y)) set)
        (Partition.pairs rank 1 max_rank) acc

let graded_sym_power rank set =
    graded_sym_power_fold rank (fun pair acc → pair :: acc) set []

let to_list (x, y) = [x; y]

let of2_kludge = of2

exception No_termination
end
```

### 2.2.3    Triples

```
module type Ternary =
    sig
        include Mono
        val of3 : α → α → α → α t
    end
module Ternary =
    struct

        type α t = α × α × α

        let arity _ = 3
        let max_arity () = 3

        let of3 x y z = (x, y, z)

        let compare cmp (x1, y1, z1) (x2, y2, z2) =
            let cx = cmp x1 x2 in
            if cx ≠ 0 then
                cx
            else
                let cy = cmp y1 y2 in
                if cy ≠ 0 then
```

```
            cy
          else
            cmp z1 z2
```

let *for_all p (x, y, z) = p x ∧ p y ∧ p z*

let *map f (x, y, z) = (f x, f y, f z)*
let *iter f (x, y, z) = f x; f y; f z*
let *fold_left f init (x, y, z) = f (f (f init x) y) z*
let *fold_right f (x, y, z) init = f x (f y (f z init))*
let *fold_left_internal f (x, y, z) = f (f x y) z*
let *fold_right_internal f (x, y, z) = f x (f y z)*

## Topologies

### 3.1 Interface of Topology

module type $T$ =
   sig

*partition* is a collection of integers, with arity one larger than the arity of $\alpha$ *children* below. These arities can one fixed number corresponding to homogeneous tuples or a collection of tupes or lists.

    type *partition*

*partitions* $n$ returns the union of all $[n_1; n_2; \ldots; n_d]$ with $1 \leq n_1 \leq n_2 \leq \ldots \leq n_d \leq \lfloor n/2 \rfloor$ and

$$\sum_{i=1}^{d} n_i = n \tag{3.1}$$

for $d$ from 3 to $d_{\max}$, where $d_{\max}$ is a fixed number for each module implementating $T$. In particular, if type *partition* $= int \times int \times int$, then *partitions* $n$ returns all $(n_1, n_2, n_3)$ with $n_1 \leq n_2 \leq n_3$ and $n_1 + n_2 + n_3 = n$.

    val *partitions* : $int \rightarrow partition\ list$

A (poly)tuple as implemented by the modules in *Tuple*:

    type $\alpha$ *children*

*keystones externals* returns all keystones for the amplitude with external states *externals* in the vanilla scalar theory with a

$$\sum_{3 \leq k \leq d_{\max}} \lambda_k \phi^k \tag{3.2}$$

interaction. One factor of the products is factorized. In particular, if

    type $\alpha$ *children* $= \alpha$ *Tuple.Binary.t* $= \alpha \times \alpha$,

then *keystones externals* returns all keystones for the amplitude with external states *externals* in the vanilla scalar $\lambda \phi^3$-theory.

    val *keystones* : $\alpha\ list \rightarrow (\alpha\ list \times \alpha\ list\ children\ list)\ list$

The maximal depth of subtrees for a given number of external lines.

    val *max_subtree* : $int \rightarrow int$

Only for diagnostics:

    val *inspect_partition* : $partition \rightarrow int\ list$
   end

module $Binary$ : $T$ with type $\alpha$ *children* $= \alpha$ *Tuple.Binary.t*
module $Ternary$ : $T$ with type $\alpha$ *children* $= \alpha$ *Tuple.Ternary.t*
module $Mixed23$ : $T$ with type $\alpha$ *children* $= \alpha$ *Tuple.Mixed23.t*
module $Nary$ : functor $(B : Tuple.Bound) \rightarrow$
  $(T$ with type $\alpha$ *children* $= \alpha$ *Tuple.Nary(B).t*$)$

### 3.1.1   Diagnostics: Counting Diagrams and Factorizations for $\sum_n \lambda_n \phi^n$

The number of diagrams for many particles can easily exceed the range of native integers. Even if we can not calculate the corresponding amplitudes, we want to check combinatorical factors. Therefore we code a functor that can use arbitray implementations of integers.

```
module type Integer =
  sig
    type t
    val zero : t
    val one : t
    val ( + ) : t → t → t
    val ( − ) : t → t → t
    val ( × ) : t → t → t
    val ( / ) : t → t → t
    val pred : t → t
    val succ : t → t
    val ( = ) : t → t → bool
    val ( ≠ ) : t → t → bool
    val ( < ) : t → t → bool
    val ( ≤ ) : t → t → bool
    val ( > ) : t → t → bool
    val ( ≥ ) : t → t → bool
    val of_int : int → t
    val to_int : t → int
    val to_string : t → string
    val compare : t → t → int
    val factorial : t → t
  end
```

Of course, native integers will provide the fastest implementation:

```
module Int : Integer
```

```
module type Count =
  sig
    type integer
```

*diagrams f d n* returns the number of tree diagrams contributing to the *n*-point amplitude in vanilla scalar theory with

$$\sum_{3 \leq k \leq d \wedge f(k)} \lambda_k \phi^k \tag{3.3}$$

interaction. The default value of $f$ returns true for all arguments.

```
    val diagrams : ?f : (integer → bool) → integer → integer → integer
    val diagrams_via_keystones : integer → integer → integer
```

$$\frac{1}{S(n_k, n - n_k)} \frac{1}{S(n_1, n_2, \ldots, n_k)} \binom{n_1 + n_2 + \ldots + n_k}{n_1, n_2, \ldots, n_k} \tag{3.4}$$

```
    val keystones : integer list → integer
```

*diagrams_via_keystones d n* must produce the same results as *diagrams d n*. This is shown explicitly in tables 3.2, 3.3 and 3.4 for small values of $d$ and $n$. The test program in appendix R can be used to verify this relation for larger values.

```
    val diagrams_per_keystone : integer → integer list → integer

  end
```

```
module Count : functor (I : Integer) → Count with type integer = I.t
```

Table 3.1: *partitions n* for moderate values of $n$.

### 3.1.2  *Emulating HELAC*

We can also proceed á la [2].

module *Helac* : functor (*B* : *Tuple.Bound*) →
  (*T* with type $\alpha$ *children* = $\alpha$ *Tuple.Nary(B).t*)

The following has never been tested, but it is no rocket science and should work anyway . . .

module *Helac_Binary* : *T* with type $\alpha$ *children* = $\alpha$ *Tuple.Binary.t*

## 3.2  *Implementation of Topology*

module type *T* =
  sig
    type *partition*
    val *partitions* : *int* → *partition list*
    type $\alpha$ *children*
    val *keystones* : $\alpha$ *list* → ($\alpha$ *list* × $\alpha$ *list children list*) *list*
    val *max_subtree* : *int* → *int*
    val *inspect_partition* : *partition* → *int list*
  end

### 3.2.1  *Factorizing Diagrams for* $\phi^3$

module *Binary* =
  struct
    type *partition* = *int* × *int* × *int*
    let *inspect_partition* (*n1*, *n2*, *n3*) = [*n1*; *n2*; *n3*]

One way [1] to lift the degeneracy is to select the vertex that is closest to the center (see table 3.1):

$$ partitions : n \rightarrow \big\{ (n_1, n_2, n_3) \,|\, n_1 + n_2 + n_3 = n \wedge n_1 \leq n_2 \leq n_3 \leq \lfloor n/2 \rfloor \big\} \tag{3.5} $$

Other, less symmetric, approaches are possible. The simplest of these is: choose the vertex adjacent to a fixed external line [2]. They will be made available for comparison in the future.

An obvious consequence of $n_1 + n_2 + n_3 = n$ and $n_1 \leq n_2 \leq n_3$ is $n_1 \leq \lfloor n/3 \rfloor$:

    let rec *partitions'* *n* *n1* =
      if *n1* > *n* / 3 then
        []
      else
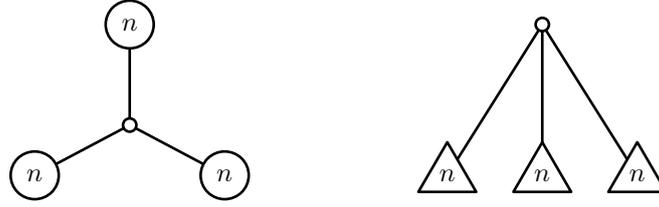

Figure 3.1:   Topologies with a blatant three-fold permutation symmetry, if the number of external lines is a multiple of three

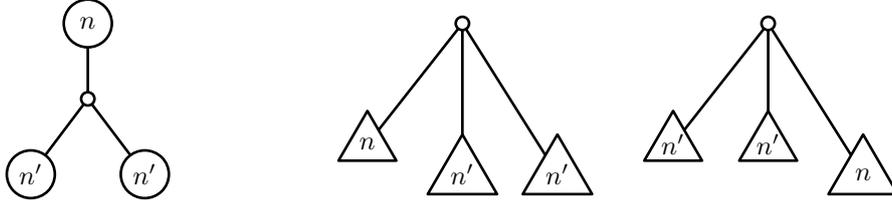

Figure 3.2:   Topologies with a blatant two-fold symmetry.

$$List.map \; (\text{fun} \; (n2, \; n3) \; \rightarrow \; (n1, \; n2, \; n3))$$
$$(Partition.pairs \; (n \; - \; n1) \; n1 \; (n \; / \; 2)) \; @ \; partitions' \; n \; (succ \; n1)$$

$$\text{let} \; partitions \; n \; = \; partitions' \; n \; 1$$

$$\text{type} \; \alpha \; children \; = \; \alpha \; Tuple.Binary.t$$

There remains one peculiar case, when the number of external lines is even and $n_3 = n_1 + n_2$ (cf. figure 3.3). Unfortunately, this reflection symmetry is not respected by the equivalence classes. E. g.

$$\{1\}\{2,3\}\{4,5,6\} \mapsto \{\{4\}\{5,6\}\{1,2,3\}; \{5\}\{4,6\}\{1,2,3\}; \{6\}\{4,5\}\{1,2,3\}\} \tag{3.6}$$

However, these reflections will always exchange the two halves and a representative can be chosen by requiring that one fixed momentum remains in one half. We choose to filter out the half of the partitions where the element $p$ appears in the second half, i. e. the list of length $n3$.

Finally, a closed expression for the number of Feynman diagrams in the equivalence class $(n_1, n_2, n_3)$ is

$$N(n_1, n_2, n_3) = \frac{(n_1 + n_2 + n_3)!}{S(n_1, n_2, n_3)} \prod_{i=1}^{3} \frac{(2n_i - 3)!!}{n_i!} \tag{3.7}$$

where the symmetry factor from the above arguments is

$$S(n_1, n_2, n_3) = \begin{cases} 3! & \text{for } n_1 = n_2 = n_3 \\ 2 \cdot 2 & \text{for } n_3 = 2n_1 = 2n_2 \\ 2 & \text{for } n_1 = n_2 \vee n_2 = n_3 \\ 2 & \text{for } n_1 + n_2 = n_3 \end{cases} \tag{3.8}$$

Indeed, the sum of all Feynman diagrams

$$\sum_{\substack{n_1+n_2+n_3=n \\ 1 \le n_1 \le n_2 \le n_3 \le \lfloor n/2 \rfloor}} N(n_1, n_2, n_3) = (2n - 5)!! \tag{3.9}$$

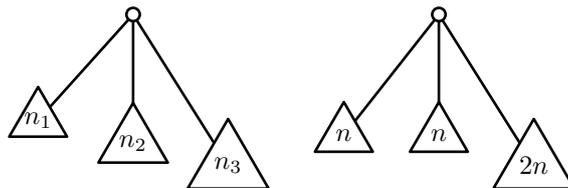

Figure 3.3:   If $n_3 = n_1 + n_2$, the apparently asymmetric topologies on the left hand side have a non obvious two-fold symmetry, that exchanges the two halves. Therefore, the topologies on the right hand side have a four fold symmetry.

| $n$ | $(2n-5)!!$ | $\sum N(n_1, n_2, n_3)$ |
|---|---|---|
| 4 | 3 | $3 \cdot (1, 1, 2)$ |
| 5 | 15 | $15 \cdot (1, 2, 2)$ |
| 6 | 105 | $90 \cdot (1, 2, 3) + 15 \cdot (2, 2, 2)$ |
| 7 | 945 | $630 \cdot (1, 3, 3) + 315 \cdot (2, 2, 3)$ |
| 8 | 10395 | $6300 \cdot (1, 3, 4) + 1575 \cdot (2, 2, 4) + 2520 \cdot (2, 3, 3)$ |
| 9 | 135135 | $70875 \cdot (1, 4, 4) + 56700 \cdot (2, 3, 4) + 7560 \cdot (3, 3, 3)$ |
| 10 | 2027025 | $992250 \cdot (1, 4, 5) + 396900 \cdot (2, 3, 5)$ |
| | | $\quad + 354375 \cdot (2, 4, 4) + 283500 \cdot (3, 3, 4)$ |
| 11 | 34459425 | $15280650 \cdot (1, 5, 5) + 10914750 \cdot (2, 4, 5)$ |
| | | $\quad + 4365900 \cdot (3, 3, 5) + 3898125 \cdot (3, 4, 4)$ |
| 12 | 654729075 | $275051700 \cdot (1, 5, 6) + 98232750 \cdot (2, 4, 6)$ |
| | | $\quad + 91683900 \cdot (2, 5, 5) + 39293100 \cdot (3, 3, 6)$ |
| | | $\quad + 130977000 \cdot (3, 4, 5) + 19490625 \cdot (4, 4, 4)$ |

Table 3.2: Equation (3.9) for small values of $n$.

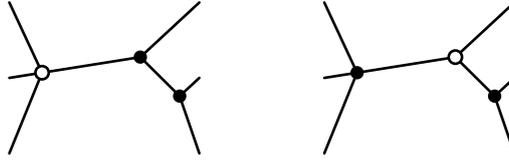

Figure 3.4: Degenerate $(1, 1, 1, 3)$ and $(1, 2, 3)$.

can be checked numerically for large values of $n = n_1 + n_2 + n_3$, verifying the symmetry factor (see table 3.2).

P. M. claims to have seen similar formulae in the context of Young tableaux. That's a good occasion to read the new edition of Howard's book . . .

Return a list of all inequivalent partitions of the list $l$ in three lists of length $n1$, $n2$ and $n3$, respectively. Common first lists are factored. This is nothing more than a typedafe wrapper around *Combinatorics.factorized_keystones*.

    (Combinatorics.factorized_keystones [n1; n2; n3] l)

let keystones l =
  ThoList.flatmap (fun n123 → keystone n123 l) (partitions (List.length l))

let max_subtree n = n / 2

end
```

### 3.2.2  Factorizing Diagrams for $\sum_n \lambda_n \phi^n$

Mixed $\phi^n$ adds new degeneracies, as in figure 3.4. They appear if and only if one part takes exactly half of the external lines and can relate central vertices of different arity.

```
module Nary (B : Tuple.Bound) =
  struct
    type partition = int list
    let inspect_partition p = p

    let partition d sum =
      Partition.tuples d sum 1 (sum / 2)
```

| $n$ | $\sum$ | $\sum$ |
|---|---|---|
| 4 | 4 | $1 \cdot (1,1,1,1) + 3 \cdot (1,1,2)$ |
| 5 | 25 | $10 \cdot (1,1,1,2) + 15 \cdot (1,2,2)$ |
| 6 | 220 | $40 \cdot (1,1,1,3) + 45 \cdot (1,1,2,2) + 120 \cdot (1,2,3) + 15 \cdot (2,2,2)$ |
| 7 | 2485 | $840 \cdot (1,1,2,3) + 105 \cdot (1,2,2,2) + 1120 \cdot (1,3,3) + 420 \cdot (2,2,3)$ |
| 8 | 34300 | $5250 \cdot (1,1,2,4) + 4480 \cdot (1,1,3,3) + 3360 \cdot (1,2,2,3)$ $+ 105 \cdot (2,2,2,2) + 14000 \cdot (1,3,4)$ $+ 2625 \cdot (2,2,4) + 4480 \cdot (2,3,3)$ |
| 9 | 559405 | $126000 \cdot (1,1,3,4) + 47250 \cdot (1,2,2,4) + 40320 \cdot (1,2,3,3)$ $+ 5040 \cdot (2,2,2,3) + 196875 \cdot (1,4,4)$ $+ 126000 \cdot (2,3,4) + 17920 \cdot (3,3,3)$ |
| 10 | 10525900 | $1108800 \cdot (1,1,3,5) + 984375 \cdot (1,1,4,4) + 415800 \cdot (1,2,2,5)$ $+ 1260000 \cdot (1,2,3,4) + 179200 \cdot (1,3,3,3) + 78750 \cdot (2,2,2,4)$ $+ 100800 \cdot (2,2,3,3) + 3465000 \cdot (1,4,5) + 1108800 \cdot (2,3,5)$ $+ 984375 \cdot (2,4,4) + 840000 \cdot (3,3,4)$ |

Table 3.3: $\mathcal{L} = \lambda_3 \phi^3 + \lambda_4 \phi^4$

| $n$ | $\sum$ | $\sum$ |
|---|---|---|
| 4 | 4 | $1 \cdot (1,1,1,1) + 3 \cdot (1,1,2)$ |
| 5 | 26 | $1 \cdot (1,1,1,1,1) + 10 \cdot (1,1,1,2) + 15 \cdot (1,2,2)$ |
| 6 | 236 | $1 \cdot (1,1,1,1,1,1) + 15 \cdot (1,1,1,1,2) + 40 \cdot (1,1,1,3)$ $+ 45 \cdot (1,1,2,2) + 120 \cdot (1,2,3) + 15 \cdot (2,2,2)$ |
| 7 | 2751 | $21 \cdot (1,1,1,1,1,2) + 140 \cdot (1,1,1,1,3) + 105 \cdot (1,1,1,2,2)$ $+ 840 \cdot (1,1,2,3) + 105 \cdot (1,2,2,2) + 1120 \cdot (1,3,3) + 420 \cdot (2,2,3)$ |
| 8 | 39179 | $224 \cdot (1,1,1,1,1,3) + 210 \cdot (1,1,1,1,2,2) + 910 \cdot (1,1,1,1,4)$ $+ 2240 \cdot (1,1,1,2,3) + 420 \cdot (1,1,2,2,2) + 5460 \cdot (1,1,2,4)$ $+ 4480 \cdot (1,1,3,3) + 3360 \cdot (1,2,2,3) + 105 \cdot (2,2,2,2)$ $+ 14560 \cdot (1,3,4) + 2730 \cdot (2,2,4) + 4480 \cdot (2,3,3)$ |

Table 3.4: $\mathcal{L} = \lambda_3 \phi^3 + \lambda_4 \phi^4 + \lambda_5 \phi^5 + \lambda_6 \phi^6$

```
let rec partitions' d sum =
  if d < 3 then
    []
  else
    partition d sum @ partitions' (pred d) sum

let partitions sum = partitions' (succ (B.max_arity ())) sum

module Tuple = Tuple.Nary(B)
type α children = α Tuple.t

let keystones' l =
  let n = List.length l in
  ThoList.flatmap (fun p → Combinatorics.factorized_keystones p l)
    (partitions n)

let keystones l =
  List.map (fun (bra, kets) → (bra, List.map Tuple.of_list kets))
    (keystones' l)

let max_subtree n = n / 2

end

module Nary4 = Nary (struct let max_arity () = 3 end)
```

### 3.2.3   Factorizing Diagrams for $\phi^4$

```
module Ternary =
  struct
    type partition = int × int × int × int
    let inspect_partition (n1, n2, n3, n4) = [n1; n2; n3; n4]
    type α children = α Tuple.Ternary.t
    let collect4 acc = function
      | [x; y; z; u] → (x, y, z, u) :: acc
      | _ → acc
    let partitions n =
      List.fold_left collect4 [] (Nary4.partitions n)
    let collect3 acc = function
      | [x; y; z] → Tuple.Ternary.of3 x y z :: acc
      | _ → acc
    let keystones l =
      List.map (fun (bra, kets) → (bra, List.fold_left collect3 [] kets))
        (Nary4.keystones' l)
    let max_subtree = Nary4.max_subtree
  end
```

### 3.2.4   Factorizing Diagrams for $\phi^3 + \phi^4$

```
module Mixed23 =
  struct
    type partition =
      | P3 of int × int × int
      | P4 of int × int × int × int
    let inspect_partition = function
      | P3 (n1, n2, n3) → [n1; n2; n3]
      | P4 (n1, n2, n3, n4) → [n1; n2; n3; n4]
    type α children = α Tuple.Mixed23.t
    let collect34 acc = function
      | [x; y; z] → P3 (x, y, z) :: acc
      | [x; y; z; u] → P4 (x, y, z, u) :: acc
      | _ → acc
    let partitions n =
      List.fold_left collect34 [] (Nary4.partitions n)
    let collect23 acc = function
      | [x; y] → Tuple.Mixed23.of2 x y :: acc
      | [x; y; z] → Tuple.Mixed23.of3 x y z :: acc
      | _ → acc
    let keystones l =
      List.map (fun (bra, kets) → (bra, List.fold_left collect23 [] kets))
        (Nary4.keystones' l)
    let max_subtree = Nary4.max_subtree
  end
```

### 3.2.5   Diagnostics: Counting Diagrams and Factorizations for $\sum_n \lambda_n \phi^n$

```
module type Integer =
  sig
    type t
    val zero : t
    val one : t
    val ( + ) : t → t → t
    val ( − ) : t → t → t
    val ( × ) : t → t → t
    val ( / ) : t → t → t
```

```
      val pred  :  t  →  t
      val succ  :  t  →  t
      val ( = )  :  t  →  t  →  bool
      val ( ≠ )  :  t  →  t  →  bool
      val ( < )  :  t  →  t  →  bool
      val ( ≤ )  :  t  →  t  →  bool
      val ( > )  :  t  →  t  →  bool
      val ( ≥ )  :  t  →  t  →  bool
      val of_int  :  int  →  t
      val to_int  :  t  →  int
      val to_string  :  t  →  string
      val compare  :  t  →  t  →  int
      val factorial  :  t  →  t
   end
```

O'Caml's native integers suffice for all applications, but in appendix R, we want to use big integers for numeric checks in high orders:

```
module Int  :  Integer  =
   struct
      type t  =  int
      let zero  =  0
      let one  =  1
      let ( + )  =  ( + )
      let ( − )  =  ( − )
      let ( × )  =  ( × )
      let ( / )  =  ( / )
      let pred  =  pred
      let succ  =  succ
      let ( = )  =  ( = )
      let ( ≠ )  =  ( ≠ )
      let ( < )  =  ( < )
      let ( ≤ )  =  ( ≤ )
      let ( > )  =  ( > )
      let ( ≥ )  =  ( ≥ )
      let of_int n  =  n
      let to_int n  =  n
      let to_string  =  string_of_int
      let compare  =  compare
      let factorial  =  Combinatorics.factorial
   end

module type Count  =
   sig
      type integer
      val diagrams  :  ?f : (integer  →  bool)  →  integer  →  integer  →  integer
      val diagrams_via_keystones  :  integer  →  integer  →  integer
      val keystones  :  integer list →  integer
      val diagrams_per_keystone  :  integer  →  integer list →  integer
   end

module Count (I  :  Integer)  =
   struct
      let description  =  ["(still␣inoperational)␣phi^n␣topology"]

      type integer  =  I.t
      open I
      let two  =  of_int 2
      let three  =  of_int 3
```

If $I.t$ is an abstract datatype, the polymorphic *Pervasives.min* can fail. Provide our own version using the specific comparison "$( \leq )$".

```
      let min x y  =
         if x  ≤  y then
```

$$x$$
else
$$y$$

<div align="center">

*Counting Diagrams for $\sum_n \lambda_n \phi^n$*

</div>

Classes of diagrams are defined by the number of vertices and their degrees. We could use fixed size arrays, but we will use a map instead. For efficiency, we also maintain the number of external lines and the total number of propagators.

> module *IMap* = *Map.Make* (struct type *t* = *integer* let *compare* = *compare* end)

> type *diagram_class* = { *ext* : *integer*; *prop* : *integer*; *v* : *integer IMap.t* }

The numbers of external lines, propagators and vertices are determined by the degrees and multiplicities of vertices:

$$E(\{n_3, n_4, \ldots\}) = 2 + \sum_{d=3}^{\infty} (d - 2)n_d \tag{3.10a}$$

$$P(\{n_3, n_4, \ldots\}) = \sum_{d=3}^{\infty} n_d - 1 = V(\{n_3, n_4, \ldots\}) - 1 \tag{3.10b}$$

$$V(\{n_3, n_4, \ldots\}) = \sum_{d=3}^{\infty} n_d \tag{3.10c}$$

> let *num_ext v* =
>     *List.fold_left* (fun *sum* (*d*, *n*) → *sum* + (*d* − *two*) × *n*) *two v*

> let *num_prop v* =
>     *List.fold_left* (fun *sum* (_, *n*) → *sum* + *n*) (*zero* − *one*) *v*

The sum of all vertex degrees must be equal to the number of propagator end points. This can be verified easily:

$$2P(\{n_3, n_4, \ldots\}) + E(\{n_3, n_4, \ldots\}) = \sum_{d=3}^{\infty} dn_d \tag{3.11}$$

> let *add_degree map* (*d*, *n*) =
>     if *d* < *three* then
>         *invalid_arg* `"add_degree:␣d␣<␣3"`
>     else if *n* < *zero* then
>         *invalid_arg* `"add_degree:␣n␣<=␣0"`
>     else if *n* = *zero* then
>         *map*
>     else
>         *IMap.add d n map*

> let *create_class v* =
>     { *ext* = *num_ext v*;
>         *prop* = *num_prop v*;
>         *v* = *List.fold_left add_degree IMap.empty v* }

> let *multiplicity cl d* =
>     if *d* ≥ *three* then
>         try
>             *IMap.find d cl.v*
>         with
>         | *Not_found* → *zero*
>     else
>         *invalid_arg* `"multiplicity:␣d␣<␣3"`

Remove one vertex of degree $d$, maintaining the invariants. Raises *Zero* if all vertices of degree $d$ are exhausted.

> exception *Zero*

> let *remove cl d* =

```
      let n  =  pred (multiplicity cl d) in
      if n  <  zero then
          raise Zero
      else
          { ext  =  cl.ext  −  (d  −  two);
            prop  =  pred cl.prop;
            v  =  if n  =  zero then
                IMap.remove d cl.v
            else
                IMap.add d n cl.v }
```

Add one vertex of degree $d$, maintaining the invariants.

```
      let add cl d  =
          { ext  =  cl.ext  +  (d  −  two);
            prop  =  succ cl.prop;
            v  =  IMap.add d (succ (multiplicity cl d)) cl.v }
```

Count the number of diagrams. Any diagram can be obtained recursively either from a diagram with one ternary vertex less by insertion if a ternary vertex in an internal or external propagator or from a diagram with a higher order vertex that has its degree reduced by one:

$$D(\{n_3, n_4, \ldots\}) =$$
$$(P(\{n_3 - 1, n_4, \ldots\}) + E(\{n_3 - 1, n_4, \ldots\}))\, D(\{n_3 - 1, n_4, \ldots\})$$
$$+ \sum_{d=4}^{\infty} (n_{d-1} + 1) D(\{n_3, n_4, \ldots, n_{d-1} + 1, n_d - 1, \ldots\}) \quad (3.12)$$

```
      let rec class_size cl  =
          if cl.ext  =  two  ∨  cl.prop  =  zero then
              one
          else
              IMap.fold (fun d _ s  →  class_size_n cl d  +  s) cl.v (class_size_3 cl)
```

Purely ternary vertices recurse among themselves:

```
      and class_size_3 cl  =
          try
              let d'  =  remove cl three in
              (d'.ext  +  d'.prop)  ×  class_size d'
          with
          | Zero  →  zero
```

Vertices of higher degree recurse one step towards lower degrees:

```
      and class_size_n cl d  =
          if d  >  three then begin
              try
                  let d'  =  pred d in
                  let cl'  =  add (remove cl d) d' in
                  multiplicity cl' d'  ×  class_size cl'
              with
              | Zero  →  zero
          end else
              zero
```

Find all $\{n_3, n_4, \ldots, n_d\}$ with

$$E(\{n_3, n_4, \ldots, n_d\}) - 2 = \sum_{i=3}^{c} l(i - 2) n_i = sum \quad (3.13)$$

The implementation is a variant of *tuples* above.

```
      let rec distribute_degrees' d sum  =
          if d  <  three then
```

```
            invalid_arg "distribute_degrees"
          else if d = three then
            [[(d, sum)]]
          else
            distribute_degrees″ d sum (sum / (d − two))
```

```
    and distribute_degrees″ d sum n =
      if n < zero then
        []
      else
        List.fold_left (fun ll l → ((d, n) :: l) :: ll)
          (distribute_degrees″ d sum (pred n))
          (distribute_degrees′ (pred d) (sum − (d − two) × n))
```

Actually, we need to find all $\{n_3, n_4, \ldots, n_d\}$ with

$$E(\{n_3, n_4, \ldots, n_d\}) = sum \tag{3.14}$$

```
      let distribute_degrees d sum = distribute_degrees′ d (sum − two)
```

Finally we can count all diagrams by adding all possible ways of splitting the degrees of vertices. We can also count diagrams where _all_ degrees satisfy a predicate $f$:

```
    let diagrams ?(f = fun _ → true) deg n =
      List.fold_left (fun s d →
        if List.for_all (fun (d′, n′) → f d′ ∨ n′ = zero) d then
          s + class_size (create_class d)
        else
          s)
        zero (distribute_degrees deg n)
```

The next two are duplicated from _ThoList_ and _Combinatorics_, in order to use the specific comparison functions.

```
    let classify l =
      let rec add_to_class a = function
        | [] → [of_int 1, a]
        | (n, a′) :: rest →
            if a = a′ then
              (succ n, a) :: rest
            else
              (n, a′) :: add_to_class a rest
      in
      let rec classify′ cl = function
        | [] → cl
        | a :: rest → classify′ (add_to_class a cl) rest
      in
      classify′ [] l
```

```
    let permutation_symmetry l =
      List.fold_left (fun s (n, _) → factorial n × s) one (classify l)
```

```
    let symmetry l =
      let sum = List.fold_left (+) zero l in
      if List.exists (fun x → two × x = sum) l then
        two × permutation_symmetry l
      else
        permutation_symmetry l
```

The number of Feynman diagrams built of vertices with maximum degree $d_{\max}$ in a partition $N_{d,n} = \{n_1, n_2, \ldots, n_d\}$ with $n = n_1 + n_2 + \cdots + n_d$ and

$$\tilde{F}(d_{\max}, N_{d,n}) = \frac{n!}{|\mathcal{S}(N_{d,n})|\sigma(n_d, n)} \prod_{i=1}^{d} \frac{F(d_{\max}, n_i + 1)}{n_i!} \tag{3.15}$$

with $|\mathcal{S}(N)|$ the size of the symmetric group of $N$, $\sigma(n, 2n) = 2$ and $\sigma(n, m) = 1$ otherwise.

```
let keystones p =
  let sum = List.fold_left (+) zero p in
  List.fold_left (fun acc n → acc / (factorial n)) (factorial sum) p
    / symmetry p

let diagrams_per_keystone deg p =
  List.fold_left (fun acc n → acc × diagrams deg (succ n)) one p
```

We must find

$$F(d_{\max}, n) = \sum_{d=3}^{d_{\max}} \sum_{\substack{N=\{n_1,n_2,\ldots,n_d\} \\ n_1+n_2+\cdots+n_d=n \\ 1 \le n_1 \le n_2 \le \cdots \le n_d \le \lfloor n/2 \rfloor}} \tilde{F}(d_{\max}, N) \tag{3.16}$$

```
let diagrams_via_keystones deg n =
  let module N = Nary (struct let max_arity () = to_int (pred deg) end) in
  List.fold_left
    (fun acc p → acc + diagrams_per_keystone deg p × keystones p)
    zero (List.map (List.map of_int) (N.partitions (to_int n)))
```

end

### 3.2.6   Emulating HELAC

In [2], one leg is singled out:

```
module Helac (B : Tuple.Bound) =
  struct
    module Tuple = Tuple.Nary(B)

    type partition = int list
    let inspect_partition p = p

    let partition d sum =
      Partition.tuples d sum 1 (sum − d + 1)

    let rec partitions' d sum =
      let d' = pred d in
      if d' < 2 then
        []
      else
        List.map (fun p → 1 :: p) (partition d' (pred sum)) @ partitions' d' sum

    let partitions sum = partitions' (succ (B.max_arity ())) sum

    type α children = α Tuple.t

    let keystones' l =
      match l with
      | [] → []
      | head :: tail →
          [([head],
            ThoList.flatmap (fun p → Combinatorics.partitions (List.tl p) tail)
              (partitions (List.length l)))]

    let keystones l =
      List.map (fun (bra, kets) → (bra, List.map Tuple.of_list kets))
        (keystones' l)

    let max_subtree n = pred n
  end
```

The following is not tested, but it is no rocket science either …

```
module Helac_Binary =
  struct
    type partition = int × int × int
```

```
let inspect_partition (n1, n2, n3) = [n1; n2; n3]

let partitions sum =
    List.map (fun (n2, n3) → (1, n2, n3))
        (Partition.pairs (sum − 1) 1 (sum − 2))

type α children = α Tuple.Binary.t

let keystones' l =
    match l with
    | [] → []
    | head :: tail →
        [([head],
            ThoList.flatmap (fun (_, p2, _) → Combinatorics.split p2 tail)
                (partitions (List.length l)))]

let keystones l =
    List.map (fun (bra, kets) →
        (bra, List.map (fun (x, y) → Tuple.Binary.of2 x y) kets))
        (keystones' l)

let max_subtree n = pred n

end
```

# —4—
## DIRECTED ACYCLICAL GRAPHS

## 4.1 Interface of DAG

This datastructure describes large collections of trees with many shared nodes. The sharing of nodes is semantically irrelevant, but can turn a factorial complexity to exponential complexity. Note that $DAG$ implements only a very specialized subset of Directed Acyclical Graphs (DAGs).

If $T(n, D)$ denotes the set of all binary trees with root $n$ encoded in $D$, while

$$O(n, D) = \{(e_1, n_1, n'_1), \ldots, (e_k, n_k, n'_k)\} \tag{4.1}$$

denotes the set of all *offspring* of $n$ in $D$, and $\mathrm{tree}(e, t, t')$ denotes the binary tree formed by joining the binary trees $t$ and $t'$ with the label $e$, then

$$T(n, D) = \big\{ \mathrm{tree}(e_i, t_i, t'_i) \, \big| \, (e_i, t_i, t'_i) \in \{e_1\} \times T(n_1, D) \times T(n'_1, D) \cup \ldots$$
$$\ldots \cup \{e_k\} \times T(n_k, D) \times T(n'_k, D) \big\} \tag{4.2}$$

is the recursive definition of the binary trees encoded in $D$. It is obvious how this definitions translates to $n$-ary trees (including trees with mixed arity).

### 4.1.1 Forests

We require edges and nodes to be members of ordered sets. The sematics of *compare* are compatible with *Pervasives.compare*:

$$compare(x, y) = \begin{cases} -1 & \text{for } x < y \\ 0 & \text{for } x = y \\ 1 & \text{for } x > y \end{cases} \tag{4.3}$$

Note that this requirement does *not* exclude any trees. Even if we consider only topological equivalence classes with anonymous nodes, we can always construct a canonical labeling and order from the children of the nodes. However, if practical applications, we will often have more efficient labelings and orders at our disposal.

module type $Ord$ =
  sig
    type $t$
    val $compare$ : $t$ → $t$ → $int$
  end

A forest $F$ over a set of nodes and a set of edges is a map from the set of nodes $N$, to the direct product of the set of edges $E$ and the power set $2^N$ of $N$ augmented by a special element $\perp$ ("bottom").

$$F : N \to (E \times 2^N) \cup \{\perp\}$$
$$n \mapsto \begin{cases} (e, \{n'_1, n'_2, \ldots\}) \\ \perp \end{cases} \tag{4.4}$$

The nodes are ordered so that cycles can be detected

$$\forall n \in N : F(n) = (e, x) \Rightarrow \forall n' \in x : n > n' \tag{4.5}$$

A suitable function that exists for *all* forests is the depth of the tree beneath a node.

    Nodes that are mapped to $\perp$ are called *leaf* nodes and nodes that do not appear in any $F(n)$ are called *root* nodes. There are as many trees in the forest as there are root nodes.

module type *Forest* =
  sig

    module *Nodes* : *Ord*
    type *node* = *Nodes.t*
    type *edge*

A subset $X \subset 2^N$ of the powerset of the set of nodes. The members of $X$ can be be characterized by a fixed number of members (e. g. two for binary trees, as in QED). We can also have mixed arities (e. g. two and three for QCD) or even arbitrary arities. However, in most cases, the members of $X$ will have at least two members.

    type *children*

This type abbreviation and order allow to apply the *Set.Make* functor to $E \times X$.

    type *t* = *edge* × *children*
    val *compare* : *t* → *t* → *int*

Test a predicate for *all* children.

    val *for_all* : (*node* → *bool*) → *t* → *bool*

*fold f* (_, *children*) *acc* will calculate

$$f(x_1, f(x_2, \cdots f(x_n, acc)))$$  (4.6)

where the *children* are $\{x_1, x_2, \ldots, x_n\}$. There are slightly more efficient alternatives for fixed arity (in particular binary), but we want to be general.

    val *fold* : (*node* → $\alpha$ → $\alpha$) → *t* → $\alpha$ → $\alpha$

  end

module *Forest* : functor (*PT* : *Tuple.Poly*) →
  functor (*N* : *Ord*) → functor (*E* : *Ord*) →
      *Forest* with module *Nodes* = *N* and type *edge* = *E.t*
      and type *node* = *N.t* and type *children* = *N.t PT.t*

## *4.1.2   DAGs*

module type *T* =
  sig

    type *node*
    type *edge*

In the description of the function we assume for definiteness DAGs of binary trees with type *children* = *node* × *node*. However, we will also have implementations with type *children* = *node list* below.
Other possibilities include type *children* = *V3* of *node* × *node* | *V4* of *node* × *node* × *node*. There's probable never a need to use sets with logarithmic access, but it is easy to add.

    type *children*
    type *t*

The empty DAG.

    val *empty* : *t*

*add_node n dag* returns the DAG *dag* with the node *n*. If the node *n* already exists in *dag*, it is returned unchanged. Otherwise *n* is added without offspring.

    val *add_node* : *node* → *t* → *t*

*add_offspring n* (*e*, (*n1*, *n2*)) *dag* returns the DAG *dag* with the node *n* and its offspring *n1* and *n2* with edge label *e*. Each node can have an arbitrary number of offspring, but identical offspring are added only once. In order to prevent cycles, *add_offspring* requires both $n > n1$ and $n > n2$ in the given ordering. The nodes *n1* and *n2* are added as by *add_node*. NB: Adding all nodes *n1* and *n2*, even if they are sterile, is not strictly necessary for our applications. It even slows down the code by a few percent. But it is desirable for consistency and allows much more efficient *iter_nodes* and *fold_nodes* below.

    val *add_offspring* : *node* → *edge* × *children* → *t* → *t*

exception *Cycle*

Just like *add_offspring*, but does not check for potential cycles.

val *add_offspring_unsafe* : *node* → *edge* × *children* → *t* → *t*

*is_node n dag* returns true iff *n* is a node in *dag*.

val *is_node* : *node* → *t* → *bool*

*is_sterile n dag* returns true iff *n* is a node in *dag* and boasts no offspring.

val *is_sterile* : *node* → *t* → *bool*

*is_offspring n* (*e*, (*n1*, *n2*)) *dag* returns true iff *n1* and *n2* are offspring of *n* with label *e* in *dag*.

val *is_offspring* : *node* → *edge* × *children* → *t* → *bool*

Note that the following functions can run into infinite recursion if the DAG given as argument contains cycles. The usual functionals for processing all nodes (including sterile) . . .

val *iter_nodes* : (*node* → *unit*) → *t* → *unit*
val *map_nodes* : (*node* → *node*) → *t* → *t*
val *fold_nodes* : (*node* → $\alpha$ → $\alpha$) → *t* → $\alpha$ → $\alpha$

. . . and all parent/offspring relations. Note that *map* requires *two* functions: one for the nodes and one for the edges and children. This is so because a change in the definition of node is *not* propagated automatically to where it is used as a child.

val *iter* : (*node* → *edge* × *children* → *unit*) → *t* → *unit*
val *map* : (*node* → *node*) →
(*node* → *edge* × *children* → *edge* × *children*) → *t* → *t*
val *fold* : (*node* → *edge* × *children* → $\alpha$ → $\alpha$) → *t* → $\alpha$ → $\alpha$

⚡ Note that in it's current incarnation, *fold add_offspring dag empty* copies *only* the fertile nodes, while *fold add_offspring dag* (*fold_nodes add_node dag empty*) includes sterile ones, as does *map* (fun *n* → *n*) (fun *n ec* → *ec*) *dag*.

Return the DAG as a list of lists.

val *lists* : *t* → (*node* × (*edge* × *children*) *list*) *list*

*dependencies dag node* returns a canonically sorted *Tree2.t* of all nodes reachable from *node*.

val *dependencies* : *t* → *node* → (*node*, *edge*) *Tree2.t*

*harvest dag n roots* returns the DAG *roots* enlarged by all nodes in *dag* reachable from *n*.

val *harvest* : *t* → *node* → *t* → *t*

*harvest_list dag nlist* returns the part of the DAG *dag* that is reachable from the nodes in *nlist*.

val *harvest_list* : *t* → *node list* → *t*

*size dag* returns the number of nodes in the DAG *dag*.

val *size* : *t* → *int*

*eval f mul_edge mul_nodes add null unit root dag* interprets the part of *dag* beneath *root* as an algebraic expression:

- each node is evaluated by *f* : *node* → $\alpha$

- each set of children is evaluated by iterating the binary *mul_nodes* : $\alpha$ → $\gamma$ → $\gamma$ on the values of the nodes, starting from *unit*: $\gamma$

- each offspring relation (*node*, (*edge*, *children*)) is evaluated by applying *mul_edge* : *node* → *edge* → $\gamma$ → $\delta$ to *node*, *edge* and the evaluation of *children*.

- all offspring relations of a *node* are combined by iterating the binary *add* : $\delta$ → $\alpha$ → $\alpha$ starting from *null* : $\alpha$

In our applications, we will always have $\alpha = \gamma = \delta$, but the more general type is useful for documenting the relationships. The memoizing variant _eval_memoized f mul_edge mul_nodes add null unit root dag_ requires some overhead, but can be more efficient for complex operations.

> val _eval_ : $(node \rightarrow \alpha) \rightarrow (node \rightarrow edge \rightarrow \gamma \rightarrow \delta) \rightarrow$
> $(\alpha \rightarrow \gamma \rightarrow \gamma) \rightarrow (\delta \rightarrow \alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \gamma \rightarrow node \rightarrow t \rightarrow \alpha$
> val _eval_memoized_ : $(node \rightarrow \alpha) \rightarrow (node \rightarrow edge \rightarrow \gamma \rightarrow \delta) \rightarrow$
> $(\alpha \rightarrow \gamma \rightarrow \gamma) \rightarrow (\delta \rightarrow \alpha \rightarrow \alpha) \rightarrow \alpha \rightarrow \gamma \rightarrow node \rightarrow t \rightarrow \alpha$

_forest root dag_ expands the _dag_ beneath _root_ into the equivalent list of trees _Tree.t_. _children_ are represented as list of nodes.

⚠ A sterile node $n$ is represented as _Tree.Leaf_ $((n, None), n)$, cf. page . There might be a better way, but we need to change the interface and semantics of _Tree_ for this.

> val _forest_ : $node \rightarrow t \rightarrow (node \times edge\ option,\ node)$ _Tree.t list_
> val _forest_memoized_ : $node \rightarrow t \rightarrow (node \times edge\ option,\ node)$ _Tree.t list_

_count_trees n dag_ returns the number of trees with root $n$ encoded in the DAG _dag_, i.e. $|T(n, D)|$. NB: the current implementation is very naive and can take a _very_ long time for moderately sized DAGs that encode a large set of trees.

> val _count_trees_ : $node \rightarrow t \rightarrow int$

> end

module _Make_ $(F : Forest)$ :
> $T$ with type $node = F.node$ and type $edge = F.edge$
> and type $children = F.children$

## 4.1.3  Graded Sets, Forests & DAGs

A graded ordered[1] set is an ordered set with a map into another ordered set (often the non-negative integers). The grading does not necessarily respect the ordering.

module type _Graded_Ord_ =
> sig
> > include _Ord_
> > module $G$ : _Ord_
> > val _rank_ : $t \rightarrow G.t$
> end

For all ordered sets, there are two canonical gradings: a _Chaotic_ grading that assigns the same rank (e.g. _unit_) to all elements and the _Discrete_ grading that uses the identity map as grading.

module type _Grader_ = functor $(O : Ord) \rightarrow$ _Graded_Ord_ with type $t = O.t$
module _Chaotic_ : _Grader_
module _Discrete_ : _Grader_

A graded forest is just a forest in which the nodes form a graded ordered set.

⚠ There doesn't appear to be a nice syntax for avoiding the repetition here. Fortunately, the signature is short ...

module type _Graded_Forest_ =
> sig
> > module _Nodes_ : _Graded_Ord_
> > type $node = Nodes.t$
> > type _edge_
> > type _children_
> > type $t = edge \times children$
> > val _compare_ : $t \rightarrow t \rightarrow int$
> > val _for_all_ : $(node \rightarrow bool) \rightarrow t \rightarrow bool$
> > val _fold_ : $(node \rightarrow \alpha \rightarrow \alpha) \rightarrow t \rightarrow \alpha \rightarrow \alpha$
> end

---

[1]We don't appear to have use for graded unordered sets.

```
module type Forest_Grader  =  functor (G  :  Grader)  →  functor (F  :  Forest)  →
  Graded_Forest with type Nodes.t  =  F.node
    and type node  =  F.node
    and type edge  =  F.edge
    and type children  =  F.children
    and type t  =  F.t

module Grade_Forest  :  Forest_Grader
```

Finally, a graded DAG is a DAG in which the nodes form a graded ordered set and the subsets with a given rank can be accessed cheaply.

```
module type Graded  =
  sig
    include T
    type rank
    val rank  :  node  →  rank
    val ranks  :  t  →  rank list
    val min_max_rank  :  t  →  rank  ×  rank
    val ranked  :  rank  →  t  →  node list
  end

module Graded (F  :  Graded_Forest)  :
    Graded with type node  =  F.node and type edge  =  F.edge
    and type children  =  F.children and type rank  =  F.Nodes.G.t
```

## 4.2   Implementation of DAG

```
module type Ord  =
  sig
    type t
    val compare  :  t  →  t  →  int
  end

module type Forest  =
  sig
    module Nodes  :  Ord
    type node  =  Nodes.t
    type edge
    type children
    type t  =  edge  ×  children
    val compare  :  t  →  t  →  int
    val for_all  :  (node  →  bool)  →  t  →  bool
    val fold  :  (node  →  α  →  α)  →  t  →  α  →  α
  end

module type T  =
  sig
    type node
    type edge
    type children
    type t
    val empty  :  t
    val add_node  :  node  →  t  →  t
    val add_offspring  :  node  →  edge  ×  children  →  t  →  t
    exception Cycle
    val add_offspring_unsafe  :  node  →  edge  ×  children  →  t  →  t
    val is_node  :  node  →  t  →  bool
    val is_sterile  :  node  →  t  →  bool
    val is_offspring  :  node  →  edge  ×  children  →  t  →  bool
    val iter_nodes  :  (node  →  unit)  →  t  →  unit
    val map_nodes  :  (node  →  node)  →  t  →  t
    val fold_nodes  :  (node  →  α  →  α)  →  t  →  α  →  α
```

```
    val iter : (node → edge × children → unit) → t → unit
    val map : (node → node) →
      (node → edge × children → edge × children) → t → t
    val fold : (node → edge × children → α → α) → t → α → α
    val lists : t → (node × (edge × children) list) list
    val dependencies : t → node → (node, edge) Tree2.t
    val harvest : t → node → t → t
    val harvest_list : t → node list → t
    val size : t → int
    val eval : (node → α) → (node → edge → γ → δ) →
      (α → γ → γ) → (δ → α → α) → α → γ → node → t → α
    val eval_memoized : (node → α) → (node → edge → γ → δ) →
      (α → γ → γ) → (δ → α → α) → α → γ → node → t → α
    val forest : node → t → (node × edge option, node) Tree.t list
    val forest_memoized : node → t → (node × edge option, node) Tree.t list
    val count_trees : node → t → int
  end

module type Graded_Ord =
  sig
    include Ord
    module G : Ord
    val rank : t → G.t
  end

module type Grader = functor (O : Ord) → Graded_Ord with type t = O.t

module type Graded_Forest =
  sig
    module Nodes : Graded_Ord
    type node = Nodes.t
    type edge
    type children
    type t = edge × children
    val compare : t → t → int
    val for_all : (node → bool) → t → bool
    val fold : (node → α → α) → t → α → α
  end

module type Forest_Grader = functor (G : Grader) → functor (F : Forest) →
  Graded_Forest with type Nodes.t = F.node
  and type node = F.node
  and type edge = F.edge
  and type children = F.children
  and type t = F.t
```

## 4.2.1  The Forest Functor

```
module Forest (PT : Tuple.Poly) (N : Ord) (E : Ord) :
    Forest with module Nodes = N and type edge = E.t
    and type node = N.t and type children = N.t PT.t =
  struct
    module Nodes = N
    type edge = E.t
    type node = N.t
    type children = node PT.t
    type t = edge × children

    let compare (e1, n1) (e2, n2) =
      let c = PT.compare N.compare n1 n2 in
      if c ≠ 0 then
        c
      else
```

```
            E.compare e1 e2
      let for_all f (_, nodes) = PT.for_all f nodes
      let fold f (_, nodes) acc = PT.fold_right f nodes acc

   end
```

## 4.2.2   Gradings

```
module Chaotic (O : Ord) =
  struct
    include O
    module G =
      struct
        type t = unit
        let compare _ _ = 0
      end
    let rank _ = ()
  end

module Discrete (O : Ord) =
  struct
    include O
    module G = O
    let rank x = x
  end

module Fake_Grading (O : Ord) =
  struct
    include O
    exception Impossible of string
    module G =
      struct
        type t = unit
        let compare _ _ = raise (Impossible "G.compare")
      end
    let rank _ = raise (Impossible "G.compare")
  end

module Grade_Forest (G : Grader) (F : Forest) =
  struct
    module Nodes = G(F.Nodes)
    type node = Nodes.t
    type edge = F.edge
    type children = F.children
    type t = F.t
    let compare = F.compare
    let for_all = F.for_all
    let fold = F.fold
  end
```

The following can easily be extended to *Map.S* in its full glory, if we ever need it.

```
module type Graded_Map =
  sig
    type key
    type rank
    type α t
    val empty : α t
    val add : key → α → α t → α t
    val find : key → α t → α
    val mem : key → α t → bool
```

```
    val iter  :  (key  →  α  →  unit)  →  α t  →  unit
    val fold  :  (key  →  α  →  β  →  β)  →  α t  →  β  →  β
    val ranks  :  α t  →  rank list
    val min_max_rank  :  α t  →  rank  ×  rank
    val ranked  :  rank  →  α t  →  key list
  end

module type Graded_Map_Maker  =  functor (O  :  Graded_Ord)  →
  Graded_Map with type key  =  O.t and type rank  =  O.G.t

module Graded_Map (O  :  Graded_Ord)  :
    Graded_Map with type key  =  O.t and type rank  =  O.G.t  =
  struct
    module M1  =  Map.Make(O.G)
    module M2  =  Map.Make(O)

    type key  =  O.t
    type rank  =  O.G.t

    type (+α) t  =  α M2.t M1.t

    let empty  =  M1.empty
    let add key data map1  =
      let rank  =  O.rank key in
      let map2  =  try M1.find rank map1 with Not_found  →  M2.empty in
      M1.add rank (M2.add key data map2) map1
    let find key map  =  M2.find key (M1.find (O.rank key) map)
    let mem key map  =
      M2.mem key (try M1.find (O.rank key) map with Not_found  →  M2.empty)
    let iter f map1  =  M1.iter (fun rank  →  M2.iter f) map1
    let fold f map1 acc1  =  M1.fold (fun rank  →  M2.fold f) map1 acc1
```

The set of ranks and its minimum and maximum should be maintained explicitly!

```
    module S1  =  Set.Make(O.G)
    let ranks map  =  M1.fold (fun key data acc  →  key ::  acc) map []
    let rank_set map  =  M1.fold (fun key data  →  S1.add key) map S1.empty
    let min_max_rank map  =
      let s  =  rank_set map in
      (S1.min_elt s,  S1.max_elt s)

    module S2  =  Set.Make(O)
    let keys map  =  M2.fold (fun key data acc  →  key ::  acc) map []
    let sorted_keys map  =
      S2.elements (M2.fold (fun key data  →  S2.add key) map S2.empty)
    let ranked rank map  =
      keys (try M1.find rank map with Not_found  →  M2.empty)
  end
```

### 4.2.3   The DAG Functor

```
module Maybe_Graded (GMM  :  Graded_Map_Maker) (F  :  Graded_Forest)  =
  struct

    module G  =  F.Nodes.G

    type node  =  F.node
    type rank  =  G.t
    type edge  =  F.edge
    type children  =  F.children
```

If we get tired of graded DAGs, we just have to replace *Graded_Map* by *Map* here and remove *ranked* below and gain a tiny amount of simplicity and efficiency.

```
    module Parents  =  GMM(F.Nodes)
```

```
module Offspring = Set.Make(F)

type t = Offspring.t Parents.t

let rank = F.Nodes.rank
let ranks = Parents.ranks
let min_max_rank = Parents.min_max_rank
let ranked = Parents.ranked

let empty = Parents.empty

let add_node node dag =
  if Parents.mem node dag then
    dag
  else
    Parents.add node Offspring.empty dag

let add_offspring_unsafe node offspring dag =
  let offsprings =
    try Parents.find node dag with Not_found → Offspring.empty in
  Parents.add node (Offspring.add offspring offsprings)
    (F.fold add_node offspring dag)

exception Cycle

let add_offspring node offspring dag =
  if F.for_all (fun n → F.Nodes.compare n node < 0) offspring then
    add_offspring_unsafe node offspring dag
  else
    raise Cycle

let is_node node dag =
  Parents.mem node dag

let is_sterile node dag =
  try
    Offspring.is_empty (Parents.find node dag)
  with
  | Not_found → false

let is_offspring node offspring dag =
  try
    Offspring.mem offspring (Parents.find node dag)
  with
  | Not_found → false

let iter_nodes f dag =
  Parents.iter (fun n _ → f n) dag

let iter f dag =
  Parents.iter (fun node → Offspring.iter (f node)) dag

let map_nodes f dag =
  Parents.fold (fun n → Parents.add (f n)) dag Parents.empty

let map fn fo dag =
  Parents.fold (fun node offspring →
    Parents.add (fn node)
      (Offspring.fold (fun o → Offspring.add (fo node o))
        offspring Offspring.empty)) dag Parents.empty

let fold_nodes f dag acc =
  Parents.fold (fun n _ → f n) dag acc

let fold f dag acc =
  Parents.fold (fun node → Offspring.fold (f node)) dag acc
```

Note that in it's current incarnation, *fold add_offspring dag empty* copies *only* the fertile nodes, while *fold add_offspring dag (fold_nodes add_node dag empty)* includes sterile ones, as does *map* (fun $n$ → $n$) (fun $n$ $ec$ → $ec$) *dag*.

```
let dependencies dag node =
  let rec dependencies' node' =
    let offspring = Parents.find node' dag in
    if Offspring.is_empty offspring then
      Tree2.leaf node'
    else
      Tree2.cons
        (Offspring.fold
          (fun o acc →
            (fst o,
             node',
             F.fold (fun wf acc' → dependencies' wf :: acc') o []) :: acc)
          offspring [])
  in
  dependencies' node

let lists dag =
  List.sort (fun (n1, _) (n2, _) → F.Nodes.compare n1 n2)
    (Parents.fold (fun node offspring l →
      (node, Offspring.elements offspring) :: l) dag [])

let size dag =
  Parents.fold (fun _ _ n → succ n) dag 0

let rec harvest dag node roots =
  Offspring.fold
    (fun offspring roots' →
      if is_offspring node offspring roots' then
        roots'
      else
        F.fold (harvest dag)
          offspring (add_offspring_unsafe node offspring roots'))
    (Parents.find node dag) (add_node node roots)

let harvest_list dag nodes =
  List.fold_left (fun roots node → harvest dag node roots) empty nodes
```

Build a closure once, so that we can recurse faster:

```
let eval f mule muln add null unit node dag =
  let rec eval' n =
    if is_sterile n dag then
      f n
    else
      Offspring.fold
        (fun (e, _ as offspring) v0 →
          add (mule n e (F.fold muln' offspring unit)) v0)
        (Parents.find n dag) null
  and muln' n = muln (eval' n) in
  eval' node

let count_trees node dag =
  eval (fun _ → 1) (fun _ _ p → p) ( × ) (+) 0 1 node dag

let build_forest evaluator node dag =
  evaluator (fun n → [Tree.leaf (n, None) n])
    (fun n e p → List.map (fun p' → Tree.cons (n, Some e) p') p)
    (fun p1 p2 → Product.fold2 (fun n nl pl → (n :: nl) :: pl) p1 p2 [])
    (@) [] [[]] node dag

let forest = build_forest eval
```

At least for *count_trees*, the memoizing variant *eval_memoized* is considerably slower than direct recursive evaluation with *eval*.

```
let eval_offspring f mule muln add null unit dag values (node, offspring) =
  let muln' n = muln (Parents.find n values) in
```

```
      let v =
        if is_sterile node dag then

        else
          Offspring.fold
            (fun (e, _ as offspring) v0 →
              add (mule node e (F.fold muln' offspring unit)) v0)
            offspring null
      in
      (v, Parents.add node v values)

    let eval_memoized' f mule muln add null unit dag =
      let result, _ =
        List.fold_left
          (fun (v, values) → eval_offspring f mule muln add null unit dag values)
          (null, Parents.empty)
          (List.sort (fun (n1, _) (n2, _) → F.Nodes.compare n1 n2)
            (Parents.fold
              (fun node offspring l → (node, offspring) :: l) dag [])) in
      result

    let eval_memoized f mule muln add null unit node dag =
      eval_memoized' f mule muln add null unit
        (harvest dag node empty)

    let forest_memoized = build_forest eval_memoized

  end

module type Graded =
  sig
    include T
    type rank
    val rank : node → rank
    val ranks : t → rank list
    val min_max_rank : t → rank × rank
    val ranked : rank → t → node list
  end

module Graded (F : Graded_Forest) = Maybe_Graded(Graded_Map)(F)
```

The following is not a graded map, obviously. But it can pass as one by the typechecker for constructing non-graded DAGs.

```
module Fake_Graded_Map (O : Graded_Ord) :
    Graded_Map with type key = O.t and type rank = O.G.t =
  struct
    module M = Map.Make(O)
    type key = O.t
    type (+α) t = α M.t
    let empty = M.empty
    let add = M.add
    let find = M.find
    let mem = M.mem
    let iter = M.iter
    let fold = M.fold
```

We make sure that the remaining three are never called inside *DAG* and are not visible outside.

```
    type rank = O.G.t
    exception Impossible of string
    let ranks _ = raise (Impossible "ranks")
    let min_max_rank _ = raise (Impossible "min_max_rank")
    let ranked _ _ = raise (Impossible "ranked")
  end
```

We could also have used signature projection with a chaotic or discrete grading, but the *Graded_Map* can cost some efficiency. This is probably not the case for the current simple implementation, but future embellishment can change this. Therefore, the ungraded DAG uses *Map* directly, without overhead.

module *Make* (*F* : *Forest*) =
  *Maybe_Graded*(*Fake_Graded_Map*)(*Grade_Forest*(*Fake_Grading*)(*F*))

If O'Caml had *polymorphic recursion*, we could think of even more elegant implementations unifying nodes and offspring (cf. the generalized tries in [4]).

<h1 style="text-align:center">—5—</h1>

<h1 style="text-align:center">Momenta</h1>

## 5.1  Interface of Momentum

Model the finite combinations

$$p = \sum_{n=1}^{k} c_k \bar{p}_n, \qquad (\text{with } c_k \in \{0,1\}) \tag{5.1}$$

of $n_{\mathrm{in}}$ incoming and $k - n_{\mathrm{in}}$ outgoing momenta $p_n$

$$\bar{p}_n = \begin{cases} -p_n & \text{for } 1 \le n \le n_{\mathrm{in}} \\ p_n & \text{for } n_{\mathrm{in}} + 1 \le n \le k \end{cases} \tag{5.2}$$

where momentum is conserved

$$\sum_{n=1}^{k} \bar{p}_n = 0 \tag{5.3}$$

below, we need the notion of 'rank' and 'dimension':

$$dim(p) = k \tag{5.4a}$$

$$rank(p) = \sum_{n=1}^{k} c_k \tag{5.4b}$$

where 'dimension' is *not* the dimension of the underlying space-time, of course.

module type $T$ =
  sig
    type $t$

Constructor: $(k, N) \to p = \sum_{n \in N} \bar{p}_n$ and $k = dim(p)$ is the *overall* number of independent momenta, while $rank(p) = |N|$ is the number of momenta in $p$. It would be possible to fix $dim$ as a functor argument instead. This might be slightly faster and allow a few more compile time checks, but would be much more tedious to use, since the number of particles will be chosen at runtime.

  val $of\_ints$ : $int \to int\ list \to t$

No two indices may be the same. Implementions of $of\_ints$ can either raise the exception *Duplicate* or ignore the duplicate, but implementations of *add* are required to raise *Duplicate*.

  exception *Duplicate* of $int$

Raise *Range* iff $n > k$:

  exception *Range* of $int$

Binary oparations require that both momenta have the same dimension. *Mismatch* is raised if this condition is violated.

  exception *Mismatch* of $string \times t \times t$

*Negative* is raised if the result of *sub* is undefined.

  exception *Negative*

The inverses of the constructor (we have *rank* $p = List.length\ (to\_ints\ p)$, but *rank* might be more efficient):

  val $to\_ints$ : $t \to int\ list$

val *dim* : $t \rightarrow int$
val *rank* : $t \rightarrow int$

Shortcuts: *singleton d p* = *of_ints d* [$p$] and *zero d* = *of_ints d* []:

val *singleton* : $int \rightarrow int \rightarrow t$
val *zero* : $int \rightarrow t$

An arbitrary total order, with the condition $rank(p_1) < rank(p_2) \Rightarrow p_1 < p_2$.

val *compare* : $t \rightarrow t \rightarrow int$

Use momentum conservation to construct the negative momentum with positive coefficients:

val *neg* : $t \rightarrow t$

Return the momentum or its negative, whichever has the lower rank. NB: the present implementation does *not* guarantee that

$$\mathrm{abs}p = \mathrm{abs}q \Longleftrightarrow p = p \vee p = -q \tag{5.5}$$

for momenta with rank = dim/2.

val *abs* : $t \rightarrow t$

Add and subtract momenta. This can fail, since the coefficients $c_k$ must me either 0 or 1.

val *add* : $t \rightarrow t \rightarrow t$
val *sub* : $t \rightarrow t \rightarrow t$

Once more, but not raising exceptions this time:

val *try_add* : $t \rightarrow t \rightarrow t\ option$
val *try_sub* : $t \rightarrow t \rightarrow t\ option$

*Not* the total order provided by *compare*, but set inclusion of non-zero coefficients instead:

val *less* : $t \rightarrow t \rightarrow bool$
val *lesseq* : $t \rightarrow t \rightarrow bool$

$p_1 + (\pm p_2) + (\pm p_3) = 0$

val *try_fusion* : $t \rightarrow t \rightarrow t \rightarrow (bool \times bool)\ option$

A textual representation for debugging:

val *to_string* : $t \rightarrow string$

*split i n p* splits $\bar{p}_i$ into $n$ momenta $\bar{p}_i \rightarrow \bar{p}_i + \bar{p}_{i+1} + \ldots + \bar{p}_{i+n-1}$ and makes room via $\bar{p}_{j>i} \rightarrow \bar{p}_{j+n-1}$. This is used for implementating cascade decays, like combining

$$\mathrm{e}^{+}(p_1)\mathrm{e}^{-}(p_2) \rightarrow \mathrm{W}^{-}(p_3)\nu_{\mathrm{e}}(p_4)\mathrm{e}^{+}(p_5) \tag{5.6a}$$

$$\mathrm{W}^{-}(p_3) \rightarrow \mathrm{d}(p_3')\bar{\mathrm{u}}(p_4') \tag{5.6b}$$

to

$$\mathrm{e}^{+}(p_1)\mathrm{e}^{-}(p_2) \rightarrow \mathrm{d}(p_3)\bar{\mathrm{u}}(p_4)\nu_{\mathrm{e}}(p_5)\mathrm{e}^{+}(p_6) \tag{5.7}$$

in narrow width approximation for the $\mathrm{W}^{-}$.

val *split* : $int \rightarrow int \rightarrow t \rightarrow t$

### 5.1.1 Scattering Kinematics

From here on, we assume scattering kinematics $\{1, 2\} \rightarrow \{3, 4, \ldots\}$, i. e. $n_{\mathrm{in}} = 2$.

Since functions like *timelike* can be used for decays as well (in which case they must *always* return true, the representation—and consequently the constructors—should be extended by a flag discriminating between the two cases!

module *Scattering* :
sig

Test if the momentum is an incoming one: $p = \bar{p}_1 \vee p = \bar{p}_2$

        val *incoming* : $t \rightarrow bool$

$p = \bar{p}_3 \lor p = \bar{p}_4 \lor \ldots$

        val *outgoing* : $t \rightarrow bool$

$p^2 \geq 0$. NB: *par abus de langange*, we report the incoming individual momenta as spacelike, instead as timelike. This will be useful for phasespace constructions below.

        val *timelike* : $t \rightarrow bool$

$p^2 \leq 0$. NB: the simple algebraic criterion can be violated for heavy initial state particles.

        val *spacelike* : $t \rightarrow bool$

$p = \bar{p}_1 + \bar{p}_2$

        val *s_channel_in* : $t \rightarrow bool$

$p = \bar{p}_3 + \bar{p}_4 + \ldots + \bar{p}_n$

        val *s_channel_out* : $t \rightarrow bool$

$p = \bar{p}_1 + \bar{p}_2 \lor p = \bar{p}_3 + \bar{p}_4 + \ldots + \bar{p}_n$

        val *s_channel* : $t \rightarrow bool$

$\bar{p}_1 + \bar{p}_2 \rightarrow \bar{p}_3 + \bar{p}_4 + \ldots + \bar{p}_n$

        val *flip_s_channel_in* : $t \rightarrow t$
     end

## 5.1.2   Decay Kinematics

    module *Decay* :
       sig

Test if the momentum is an incoming one: $p = \bar{p}_1$

        val *incoming* : $t \rightarrow bool$

$p = \bar{p}_2 \lor p = \bar{p}_3 \lor \ldots$

        val *outgoing* : $t \rightarrow bool$

$p^2 \geq 0$. NB: here, we report the incoming individual momenta as timelike.

        val *timelike* : $t \rightarrow bool$

$p^2 \leq 0$.

        val *spacelike* : $t \rightarrow bool$

      end

   end

module *Lists* : *T*
module *Bits* : *T*
module *Default* : *T*

Wolfgang's funny tree codes:

$$(2^n, 2^{n-1}) \rightarrow (1, 2, 4, \ldots, 2^{n-2}) \tag{5.8}$$

module type *Whizard* =
  sig
    type $t$
    val *of_momentum* : $t \rightarrow int$
    val *to_momentum* : $int \rightarrow int \rightarrow t$
  end

module *ListsW* : *Whizard* with type $t = Lists.t$
module *BitsW* : *Whizard* with type $t = Bits.t$
module *DefaultW* : *Whizard* with type $t = Default.t$

## 5.2   Implementation of Momentum

```
module type  T  =
  sig

    val rank  :  t  →  int
    val singleton  :  int →  int →  t
    val zero  :  int →  t
    val compare  :  t  →  t  →  int
    val neg  :  t  →  t
    val abs  :  t  →  t
    val add  :  t  →  t  →  t
    val sub  :  t  →  t  →  t
    val try_add  :  t  →  t  →  t option
    val try_sub  :  t  →  t  →  t option
    val less  :  t  →  t  →  bool
    val lesseq  :  t  →  t  →  bool
    val try_fusion  :  t  →  t  →  t  →  (bool × bool) option
    val to_string  :  t  →  string
    val split  :  int →  int →  t  →  t
    module Scattering  :
        sig
          val incoming  :  t  →  bool
          val outgoing  :  t  →  bool
          val timelike  :  t  →  bool
          val spacelike  :  t  →  bool
          val s_channel_in  :  t  →  bool
          val s_channel_out  :  t  →  bool
          val s_channel  :  t  →  bool
          val flip_s_channel_in  :  t  →  t
        end
    module Decay  :
        sig
          val incoming  :  t  →  bool
          val outgoing  :  t  →  bool
          val timelike  :  t  →  bool
          val spacelike  :  t  →  bool
        end
  end
```

### 5.2.1   Lists of Integers

The first implementation (as part of *Fusion*) was based on sorted lists, because I did not want to preclude the use of more general indices that integers. However, there's probably not much use for this generality (the indices are typically generated automatically and integer are the most natural choice) and it is no longer supported. by the current signature. Thus one can also use the more efficient implementation based on bitvectors below.

```
module Lists  =
  struct

    type t  =  { d  :  int; r  :  int; p  :  int list }

    exception Range of int
    exception Duplicate of int
```

```
let rec check d  =  function
  |  p1  ::  p2  ::  _ when p2  ≤  p1  →  raise (Duplicate p1)
  |  p1  ::  (p2  ::  _ as rest)  →  check d rest
  |  [p] when p  <  1  ∨  p  >  d  →  raise (Range p)
  |  [p]  →  ()
  |  []  →  ()

let of_ints d p  =
  let p'  =  List.sort compare p in

<div align="center">

### 5.2.2    Bit Fiddlings

</div>

Bit vectors are popular in Fortran based implementations [1, 2, 11] and can be more efficient. In particular, when all infomation is packed into a single integer, much of the memory overhead is reduced.

```
module Bits  =
  struct

    type t = int
```

Bits $1\ldots21$ are used as a bitvector, indicating whether a particular momentum is included. Bits $22\ldots26$ represent the numbers of bits set in bits $1\ldots21$ and bits $27\ldots31$ denote the maximum number of momenta.

```
    let mask n = (1 lsl n) − 1
    let mask2 = mask 2
    let mask5 = mask 5
    let mask21 = mask 21

    let maskd = mask5 lsl 26
    let maskr = mask5 lsl 21
    let maskb = mask21

    let dim0 p = p land maskd
    let rank0 p = p land maskr
    let bits0 p = p land maskb

    let dim p = (dim0 p) lsr 26
    let rank p = (rank0 p) lsr 21
    let bits p = bits0 p

    let drb0 d r b = d lor r lor b
    let drb d r b = d lsl 26 lor r lsl 21 lor b
```

For a 64-bit architecture, the corresponding sizes could be increased to $1\ldots 51$, $52\ldots 57$, and $58\ldots 63$. However, the combinatorical complexity will have killed us long before we can reach these values.

### 5.2.3   Whizard

```
module type Whizard =
  sig
    type t
    val of_momentum : t → int
    val to_momentum : int → int → t
  end

module BitsW =
  struct
    type t = Bits.t
    open Bits (∗ NB: this includes the internal functions not in T! ∗)

    let of_momentum p =
        let d = dim p in
        let bit_in1 = 1 land p
        and bit_in2 = 1 land (p lsr 1)
        and bits_out = ((mask d) land p) lsr 2 in
        bits_out lor (bit_in1 lsl (d − 1)) lor (bit_in2 lsl (d − 2))

    let rec count_non_zero' acc i last b =
        if i > last then
            acc
        else if (1 lsl (pred i)) land b = 0 then
            count_non_zero' acc (succ i) last b
        else
            count_non_zero' (succ acc) (succ i) last b

    let count_non_zero first last b =
```

> count_non_zero' 0 first last b

    let *to_momentum* d w =
      let *bit_in1* = 1 land (w lsr (d − 1))
      and *bit_in2* = 1 land (w lsr (d − 2))
      and *bits_out* = (*mask* (d − 2)) land w in
      let b = (*bits_out* lsl 2) lor *bit_in1* lor (*bit_in2* lsl 1) in
      *drb* d (*count_non_zero* 1 d b) b

  end

The following would be a tad more efficient, if coded directly, but there's no point in wasting effort on this.

module *ListsW* =
  struct
    type t = *Lists.t*
    let *of_momentum* p =
      *BitsW.of_momentum* (*Bits.of_ints* p.Lists.d p.Lists.p)
    let *to_momentum* d w =
      *Lists.of_ints* d (*Bits.to_ints* (*BitsW.to_momentum* d w))
  end

### 5.2.4   *Suggesting a Default Implementation*

*Lists* is better tested, but the more recent *Bits* appears to work as well and is *much* more efficient, resulting in a relative factor of better than 2. This performance ratio is larger than I had expected and we are not likely to reach its limit of 21 independent vectors anyway.

module *Default* = *Bits*
module *DefaultW* = *BitsW*

### 6.2  Implementation of Cascade_syntax

Concerning the Gaussian propagators, we admit the following: In principle, they would allow for flavor sums like the off-shell lines, but for all practical purposes they are used only for determining the significance of a specified intermediate state. So we select them in the same manner as on-shell states.
*False* is probably redundant.

type (*'flavor*, *'p*, *'constant*) *t*  =
  | *True*
  | *False*
  | *On_shell* of *'flavor list* × *'p*
  | *On_shell_not* of *'flavor list* × *'p*
  | *Off_shell* of *'flavor list* × *'p*

## 6.5  Interface of Cascade

module type $T$ =
  sig

    type *constant*
    type *flavor*
    type *p*

    type *t*
    val *of_string_list* : *int* $\to$ *string list* $\to$ *t*
    val *to_string* : *t* $\to$ *string*

An opaque type that describes the set of all constraints on an amplitude and how to construct it from a cascade description.

    type *selectors*
    val *to_selectors* : *t* $\to$ *selectors*

Don't throw anything away:

    val *no_cascades* : *selectors*

*select_wf s is_timelike f p ps* returns true iff either

- the flavor $f$ and momentum $p$ match the selection $s$ or

- *all* combinations of the momenta in *ps* are compatible, i.e. $\pm \sum p_i \le q$.

The latter test is only required in theories with quartic or higher vertices, where *ps* will be the list of all incoming momenta in a fusion. *is_timelike* is required to determine, whether particles and anti-particles should be distinct.

    val *select_wf* : *selectors* $\to$ (*p* $\to$ *bool*) $\to$ *flavor* $\to$ *p* $\to$ *p list* $\to$ *bool*

*select_p s p ps* same as *select_wf s f p ps*, but ignores the flavor $f$

    val *select_p* : *selectors* $\to$ *p* $\to$ *p list* $\to$ *bool*

*on_shell s p*

    val *on_shell* : *selectors* $\to$ *flavor* $\to$ *p* $\to$ *bool*

*is_gauss s p*

    val *is_gauss* : *selectors* $\to$ *flavor* $\to$ *p* $\to$ *bool*

    val *select_vtx* : *selectors* $\to$ *constant Coupling.t* $\to$
      *flavor* $\to$ *flavor list* $\to$ *bool*

*partition s* returns a partition of the external particles that can not be reordered without violating the cascade constraints.

    val *partition* : *selectors* $\to$ *int list list*

Diagnostics:

    val *description* : *selectors* $\to$ *string option*

  end

module *Make* (*M* : *Model.T*) (*P* : *Momentum.T*) :
    $T$ with type *flavor* = *M.flavor*
      and type *constant* = *M.constant*
      and type *p* = *P.t*

## 6.6   Implementation of Cascade

```
module type T =
  sig

    type constant
    type flavor
    type p

    type t
    val of_string_list : int → string list → t
    val to_string : t → string

    type selectors
    val to_selectors : t → selectors
    val no_cascades : selectors

    val select_wf : selectors → (p → bool) → flavor → p → p list → bool
    val select_p : selectors → p → p list → bool
    val on_shell : selectors → flavor → p → bool
    val is_gauss : selectors → flavor → p → bool

    val select_vtx : selectors → constant Coupling.t →
      flavor → flavor list → bool

    val partition : selectors → int list list
    val description : selectors → string option

  end

module Make (M : Model.T) (P : Momentum.T) :
    (T with type flavor = M.flavor and type constant = M.constant and type p = P.t) =
  struct

    module CS = Cascade_syntax

    type constant = M.constant
    type flavor = M.flavor
    type p = P.t
```

Since we have

$$p \leq q \Longleftrightarrow (-q) \leq (-p) \tag{6.1}$$

also for $\leq$ as set inclusion *lesseq*, only four of the eight combinations are independent

$$
\begin{aligned}
p \leq q & \quad\Longleftrightarrow\quad (-q) \leq (-p) \\
q \leq p & \quad\Longleftrightarrow\quad (-p) \leq (-q) \\
p \leq (-q) & \quad\Longleftrightarrow\quad q \leq (-p) \\
(-q) \leq p & \quad\Longleftrightarrow\quad (-p) \leq q
\end{aligned}
\tag{6.2}
$$

```
    let one_compatible p q =
      let neg_q = P.neg q in
      P.lesseq p q ∨
      P.lesseq q p ∨
      P.lesseq p neg_q ∨
      P.lesseq neg_q p
```

'tis wasteful ... (at least by a factor of two, because every momentum combination is generated, including the negative ones.

```
    let all_compatible p p_list q =
      let l = List.length p_list in
      if l ≤ 2 then
        one_compatible p q
      else
        let tuple_lengths = ThoList.range 2 (succ l / 2) in
        let tuples = ThoList.flatmap (fun n → Combinatorics.choose n p_list) tuple_lengths in
```

```
        let momenta  =  List.map (List.fold_left P.add (P.zero (P.dim q))) tuples in
          List.for_all (one_compatible q) momenta
```

The following assumes that the *flavor list* is always very short. Otherwise one should use an efficient set implementation.

```
    type wf  =
      | True
      | False
      | On_shell of flavor list × P.t
      | On_shell_not of flavor list × P.t
      | Off_shell of flavor list × P.t
      | Off_shell_not of flavor list × P.t
      | Gauss of flavor list × P.t
      | Gauss_not of flavor list × P.t
      | Any_flavor of P.t
      | And of wf list

    module Constant  =  Modeltools.Constant (M)

    type vtx  =
        { couplings  :  M.constant list;
          fields  :  flavor list }

    type t  =
        { wf  :  wf;
          (∗ TODO: The following lists should be sets for efficiency. ∗)
          flavors  :  flavor list;
          vertices  :  vtx list }

    let default  =
      { wf  =  True;
        flavors  =  [];
        vertices  =  [] }

    let of_string s  =
      Cascade_parser.main Cascade_lexer.token (Lexing.from_string s)
```

If we knew that we're dealing with a scattering, we could apply $P.flip\_s\_channel\_in$ to all momenta, so that $1 + 2$ accepts the particle and not the antiparticle. Right now, we don't have this information.

```
    let only_wf wf  =  { default with wf  =  wf }

## Color

</div>

## 7.1 Interface of Color

module type *Test* =
  sig
    val *suite* : *OUnit.test*
  end

### 7.1.1 Quantum Numbers

Color is not necessarily the SU(3) of QCD. Conceptually, it can be any *unbroken* symmetry (*broken* symmetries correspond to *Model.flavor*). In order to keep the group theory simple, we confine ourselves to the fundamental and adjoint representation of a single SU($N_C$) for the moment. Therefore, particles are either color singlets or live in the defining representation of SU($N_C$): $SUN(|N_C|)$, its conjugate $SUN(-|N_C|)$ or in the adjoint representation of SU($N_C$): $AdjSUN(N_C)$.

type *t* = *Singlet* | *SUN* of *int* | *AdjSUN* of *int*

val *conjugate* : *t* → *t*
val *compare* : *t* → *t* → *int*

### 7.1.2 Color Flows

  sig

    type *line*
    type *t*  =  (*line*  ×  *line*) *list*

Contract the graph by connecting lines and return the number of cycles together with the contracted graph.

  ⚠  The semantics of the contracted graph is not yet 100%ly fixed.

    val *contract*  :  *t*  →  *int* × *t*

The same as *contract*, but returns only the number of cycles and raises *Open_line* when not all lines are closed.

    val *count*  :  *t*  →  *int*
    exception *Open_line*

Mainly for debugging . . .

    val *to_string*  :  *t*  →  *string*

  end

module *Cycles* (*L*  :  *Line*)  :  *Cycles* with type *line*  =  *L.t*  =
  struct

```
type line  =  L.t
type t  =  (line  ×  line) list

exception Open_line
```

NB: The following algorithm for counting the cycles is quadratic since it performs nested scans of the lists. If this was a serious problem one could replace the lists of pairs by a *Map* and replace one power by a logarithm.

```
let rec find_fst c_final c1 disc seen  =  function
  | []  →  ((L.conj c_final, c1) ::  disc, List.rev seen)
  | (c1', c2') as c12'  ::  rest  →
      if L.equal c1 c1' then
        find_snd c_final (L.conj c2') disc [] (List.rev_append seen rest)
      else
        find_fst c_final c1 disc (c12'  ::  seen) rest

and find_snd c_final c2 disc seen  =  function
  | []  →  ((L.conj c_final, L.conj c2) ::  disc, List.rev seen)
  | (c1', c2') as c12'  ::  rest →
      if L.equal c2' c2 then begin
        if L.equal c1' c_final then
          (disc, List.rev_append seen rest)
        else
          find_fst c_final (L.conj c1') disc [] (List.rev_append seen rest)
      end else
        find_snd c_final c2 disc (c12'  ::  seen) rest

let consume  =  function
  | []  →  ([], [])
  | (c1, c2) ::  rest  →  find_snd (L.conj c1) (L.conj c2) [] [] rest

let contract lines  =
  let rec contract' acc disc  =  function
    | []  →  (acc, List.rev disc)
    | rest  →
        begin match consume rest with
        | [], rest'  →  contract' (succ acc) disc rest'
        | disc', rest'  →  contract' acc (List.rev_append disc' disc) rest'
        end in
  contract' 0 [] lines

let count lines  =
  match contract lines with
  | n, []  →  n
  | n, _  →  raise Open_line

let to_string lines  =
  String.concat ""

      lines)

end
```

## 7.2.2 Color Flows

```
module type Flow  =
  sig
    type color
    type t  =  color list × color list
    val rank  :  t  →  int
    val of_list  :  int list  →  color
    val ghost  :  unit →  color
    val to_lists  :  t  →  int list list
    val in_to_lists  :  t  →  int list list
```

```
      val out_to_lists  :  t  →  int list list
      val ghost_flags  :  t  →  bool list
      val in_ghost_flags  :  t  →  bool list
      val out_ghost_flags  :  t  →  bool list
      type power  =  { num  :  int; den  :  int; power  :  int }
      type factor  =  power list
      val factor  :  t  →  t  →  factor
      val zero  :  factor
      module Test  :  Test
    end
module Flow  :  Flow  =
    struct
```

All *int*s are non-zero!

```
      type color  =
        | N of int
        | N_bar of int
        | SUN of int × int
        | Singlet
        | Ghost
```

Incoming and outgoing, since we need to cross the incoming states.

```
      type t  =  color list × color list

      let rank cflow  =
        2
```

*Constructors*

```
      let ghost ()  =
        Ghost

      let of_list  =  function
        | [0; 0]  →  Singlet
        | [c; 0]  →  N c
        | [0; c]  →  N_bar c
        | [c1; c2]  →  SUN (c1, c2)
        | _  →  invalid_arg "Color.Flow.of_list:␣num_lines␣!=␣2"

      let to_list  =  function
        | N c  →  [c; 0]
        | N_bar c  →  [0; c]
        | SUN (c1, c2)  →  [c1; c2]
        | Singlet  →  [0; 0]
        | Ghost  →  [0; 0]

      let to_lists (cfin, cfout)  =
        (List.map to_list cfin) @ (List.map to_list cfout)

      let in_to_lists (cfin, _)  =
        List.map to_list cfin

      let out_to_lists (_, cfout)  =
        List.map to_list cfout

      let ghost_flag  =  function
        | N _  | N_bar _  | SUN (_, _) | Singlet  →  false
        | Ghost  →  true

      let ghost_flags (cfin, cfout)  =
        (List.map ghost_flag cfin) @ (List.map ghost_flag cfout)

      let in_ghost_flags (cfin, _)  =
        List.map ghost_flag cfin

      let out_ghost_flags (_, cfout)  =
        List.map ghost_flag cfout
```

*Evaluation*

```
type power = { num : int; den : int; power : int }
type factor = power list
let zero = []

let count_ghosts1 colors =
  List.fold_left
    (fun acc → function Ghost → succ acc | _ → acc)
    0 colors

let count_ghosts (fin, fout) =
  count_ghosts1 fin + count_ghosts1 fout

type α square =
  | Square of α
  | Mismatch

let conjugate = function
  | N c → N_bar (−c)
  | N_bar c → N (−c)
  | SUN (c1, c2) → SUN (−c2, − c1)
  | Singlet → Singlet
  | Ghost → Ghost

let cross_in (cin, cout) =
  cin @ (List.map conjugate cout)

let cross_out (cin, cout) =
  (List.map conjugate cin) @ cout

module C = Cycles (struct
  type t = int
  let conj = (−)
  let equal = (=)
  let to_string = string_of_int
end)
```

Match lines in the color flows *f1* and *f2* after crossing the incoming states. This will be used to compute squared diagrams in *square* and *square2* below.

```
let match_lines match1 match2 f1 f2 =
  let rec match_lines' acc f1' f2' =
    match f1', f2' with
```

If we encounter an empty list, we're done — unless the lengths don't match (which should never happen!):

```
  | [], [] → Square (List.rev acc)
  | _ :: _, [] | [], _ :: _ → Mismatch
```

Handle matching . . .

```
  | Ghost :: rest1, Ghost :: rest2
  | Singlet :: rest1, Singlet :: rest2 →
    match_lines' acc rest1 rest2
```

. . . and mismatched ghosts and singlet gluons:

```
  | Ghost :: _, Singlet :: _
  | Singlet :: _, Ghost :: _ →
    Mismatch
```

Ghosts and singlet gluons can't match anything else

```
  | (Ghost | Singlet) :: _, (N _ | N_bar _ | SUN (_, _)) :: _
  | (N _ | N_bar _ | SUN (_, _)) :: _, (Ghost | Singlet) :: _ →
    Mismatch
```

Handle matching . . .

```
  | N_bar c1 :: rest1, N_bar c2 :: rest2
```

```
    | N c1 :: rest1, N c2 :: rest2 →
        match_lines' (match1 c1 c2 acc) rest1 rest2
```

... and mismatched $N$ or $\bar{N}$ states:

```
    | N _ :: _, N_bar _ :: _
    | N_bar _ :: _, N _ :: _ →
        Mismatch
```

The $N$ and $\bar{N}$ don't match non-singlet gluons:

```
    | (N _ | N_bar _) :: _, SUN (_, _) :: _
    | SUN (_, _) :: _, (N _ | N_bar _) :: _ →
        Mismatch
```

Now we're down to non-singlet gluons:

```
    | SUN (c1, c1') :: rest1, SUN (c2, c2') :: rest2 →
        match_lines' (match2 c1 c1' c2 c2' acc) rest1 rest2 in

    match_lines' [] (cross_out f1) (cross_out f2)
```

NB: in WHIZARD versions before 3.0, the code for *match_lines* contained a bug in the pattern matching of *Singlet*, $N$, *N_bar* and *SUN* states, because they all were represented as *SUN* (*c1*, *c2*), only distinguished by the numeric conditions *c1* = 0 and/or *c2* = 0. This prevented the use of exhaustiveness checking and introduced a subtle dependence on the pattern order.

```
    let square f1 f2 =
        match_lines
            (fun c1 c2 pairs → (c1, c2) :: pairs)
            (fun c1 c1' c2 c2' pairs → (c1', c2') :: (c1, c2) :: pairs)
            f1 f2
```

In addition to counting closed color loops, we also need to count closed gluon loops. Fortunately, we can use the same algorithm on a different data type, provided it doesn't require all lines to be closed.

```
    module C2 = Cycles (struct
        type t = int × int
        let conj (c1, c2) = (− c2, − c1)
        let equal (c1, c2) (c1', c2') = c1 = c1' ∧ c2 = c2'
        let to_string (c1, c2) = "(" ^ string_of_int c1 ^ "," ^ string_of_int c2 ^ ")"
    end)

    let square2 f1 f2 =
        match_lines
            (fun c1 c2 pairs → pairs)
            (fun c1 c1' c2 c2' pairs → ((c1, c1'), (c2, c2')) :: pairs)
            f1 f2
```

*int_power* : $n\,p \to n^p$ for integers is missing from *Pervasives*!

```
    let int_power n p =
        let rec int_power' acc i =
            if i < 0 then
                invalid_arg "int_power"
            else if i = 0 then
                acc
            else
                int_power' (n × acc) (pred i) in
        int_power' 1 p
```

Instead of implementing a full fledged algebraic evaluator, let's simply expand the binomial by hand:

$$\left(\frac{N_C^2 - 2}{N_C^2}\right)^n = \sum_{i=0}^{n} \binom{n}{i}(-2)^i N_C^{-2i} \tag{7.2}$$

NB: Any result of *square* other than *Mismatch* guarantees *count_ghosts f1* = *count_ghosts f2*.

```
    let factor f1 f2 =
```

```
match square f1 f2, square2 f1 f2 with
| Mismatch, _ | _, Mismatch → []
| Square f12, Square f12' →
    let num_cycles = C.count f12
    and num_cycles2, disc = C2.contract f12'
    and num_ghosts = count_ghosts f1 in
    List.map
      (fun i →
        let parity = if num_ghosts mod 2 = 0 then 1 else -1
        and power = num_cycles − num_ghosts in
        let coeff = int_power (−2) i × Combinatorics.binomial num_cycles2 i
        and power2 = − 2 × i in
        { num = parity × coeff;
          den = 1;
          power = power + power2 })
      (ThoList.range 0 num_cycles2)

module Test : Test =

```

Note that a negative index might be summed only later in a sequence of binary products and must therefore be treated as free in this product. Therefore, we have to classify the indices as summation indices *not only* based on their sign, but in addition based on whether they appear in both factors. Only then can we reject surviving ghosts.

module BinOps  =  B.BinOps

let delta3 i j =
  [(LP.int 1, i ==> j)]

let delta8 a b =
  [(LP.int 1, a <=> b)]
```

If the $\delta_{ab}$ originates from a tr($T_a T_b$), like an effective $gg \to H \dots$ coupling, it makes a difference in the color flow basis and we must write the full expression (6.2) from [16] instead.

```
let delta8_loop a b  =
  [(LP.int 1, a  <=>  b);
   (LP.int 1, [a  =>  a; ?? b]);
   (LP.int 1, [?? a; b  =>  b]);
   (LP.nc 1, [?? a; ?? b])]
```

The following can be used for computing polarization sums (eventually, this could make the *Flow* module redundant). Note that we have $-N_C$ instead of $-1/N_C$ in the ghost contribution here, because two factors of $-1/N_C$ will be produced by *add_arrow* below, when contracting two ghost indices. Indeed, with this definition we can maintain *multiply* [*delta8* 1 (−1); *gluon* (−1) (−2); *delta8* (−2) 2] = *delta8* 1 2.

```
let ghost a b  =
  [ (LP.nc (−1), [?? a; ?? b])]

let gluon a b  =
  delta8 a b @ ghost a b
```

Do we need to introduce an index *pair* for each sextet index? Is that all?

```
let sextet n m  =
  [ (LP.fraction 2, [(n, 0) >=>> (m, 0); (n, 1) >=>> (m, 1)]);
    (LP.fraction 2, [(n, 0) >=>> (m, 1); (n, 1) >=>> (m, 0)]) ]
```

FIXME: note the flipped $i$ and $j$!

```
let t a j i =
  [ (LP.int 1, [i  =>  a;  a  =>  j]);
    (LP.int 1, [i  =>  j; ?? a]) ]
```

Using the normalization tr($T_a T_b$) = $\delta_{ab}$ we find with

$$\mathrm{i}f_{a_1 a_2 a_3} = \mathrm{tr}\left(T_{a_1}\left[T_{a_2}, T_{a_3}\right]\right) = \mathrm{tr}\left(T_{a_1} T_{a_2} T_{a_3}\right) - \mathrm{tr}\left(T_{a_1} T_{a_3} T_{a_2}\right) \tag{7.3}$$

and

$$\mathrm{tr}\left(T_{a_1} T_{a_2} T_{a_3}\right) T_{a_1}^{i_1 j_1} T_{a_2}^{i_2 j_2} T_{a_3}^{i_3 j_3} = T_{a_1}^{l_1 l_2} T_{a_2}^{l_2 l_3} T_{a_3}^{l_3 l_1} T_{a_1}^{i_1 j_1} T_{a_2}^{i_2 j_2} T_{a_3}^{i_3 j_3} =$$
$$\left(\delta^{l_1 j_1} \delta^{i_1 l_2} - \frac{1}{N_C}\delta^{l_1 l_2}\delta^{i_1 j_1}\right)\left(\delta^{l_2 j_2}\delta^{i_2 l_3} - \frac{1}{N_C}\delta^{l_2 l_3}\delta^{i_2 j_2}\right)\left(\delta^{l_3 j_3}\delta^{i_3 l_1} - \frac{1}{N_C}\delta^{l_3 l_1}\delta^{i_3 j_3}\right) \tag{7.4}$$

the decomposition

$$\mathrm{i}f_{a_1 a_2 a_3} T_{a_1}^{i_1 j_1} T_{a_2}^{i_2 j_2} T_{a_3}^{i_3 j_3} = \delta^{i_1 j_2}\delta^{i_2 j_3}\delta^{i_3 j_1} - \delta^{i_1 j_3}\delta^{i_3 j_2}\delta^{i_2 j_1} . \tag{7.5}$$

## Fusions

## 8.1   Interface of Fusion

module type $T$ =
  sig

    val *options* : *Options.t*

JRR's implementation of Majoranas needs a special case.

    val *vintage* : *bool*

Wavefunctions are an abstract data type, containing a momentum $p$ and additional quantum numbers, collected in *flavor*.

    type *wf*
    val *conjugate* : *wf* $\rightarrow$ *wf*

Obviously, *flavor* is not restricted to the physical notion of flavor, but can carry spin, color, etc.

    type *flavor*
    val *flavor* : *wf* $\rightarrow$ *flavor*
    type *flavor_sans_color*
    val *flavor_sans_color* : *wf* $\rightarrow$ *flavor_sans_color*

Momenta are represented by an abstract datatype (defined in *Momentum*) that is optimized for performance. They can be accessed either abstractly or as lists of indices of the external momenta. These indices are assigned sequentially by *amplitude* below.

    type *p*
    val *momentum* : *wf* $\rightarrow$ *p*
    val *momentum_list* : *wf* $\rightarrow$ *int list*

At tree level, the wave functions are uniquely specified by *flavor* and momentum. If loops are included, we need to distinguish among orders. Also, if we build a result from an incomplete sum of diagrams, we need to add a distinguishing mark. At the moment, we assume that a *string* that can be attached to the symbol suffices.

    val *wf_tag* : *wf* $\rightarrow$ *string option*

Coupling constants

    type *constant*

and right hand sides of assignments. The latter are formed from a sign from Fermi statistics, a coupling (constand and Lorentz structure) and wave functions.

    type *coupling*
    type *rhs*
    type $\alpha$ *children*
    val *sign* : *rhs* $\rightarrow$ *int*
    val *coupling* : *rhs* $\rightarrow$ *constant Coupling.t*

    val *coupling_tag* : *rhs* $\rightarrow$ *string option*

    type *exclusions*
    val *no_exclusions* : *exclusions*

In renormalized perturbation theory, couplings come in different orders of the loop expansion. Be prepared:
val *order* : *rhs* $\rightarrow$ *int*

⚝ This is here only for the benefit of *Target* and shall become val *children* : *rhs* → *wf children* later . . .

    val *children* : *rhs* → *wf list*

Fusions come in two types: fusions of wave functions to off-shell wave functions:

$$\phi(p+q) = \phi(p)\phi(q)$$

    type *fusion*
    val *lhs* : *fusion* → *wf*
    val *rhs* : *fusion* → *rhs list*

and products at the keystones:

$$\phi(-p-q) \cdot \phi(p)\phi(q)$$

    type *braket*
    val *bra* : *braket* → *wf*
    val *ket* : *braket* → *rhs list*

*amplitude goldstones incoming outgoing* calculates the amplitude for scattering of *incoming* to *outgoing*. If *goldstones* is true, also non-propagating off-shell Goldstone amplitudes are included to allow the checking of Slavnov-Taylor identities.

    type *amplitude*
    type *amplitude_sans_color*
    type *selectors*
    val *amplitudes* : *bool* → *exclusions* → *selectors* →
        *flavor_sans_color list* → *flavor_sans_color list* → *amplitude list*
    val *amplitude_sans_color* : *bool* → *exclusions* → *selectors* →
        *flavor_sans_color list* → *flavor_sans_color list* → *amplitude_sans_color*

    val *dependencies* : *amplitude* → *wf* → (*wf*, *coupling*) *Tree2.t*

We should be precise regarding the semantics of the following functions, since modules implementating *Target* must not make any mistakes interpreting the return values. Instead of calculating the amplitude

$$\langle f_3, p_3, f_4, p_4, \dots | T | f_1, p_1, f_2, p_2 \rangle \tag{8.1a}$$

directly, O'Mega calculates the—equivalent, but more symmetrical—crossed amplitude

$$\langle \bar{f}_1, -p_1, \bar{f}_2, -p_2, f_3, p_3, f_4, p_4, \dots | T | 0 \rangle \tag{8.1b}$$

Internally, all flavors are represented by their charge conjugates

$$A(f_1, -p_1, f_2, -p_2, \bar{f}_3, p_3, \bar{f}_4, p_4, \dots) \tag{8.1c}$$

The correspondence of vertex and term in the lagrangian

$$\bar{\psi}\slashed{A}\psi : (\mathrm{e}^+, A, \mathrm{e}^-) \tag{8.3}$$

which is more intuitive than the alternative $(\mathrm{e}^-, A, \mathrm{e}^+)$. Also, when thinking in terms of building wavefunctions from the outside in, the outgoing *antiparticle* is represented by a *particle* propagator and vice versa[1]. *incoming* and *outgoing* are the physical flavors as in (8.1a)

---

[1]Even if this choice will appear slightly counter-intuitive on the *Target* side, one must keep in mind that much more people are expected to prepare *Model*s.

val *incoming* : *amplitude* → *flavor list*
val *outgoing* : *amplitude* → *flavor list*

*externals* are flavors and momenta as in (8.1c)

val *externals* : *amplitude* → *wf list*

val *variables* : *amplitude* → *wf list*
val *fusions* : *amplitude* → *fusion list*
val *brakets* : *amplitude* → *braket list*
val *on_shell* : *amplitude* → (*wf* → *bool*)
val *is_gauss* : *amplitude* → (*wf* → *bool*)
val *constraints* : *amplitude* → *string option*
val *symmetry* : *amplitude* → *int*

val *allowed* : *amplitude* → *bool*

### *Performance Hacks*

val *initialize_cache* : *string* → *unit*
val *set_cache_name* : *string* → *unit*

### *Diagnostics*

val *check_charges* : *unit* → *flavor_sans_color list list*
val *count_fusions* : *amplitude* → *int*
val *count_propagators* : *amplitude* → *int*
val *count_diagrams* : *amplitude* → *int*

val *forest* : *wf* → *amplitude* → ((*wf* × *coupling option*, *wf*) *Tree.t*) *list*
val *poles* : *amplitude* → *wf list list*
val *s_channel* : *amplitude* → *wf list*

val *tower_to_dot* : *out_channel* → *amplitude* → *unit*
val *amplitude_to_dot* : *out_channel* → *amplitude* → *unit*

### *WHIZARD*

val *phase_space_channels* : *out_channel* → *amplitude_sans_color* → *unit*
val *phase_space_channels_flipped* : *out_channel* → *amplitude_sans_color* → *unit*

end

There is more than one way to make fusions.

module type *Maker* =
    functor (*P* : *Momentum.T*) → functor (*M* : *Model.T*) →
        *T* with type *p* = *P.t*
        and type *flavor* = *Colorize.It(M).flavor*
        and type *flavor_sans_color* = *M.flavor*
        and type *constant* = *M.constant*
        and type *selectors* = *Cascade.Make(M)(P).selectors*

Straightforward Dirac fermions vs. slightly more complicated Majorana fermions:

exception *Majorana*

module *Binary* : *Maker*
module *Binary_Majorana* : *Maker*

module *Mixed23* : *Maker*
module *Mixed23_Majorana* : *Maker*

module *Nary* : functor (*B* : *Tuple.Bound*) → *Maker*
module *Nary_Majorana* : functor (*B* : *Tuple.Bound*) → *Maker*

We can also proceed á la [2]. Empirically, this will use slightly ($O(10\%)$) fewer fusions than the symmetric factorization. Our implementation uses significantly ($O(50\%)$) fewer fusions than reported by [2]. Our pruning of the DAG might be responsible for this.

module *Helac* : functor (*B* : *Tuple.Bound*) → *Maker*
(∗ module *Helac_Majorana* : functor (*B* : *Tuple.Bound*) → *Maker* ∗)

### 8.1.1  Multiple Amplitudes

module type *Multi* =
  sig
    exception *Mismatch*
    val *options* : *Options.t*

    type *flavor*
    type *process* = *flavor list* × *flavor list*
    type *amplitude*
    type *fusion*
    type *wf*
    type *exclusions*
    val *no_exclusions* : *exclusions*
    type *selectors*
    type *amplitudes*

Construct all possible color flow amplitudes for a given process.

    val *amplitudes* : *bool* → *int option* →
      *exclusions* → *selectors* → *process list* → *amplitudes*
    val *empty* : *amplitudes*

Precompute the vertex table cache.

    val *initialize_cache* : *string* → *unit*
    val *set_cache_name* : *string* → *unit*

The list of all combinations of incoming and outgoing particles with a nonvanishing scattering amplitude.

    val *flavors* : *amplitudes* → *process list*

The list of all combinations of incoming and outgoing particles that don't lead to any color flow with non vanishing scattering amplitude.

    val *vanishing_flavors* : *amplitudes* → *process list*

The list of all color flows with a nonvanishing scattering amplitude.

    val *color_flows* : *amplitudes* → *Color.Flow.t list*

The list of all valid helicity combinations.

    val *helicities* : *amplitudes* → (*int list* × *int list*) *list*

The list of all amplitudes.

    val *processes* : *amplitudes* → *amplitude list*

(*process_table a*).(*f*).(*c*) returns the amplitude for the *f*th allowed flavor combination and the *c*th allowed color flow as an *amplitude option*.

    val *process_table* : *amplitudes* → *amplitude option array array*

The list of all non redundant fusions together with the amplitudes they came from.

    val *fusions* : *amplitudes* → (*fusion* × *amplitude*) *list*

If there's more than external flavor state, the wavefunctions are *not* uniquely specified by *flavor* and *Momentum.t*. This function can be used to determine how many variables must be allocated.

    val *multiplicity* : *amplitudes* → *wf* → *int*

This function can be used to disambiguate wavefunctions with the same combination of *flavor* and *Momentum.t*.

val *dictionary* : *amplitudes* → *amplitude* → *wf* → *int*

(*color_factors a*).(*c1*).(*c2*) power of $N_C$ for the given product of color flows.

val *color_factors* : *amplitudes* → *Color.Flow.factor array array*

A description of optional diagram selectors.

val *constraints* : *amplitudes* → *string option*

  end

module type *Multi_Maker* = functor (*Fusion_Maker* : *Maker*) →
  functor (*P* : *Momentum.T*) →
    functor (*M* : *Model.T*) →
      *Multi* with type *flavor* = *M.flavor*
      and type *amplitude* = *Fusion_Maker(P)(M).amplitude*
      and type *fusion* = *Fusion_Maker(P)(M).fusion*
      and type *wf* = *Fusion_Maker(P)(M).wf*
      and type *selectors* = *Fusion_Maker(P)(M).selectors*

module *Multi* : *Multi_Maker*

### 8.1.2  Tags

It appears that there are useful applications for tagging couplings and wave functions, e. g. skeleton expansion and diagram selections. We can abstract this in a *Tags* signature:

module type *Tags* =
  sig
    type *wf*
    type *coupling*
    type *α children*
    val *null_wf* : *wf*
    val *null_coupling* : *coupling*
    val *fuse* : *coupling* → *wf children* → *wf*
    val *wf_to_string* : *wf* → *string option*
    val *coupling_to_string* : *coupling* → *string option*
  end

module type *Tagger* =
    functor (*PT* : *Tuple.Poly*) → *Tags* with type *α children* = *α PT.t*

module type *Tagged_Maker* =
    functor (*Tagger* : *Tagger*) →
      functor (*P* : *Momentum.T*) → functor (*M* : *Model.T*) →
        *T* with type *p* = *P.t*
        and type *flavor* = *Colorize.It(M).flavor*
        and type *flavor_sans_color* = *M.flavor*
        and type *constant* = *M.constant*

module *Tagged_Binary* : *Tagged_Maker*

## 8.2  Implementation of Fusion

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare* = *compare*

### 8.2.3   *Tags*

module type *Tags* =
  sig
    type *wf*
    type *coupling*
    type *α children*
    val *null_wf* : *wf*

```
    val null_coupling : coupling
    val fuse : coupling → wf children → wf
    val wf_to_string : wf → string option
    val coupling_to_string : coupling → string option
  end

module type Tagger =
    functor (PT : Tuple.Poly) → Tags with type α children = α PT.t

module type Tagged_Maker =
    functor (Tagger : Tagger) →
      functor (P : Momentum.T) → functor (M : Model.T) →
        T with type p = P.t
        and type flavor = Colorize.It(M).flavor
        and type flavor_sans_color = M.flavor
        and type constant = M.constant
```

No tags is one option for good tags . . .

```
module No_Tags (PT : Tuple.Poly) =
  struct
    type wf = unit
    type coupling = unit
    type α children = α PT.t
    let null_wf = ()
    let null_coupling = ()
    let fuse () _ = ()
    let wf_to_string () = None
    let coupling_to_string () = None
  end
```

Here's a simple additive tag that can grow into something useful for loop calculations.

```
module Loop_Tags (PT : Tuple.Poly) =
  struct
    type wf = int
    type coupling = int
    type α children = α PT.t
    let null_wf = 0
    let null_coupling = 0
    let fuse c wfs = PT.fold_left (+) c wfs
    let wf_to_string n = Some (string_of_int n)
    let coupling_to_string n = Some (string_of_int n)
  end

module Order_Tags (PT : Tuple.Poly) =
  struct
    type wf = int
    type coupling = int
    type α children = α PT.t
    let null_wf = 0
    let null_coupling = 0
    let fuse c wfs = PT.fold_left (+) c wfs
    let wf_to_string n = Some (string_of_int n)
    let coupling_to_string n = Some (string_of_int n)
  end
```

### 8.2.4   Tagged, the Fusion.Make Functor

type *constant* = *M.constant*

*Wave Functions*

The code below is not yet functional. Too often, we assign to *Tags.null_wf* instead of calling *Tags.fuse*.

We will need two types of amplitudes: with color and without color. Since we can build them using the same types with only *flavor* replaced, it pays to use a functor to set up the scaffolding.

module *Tags* = *Tagger*(*PT*)

In the future, we might want to have *Coupling* among the functor arguments. However, for the moment, *Coupling* is assumed to be comprehensive.

module type *Tagged_Coupling* =

```

⚠ In the end, *PT.to_list* should become redudant!

```
   let fuse_rhs rhs  =  M.fuse (PT.to_list rhs)
```

<div align="center">*Vertices*</div>

Compute the set of all vertices in the model from the allowed fusions and the set of all flavors:

⚠ One could think of using *M.vertices* instead of *M.fuse2*, *M.fuse3* and *M.fuse* …

```
   module VSet  =  Map.Make(struct type t  =  A.flavor let compare  =  compare end)

   let add_vertices f rhs m  =
      VSet.add f (try rhs :: VSet.find f m with Not_found  →  [rhs]) m

   let collect_vertices rhs  =
      List.fold_right (fun (f1, c)  →  add_vertices (M.conjugate f1) (c, rhs))
         (fuse_rhs rhs)
```

The set of all vertices with common left fields factored.
I used to think that constant initializers are a good idea to allow compile time optimizations. The down side turned out to be that the constant initializers will be evaluated *every time* the functor is applied. *Relying on the fact that the functor will be called only once is not a good idea!*

```
   type vertices  =  (A.flavor × (constant Coupling.t × A.flavor PT.t) list) list

   let vertices_nocache max_degree flavors : vertices  =
      VSet.fold (fun f rhs v → (f, rhs) :: v)
         (PT.power_fold collect_vertices flavors VSet.empty) []
```

Performance hack:

```
   type vertex_table  =
            ((A.flavor × A.flavor × A.flavor) × constant Coupling.vertex3 × constant) list
         × ((A.flavor × A.flavor × A.flavor × A.flavor)
               × constant Coupling.vertex4 × constant) list
         × (A.flavor list × constant Coupling.vertexn × constant) list

   module VCache  =
      Cache.Make (struct type t  =  vertex_table end) (struct type t  =  vertices end)

   let vertices_cache  =  ref None
   let hash ()  =  VCache.hash (M.vertices ())
```

Can we do better than the executable name provided by *Config.cache_prefix*??? We need a better way to avoid collisions among the caches for different models in the same program.

```
let cache_name =
  ref (Config.cache_prefix ^ "." ^ Config.cache_suffix)

let set_cache_name name =
  cache_name := name

              flush stderr;
              result
          | VCache.Stale file →
              Printf.eprintf
                "␣>>>␣Re-initializing␣stale␣vertex␣table␣%s␣in␣file␣%s.␣␣"
                !cache_name file;
              Printf.eprintf "This␣may␣take␣some␣time␣...␣";
              flush stderr;
              let result = vertices_nocache max_degree flavors in
              VCache.write (hash ()) !cache_name (result);
              vertices_cache := Some result;
              Printf.eprintf "done.␣<<<␣\n";
              flush stderr;
              result
          end
      | Cache_Overwrite →
          Printf.eprintf
            "␣>>>␣Overwriting␣vertex␣table␣%s.␣␣This␣may␣take␣some␣time␣...␣"
            !cache_name;
          flush stderr;
          let result = vertices_nocache max_degree flavors in
          VCache.write (hash ()) !cache_name (result);
          vertices_cache := Some result;
          Printf.eprintf "done.␣<<<␣\n";
          flush stderr;
          result
      | Cache_Ignore →
          let result = vertices_nocache max_degree flavors in
```

```
                vertices_cache := Some result;
                result
          end
   | Some result → result
```

Note that we must perform any filtering of the vertices *after* caching, because the restrictions *must not* influence the cache (unless we tag the cache with model and restrictions).

```
   let filter_vertices select_vtx vertices =
      List.fold_left
        (fun acc (f, cfs) →
           let f' = M.conjugate f in
           let cfs =
              List.filter
                (fun (c, fs) → select_vtx c f' (PT.to_list fs))
                cfs
           in
           match cfs with
           | [] → acc
           | cfs → (f, cfs) :: acc)
        [] vertices
```

<div align="center"><em>Partitions</em></div>

Vertices that are not crossing invariant need special treatment so that they're only generated for the correct combinations of momenta.

NB: the *crossing* checks here are a bit redundant, because *CM.fuse* below will bring the killed vertices back to life and will have to filter once more. Nevertheless, we keep them here, for the unlikely case that anybody ever wants to use uncolored amplitudes directly.

NB: the analogous problem does not occur for *select_wf*, because this applies to momenta instead of vertices.

This approach worked before the colorize, but has become *futile*, because *CM.fuse* will bring the killed vertices back to life. We need to implement the same checks there again!!!

Using *PT.Mismatched_arity* is not really good style ...

Tho's approach doesn't work since he does not catch charge conjugated processes or crossed processes. Another very strange thing is that O'Mega seems always to run in the q2 q3 timelike case, but not in the other two. (Property of how the DAG is built?). For the *ZZZZ* vertex I add the same vertex again, but interchange 1 and 3 in the *crossing* vertex

```

Produce all possible combinations of vertices (flavor keystones) and momenta by forming the direct product. The semantically equivalent *Product.list2* (*flavor_keystone select_wf n*) *vertices keystones* with *subsequent* filtering would be a *very bad* idea, because a potentially huge intermediate list is built for large models. E. g. for the MSSM this would lead to non-termination by thrashing for $2 \to 4$ processes on most PCs.

```

Eventually, the pairs of *tower* and *dag* in *fusion_tower'* below could and should be replaced by a graded *DAG*. This will look like, but currently *tower* containts statistics information that is missing from *dag*:

```
Type node = flavor * p is not compatible with type wf * stat
```

This should be easy to fix. However, replacing type $t$ $=$ $wf$ with type $t$ $=$ $wf$ $\times$ $stat$ is *not* a good idea because the variable *stat* makes it impossible to test for the existance of a particular *wf* in a *DAG*.

In summary, it seems that ($wf$ $\times$ $stat$) $list$ $array$ $\times$ $A.D.t$ should be replaced by ($wf$ $\rightarrow$ $stat$) $\times$ $A.D.t$.

The function *fusion_tower'* recursively builds the tower of all fusions from bottom up to a chosen level. The argument *tower* is an array of lists, where the $i$-th sublist (counting from 0) represents all off shell wave functions depending on $i+1$ momenta and their Fermistatistics.

$$\begin{bmatrix} \{\phi_1(p_1), \phi_2(p_2), \phi_3(p_3), \ldots\}, \\ \{\phi_{12}(p_1 + p_2), \phi'_{12}(p_1 + p_2), \ldots, \phi_{13}(p_1 + p_3), \ldots, \phi_{23}(p_2 + p_3), \ldots\}, \\ \cdots \\ \{\phi_{1\cdots n}(p_1 + \cdots + p_n), \phi'_{1\cdots n}(p_1 + \cdots + p_n), \ldots\} \end{bmatrix} \quad (8.6)$$

The argument *dag* is a DAG representing all the fusions calculated so far. NB: The outer array in *tower* is always very short, so we could also have accessed a list with *List.nth*. Appending of new members at the end brings no loss of performance. NB: the array is supposed to be immutable.
The towers must be sorted so that the combinatorical functions can make consistent selections.

⚠ Intuitively, this seems to be correct. However, one could have expected that no element appears twice and that this ordering is not necessary ...

```
let grow select_wf select_vtx tower =
  let rank = succ (Array.length tower) in
  List.sort pcompare
    (PT.graded_sym_power_fold rank
      (fun wfs acc → fuse select_wf select_vtx wfs @ acc) tower [])

let add_offspring dag (wf, _, rhs) =
  A.D.add_offspring wf rhs dag

let filter_offspring fusions =
  List.map (fun (wf, s, _) → (wf, s)) fusions

let rec fusion_tower' n_max select_wf select_vtx tower dag : (A.wf × stat) list array × A.D.t =
  if Array.length tower ≥ n_max then
    (tower, dag)
  else
    let tower' = grow select_wf select_vtx tower in
    fusion_tower' n_max select_wf select_vtx
      (Array.append tower [|filter_offspring tower'|])
      (List.fold_left add_offspring dag tower')
```

Discard the tower and return a map from wave functions to Fermistatistics together with the DAG.

```
let make_external_dag wfs =
  List.fold_left (fun m (wf, _) → A.D.add_node wf m) A.D.empty wfs

let mixed_fold_left f acc lists =
  Array.fold_left (List.fold_left f) acc lists

module Stat_Map =
  Map.Make (struct type t = A.wf let compare = A.order_wf end)

let fusion_tower height select_wf select_vtx wfs : (A.wf → stat) × A.D.t =
  let tower, dag =
    fusion_tower' height select_wf select_vtx [|wfs|] (make_external_dag wfs) in
  let stats = mixed_fold_left
      (fun m (wf, s) → Stat_Map.add wf s m) Stat_Map.empty tower in
  ((fun wf → Stat_Map.find wf stats), dag)
```

Calculate the minimal tower of fusions that suffices for calculating the amplitude.

```
let minimal_fusion_tower n select_wf select_vtx wfs : (A.wf → stat) × A.D.t =
  fusion_tower (T.max_subtree n) select_wf select_vtx wfs
```

Calculate the complete tower of fusions. It is much larger than required, but it allows a complete set of gauge checks.

```
let complete_fusion_tower select_wf select_vtx wfs : (A.wf → stat) × A.D.t =
  fusion_tower (List.length wfs − 1) select_wf select_vtx wfs
```

⚠ There is a natural product of two DAGs using *fuse*. Can this be used in a replacement for *fusion_tower*? The hard part is to avoid double counting, of course. A straight forward solution could do a diagonal sum (in order to reject flipped offspring representing the same fusion) and rely on the uniqueness in *DAG* otherwise. However, this will (probably) slow down the procedure significanty, because most fusions (including Fermi signs!) will be calculated before being rejected by *DAG().add_offspring*.

Add to *dag* all Goldstone bosons defined in *tower* that correspond to gauge bosons in *dag*. This is only required for checking Slavnov-Taylor identities in unitarity gauge. Currently, it is not used, because we use the complete tower for gauge checking.

```
let harvest_goldstones tower dag =
  A.D.fold_nodes (fun wf dag' →
    match M.goldstone wf.A.flavor with
    | Some (g, _) →
        let wf' = { wf with A.flavor = g } in
```

```
            if A.D.is_node wf' tower then begin
               A.D.harvest tower wf' dag'
            end else begin
               dag'
            end
      | None → dag') dag dag
```

Calculate the sign from Fermi statistics that is not already included in the children.

```

```
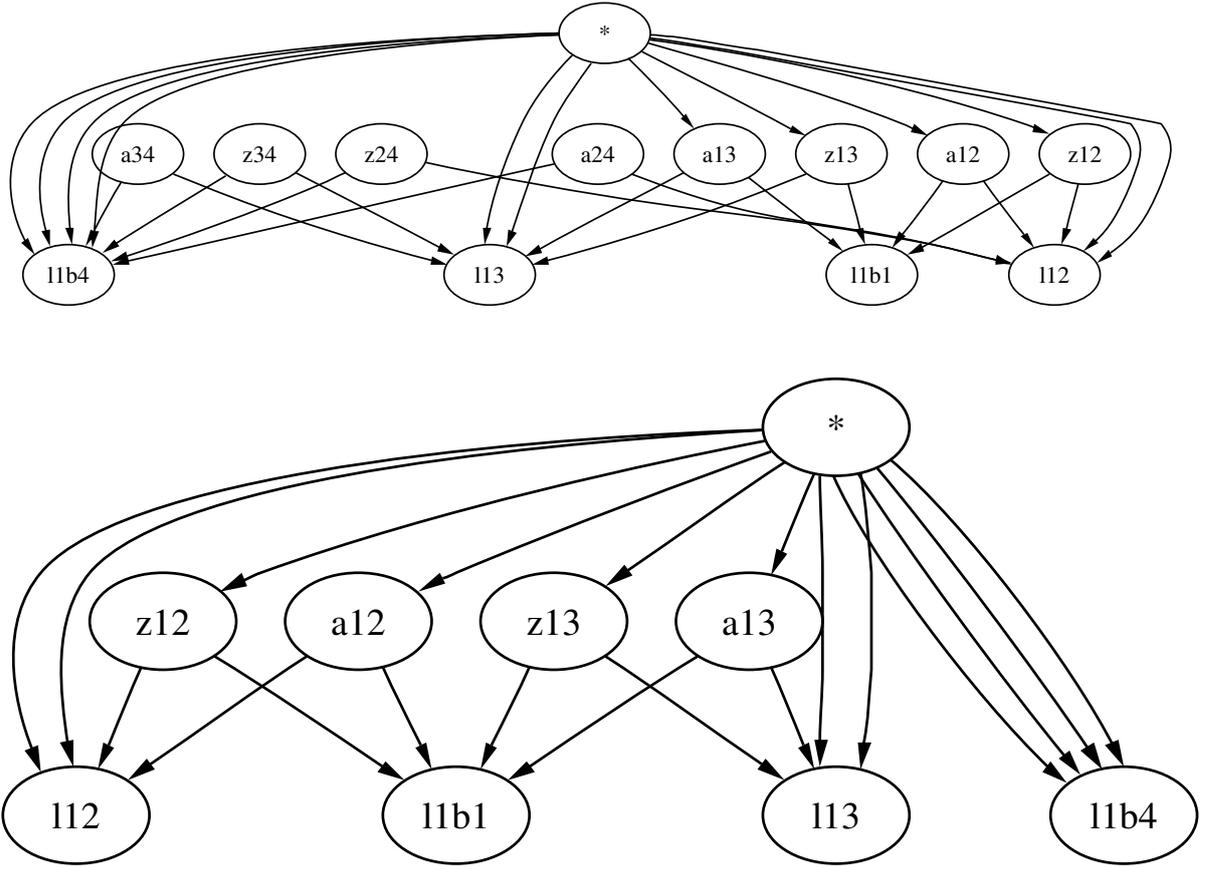

Figure 8.2: The DAGs for Bhabha scattering before and after weeding out unused nodes. The blatant asymmetry of these DAGs is caused by our prescription for removing doubling counting for an even number of external lines.

Test all members of a list of wave functions are defined by the DAG simultaneously:

```
let test_rhs dag (_, wfs) =
    PT.for_all (fun wf → is_source wf ∧ A.D.is_node wf dag) wfs
```

Add the keystone $(wf1, pairs)$ to $acc$ only if it is present in $dag$ and calculate the statistical factor depending on *stats en passant*:

```
let filter_keystone stats dag (wf1, pairs) acc =
    if is_source wf1 ∧ A.D.is_node wf1 dag then
        match List.filter (test_rhs dag) pairs with
        | [] → acc
        | pairs' → (wf1, List.map (fun (c, wfs) →
            ({ Tagged_Coupling.sign = stat_keystone c stats wf1 wfs;
                Tagged_Coupling.coupling = c;
                Tagged_Coupling.coupling_tag = A.Tags.null_coupling },
            wfs)) pairs') :: acc
    else
        acc
```

*Amplitudes*

```
module C = Cascade.Make(M)(P)
type selectors = C.selectors

let external_wfs n particles =
```
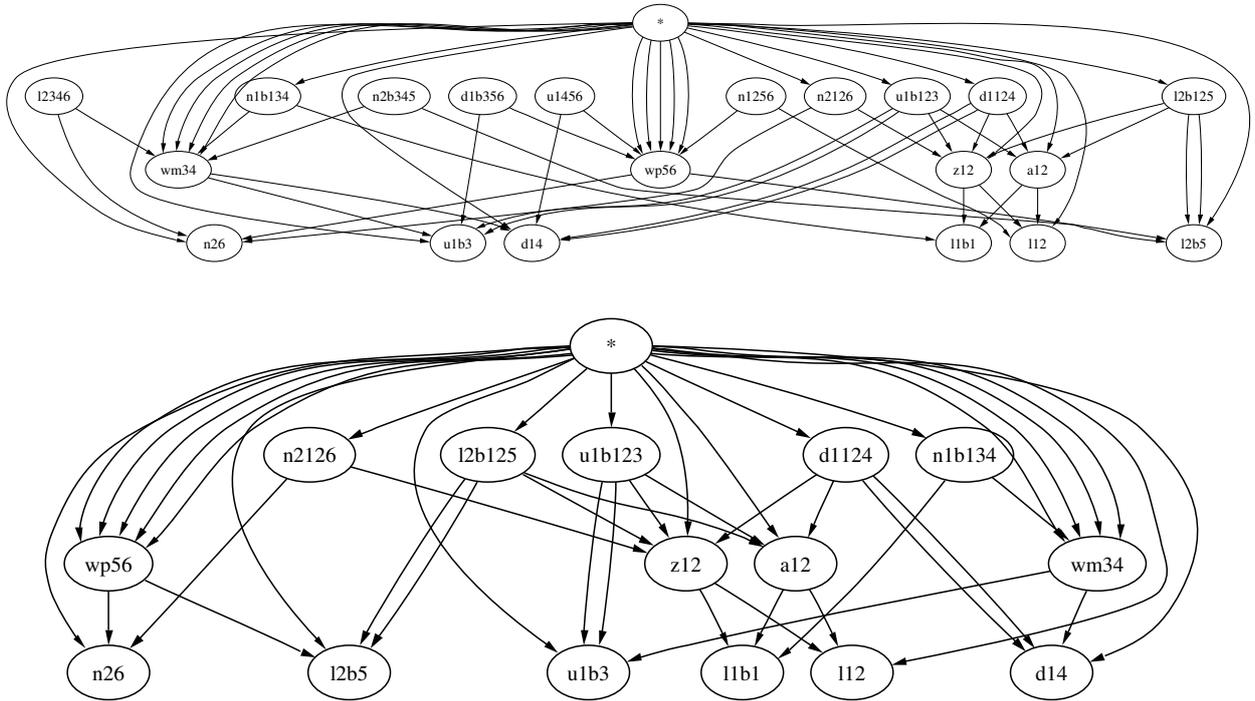

Figure 8.3: The DAGs for $e^+e^- \to u\bar{d}\mu^-\bar{\nu}_\mu$ before and after weeding out unused nodes.

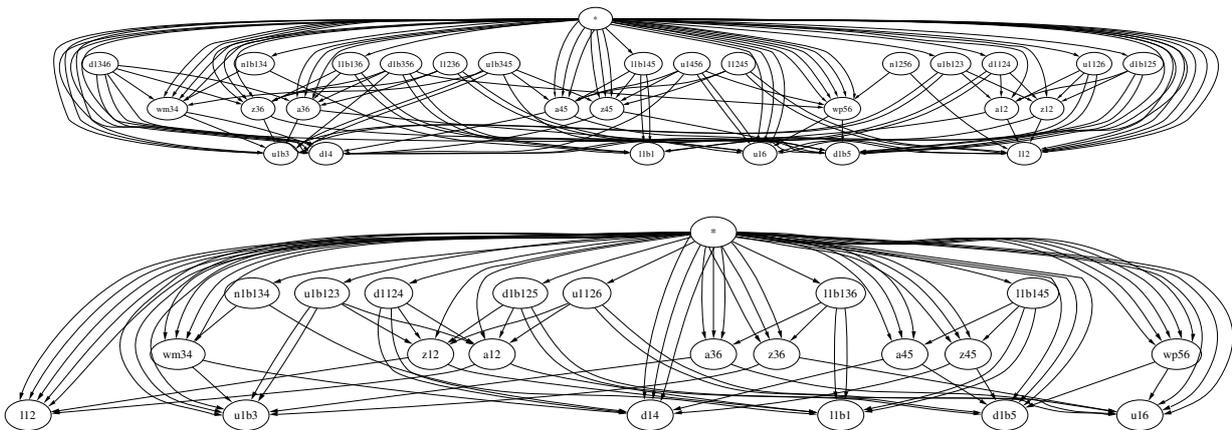

Figure 8.4: The DAGs for $e^+e^- \to u\bar{d}d\bar{u}$ before and after weeding out unused nodes.

```
    List.map (fun (f, p) →
      ({ A.flavor = f;
          A.momentum = P.singleton n p;
          A.wf_tag = A.Tags.null_wf },
        stat f p)) particles
```

*Main Function*

module *WFMap = Map.Make* (struct type *t = A.wf* let *compare = compare* end)

*map_amplitude_wfs f a* applies the function $f : wf \rightarrow wf$ to all wavefunctions appearing in the amplitude *a*.

```
  let map_amplitude_wfs f a =
    let map_rhs (c, wfs) = (c, PT.map f wfs) in
    let map_braket (wf, rhs) = (f wf, List.map map_rhs rhs)
    and map_fusion (lhs, rhs) = (f lhs, List.map map_rhs rhs) in
    let map_dag = A.D.map f (fun node rhs → map_rhs rhs) in
    let tower = map_dag a.A.fusion_tower
    and dag = map_dag a.A.fusion_dag in
    let dependencies_map =
      A.D.fold (fun wf _ → WFMap.add wf (A.D.dependencies dag wf)) dag WFMap.empty in
    { A.fusions = List.map map_fusion a.A.fusions;
      A.brakets = List.map map_braket a.A.brakets;
      A.on_shell = a.A.on_shell;
      A.is_gauss = a.A.is_gauss;
      A.constraints = a.A.constraints;
      A.incoming = a.A.incoming;
      A.outgoing = a.A.outgoing;
      A.externals = List.map f a.A.externals;
      A.symmetry = a.A.symmetry;
      A.dependencies = (fun wf → WFMap.find wf dependencies_map);
      A.fusion_tower = tower;
      A.fusion_dag = dag }
```

This is the main function that constructs the amplitude for sets of incoming and outgoing particles and returns the results in conveniently packaged pieces.

```
  let amplitude goldstones selectors fin fout =
```

Set up external lines and match flavors with numbered momenta.

```
    let f = fin @ List.map M.conjugate fout in
    let nin, nout = List.length fin, List.length fout in
    let n = nin + nout in
    let externals = List.combine f (ThoList.range 1 n) in
    let wfs = external_wfs n externals in
    let select_p = C.select_p selectors in
    let select_wf =
      match fin with
      | [_] → C.select_wf selectors P.Decay.timelike
      | _ → C.select_wf selectors P.Scattering.timelike in
    let select_vtx = C.select_vtx selectors in
```

Build the full fusion tower (including nodes that are never needed in the amplitude).

```
    let stats, tower =

      if goldstones then
        complete_fusion_tower select_wf select_vtx wfs
      else
        minimal_fusion_tower n select_wf select_vtx wfs in
```

Find all vertices for which *all* off shell wavefunctions are defined by the tower.

```
    let brakets =
      flavor_keystones (filter_keystone stats tower) select_p n
```

```
    (filter_vertices select_vtx
        (vertices (M.max_degree ()) (M.flavors ())))
    (T.keystones (ThoList.range 1 n)) in
```

Remove the part of the DAG that is never needed in the amplitude.

```
let dag =
  if goldstones then
    tower
  else
    A.D.harvest_list tower (A.wavefunctions brakets) in
```

Remove the leaf nodes of the DAG, corresponding to external lines.

```
let fusions =
  List.filter (function (_, []) → false | _ → true) (A.D.lists dag) in
```

Calculate the symmetry factor for identical particles in the final state.

```
let symmetry =
  Combinatorics.symmetry fout in

let dependencies_map =
  A.D.fold (fun wf _ → WFMap.add wf (A.D.dependencies dag wf)) dag WFMap.empty in
```

Finally: package the results:

```
{ A.fusions = fusions;
  A.brakets = brakets;
  A.on_shell = (fun wf → C.on_shell selectors (A.flavor wf) wf.A.momentum);
  A.is_gauss = (fun wf → C.is_gauss selectors (A.flavor wf) wf.A.momentum);
  A.constraints = C.description selectors;
  A.incoming = fin;
  A.outgoing = fout;
  A.externals = List.map fst wfs;
  A.symmetry = symmetry;
  A.dependencies = (fun wf → WFMap.find wf dependencies_map);
  A.fusion_tower = tower;
  A.fusion_dag = dag }
```

*Color*

```
module CM = Colorize.It(M)
module CA = Amplitude(PT)(P)(CM)

let colorize_wf flavor wf =
  { CA.flavor = flavor;
    CA.momentum = wf.A.momentum;
    CA.wf_tag = wf.A.wf_tag }

let uncolorize_wf wf =
  { A.flavor = CM.flavor_sans_color wf.CA.flavor;
    A.momentum = wf.CA.momentum;
    A.wf_tag = wf.CA.wf_tag }
```

⚠ At the end of the day, I shall want to have some sort of *fibered DAG* as abstract data type, with a projection of colored nodes to their uncolored counterparts.

```
module CWFBundle = Bundle.Make
    (struct
        type elt = CA.wf
        let compare_elt = compare
        type base = A.wf
        let compare_base = compare
        let pi wf =
          { A.flavor = CM.flavor_sans_color wf.CA.flavor;
```

$$A.momentum = wf.CA.momentum;$$
$$A.wf\_tag = wf.CA.wf\_tag \}$$
end)

For now, we can live with simple aggregation:

type *fibered_dag* = { *dag* : *CA.D.t*; *bundle* : *CWFBundle.t* }

Not yet(?) needed: module *CS* = *Stat* (*CM*)

let *colorize_sterile_nodes dag f wf fibered_dag* =
  if *A.D.is_sterile wf dag* then
    let *wf′, wf_bundle′* = *f wf fibered_dag* in
    { *dag* = *CA.D.add_node wf′ fibered_dag.dag*;
      *bundle* = *wf_bundle′* }
  else
    *fibered_dag*

let *colorize_nodes f wf rhs fibered_dag* =
  let *wf_rhs_list′, wf_bundle′* = *f wf rhs fibered_dag* in
  let *dag′* =
    *List.fold_right*
      (fun (*wf′, rhs′*) → *CA.D.add_offspring wf′ rhs′*)
      *wf_rhs_list′ fibered_dag.dag* in
  { *dag* = *dag′*;
  *bundle* = *wf_bundle′* }

O'Caml (correctly) infers the type val *colorize_dag* : (*D.node* → *D.edge* × *D.children* → *fibered_dag* → (*CA.D.node* × (*CA.D.edge* × *CA.D.children*)) *list* × *CWFBundle.t*) → (*D.node* → *fibered_dag* → *CA.D.node* × *CWFBundle.t*) → *D.t* → *CWFBundle.t* → *fibered_dag*.

let *colorize_dag f_node f_ext dag wf_bundle* =
  *A.D.fold* (*colorize_nodes f_node*) *dag*
    (*A.D.fold_nodes* (*colorize_sterile_nodes dag f_ext*) *dag*
      { *dag* = *CA.D.empty*; *bundle* = *wf_bundle* })

let *colorize_external wf fibered_dag* =
  match *CWFBundle.inv_pi wf fibered_dag.bundle* with
  | [*c_wf*] → (*c_wf, fibered_dag.bundle*)
  | [] → *failwith* "colorize_external:␣not␣found"
  | _ → *failwith* "colorize_external:␣not␣unique"

let *fuse_c_wf rhs* =
  let *momenta* = *PT.map* (fun *wf* → *wf.CA.momentum*) *rhs* in
  *List.filter*
    (fun (_, *c*) → *kmatrix_cuts c momenta*)
    (*CM.fuse* (*List.map* (fun *wf* → *wf.CA.flavor*) (*PT.to_list rhs*)))

let *colorize_coupling c coupling* =
  { *coupling* with *Tagged_Coupling.coupling* = *c* }

let *colorize_fusion wf* (*coupling, children*) *fibered_dag* =
  let *match_flavor* (*f*, _) = (*CM.flavor_sans_color f* = *A.flavor wf*)
  and *find_colored wf′* = *CWFBundle.inv_pi wf′ fibered_dag.bundle* in
  let *fusions* =
    *ThoList.flatmap*
      (fun *c_children* →
        *List.map*
          (fun (*f, c*) →
            (*colorize_wf f wf*, (*colorize_coupling c coupling, c_children*)))
          (*List.filter match_flavor* (*fuse_c_wf c_children*)))
      (*PT.product* (*PT.map find_colored children*)) in
  let *bundle* =
    *List.fold_right*
      (fun (*c_wf*, _) → *CWFBundle.add c_wf*)

```
        fusions fibered_dag.bundle in
      (fusions, bundle)
    let colorize_braket1 (wf, (coupling, children)) fibered_dag =
      let find_colored wf' = CWFBundle.inv_pi wf' fibered_dag.bundle in
      Product.fold2
        (fun bra ket acc →
          List.fold_left
            (fun brakets (f, c) →
              if CM.conjugate bra.CA.flavor = f then
                (bra, (colorize_coupling c coupling, ket)) :: brakets
              else
                brakets)
            acc (fuse_c_wf ket))
        (find_colored wf) (PT.product (PT.map find_colored children)) []
  module CWFMap =
    Map.Make (struct type t = CA.wf let compare = CA.order_wf end)

  module CKetSet =
    Set.Make (struct type t = CA.rhs let compare = compare end)
```

Find a set of kets in *map* that belong to *bra*. Return the empty set, if nothing is found.

```
    let lookup_ketset bra map =
      try CWFMap.find bra map with Not_found → CKetSet.empty
```

Return the set of kets belonging to *bra* in *map*, augmented by *ket*.

```
    let addto_ketset bra ket map =
      CKetSet.add ket (lookup_ketset bra map)
```

Augment or update *map* with a new (*bra*, *ket*) relation.

```
    let addto_ketset_map map (bra, ket) =
      CWFMap.add bra (addto_ketset bra ket map) map
```

Take a list of (*bra*, *ket*) pairs and group the *ket*s according to *bra*. This is very similar to *ThoList.factorize* on page 587, but the latter keeps duplicate copies, while we keep only one, with equality determined by *CA.order_wf*.

⚠ Isn't *Bundle* L.1 the correct framework for this?

```

### 8.2.5   Fusions with Majorana Fermions

let *majorana_log silent logging* = *logging*
let *majorana_log silent logging* = *silent*
let *force_legacy* = true
let *force_legacy* = false

module *Stat_Majorana* (*M* : *Model.T*) : (*Stat* with type *flavor* = *M.flavor*) =
  struct

    type *flavor* = *M.flavor*

JRR's algorithm doesn't use lists of pairs representing directed arrows as in *Stat._Dirac*().*stat* above, but a list of integers denoting the external leg a fermion line connects to:

    type *stat* =
     | *Fermion* of *int* × *int list*
     | *AntiFermion* of *int* × *int list*
     | *Boson* of *int list*
     | *Majorana* of *int* × *int list*

    let *sign_of_permutation lines* = *fst* (*Combinatorics.sort_signed lines*)

    let *lines_equivalent l1 l2* =
     *sign_of_permutation l1* = *sign_of_permutation l2*

    let *stat_to_string s* =
     let open *Printf* in
     let *l2s* = *ThoList.to_string string_of_int* in
     match *s* with
     | *Boson lines* → *sprintf* "B␣%s" (*l2s lines*)
     | *Fermion* (*p, lines*) → *sprintf* "F␣(%d,␣%s)" *p* (*l2s lines*)
     | *AntiFermion* (*p, lines*) → *sprintf* "A␣(%d,␣%s)" *p* (*l2s lines*)
     | *Majorana* (*p, lines*) → *sprintf* "M␣(%d,␣%s)" *p* (*l2s lines*)

Writing a cases explicitely to allow exhaustiveness checking is too tedious here.

    let *equal s1 s2* =
     match *s1, s2* with
     | *Boson l1, Boson l2* →
      *lines_equivalent l1 l2*
     | *Majorana* (*p1, l1*), *Majorana* (*p2, l2*)
     | *Fermion* (*p1, l1*), *Fermion* (*p2, l2*)
     | *AntiFermion* (*p1, l1*), *AntiFermion* (*p2, l2*) →
      *p1* = *p2* ∧ *lines_equivalent l1 l2*
     | _ → false

The final amplitude must not be fermionic!

    let *complete* = function
     | *Boson* _ → true
     | _ → false

*stat f p* interprets the numeric fermion numbers of flavor *f* at external leg *p* at creates a leaf:

    let *stat f p* =
     match *M.fermion f* with
     | 0 → *Boson* []

```
  | 1  →  Fermion (p, [])
  | −1  →  AntiFermion (p, [])
  | 2  →  Majorana (p, [])
  | _  →  invalid_arg "Fusion.Stat_Majorana:␣invalid␣fermion␣number"
```

In the formalism of [7], it does not matter to distinguish spinors and conjugate spinors, it is only important to know in which direction a fermion line is calculated. So the sign is made by the calculation together with an aditional one due to the permuation of the pairs of endpoints of fermion lines in the direction they are calculated. We propose a "canonical" direction from the right to the left child at a fusion point so we only have to keep in mind which external particle hangs at each side. Therefore we need not to have a list of pairs of conjugate spinors and spinors but just a list in which the pairs are right-left-right-left and so on. Unfortunately it is unavoidable to have couplings with clashing arrows in supersymmetric theories so we need transmutations from fermions in antifermions and vice versa as well.

    **exception** *Impossible*

In old case with at most one fermion line, it was straight forward to determine the kind of outgoing line from the corresponding flavor. In the general case, it is not possible to maintain this constraint, when constructing the *n*-ary fusion from binary ones.
We can break up the process into two steps however: first perform unconstrained fusions pairwise ...

```
  let stat_fuse_pair_unconstrained s1 s2  =
    match s1, s2 with
    | Boson l1, Boson l2  →  Boson (l1 @ l2)
    | (Majorana (p1, l1) | Fermion (p1, l1) | AntiFermion (p1, l1)),
      (Majorana (p2, l2) | Fermion (p2, l2) | AntiFermion (p2, l2))  →
        Boson ([p2; p1] @ l1 @ l2)
    | Boson l1, Majorana (p, l2)  →  Majorana (p, l1 @ l2)
    | Boson l1, Fermion (p, l2)  →  Fermion (p, l1 @ l2)
    | Boson l1, AntiFermion (p, l2)  →  AntiFermion (p, l1 @ l2)
    | Majorana (p, l1), Boson l2  →  Majorana (p, l1 @ l2)
    | Fermion (p, l1), Boson l2  →  Fermion (p, l1 @ l2)
    | AntiFermion (p, l1), Boson l2  →  AntiFermion (p, l1 @ l2)
```

... and only apply the constraint to the outgoing leg.

```
  let constrain_stat_fusion s f  =
    match s, M.lorentz f with
    | (Majorana (p, l) | Fermion (p, l) | AntiFermion (p, l)),
      (Coupling.Majorana | Coupling.Vectorspinor)  →  Majorana (p, l)
    | (Majorana (p, l) | Fermion (p, l) | AntiFermion (p, l)),
      Coupling.Spinor  →  Fermion (p, l)
    | (Majorana (p, l) | Fermion (p, l) | AntiFermion (p, l)),
      Coupling.ConjSpinor  →  AntiFermion (p, l)
    | (Majorana _ | Fermion _ | AntiFermion _ as s), _  →
        invalid_arg
          (Printf.sprintf
             "Fusion.stat_fuse_pair_constrained:␣expected␣boson,␣got␣%s"
             (stat_to_string s))
    | Boson l as s,
      (Coupling.Majorana | Coupling.Spinor | Coupling.ConjSpinor)  →
        invalid_arg
          (Printf.sprintf
             "Fusion.stat_fuse_pair_constrained:␣expected␣fermion,␣got␣%s"
             (stat_to_string s))
    | Boson l, _  →  Boson l

  let stat_fuse_pair_legacy f s1 s2  =
    stat_fuse_pair_unconstrained s1 s2

  let stat_fuse_pair_legacy_logging f s1 s2  =
    let stat  =  stat_fuse_pair_legacy f s1 s2 in
    Printf.eprintf
      "stat_fuse_pair_legacy:␣(%s,␣%s)␣->␣%s␣=␣%s\n"
      (stat_to_string s1) (stat_to_string s2) (stat_to_string stat)
```

```
        (M.flavor_to_string f);
      stat

  let stat_fuse_pair_legacy  =
    majorana_log stat_fuse_pair_legacy stat_fuse_pair_legacy_logging
```

Note that we are using *List.fold_left*, therefore we perform the fusions as $f(f(\ldots(f(s_1, s_2), s_3), \ldots), s_n)$. Had we used *List.fold_right* instead, we would compute $f(s_1, f(s_2, \ldots f(s_{n-1}, s_n)))$. For our Dirac algorithm, this makes no difference, but JRR's Majorana algorithm depends on the order!

Also not that we *must not* apply *constrain_stat_fusion* here, because *stat_fuse_legacy* will be used in *stat_keystone_legacy* again, where we always expect *Boson* _.

```
  let stat_fuse_legacy s1 s23__n f  =
    List.fold_left (stat_fuse_pair_legacy f) s1 s23__n

  let stat_fuse_legacy′ s1 s23__n f  =
    match List.rev (s1 :: s23__n) with
    | s1 :: s23__n → List.fold_left (stat_fuse_pair_legacy f) s1 s23__n
    | [] → failwith "stat_fuse_legacy:␣impossible"

  let stat_fuse_legacy′ s1 s23__n f  =
    List.fold_right (stat_fuse_pair_legacy f) s23__n s1

  let stat_fuse_legacy_logging s1 s23__n f  =
    let stat  =  stat_fuse_legacy s1 s23__n f in
    Printf.eprintf
      "stat_fuse_legacy:␣␣␣␣␣␣␣%s␣->␣%s␣=␣%s\n"
      (ThoList.to_string stat_to_string (s1 :: s23__n))
      (stat_to_string stat)
      (M.flavor_to_string f);
    stat

  let stat_fuse_legacy  =
    majorana_log stat_fuse_legacy stat_fuse_legacy_logging
```

We need to match the fermion lines in the incoming propagators using the connection information in the vertex. This used to be trivial in the old omega, because there was at most one fermion line in a vertex.

```
  module IMap  =  Map.Make (struct type t  =  int let compare  =  compare end)
```

From version 4.05 on, this is just *IMap.find_opt*.

```
  let imap_find_opt p map  =
    try Some (IMap.find p map) with Not_found → None
```

Partially combined *stat*s of the incoming propagators and keeping track of the fermion lines, while we're scanning them. We will perform two passes:

1. collect the saturated fermion lines in a *Boson*, while building a map from the indices in the vertex to the open fermion lines

2. connect the open fermion lines using this map.

```
  type partial  =
    { stat  :  stat (* the stat accumulated so far *);
      fermions  :  int IMap.t (* a map from the indices in the vertex to open fermion lines *);
      n  :  int (* the number of incoming propagators *) }

  let empty_partial  =
    { stat  =  Boson [];
      fermions  =  IMap.empty;
      n  =  0 }
```

Only for debugging:

```
  let partial_to_string p  =
    Printf.sprintf
      "{␣%s,␣%s,␣%d␣}"
      (ThoList.to_string
```

$$(\mathsf{fun}\ (i,\ particle)\ \rightarrow\ Printf.sprintf\ \texttt{"\%d@\%d"}\ i\ particle)$$
$$(IMap.bindings\ p.fermions))$$
$$(stat\_to\_string\ p.stat)$$
$$p.n$$

Add a list of saturated fermion lines at the top of the list of lines in a *stat*.

> let *add_lines l* = function
> | *Boson l′* → *Boson (l @ l′)*
> | *Fermion (n, l′)* → *Fermion (n, l @ l′)*
> | *AntiFermion (n, l′)* → *AntiFermion (n, l @ l′)*
> | *Majorana (n, l′)* → *Majorana (n, l @ l′)*

Single step of pass 1: collect the saturated fermion lines and add a pointer to an open fermion line in case of a fermion.

> let *add_lines_to_partial p stat* =
> let *n* = *succ p.n* in
> match *stat* with
> | *Boson l* →
>   { *fermions* = *p.fermions*;
>     *stat* = *add_lines l p.stat*;
>     *n* }
> | *Majorana (f, l)* →
>   { *fermions* = *IMap.add n f p.fermions*;
>     *stat* = *add_lines l p.stat*;
>     *n* }
> | *Fermion (p, l)* →
>   *invalid_arg*
>     `"Fusion.Stat_Majorana.add_lines_to_partial:␣unexpected␣Fermion"`
> | *AntiFermion (p, l)* →
>   *invalid_arg*
>     `"Fusion.Stat_Majorana.add_lines_to_partial:␣unexpected␣AntiFermion"`

> let *partial_of_slist stat_list* =
> *List.fold_left add_lines_to_partial empty_partial stat_list*

> let *partial_of_rev_slist stat_list* =
> *List.fold_left add_lines_to_partial empty_partial (List.rev stat_list)*

The indices *i* and *j* refer to incoming lines: add a saturated line to *p.stat* and remove the corresponding open lines from the map.

> let *saturate_fermion_line p i j* =
> match *imap_find_opt i p.fermions*, *imap_find_opt j p.fermions* with
> | *Some f, Some f′* →
>   { *stat* = *add_lines [f′; f] p.stat*;
>     *fermions* = *IMap.remove i (IMap.remove j p.fermions)*;
>     *n* = *p.n* }
> | _ → *invalid_arg* `"saturate_fermion_line:␣mismatch"`

The index *i* refers to an incoming line: add the open line to *p.stat* and remove it from the map.

> let *pass_through_fermion_line p i* =
> match *imap_find_opt i p.fermions*, *p.stat* with
> | *Some f, Boson l* →
>   { *stat* = *Majorana (f, l)*;
>     *fermions* = *IMap.remove i p.fermions*;
>     *n* = *p.n* }
> | *None, Boson l* →
>   *invalid_arg* `"pass_through_fermion_line:␣mismatch"`
> | _, (*Majorana* _ | *Fermion* _ | *AntiFermion* _) →
>   *invalid_arg* `"pass_through_fermion_line:␣more␣than␣one␣open␣lines"`

Single step of pass 2: saturate a fermion line or pass it through:

Experimental: ignore the direction of the fermion line in order to reproduce JRR's algorithm.

let *sort_pair* $(i, j)$ =
  if $i < j$ then
    $(i, j)$

All wavefunctions are unique per amplitude. So we can use per-amplitude dependency trees without additional *internal* tags to identify identical wave functions.

**NB:** we miss potential optimizations, because we assume all coupling to be different, while in fact we have horizontal/family symmetries and non abelian gauge couplings are universal anyway.

# —9—
# Lorentz Representations, Couplings, Models and Targets

## 9.1 Interface of Coupling

The enumeration types used for communication from *Models* to *Targets*. On the physics side, the modules in *Models* must implement the Feynman rules according to the conventions set up here. On the numerics side, the modules in *Targets* must handle all cases according to the same conventions.

### 9.1.1 Propagators

The Lorentz representation of the particle. NB: O'Mega treats all lines as *outgoing* and particles are therefore transforming as *ConjSpinor* and antiparticles as *Spinor*.

type *lorentz* =
| *Scalar*
| *Spinor* (∗ $\psi$ ∗)
| *ConjSpinor* (∗ $\bar{\psi}$ ∗)
| *Majorana* (∗ $\chi$ ∗)
| *Maj_Ghost* (∗ SUSY ghosts ∗)
| *Vector*
| *Massive_Vector*
| *Vectorspinor* (∗ supersymmetric currents and gravitinos ∗)
| *Tensor_1*
| *Tensor_2* (∗ massive gravitons (large extra dimensions) ∗)
| *BRS* of *lorentz*

type *lorentz3* = *lorentz* × *lorentz* × *lorentz*
type *lorentz4* = *lorentz* × *lorentz* × *lorentz* × *lorentz*
type *lorentzn* = *lorentz list*

type *fermion_lines* = (*int* × *int*) *list*

If there were no vectors or auxiliary fields, we could deduce the propagator from the Lorentz representation. While we're at it, we can introduce "propagators" for the contact interactions of auxiliary fields as well. *Prop_Gauge* and *Prop_Feynman* are redundant as special cases of *Prop_Rxi*.

The special case *Only_Insertion* corresponds to operator insertions that do not correspond to a propagating field all. These are used for checking Slavnov-Taylor identities

$$\partial_\mu \langle \text{out}|W^\mu(x)|\text{in}\rangle = m_W \langle \text{out}|\phi(x)|\text{in}\rangle \tag{9.1}$$

of gauge theories in unitarity gauge where the Goldstone bosons are not propagating. Numerically, it would suffice to use a vanishing propagator, but then superflous fusions would be calculated in production code in which the Slavnov-Taylor identities are not tested.

type $\alpha$ *propagator* =
| *Prop_Scalar* | *Prop_Ghost*
| *Prop_Spinor* | *Prop_ConjSpinor* | *Prop_Majorana*
| *Prop_Unitarity* | *Prop_Feynman* | *Prop_Gauge* of $\alpha$ | *Prop_Rxi* of $\alpha$
| *Prop_Tensor_2* | *Prop_Tensor_pure* | *Prop_Vector_pure*
| *Prop_Vectorspinor*
| *Prop_Col_Scalar* | *Prop_Col_Feynman* | *Prop_Col_Majorana*

| | only Dirac fermions | incl. Majorana fermions |
|---|---|---|
| *Prop_Scalar* | $\phi(p) \leftarrow \dfrac{\mathrm{i}}{p^2 - m^2 + \mathrm{i}m\Gamma}\phi(p)$ | |
| *Prop_Spinor* | $\psi(p) \leftarrow \dfrac{\mathrm{i}(-\not{p} + m)}{p^2 - m^2 + \mathrm{i}m\Gamma}\psi(p)$ | $\psi(p) \leftarrow \dfrac{\mathrm{i}(-\not{p} + m)}{p^2 - m^2 + \mathrm{i}m\Gamma}\psi(p)$ |
| *Prop_ConjSpinor* | $\bar{\psi}(p) \leftarrow \bar{\psi}(p)\dfrac{\mathrm{i}(\not{p} + m)}{p^2 - m^2 + \mathrm{i}m\Gamma}$ | $\psi(p) \leftarrow \dfrac{\mathrm{i}(-\not{p} + m)}{p^2 - m^2 + \mathrm{i}m\Gamma}\psi(p)$ |
| *Prop_Majorana* | N/A | $\chi(p) \leftarrow \dfrac{\mathrm{i}(-\not{p} + m)}{p^2 - m^2 + \mathrm{i}m\Gamma}\chi(p)$ |
| *Prop_Unitarity* | $\epsilon_\mu(p) \leftarrow \dfrac{\mathrm{i}}{p^2 - m^2 + \mathrm{i}m\Gamma}\left(-g_{\mu\nu} + \dfrac{p_\mu p_\nu}{m^2}\right)\epsilon^\nu(p)$ | |
| *Prop_Feynman* | $\epsilon^\nu(p) \leftarrow \dfrac{-\mathrm{i}}{p^2 - m^2 + \mathrm{i}m\Gamma}\epsilon^\nu(p)$ | |
| *Prop_Gauge* | $\epsilon_\mu(p) \leftarrow \dfrac{\mathrm{i}}{p^2}\left(-g_{\mu\nu} + (1-\xi)\dfrac{p_\mu p_\nu}{p^2}\right)\epsilon^\nu(p)$ | |
| *Prop_Rxi* | $\epsilon_\mu(p) \leftarrow \dfrac{\mathrm{i}}{p^2 - m^2 + \mathrm{i}m\Gamma}\left(-g_{\mu\nu} + (1-\xi)\dfrac{p_\mu p_\nu}{p^2 - \xi m^2}\right)\epsilon^\nu(p)$ | |

Table 9.1: Propagators. NB: The sign of the momenta in the spinor propagators comes about because O'Mega treats all momenta as *outgoing* and the charge flow for *Spinor* is therefore opposite to the momentum, while the charge flow for *ConjSpinor* is parallel to the momentum.

| | |
|---|---|
| *Aux_Scalar* | $\phi(p) \leftarrow \mathrm{i}\phi(p)$ |
| *Aux_Spinor* | $\psi(p) \leftarrow \mathrm{i}\psi(p)$ |
| *Aux_ConjSpinor* | $\bar{\psi}(p) \leftarrow \mathrm{i}\bar{\psi}(p)$ |
| *Aux_Vector* | $\epsilon^\mu(p) \leftarrow \mathrm{i}\epsilon^\mu(p)$ |
| *Aux_Tensor_1* | $T^{\mu\nu}(p) \leftarrow \mathrm{i}T^{\mu\nu}(p)$ |
| *Only_Insertion* | N/A |

Table 9.2: Auxiliary and non propagating fields

*JR sez' (regarding the Majorana Feynman rules):* We don't need different fermionic propagators as supposed by the variable names *Prop_Spinor*, *Prop_ConjSpinor* or *Prop_Majorana*. The propagator in all cases has to be multiplied on the left hand side of the spinor out of which a new one should be built. All momenta are treated as *outgoing*, so for the propagation of the different fermions the following table arises, in which the momentum direction is always downwards and the arrows show whether the momentum and the fermion line, respectively are parallel or antiparallel to the direction of calculation:

| Fermion type | fermion arrow | mom. | calc. | sign |
|---|---|---|---|---|
| Dirac fermion | ↑ | ↑  ↓ | ↑  ↑ | negative |
| Dirac antifermion | ↓ | ↓  ↓ | ↑  ↓ | negative |
| Majorana fermion | - | ↑  ↓ | - | negative |

So the sign of the momentum is always negative and no further distinction is needed. *(JR's probably right, but I need to check myself ...)*

### 9.1.2  Vertices

The combined $S - P$ and $V - A$ couplings (see tables 9.5, 9.6, 9.8 and 9.12) are redundant, of course, but they allow some targets to create more efficient numerical code.[1] Choosing VA2 over VA will cause the FORTRAN backend to pass the coupling as a whole array

type *fermion* = *Psi* | *Chi* | *Grav*

The integer is an additional coefficient that multiplies the respective coupling constant. This allows to reduce the number of required coupling constants in manifestly symmetrc cases. Most of times it will be equal unity, though.
The two vertex types *PBP* and *BBB* for the couplings of two fermions or two antifermions ("clashing arrows") is unavoidable in supersymmetric theories.

... tho doesn't like the names and has promised to find a better mnemonics!

As long as we stick to renormalizable couplings, there are only three types of quartic couplings: *Scalar4*, *Scalar2_Vector2* and *Vector4*. However, there are three inequivalent contractions for the latter and the general vertex will be a linear combination with integer coefficients:

$$Scalar4\ 1: \quad \phi_1\phi_2\phi_3\phi_4 \tag{9.2a}$$

$$Scalar2\_Vector2\ 1: \quad \phi_1\phi_2 V_3^\mu V_{4,\mu} \tag{9.2b}$$

$$Vector4\ [1, C\_12\_34]: \quad V_1^\mu V_{2,\mu} V_3^\nu V_{4,\nu} \tag{9.2c}$$

$$Vector4\ [1, C\_13\_42]: \quad V_1^\mu V_2^\nu V_{3,\mu} V_{4,\nu} \tag{9.2d}$$

$$Vector4\ [1, C\_14\_23]: \quad V_1^\mu V_2^\nu V_{3,\nu} V_{4,\mu} \tag{9.2e}$$

In some applications, we have to allow for contributions outside of perturbation theory. The most prominent example is heavy gauge boson scattering at very high energies, where the perturbative expression violates unitarity.

One solution is the '*K*-matrix' ansatz. Such unitarizations typically introduce effective propagators and/or vertices that violate crossing symmetry and vanish in the *t*-channel. This can be taken care of in *Fusion* by filtering out vertices that have the wrong momenta.

In this case the ordering of the fields in a vertex of the Feynman rules becomes significant. In particular, we assume that $(V_1, V_2, V_3, V_4)$ implies

$$\tag{9.3}$$

The list of pairs of parameters denotes the location and strengths of the poles in the *K*-matrix ansatz:

$$(c_1, a_1, c_2, a_2, \ldots, c_n, a_n) \Longrightarrow f(s) = \sum_{i=1}^n \frac{c_i}{s - a_i} \tag{9.4}$$

$- (\partial^\nu H_1) H_2 (\partial_\nu A_\mu) Z^\mu - H_1 (\partial^\nu H_2) (\partial_\nu A_\mu) Z^\mu) *)$

| *Dim6_AHHZ_PB* of *int*
$(* \ \mathrm{i} (H_1 H_2 (\partial^\nu A_\mu)(\partial_\nu Z^\mu) - H_1 H_2 (\partial^\nu A_\mu)(\partial^\mu Z_\nu)) *)$

type $\alpha$ *vertexn* =
| *UFO* of *Algebra.QC.t* × *string* × *lorentzn* × *fermion_lines* × *Color.Vertex.t*

An obvious candidate for addition to *boson* is $T$, of course.

◈ This list is sufficient for the minimal standard model, but not comprehensive enough for most of its extensions, supersymmetric or otherwise. In particular, we need a *general* parameterization for all trilinear vertices. One straightforward possibility are polynomials in the momenta for each combination of fields.

◈ *JR sez' (regarding the Majorana Feynman rules):* Here we use the rules which can be found in [7] and are more properly described in *Targets* where the performing of the fusion rules in analytical expressions is encoded. *(JR's probably right, but I need to check myself ...)*

Signify which two of three fields are fused:

type *fuse2* = *F23* | *F32* | *F31* | *F13* | *F12* | *F21*

Signify which three of four fields are fused:

type *fuse3* =
| *F123* | *F231* | *F312* | *F132* | *F321* | *F213*
| *F124* | *F241* | *F412* | *F142* | *F421* | *F214*
| *F134* | *F341* | *F413* | *F143* | *F431* | *F314*
| *F234* | *F342* | *F423* | *F243* | *F432* | *F324*

Explicit enumeration types make no sense for higher degrees.

type *fusen* = *int list*

The third member of the triplet will contain the coupling constant:

type $\alpha$ *t* =
| *V3* of $\alpha$ *vertex3* × *fuse2* × $\alpha$
| *V4* of $\alpha$ *vertex4* × *fuse3* × $\alpha$
| *Vn* of $\alpha$ *vertexn* × *fusen* × $\alpha$

### 9.1.3 Gauge Couplings

Dimension-4 trilinear vector boson couplings

$$f_{abc} \partial^\mu A^{a,\nu} A^b_\mu A^c_\nu \rightarrow \mathrm{i} f_{abc} k_1^\mu A^{a,\nu}(k_1) A^b_\mu(k_2) A^c_\nu(k_3)$$

$$= -\frac{\mathrm{i}}{3!} f_{a_1 a_2 a_3} C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3) A^{a_1}_{\mu_1}(k_1) A^{a_2}_{\mu_2}(k_2) A^{a_3}_{\mu_3}(k_3) \quad (9.5\mathrm{a})$$

with the totally antisymmetric tensor (under simultaneous permutations of all quantum numbers $\mu_i$ and $k_i$) and all momenta *outgoing*

$$C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3) = (g^{\mu_1 \mu_2}(k_1^{\mu_3} - k_2^{\mu_3}) + g^{\mu_2 \mu_3}(k_2^{\mu_1} - k_3^{\mu_1}) + g^{\mu_3 \mu_1}(k_3^{\mu_2} - k_1^{\mu_2})) \quad (9.5\mathrm{b})$$

Since $f_{a_1 a_2 a_3} C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3)$ is totally symmetric (under simultaneous permutations of all quantum numbers $a_i$, $\mu_i$ and $k_i$), it is easy to take the partial derivative

$$A^{a,\mu}(k_2 + k_3) = -\frac{\mathrm{i}}{2!} f_{abc} C^{\mu \rho \sigma}(-k_2 - k_3, k_2, k_3) A^b_\rho(k_2) A^c_\sigma(k_3) \quad (9.6\mathrm{a})$$

Table 9.18: ...

with

$$C^{\mu\rho\sigma}(-k_2-k_3,k_2,k_3) = (g^{\rho\sigma}(k_2^\mu-k_3^\mu)+g^{\mu\sigma}(2k_3^\rho+k_2^\rho)-g^{\mu\rho}(2k_2^\sigma+k_3^\sigma)) \tag{9.6b}$$

i.e.

$$A^{a,\mu}(k_2+k_3) = -\frac{\mathrm{i}}{2!}f_{abc}\big((k_2^\mu-k_3^\mu)A^b(k_2)\cdot A^c(k_3)$$
$$+ (2k_3+k_2)\cdot A^b(k_2)A^{c,\mu}(k_3) - A^{b,\mu}(k_2)A^c(k_3)\cdot(2k_2+k_3)\big) \tag{9.6c}$$

⚠ Investigate the rearrangements proposed in [5] for improved numerical stability.

### Non-Gauge Vector Couplings

As a basis for the dimension-4 couplings of three vector bosons, we choose "transversal" and "longitudinal" (with respect to the first vector field) tensors that are odd and even under permutation of the second and third argument

$$\mathcal{L}_T(V_1,V_2,V_3) = V_1^\mu(V_{2,\nu}\mathrm{i}\overleftrightarrow{\partial_\mu}V_3^\nu) = -\mathcal{L}_T(V_1,V_3,V_2) \tag{9.7a}$$
$$\mathcal{L}_L(V_1,V_2,V_3) = (\mathrm{i}\partial_\mu V_1^\mu)V_{2,\nu}V_3^\nu = \mathcal{L}_L(V_1,V_3,V_2) \tag{9.7b}$$

Using partial integration in $\mathcal{L}_L$, we find the convenient combinations

$$\mathcal{L}_T(V_1,V_2,V_3) + \mathcal{L}_L(V_1,V_2,V_3) = -2V_1^\mu\mathrm{i}\partial_\mu V_{2,\nu}V_3^\nu \tag{9.8a}$$
$$\mathcal{L}_T(V_1,V_2,V_3) - \mathcal{L}_L(V_1,V_2,V_3) = 2V_1^\mu V_{2,\nu}\mathrm{i}\partial_\mu V_3^\nu \tag{9.8b}$$

As an important example, we can rewrite the dimension-4 "anomalous" triple gauge couplings

$$\mathrm{i}\mathcal{L}_{\text{TGC}}(g_1,\kappa,g_4)/g_{VWW} = g_1 V^\mu(W_{\mu\nu}^- W^{+,\nu} - W_{\mu\nu}^+ W^{-,\nu})$$
$$+ \kappa W_\mu^+ W_\nu^- V^{\mu\nu} + g_4 W_\mu^+ W_\nu^-(\partial^\mu V^\nu + \partial^\nu V^\mu) \tag{9.9}$$

as

$$\mathcal{L}_{\text{TGC}}(g_1,\kappa,g_4) = g_1\mathcal{L}_T(V,W^-,W^+)$$
$$-\frac{\kappa+g_1-g_4}{2}\mathcal{L}_T(W^-,V,W^+) + \frac{\kappa+g_1+g_4}{2}\mathcal{L}_T(W^+,V,W^-)$$
$$-\frac{\kappa-g_1-g_4}{2}\mathcal{L}_L(W^-,V,W^+) + \frac{\kappa-g_1+g_4}{2}\mathcal{L}_L(W^+,V,W^-) \tag{9.10}$$

### CP Violation

$$\mathcal{L}_{\tilde{T}}(V_1,V_2,V_3) = V_{1,\mu}(V_{2,\rho}\mathrm{i}\overleftrightarrow{\partial_\nu}V_{3,\sigma})\epsilon^{\mu\nu\rho\sigma} = +\mathcal{L}_T(V_1,V_3,V_2) \tag{9.11a}$$
$$\mathcal{L}_{\tilde{L}}(V_1,V_2,V_3) = (\mathrm{i}\partial_\mu V_{1,\nu})V_{2,\rho}V_{3,\sigma}\epsilon^{\mu\nu\rho\sigma} = -\mathcal{L}_L(V_1,V_3,V_2) \tag{9.11b}$$

Here the notations $\tilde{T}$ and $\tilde{L}$ are clearly *abuse de langage*, because $\mathcal{L}_{\tilde{L}}(V_1,V_2,V_3)$ is actually the transversal combination, due to the antisymmetry of $\epsilon$. Using partial integration in $\mathcal{L}_{\tilde{L}}$, we could again find combinations

$$\mathcal{L}_{\tilde{T}}(V_1,V_2,V_3) + \mathcal{L}_{\tilde{L}}(V_1,V_2,V_3) = -2V_{1,\mu}V_{2,\nu}\mathrm{i}\partial_\rho V_{3,\sigma}\epsilon^{\mu\nu\rho\sigma} \tag{9.12a}$$

| *F31*: | $A_2^\mu(k_1+k_3) \leftarrow -\mathrm{i}\cdot$ |

Table 9.22:  …

### 9.1.4  *SU(2) Gauge Bosons*

An important special case for table 9.13 are the two usual coordinates of SU(2)

$$W_\pm = \frac{1}{\sqrt{2}}\left(W_1 \mp \mathrm{i}W_2\right) \tag{9.15}$$

i. e.

$$W_1 = \frac{1}{\sqrt{2}}\left(W_+ + W_-\right) \tag{9.16a}$$

$$W_2 = \frac{\mathrm{i}}{\sqrt{2}}\left(W_+ - W_-\right) \tag{9.16b}$$

and

$$W_1^\mu W_2^\nu - W_2^\mu W_1^\nu = \mathrm{i}\left(W_-^\mu W_+^\nu - W_+^\mu W_-^\nu\right) \tag{9.17}$$

Thus the symmtry remains after the change of basis:

$$
\begin{aligned}
\epsilon^{abc} W_a^{\mu_1} W_b^{\mu_2} W_c^{\mu_3} = {} & \mathrm{i}W_-^{\mu_1}(W_+^{\mu_2}W_3^{\mu_3} - W_3^{\mu_2}W_+^{\mu_3}) \\
& + \mathrm{i}W_+^{\mu_1}(W_3^{\mu_2}W_-^{\mu_3} - W_-^{\mu_2}W_3^{\mu_3}) + \mathrm{i}W_3^{\mu_1}(W_-^{\mu_2}W_+^{\mu_3} - W_+^{\mu_2}W_-^{\mu_3})
\end{aligned} \tag{9.18}
$$

### 9.1.5  *Quartic Couplings and Auxiliary Fields*

Quartic couplings can be replaced by cubic couplings to a non-propagating auxiliary field. The quartic term should get a negative sign so that it the energy is bounded from below for identical fields. In the language of functional integrals

$$\mathcal{L}_{\phi^4} = -g^2 \phi_1\phi_2\phi_3\phi_4 \Longrightarrow$$
$$\mathcal{L}_{X\phi^2} = X^*X \pm gX\phi_1\phi_2 \pm gX^*\phi_3\phi_4 = (X^* \pm g\phi_1\phi_2)(X \pm g\phi_3\phi_4) - g^2\phi_1\phi_2\phi_3\phi_4 \tag{9.19a}$$

and in the language of Feynman diagrams

$$\tag{9.19b}$$

The other choice of signs

$$\mathcal{L}'_{X\phi^2} = -X^*X \pm gX\phi_1\phi_2 \mp gX^*\phi_3\phi_4 = -(X^* \pm g\phi_1\phi_2)(X \mp g\phi_3\phi_4) - g^2\phi_1\phi_2\phi_3\phi_4 \tag{9.20}$$

172

$$+\mathrm{i}g\gamma_\mu T_a \qquad (9.22\mathrm{a})$$

$$gf_{a_1a_2a_3}C^{\mu_1\mu_2\mu_3}(k_1,k_2,k_3) \qquad (9.22\mathrm{b})$$

$$\begin{aligned}
&-\mathrm{i}g^2 f_{a_1a_2b}f_{a_3a_4b}(g_{\mu_1\mu_3}g_{\mu_4\mu_2}-g_{\mu_1\mu_4}g_{\mu_2\mu_3})\\
&-\mathrm{i}g^2 f_{a_1a_3b}f_{a_4a_2b}(g_{\mu_1\mu_4}g_{\mu_2\mu_3}-g_{\mu_1\mu_2}g_{\mu_3\mu_4})\\
&-\mathrm{i}g^2 f_{a_1a_4b}f_{a_2a_3b}(g_{\mu_1\mu_2}g_{\mu_3\mu_4}-g_{\mu_1\mu_3}g_{\mu_4\mu_2})
\end{aligned} \qquad (9.22\mathrm{c})$$

Figure 9.1: Gauge couplings. See (11.1b) for the definition of the antisymmetric tensor $C^{\mu_1\mu_2\mu_3}(k_1,k_2,k_3)$.

$$= -\mathrm{i}g^2 f_{a_1a_2b}f_{a_3a_4b}(g_{\mu_1\mu_3}g_{\mu_4\mu_2}-g_{\mu_1\mu_4}g_{\mu_2\mu_3}) \qquad (9.23)$$

Figure 9.2: Gauge couplings.

can not be extended easily to identical particles and is therefore not used. For identical particles we have

$$\mathcal{L}_{\phi^4}=-\frac{g^2}{4!}\phi^4 \Longrightarrow$$

$$\mathcal{L}_{X\phi^2}=\frac{1}{2}X^2\pm\frac{g}{2}X\phi^2\pm\frac{g}{2}X\phi^2=\frac{1}{2}\left(X\pm\frac{g}{2}\phi^2\right)\left(X\pm\frac{g}{2}\phi^2\right)-\frac{g^2}{4!}\phi^4 \quad (9.21)$$

Explain the factor 1/3 in the functional setting and its relation to the three diagrams in the graphical setting?

### Quartic Gauge Couplings

The three crossed versions of figure 9.2 reproduces the quartic coupling in figure 9.1, because

$$-\mathrm{i}g^2 f_{a_1a_2b}f_{a_3a_4b}(g_{\mu_1\mu_3}g_{\mu_4\mu_2}-g_{\mu_1\mu_4}g_{\mu_2\mu_3})$$

$$= (\mathrm{i}gf_{a_1a_2b}T_{\mu_1\mu_2,\nu_1\nu_2})\left(\frac{\mathrm{i}g^{\nu_1\nu_3}g^{\nu_2\nu_4}}{2}\right)(\mathrm{i}gf_{a_3a_4b}T_{\mu_3\mu_4,\nu_3\nu_4}) \quad (9.24)$$

with $T_{\mu_1\mu_2,\mu_3\mu_4}=g_{\mu_1\mu_3}g_{\mu_4\mu_2}-g_{\mu_1\mu_4}g_{\mu_2\mu_3}$.

### 9.1.6 Gravitinos and supersymmetric currents

In supergravity theories there is a fermionic partner of the graviton, the gravitino. Therefore we have introduced the Lorentz type *Vectorspinor*.

Table 9.23: Combined dimension-4 trilinear fermionic couplings including a momentum. *Ferm* stands for *Psi* and *Chi*. The case of *MOMR* is identical to *MOML* if one substitutes $1+\gamma^5$ for $1-\gamma^5$, as well as for *LMOM* and *RMOM*. The mass term forces us to keep the chiral projector always on the left after "inverting the line" for *MOML* while on the right for *LMOM*.

&+ D_{\mu\nu,\mu_1\mu_2}(k_1,k_2) \\
&+ \xi^{-1}E_{\mu\nu,\mu_1\mu_2}(k_1,k_2))
\end{aligned}
\tag{9.27b}
$$

$$
\begin{aligned}
-\mathrm{i}\frac{\kappa}{2}m g_{\mu\nu} &- \mathrm{i}\frac{\kappa}{8}(\gamma_\mu(p+p')_\nu + \gamma_\nu(p+p')_\mu \\
&- 2g_{\mu\nu}(\slashed{p}+\slashed{p}'))
\end{aligned}
\tag{9.27c}
$$

Figure 9.3: Three-point graviton couplings.

### 9.1.7 *Perturbative Quantum Gravity and Kaluza-Klein Interactions*

The gravitational coupling constant and the relative strength of the dilaton coupling are abbreviated as

$$\kappa = \sqrt{16\pi G_N} \tag{9.25a}$$

$$\omega = \sqrt{\frac{2}{3(n+2)}} = \sqrt{\frac{2}{3(d-2)}}\,, \tag{9.25b}$$

where $n = d-4$ is the number of extra space dimensions.

In (9.27-9.34), we use the notation of [13]:

$$C_{\mu\nu,\rho\sigma} = g_{\mu\rho}g_{\nu\sigma} + g_{\mu\sigma}g_{\nu\rho} - g_{\mu\nu}g_{\rho\sigma} \tag{9.26a}$$

$$
\begin{aligned}
D_{\mu\nu,\rho\sigma}(k_1,k_2) = g_{\mu\nu}k_{1,\sigma}k_{2,\rho} \\
- (g_{\mu\sigma}k_{1,\nu}k_{2,\rho} + g_{\mu\rho}k_{1,\sigma}k_{2,\nu} - g_{\rho\sigma}k_{1,\mu}k_{2,\nu} + (\mu \leftrightarrow \nu))
\end{aligned}
\tag{9.26b}
$$

$$
\begin{aligned}
E_{\mu\nu,\rho\sigma}(k_1,k_2) = g_{\mu\nu}(k_{1,\rho}k_{1,\sigma} + k_{2,\rho}k_{2,\sigma} + k_{1,\rho}k_{2,\sigma}) \\
- (g_{\nu\sigma}k_{1,\mu}k_{1,\rho} + g_{\nu\rho}k_{2,\mu}k_{2,\sigma} + (\mu \leftrightarrow \nu))
\end{aligned}
\tag{9.26c}
$$

$$
\begin{aligned}
F_{\mu\nu,\rho\sigma\lambda}(k_1,k_2,k_3) = \\
g_{\mu\rho}g_{\sigma\lambda}(k_2-k_3)_\nu + g_{\mu\sigma}g_{\lambda\rho}(k_3-k_1)_\nu + g_{\mu\lambda}g_{\rho\sigma}(k_1-k_2)_\nu + (\mu \leftrightarrow \nu)
\end{aligned}
\tag{9.26d}
$$

$$
\begin{aligned}
G_{\mu\nu,\rho\sigma\lambda\delta} = g_{\mu\nu}(g_{\rho\sigma}g_{\lambda\delta} - g_{\rho\delta}g_{\lambda\sigma}) \\
+ (g_{\mu\rho}g_{\nu\delta}g_{\lambda\sigma} + g_{\mu\lambda}g_{\nu\sigma}g_{\rho\delta} - g_{\mu\rho}g_{\nu\sigma}g_{\lambda\delta} - g_{\mu\lambda}g_{\nu\delta}g_{\rho\sigma} + (\mu \leftrightarrow \nu))
\end{aligned}
\tag{9.26e}
$$

Derivation of (9.27a)

$$L = \frac{1}{2}(\partial_\mu\phi)(\partial^\mu\phi) - \frac{m^2}{2}\phi^2 \tag{9.28a}$$

$$(\partial_\mu\phi)\frac{\partial L}{\partial(\partial^\nu\phi)} = (\partial_\mu\phi)(\partial_\nu\phi) \tag{9.28b}$$

$$T_{\mu\nu} = -g_{\mu\nu}L + (\partial_\mu\phi)\frac{\partial L}{\partial(\partial^\nu\phi)}+ \tag{9.28c}$$

### 9.1.8 Dependent Parameters

This is a simple abstract syntax for parameter dependencies. Later, there will be a parser for a convenient concrete syntax as a part of a concrete syntax for models. There is no intention to do *any* symbolic manipulation with this. The expressions will be translated directly by *Targets* to the target language.

type $\alpha$ *expr* =
  | *I*
  | *Integer* of *int*
  | *Float* of *float*
  | *Atom* of $\alpha$
  | *Sum* of $\alpha$ *expr list*
  | *Diff* of $\alpha$ *expr* $\times$ $\alpha$ *expr*
  | *Neg* of $\alpha$ *expr*
  | *Prod* of $\alpha$ *expr list*
  | *Quot* of $\alpha$ *expr* $\times$ $\alpha$ *expr*
  | *Rec* of $\alpha$ *expr*
  | *Pow* of $\alpha$ *expr* $\times$ *int*
  | *PowX* of $\alpha$ *expr* $\times$ $\alpha$ *expr*
  | *Sqrt* of $\alpha$ *expr*
  | *Sin* of $\alpha$ *expr*
  | *Cos* of $\alpha$ *expr*
  | *Tan* of $\alpha$ *expr*

Figure 9.4: Three-point dilaton couplings.

Table 9.39:   …

    val *color* : *flavor* → *Color.t*
    val *nc* : *unit* → *int*

The set of conserved charges.

    module *Ch* : *Charges.T*
    val *charges* : *flavor* → *Ch.t*

The PDG particle code for interfacing with Monte Carlos.

    val *pdg* : *flavor* → *int*

The Lorentz representation of the particle.

    val *lorentz* : *flavor* → *Coupling.lorentz*

The propagator for the particle, which *can* depend on a gauge parameter.

    type *gauge*
    val *propagator* : *flavor* → *gauge Coupling.propagator*

*Not* the symbol for the numerical value, but the scheme or strategy.

    val *width* : *flavor* → *Coupling.width*

Charge conjugation, with and without color.

    val *conjugate* : *flavor* → *flavor*

Returns 1 for fermions, −1 for anti-fermions, 2 for Majoranas and 0 otherwise.

    val *fermion* : *flavor* → *int*

The Feynman rules. *vertices* and (*fuse2*, *fuse3*, *fusen*) are redundant, of course. However, *vertices* is required for building functors for models and *vertices* can be recovered from (*fuse2*, *fuse3*, *fusen*) only at great cost.

Nevertheless: *vertices* is a candidate for removal, b/c we can build a smarter *Colorize* functor acting on (*fuse2*, *fuse3*, *fusen*). It can support an arbitrary numer of color lines. But we have to test whether it is efficient enough. And we have to make sure that this wouldn't break the UFO interface.

    type *constant*

Later: type *orders* to count orders of couplings

    val *max_degree* : *unit* → *int*
    val *vertices* : *unit* →
      ((((*flavor* × *flavor* × *flavor*) × *constant Coupling.vertex3* × *constant*) *list*)
         × (((*flavor* × *flavor* × *flavor* × *flavor*) × *constant Coupling.vertex4* × *constant*) *list*)
         × (((*flavor list*) × *constant Coupling.vertexn* × *constant*) *list*))
    val *fuse2* : *flavor* → *flavor* → (*flavor* × *constant Coupling.t*) *list*
    val *fuse3* : *flavor* → *flavor* → *flavor* → (*flavor* × *constant Coupling.t*) *list*
    val *fuse* : *flavor list* → (*flavor* × *constant Coupling.t*) *list*

Later: val *orders* : *constant* → *orders* counting orders of couplings
The list of all known flavors.

    val *flavors* : *unit* → *flavor list*

The flavors that can appear in incoming or outgoing states, grouped in a way that is useful for user interfaces.

    val *external_flavors* : *unit* → (*string* × *flavor list*) *list*

The Goldstone bosons corresponding to a gauge field, if any.

    val *goldstone* : *flavor* → (*flavor* × *constant Coupling.expr*) *option*

The dependent parameters.

    val *parameters* : *unit* → *constant Coupling.parameters*

Translate from and to convenient textual representations of flavors.

    val *flavor_of_string* : *string* → *flavor*
    val *flavor_to_string* : *flavor* → *string*

TEX and LATEX

val *flavor_to_TeX* : *flavor* → *string*

The following must return unique symbols that are acceptable as symbols in all programming languages under consideration as targets. Strings of alphanumeric characters (starting with a letter) should be safe. Underscores are also usable, but would violate strict Fortran77.

val *flavor_symbol* : *flavor* → *string*
val *gauge_symbol* : *gauge* → *string*
val *mass_symbol* : *flavor* → *string*
val *width_symbol* : *flavor* → *string*
val *constant_symbol* : *constant* → *string*

Model specific options.

val *options* : *Options.t*

*Not ready for prime time* or other warnings to be written to the source files for the amplitudes.

val *caveats* : *unit* → *string list*

end

In addition to hardcoded models, we can have models that are initialized at run time.

### 9.2.2  Mutable Quantum Field Theories

module type *Mutable* =
  sig
    include *T*

val *init* : *unit* → *unit*

Export only one big initialization function to discourage partial initializations. Labels make this usable.

val *setup* :
    *color* : (*flavor* → *Color.t*) →
    *nc* : (*unit* → *int*) →
    *pdg* : (*flavor* → *int*) →
    *lorentz* : (*flavor* → *Coupling.lorentz*) →
    *propagator* : (*flavor* → *gauge Coupling.propagator*) →
    *width* : (*flavor* → *Coupling.width*) →
    *goldstone* : (*flavor* → (*flavor* × *constant Coupling.expr*) *option*) →
    *conjugate* : (*flavor* → *flavor*) →
    *fermion* : (*flavor* → *int*) →
    *vertices* :
      (*unit* →
      ((((*flavor* × *flavor* × *flavor*) × *constant Coupling.vertex3* × *constant*) *list*)
        × (((*flavor* × *flavor* × *flavor* × *flavor*) × *constant Coupling.vertex4* × *constant*) *list*)
        × (((*flavor list*) × *constant Coupling.vertexn* × *constant*) *list*))) →
    *flavors* : ((*string* × *flavor list*) *list*) →
    *parameters* : (*unit* → *constant Coupling.parameters*) →
    *flavor_of_string* : (*string* → *flavor*) →
    *flavor_to_string* : (*flavor* → *string*) →
    *flavor_to_TeX* : (*flavor* → *string*) →
    *flavor_symbol* : (*flavor* → *string*) →
    *gauge_symbol* : (*gauge* → *string*) →
    *mass_symbol* : (*flavor* → *string*) →
    *width_symbol* : (*flavor* → *string*) →
    *constant_symbol* : (*constant* → *string*) →
    *unit*
  end

### 9.2.3  Gauge Field Theories

The following signatures are used only for model building. The diagrammatics and numerics is supposed to be completely ignorant about the detail of the models and expected to rely on the interface *T* exclusively.

> In the end, we might have functors $(M : T) \rightarrow Gauge$, but we will need to add the quantum numbers to $T$.

module type *Gauge*  =
  sig
    include *T*

Matter field carry conserved quantum numbers and can be replicated in generations without changing the gauge sector.

     type *matter_field*

Gauge bosons proper.

     type *gauge_boson*

Higgses, Goldstones and all the rest:

     type *other*

We can query the kind of field

     type *field*  =
       | *Matter* of *matter_field*
       | *Gauge* of *gauge_boson*
       | *Other* of *other*
     val *field*  :  *flavor*  →  *field*

and we can build new fields of a given kind:

     val *matter_field*  :  *matter_field*  →  *flavor*
     val *gauge_boson*  :  *gauge_boson*  →  *flavor*
     val *other*  :  *other*  →  *flavor*
  end

## 9.2.4   Gauge Field Theories with Broken Gauge Symmetries

Both are carefully crafted as subtypes of *Gauge* so that they can be used in place of *Gauge* and *T* everywhere:

module type *Broken_Gauge*  =
  sig
    include *Gauge*

     type *massless*
     type *massive*
     type *goldstone*

     type *kind*  =
       | *Massless* of *massless*
       | *Massive* of *massive*
       | *Goldstone* of *goldstone*
     val *kind*  :  *gauge_boson*  →  *kind*

     val *massless*  :  *massive*  →  *gauge_boson*
     val *massive*  :  *massive*  →  *gauge_boson*
     val *goldstone*  :  *goldstone*  →  *gauge_boson*

  end

module type *Unitarity_Gauge*  =
  sig
    include *Gauge*

     type *massless*
     type *massive*

     type *kind*  =

## *Symbol Tables*

module type *Symbol* =
  sig

    type *file* = *Vertex_syntax.File.t*
    type *t* = *Vertex_syntax.Token.t*

Tensors and their indices are representations of color, flavor or Lorentz groups. In the end it might turn out to be unnecessary to distinguish *Color* from *Flavor*.

    type *space* =

```
    | Color of Vertex_syntax.Lie.t
    | Flavor of t list × t list
    | Lorentz of t list
```

A symbol (i. e. a *Symbol.t = Vertex_syntax.Token.t*) can refer either to particles, to parameters (derived and input) or to tensors and indices.

```
    type kind =
    | Neutral
    | Charged
    | Anti
    | Parameter
    | Derived
    | Index of space
    | Tensor of space

    type table
    val load : file → table
    val dump : out_channel → table → unit
```

Look up the *kind* of a symbol.

```
    val kind_of_symbol : table → t → kind option
```

Look up the *kind* of a symbol's stem.

```
    val kind_of_stem : table → t → kind option
```

Look up the *kind* of a symbol and fall back to the *kind* of the symbol's stem, if necessary.

```
    val kind_of_symbol_or_stem : table → t → kind option
```

A table to look up all symbols with the same *stem*.

```
    val common_stem : table → t → t list

### 9.6.2   New Implementation: Obsolete Version 1

Start of version 1 of the new implementation. The old syntax will not be used in the real implementation, but the library for dealing with indices and permutations will remail important.

Note that *arity* = *length lorentz_reps* = *length color_reps*. Do we need to enforce this by an abstract type constructor?

A cleaner approach would be type *context* = (*Coupling.lorentz*, *Color.t*) *array*, but it would also require more tedious deconstruction of the pairs. Well, an abstract type with accessors might be the way to go after all . . .

```
type context =
    { arity : int;
      lorentz_reps : Coupling.lorentz array;
      color_reps : Color.t array }
```

```
let distinct2 i j =
  i ≠ j
```

```
let distinct3 i j k =
  i ≠ j ∧ j ≠ k ∧ k ≠ i
```

```
let distinct ilist =
  List.length (ThoList.uniq (List.sort compare ilist)) =
  List.length ilist
```

An abstract type that allows us to distinguish offsets in the field array from color and Lorentz indices in different representations.

```
module type Index =
  sig
    type t
    val of_int : int → t
    val to_int : t → int
  end
```

While the number of allowed indices is unlimited, the allowed offsets into the field arrays are of course restricted to the fields in the current *context*.

```
module type Field =
  sig
    type t
    exception Out_of_range of int
    val of_int : context → int → t
    val to_int : t → int
    val get : α array → t → α
  end
```

```
module Field : Field =
  struct
    type t = int
    exception Out_of_range of int
    let of_int context i =
      if 0 ≤ i ∧ i < context.arity then
        i
      else
        raise (Out_of_range i)
    let to_int i = 0
    let get = Array.get
  end
```

```
type field = Field.t
```

```
module type Lorentz =
  sig
```

We combine indices *I* and offsets *F* into the field array into a single type so that we can unify vectors with vector components.

type *index* = *I* of *int* | *F* of *field*

type *vector* = *Vector* of *index*

type *spinor* = *Spinor* of *index*

type *conjspinor* = *ConjSpinor* of *index*

These are all the primitive ways to construct Lorentz tensors, a. k. a. objects with Lorentz indices, from momenta, other Lorentz tensors and Dirac spinors:

type *primitive* =
| *G* of *vector* × *vector* (* $g_{\mu_1\mu_2}$ *)
| *E* of *vector* × *vector* × *vector* × *vector* (* $\epsilon_{\mu_1\mu_2\mu_3\mu_4}$ *)
| *K* of *vector* × *field* (* $k_2^{\mu_1}$ *)
| *S* of *conjspinor* × *spinor* (* $\bar{\psi}_1\psi_2$ *)
| *V* of *vector* × *conjspinor* × *spinor* (* $\bar{\psi}_1\gamma_{\mu_2}\psi_3$ *)
| *T* of *vector* × *vector* × *conjspinor* × *spinor* (* $\bar{\psi}_1\sigma_{\mu_2\mu_3}\psi_4$ *)
| *A* of *vector* × *conjspinor* × *spinor* (* $\bar{\psi}_1\gamma_{\mu_2}\gamma_5\psi_3$ *)
| *P* of *conjspinor* × *spinor* (* $\bar{\psi}_1\gamma_5\psi_2$ *)

type *tensor* = *int* × *primitive list*

Below, we will need to permute fields. For this purpose, we introduce the function *map_primitive v_idx v_fld s_idx s_fld c_idx* that returns a structurally identical tensor, with *v_idx* : *int* → *int* applied to all vector indices, *v_fld* : *field* → *field* to all vector fields, *s_idx* and *c_idx* to all (conj)spinor indices and *s_fld* and *c_fld* to all (conj)spinor fields.

Note we must treat spinors and vectors differently, even for simple permuations, in order to handle the statistics properly.

val *map_tensor* :
(*int* → *int*) → (*field* → *field*) → (*int* → *int*) → (*field* → *field*) →
(*int* → *int*) → (*field* → *field*) → *tensor* → *tensor*

Check whether the *tensor* is well formed in the *context*.

val *tensor_ok* : *context* → *tensor* → *bool*

The lattice $\mathbf{N} + i\mathbf{N} \subset \mathbf{C}$, which suffices for representing the matrix elements of Dirac matrices. We hope to be able to avoid the lattice $\mathbf{Q} + i\mathbf{Q} \subset \mathbf{C}$ or $\mathbf{C}$ itself down the road.

module *Complex* :
sig
type *t* = *int* × *int*
type *t'* =
| *Z* (* 0 *)
| *O* (* 1 *)
| *M* (* −1 *)
| *I* (* i *)
| *J* (* −i *)
| *C* of *int* × *int* (* $x + iy$ *)
val *to_fortran* : *t'* → *string*
end

Sparse Dirac matrices as maps from Lorentz and Spinor indices to complex numbers. This is supposed to be independent of the representation.

module type *Dirac* =
sig
val *scalar* : *int* → *int* → *Complex.t'*
val *vector* : *int* → *int* → *int* → *Complex.t'*
val *tensor* : *int* → *int* → *int* → *int* → *Complex.t'*
val *axial* : *int* → *int* → *int* → *Complex.t'*
val *pseudo* : *int* → *int* → *Complex.t'*
end

Dirac matrices as tables of nonzero entries. There will be one concrete Module per realization.

module type *Dirac_Matrices* =

```
sig
  type t = (int × int × Complex.t') list
  val scalar : t
  val vector : (int × t) list
  val tensor : (int × int × t) list
  val axial : (int × t) list
  val pseudo : t
end
```

E. g. the chiral representation:

```
module Chiral : Dirac_Matrices
```

Here's the functor to create the maps corresponding to a given realization.

```
module Dirac : functor (M : Dirac_Matrices) → Dirac
```

```
  end

module Lorentz : Lorentz =
  struct

    type index =
      | I of int (* μ₀, μ₁, ..., not 0, 1, 2, 3 *)
      | F of field

    let map_index fi ff = function
      | I i → I (fi i)
      | F i → F (ff i)

    let indices = function
      | I i → [i]
      | F _ → []
```

Is the following level of type checks useful or redundant?
TODO: should we also support a *tensor* like $F_{\mu_1\mu_2}$?

```
    type vector = Vector of index
    type spinor = Spinor of index
    type conjspinor = ConjSpinor of index

    let map_vector fi ff (Vector i) = Vector (map_index fi ff i)
    let map_spinor fi ff (Spinor i) = Spinor (map_index fi ff i)
    let map_conjspinor fi ff (ConjSpinor i) = ConjSpinor (map_index fi ff i)

    let vector_ok context = function
      | Vector (I _) →
        (* we could perform additional checks! *)
        true
      | Vector (F i) →
          begin
            match Field.get context.lorentz_reps i with
            | Coupling.Vector → true
            | Coupling.Vectorspinor →
                failwith "Lorentz.vector_ok:␣incomplete"
            | _ → false
          end

    let spinor_ok context = function
      | Spinor (I _) →
        (* we could perfrom additional checks! *)
        true
      | Spinor (F i) →
          begin
            match Field.get context.lorentz_reps i with
            | Coupling.Spinor → true
            | Coupling.Vectorspinor | Coupling.Majorana →
                failwith "Lorentz.spinor_ok:␣incomplete"
```

```
            |  _  →  false
          end
  let conjspinor_ok context  =  function
    |  ConjSpinor (I _)  →
       (∗ we could perform additional checks! ∗)
       true
    |  ConjSpinor (F i)  →
         begin
            match Field.get context.lorentz_reps i with
            |  Coupling.ConjSpinor  →  true
            |  Coupling.Vectorspinor  |  Coupling.Majorana  →
                 failwith "Lorentz.conjspinor_ok:␣incomplete"
            |  _  →  false
         end
```

Note that *distinct2 i j* is automatically guaranteed for Dirac spinors, because the $\bar{\psi}$ and $\psi$ can not appear in the same slot. This is however not the case for Weyl and Majorana spinors.

```

### Cubic Vertices

⚠ The following pattern matches could eventually become quite long. The O'Caml compiler will (hopefully) optimize them aggressively (http://pauillac.inria.fr/~maranget/papers/opat/).

```
let colorize_fusion2 f1 f2 (f, v) =
    match M.color f with

    | C.Singlet →
        begin match f1, f2 with

        | White _, White _ →
            [White f, v]

        | CF_in (_, c1), CF_out (_, c2')
        | CF_out (_, c1), CF_in (_, c2') →
            if c1 = c2' then
                [White f, v]
            else
                []

        | CF_io (f1, c1, c1'), CF_io (f2, c2, c2') →
            if c1 = c2' ∧ c2 = c1' then
```

```
                    [White f, v]
                 else
                    []

       | CF_aux f1, CF_aux f2 →
            [White f, mult_vertex (− (nc ())) v]

       | CF_aux _, CF_io _ | CF_io _, CF_aux _ →
            []

       | (CF_in _ | CF_out _ | CF_io _ | CF_aux _), White _

            if nc1 > 0 then
              baryonic_vertex "colorize_fusion2"
            else
              colored_vertex "colorize_fusion2"

       | CF_out _, CF_out _ →
            if nc1 < 0 then
              baryonic_vertex "colorize_fusion2"
            else
              colored_vertex "colorize_fusion2"
```

```
        |  CF_in _,  CF_out _  |  CF_out _,  CF_in _
        |  (White _  |  CF_io _  |  CF_aux _),
              (White _  |  CF_io _  |  CF_aux _)  →
              colored_vertex "colorize_fusion2"

      end

  |  C.AdjSUN _  →
      begin match f1, f2 with

      |  White _,  CF_io (_, c1, c2')  |  CF_io (_, c1, c2'),  White _  →
           [CF_io (f, c1, c2'), v]

      |  White _,  CF_aux _  |  CF_aux _,  White _  →
           [CF_aux f, mult_vertex (− (nc ())) v]

      |  CF_in (_, c1),  CF_out (_, c2')
      |  CF_out (_, c2'),  CF_in (_, c1)  →
           if c1 ≠ c2' then
              [CF_io (f, c1, c2'), v]
           else
              [CF_aux f, v]
```

In the adjoint representation

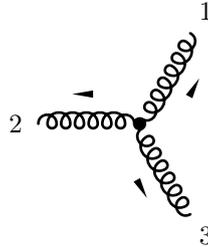

$$= g f_{a_1 a_2 a_3} C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3) \tag{11.1a}$$

with

$$C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3) =$$
$$\left( g^{\mu_1 \mu_2}(k_1^{\mu_3} - k_2^{\mu_3}) + g^{\mu_2 \mu_3}(k_2^{\mu_1} - k_3^{\mu_1}) + g^{\mu_3 \mu_1}(k_3^{\mu_2} - k_1^{\mu_2}) \right) \tag{11.1b}$$

while in the color flow basis find from

$$\mathrm{i} f_{a_1 a_2 a_3} = \mathrm{tr}\left(T_{a_1}\left[T_{a_2}, T_{a_3}\right]\right) = \mathrm{tr}\left(T_{a_1} T_{a_2} T_{a_3}\right) - \mathrm{tr}\left(T_{a_1} T_{a_3} T_{a_2}\right) \tag{11.2}$$

the decomposition

$$\mathrm{i} f_{a_1 a_2 a_3} T_{a_1}^{i_1 j_1} T_{a_2}^{i_2 j_2} T_{a_3}^{i_3 j_3} = \delta^{i_1 j_2} \delta^{i_2 j_3} \delta^{i_3 j_1} - \delta^{i_1 j_3} \delta^{i_3 j_2} \delta^{i_2 j_1}. \tag{11.3}$$

The resulting Feynman rule is

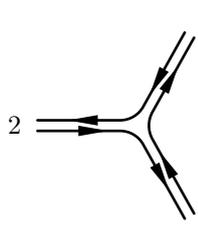

$$= \mathrm{i} g \left( \delta^{i_1 j_3} \delta^{i_2 j_1} \delta^{i_3 j_2} - \delta^{i_1 j_2} \delta^{i_2 j_3} \delta^{i_3 j_1} \right) C^{\mu_1 \mu_2 \mu_3}(k_1, k_2, k_3) \tag{11.4}$$

We have to generalize this for cases of three particles in the adjoint that are not all gluons (gluinos, scalar octets):

- scalar-scalar-scalar
- scalar-scalar-vector
- scalar-vector-vector
- scalar-fermion-fermion
- vector-fermion-fermion

We could use a better understanding of the signs for the gaugino-gaugino-gaugeboson couplings!!!

```

$$
\begin{aligned}
&-\mathrm{i}g^2 f_{a_1a_2b}f_{a_3a_4b}(g_{\mu_1\mu_3}g_{\mu_4\mu_2} - g_{\mu_1\mu_4}g_{\mu_2\mu_3})\\
&-\mathrm{i}g^2 f_{a_1a_3b}f_{a_4a_2b}(g_{\mu_1\mu_4}g_{\mu_2\mu_3} - g_{\mu_1\mu_2}g_{\mu_3\mu_4})\\
&-\mathrm{i}g^2 f_{a_1a_4b}f_{a_2a_3b}(g_{\mu_1\mu_2}g_{\mu_3\mu_4} - g_{\mu_1\mu_3}g_{\mu_4\mu_2})
\end{aligned}
$$

Using

$$\mathcal{P}_4 = \{\{1,2,3,4\},\{1,3,4,2\},\{1,4,2,3\},\{1,2,4,3\},\{1,4,3,2\},\{1,3,2,4\}\} \tag{11.6}$$

as the set of permutations of $\{1,2,3,4\}$ with the cyclic permutations factored out, we have:

$$
\begin{aligned}
&= \mathrm{i}g^2 \sum_{\{\alpha_k\}_{k=1,2,3,4}\in\mathcal{P}_4} \delta^{i_{\alpha_1}j_{\alpha_2}}\delta^{i_{\alpha_2}j_{\alpha_3}}\delta^{i_{\alpha_3}j_{\alpha_4}}\delta^{i_{\alpha_4}j_{\alpha_1}}\\
&\quad \left(2g_{\mu_{\alpha_1}\mu_{\alpha_3}}g_{\mu_{\alpha_4}\mu_{\alpha_2}} - g_{\mu_{\alpha_1}\mu_{\alpha_4}}g_{\mu_{\alpha_2}\mu_{\alpha_3}} - g_{\mu_{\alpha_1}\mu_{\alpha_2}}g_{\mu_{\alpha_3}\mu_{\alpha_4}}\right)
\end{aligned}
\tag{11.7}
$$

The different color connections correspond to permutations of the particles entering the fusion and have to be matched by a corresponding permutation of the Lorentz structure:

We have to generalize this for cases of four particles in the adjoint that are not all gluons:

- scalar-scalar-scalar-scalar
- scalar-scalar-vector-vector

and even ones including fermions (gluinos) if higher dimensional operators are involved.

```

```
let constant_symbol = M.constant_symbol
```

## Vertices

*vertices* are *only* used by functor applications and for indexing a cache of precomputed fusion rules, which is not used for colorized models.

```
let vertices () =
    invalid "vertices"
```

```
module Legacy = Legacy_Implementation (M)
```

```
let colorize_fusion2 f1 f2 (f, v) =
    match v with
    | V3 _ → Legacy.colorize_fusion2 f1 f2 (f, v)
    | _ → []
```

```
let colorize_fusion3 f1 f2 f3 (f, v) =
    match v with
    | V4 _ → Legacy.colorize_fusion3 f1 f2 f3 (f, v)
    | _ → []
```

In order to match the *correct* positions of the fields in the vertices, we have to undo the permutation effected by the fusion according to *Coupling.fusen*.

```
module PosMap =
    Partial.Make (struct type t = int let compare = compare end)
```

Note that due to the *inverse*, the list $l'$ can be interpreted here as a map reshuffling the indices. E.g., *inverse* (*Permutation.Default.list* [2;0;1]) applied to [1;2;3] gives [3;1;2].

```
let partial_map_redoing_permutation l l' =
    let module P = Permutation.Default in
    let p = P.inverse (P.of_list (List.map pred l')) in
    PosMap.of_lists l (P.list p l)
```

Note that, the list $l'$ can not be interpreted as a map reshuffling the indices, but gives the new order of the argument. E.g., *Permutation.Default.list* [2;0;1] applied to [1;2;3] gives [2;3;1].

# —12—
## Processes

## 12.1 Interface of Process

module type $T$ =
    sig

        type *flavor*

Eventually this should become an abstract type:

        type $t$ = *flavor list* × *flavor list*

        val *incoming* : $t$ → *flavor list*
        val *outgoing* : $t$ → *flavor list*

*parse_decay s* decodes a decay description `"a␣->␣b␣c␣..."`, where each word is split into a bag of flavors separated by `':'`s.

        type *decay*
        val *parse_decay* : *string* → *decay*
        val *expand_decays* : *decay list* → $t$ *list*

*parse_scattering s* decodes a scattering description `"a␣b␣->␣c␣d␣..."`, where each word is split into a bag of flavors separated by `':'`s.

        type *scattering*
        val *parse_scattering* : *string* → *scattering*
        val *expand_scatterings* : *scattering list* → $t$ *list*

*parse_process s* decodes process descriptions

$$\texttt{"a b c d"} \Rightarrow Any\ [a;\ b;\ c;\ d] \tag{12.1a}$$

$$\texttt{"a -> b c d"} \Rightarrow Decay\ (a,\ [b;\ c;\ d]) \tag{12.1b}$$

$$\texttt{"a b -> c d"} \Rightarrow Scattering\ (a,\ b,\ [c;\ d]) \tag{12.1c}$$

where each word is split into a bag of flavors separated by `':'`s.

        type *any*
        type *process* = *Any* of *any* | *Decay* of *decay* | *Scattering* of *scattering*
        val *parse_process* : *string* → *process*

*remove_duplicate_final_states partition processes* removes duplicates from *processes*, which differ only by a permutation of final state particles. The permutation must respect the partitioning given by the offset 1 integers in *partition*.

        val *remove_duplicate_final_states* : *int list list* → $t$ *list* → $t$ *list*

*diff set1 set2* returns the processes in *set1* with the processes in *set2* removed. *set2* does not need to be a subset of *set1*.

        val *diff* : $t$ *list* → $t$ *list* → $t$ *list*

Not functional yet. Interface subject to change. Should be moved to *Fusion.Multi*, because we will want to cross *colored* matrix elements.

Factor amplitudes that are related by crossing symmetry.

> val *crossing* : *t list* → (*flavor list* × *int list* × *t*) *list*

   end

module *Make* (*M* : *Model.T*) : *T* with type *flavor* = *M.flavor*

## 12.2   Implementation of Process

## Model Files

### 13.1 Interface of Vertex_syntax

The concrete syntax described below is modelled on LaTeX and correct model descriptions should be correct LaTeX-input (provided a few simple macros have been loaded.

#### 13.1.1 Abstract Syntax

exception *Syntax_Error* of *string* $\times$ *Lexing.position* $\times$ *Lexing.position*

*Tokens*

Tokenization follows TeX's rules.

module *Token* :
  sig

Single-character tokens other than digits are stored as one character strings. Multi-character tokens like `\psi` are stored as a string *including* the leading `\`. Since `a_12` is interpreted by TeX as `{a_1}2`, we can not use the lexer to construct integers, but interpret them as lists of digits. Below, in *Expr*, the parser can interpret then as integers.

    type $t$ = private
    | *Digit* of *int*
    | *Token* of *string*
    | *Scripted* of *scripted*
    | *List* of $t$ *list*

TODO: investigate if it is possible to introduce *stem* as a separate type to allow more fine-grained compile-time checks.

In addition to super- and subscripts, there are prefixes such as `\bar`, `\hat`, etc.

    and *scripted* = private
      { *stem* : $t$;
        *prefix* : *prefix list*;
        *super* : $t$ *list*;
        *sub* : $t$ *list* }

    and *prefix* =
    | *Bar* | *Hat* | *Tilde*
    | *Dagger* | *Star*
    | *Prime*

    val *prefix_of_string* : *string* $\rightarrow$ *prefix*
    val *prefix_to_string* : *prefix* $\rightarrow$ *string*

Smart constructors that avoid redundant nestings of lists and scripted tokens with empty scripts.

    val *digit* : *int* $\rightarrow$ $t$
    val *token* : *string* $\rightarrow$ $t$
    val *scripted* : *string list* $\rightarrow$ $t$ $\rightarrow$ $t$ *option* $\times$ $t$ *option* $\rightarrow$ $t$
    val *list* : $t$ *list* $\rightarrow$ $t$

If it's *Scripted*, return unchanged, else as a scripted token with empty prefix, super- and subscripts.

val *wrap_scripted* : *t* → *scripted*

If it's a *List*, return the list itself, otherwise a singleton list.

val *wrap_list* : *t* → *t list*

Recursively strip all prefixes, super- and subscripts and return only the LAST token in a list. I.e. *stem* `"\\bar\\psi_i"` and *stem* `"\\bar{\\phi\\psi}'"` both yield `"\\psi"`.

val *stem* : *t* → *t*

Unparse the abstract syntax. Since the smart constructors perform some normalization and minimize nested braces, the result is not guaranteed to be identical to the string that has been parsed, just equivalent.

val *to_string* : *t* → *string*
val *scripted_to_string* : *scripted* → *string*
val *list_to_string* : *t list* → *string*

val *compare* : *t* → *t* → *int*

  end

## Expressions

A straightforward type for recursive expressions. Note that values (a. k. a. variables) are represented as functions with an empty argument list.

module *Expr* :
  sig

type *t* =
| *Integer* of *int*
| *Sum* of *t list* | *Diff* of *t* × *t*
| *Product* of *t list* | *Ratio* of *t* × *t*
| *Function* of *Token.t* × *t list*

val *integer* : *int* → *t*
val *add* : *t* → *t* → *t*
val *sub* : *t* → *t* → *t*
val *mult* : *t* → *t* → *t*
val *div* : *t* → *t* → *t*
val *apply* : *Token.t* → *t list* → *t*

val *to_string* : *t* → *string*

  end

## Particle Declarations

module *Particle* :
  sig

Neutral particles are known by a single name, charged particles also by the name of the anti-particle, . . .

type *name* =
| *Neutral* of *Token.t*
| *Charged* of *Token.t* × *Token.t*

. . . and a list of attributes: aliases, external representations for LATEX and Fortran, quantum numbers and symbols for mass and width.

type *attr* =
| *TeX* of *Token.t list* | *TeX_Anti* of *Token.t list*
| *Alias* of *Token.t list* | *Alias_Anti* of *Token.t list*
| *Fortran* of *Token.t list* | *Fortran_Anti* of *Token.t list*
| *Spin* of *Expr.t* | *Charge* of *Expr.t*
| *Color* of *Token.t list* × *Token.t list*
| *Mass* of *Token.t list* | *Width* of *Token.t list*

```
  type t  =
    { name  :  name;
      attr  :  attr list }
```

Unparsing:

```
  val to_string  :  t  →  string
```

```
end
```

*Parameter Declarations*

module *Parameter* :
sig

```
    type attr  =
    |  TeX of Token.t list
    |  Alias of Token.t list
    |  Fortran of Token.t list

    type t′  =
      { name  :  Token.t;
        value  :  Expr.t;
        attr  :  attr list}

    type t  =
    |  Parameter of t′
    |  Derived of t′

    val to_string  :  t  →  string
```

end

*Lie Groups and Algebras*

module *Lie* :
sig

The full list *SU* of *int* | *U* of *int* | *SO* of *int* | *O* of *int* | *Sp* of *int* | *E6* | *E7* | *E8* | *F4* | *G2* is not realistic. In practice, we will concentrate on SU(3) for now.

```
    type group

    val default_group  :  group (∗ SU(3), of course ∗)
    val group_of_string  :  string →  group
    val group_to_string  :  group  →  string
```

For now, we only support the **3**, $\bar{\mathbf{3}}$ and **8** of SU(3).

```
    type rep

    val rep_of_string  :  group  →  string →  rep
    val rep_to_string  :  rep  →  string

    type t  =  group  ×  rep
```

end

*Lorentz Representations*

module *Lorentz* :
sig

```
    type rep  =
    |  Scalar  |  Vector
    |  Dirac  |  ConjDirac  |  Majorana
    |  Weyl  |  ConjWeyl
```

end

<div align="center"><em>Indices</em></div>

module *Index* :
  sig

    type *attr* =
    | *Color* of *Token.t list* × *Token.t list*
    | *Flavor* of *Token.t list* × *Token.t list*
    | *Lorentz* of *Token.t list*

    type *t* =
      { *name* : *Token.t*;
        *attr* : *attr list* }

    val *to_string* : *t* → *string*

  end

<div align="center"><em>Tensors</em></div>

module *Tensor* :
  sig

    type *attr* =
    | *Color* of *Token.t list* × *Token.t list*
    | *Flavor* of *Token.t list* × *Token.t list*
    | *Lorentz* of *Token.t list*

    type *t* =
      { *name* : *Token.t*;
        *attr* : *attr list* }

    val *to_string* : *t* → *string*

  end

<div align="center"><em>Files</em></div>

The abstract representation of a file, immediately after lexical and syntactical analysis and before any type checking or semantic analysis, is a list of declarations.
There is one version with unexpanded `\include` statements.

module *File_Tree* :
  sig

    type *declaration* =
    | *Particle* of *Particle.t*
    | *Parameter* of *Parameter.t*
    | *Index* of *Index.t*
    | *Tensor* of *Tensor.t*
    | *Vertex* of *Expr.t* × *Token.t*
    | *Include* of *string*

    type *t* = *declaration list*

    val *empty* : *t*

  end

A linear file, just like *File_Tree*, but with all the `\include` statements expanded.

module *File* :
  sig

    type *declaration* =
    | *Particle* of *Particle.t*
    | *Parameter* of *Parameter.t*
    | *Index* of *Index.t*

<div align="center">263</div>

```
  |  Tensor of Tensor.t
  |  Vertex of Expr.t  ×  Token.t
type t  =  declaration list
val empty  :  t
```

*expand_includes* parser *file_tree* recursively expands all include statemens in *file_tree*, using parser to map a filename to a *File_Tree.t*.

```
val expand_includes : (string →  File_Tree.t)  →  File_Tree.t  →  t
val to_strings : t →  string list
```
```
end
```

## 13.2   Implementation of *Vertex_syntax*

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare*  =  *compare*

### 13.2.1   Abstract Syntax

### 13.6.2   New Implementation: Obsolete Version 1

Start of version 1 of the new implementation. The old syntax will not be used in the real implementation, but the library for dealing with indices and permutations will remail important.

Note that *arity = length lorentz_reps = length color_reps*. Do we need to enforce this by an abstract type constructor?

A cleaner approach would be type *context = (Coupling.lorentz, Color.t) array*, but it would also require more tedious deconstruction of the pairs. Well, an abstract type with accessors might be the way to go after all . . .

type *context* =
    { *arity  :  int*;
      *lorentz_reps  :  Coupling.lorentz array*;
      *color_reps  :  Color.t array* }

let *distinct2 i j* =
  *i ≠ j*

let *distinct3 i j k* =
  *i ≠ j ∧ j ≠ k ∧ k ≠ i*

let *distinct ilist* =
  *List.length (ThoList.uniq (List.sort compare ilist))* =
  *List.length ilist*

An abstract type that allows us to distinguish offsets in the field array from color and Lorentz indices in different representations.

module type *Index* =
  sig
    type *t*
    val *of_int  :  int → t*
    val *to_int  :  t → int*
  end

While the number of allowed indices is unlimited, the allowed offsets into the field arrays are of course restricted to the fields in the current *context*.

module type *Field* =
  sig
    type *t*
    exception *Out_of_range* of *int*
    val *of_int  :  context → int → t*
    val *to_int  :  t → int*
    val *get  :  α array → t → α*
  end

module *Field  :  Field* =
  struct
    type *t = int*
    exception *Out_of_range* of *int*
    let *of_int context i* =
      if *0 ≤ i ∧ i < context.arity* then
        *i*
      else
        *raise (Out_of_range i)*
    let *to_int i = 0*
    let *get = Array.get*
  end

type *field = Field.t*

module type *Lorentz* =
  sig

We combine indices *I* and offsets *F* into the field array into a single type so that we can unify vectors with vector components.

type $index$ $=$ $I$ of $int$ | $F$ of $field$

type $vector$ $=$ $Vector$ of $index$

type $spinor$ $=$ $Spinor$ of $index$

type $conjspinor$ $=$ $ConjSpinor$ of $index$

These are all the primitive ways to construct Lorentz tensors, a. k. a. objects with Lorentz indices, from momenta, other Lorentz tensors and Dirac spinors:

type $primitive$ $=$
  | $G$ of $vector$ $\times$ $vector$ (* $g_{\mu_1 \mu_2}$ *)
  | $E$ of $vector$ $\times$ $vector$ $\times$ $vector$ $\times$ $vector$ (* $\epsilon_{\mu_1 \mu_2 \mu_3 \mu_4}$ *)
  | $K$ of $vector$ $\times$ $field$ (* $k_2^{\mu_1}$ *)
  | $S$ of $conjspinor$ $\times$ $spinor$ (* $\bar{\psi}_1 \psi_2$ *)
  | $V$ of $vector$ $\times$ $conjspinor$ $\times$ $spinor$ (* $\bar{\psi}_1 \gamma_{\mu_2} \psi_3$ *)
  | $T$ of $vector$ $\times$ $vector$ $\times$ $conjspinor$ $\times$ $spinor$ (* $\bar{\psi}_1 \sigma_{\mu_2 \mu_3} \psi_4$ *)
  | $A$ of $vector$ $\times$ $conjspinor$ $\times$ $spinor$ (* $\bar{\psi}_1 \gamma_{\mu_2} \gamma_5 \psi_3$ *)
  | $P$ of $conjspinor$ $\times$ $spinor$ (* $\bar{\psi}_1 \gamma_5 \psi_2$ *)

type $tensor$ $=$ $int$ $\times$ $primitive$ $list$

Below, we will need to permute fields. For this purpose, we introduce the function $map\_primitive\ v\_idx\ v\_fld\ s\_idx\ s\_fld\ c\_idx$ that returns a structurally identical tensor, with $v\_idx$ : $int \to int$ applied to all vector indices, $v\_fld$ : $field \to field$ to all vector fields, $s\_idx$ and $c\_idx$ to all (conj)spinor indices and $s\_fld$ and $c\_fld$ to all (conj)spinor fields.

Note we must treat spinors and vectors differently, even for simple permuations, in order to handle the statistics properly.

val $map\_tensor$ :
  $(int \to int)$ $\to$ $(field \to field)$ $\to$ $(int \to int)$ $\to$ $(field \to field)$ $\to$
  $(int \to int)$ $\to$ $(field \to field)$ $\to$ $tensor$ $\to$ $tensor$

Check whether the $tensor$ is well formed in the $context$.

val $tensor\_ok$ : $context$ $\to$ $tensor$ $\to$ $bool$

The lattice $\mathbf{N} + i\mathbf{N} \subset \mathbf{C}$, which suffices for representing the matrix elements of Dirac matrices. We hope to be able to avoid the lattice $\mathbf{Q} + i\mathbf{Q} \subset \mathbf{C}$ or $\mathbf{C}$ itself down the road.

module $Complex$ :
  sig
    type $t$ $=$ $int$ $\times$ $int$
    type $t'$ $=$
      | $Z$ (* 0 *)
      | $O$ (* 1 *)
      | $M$ (* $-1$ *)
      | $I$ (* i *)
      | $J$ (* $-$i *)
      | $C$ of $int$ $\times$ $int$ (* $x + iy$ *)
    val $to\_fortran$ : $t'$ $\to$ $string$
  end

Sparse Dirac matrices as maps from Lorentz and Spinor indices to complex numbers. This is supposed to be independent of the representation.

module type $Dirac$ $=$
  sig
    val $scalar$ : $int$ $\to$ $int$ $\to$ $Complex.t'$
    val $vector$ : $int$ $\to$ $int$ $\to$ $int$ $\to$ $Complex.t'$
    val $tensor$ : $int$ $\to$ $int$ $\to$ $int$ $\to$ $int$ $\to$ $Complex.t'$
    val $axial$ : $int$ $\to$ $int$ $\to$ $int$ $\to$ $Complex.t'$
    val $pseudo$ : $int$ $\to$ $int$ $\to$ $Complex.t'$
  end

Dirac matrices as tables of nonzero entries. There will be one concrete Module per realization.

module type $Dirac\_Matrices$ $=$

```
sig
  type t = (int × int × Complex.t') list
  val scalar : t
  val vector : (int × t) list
  val tensor : (int × int × t) list
  val axial : (int × t) list
  val pseudo : t
end
```

E. g. the chiral representation:

```
module Chiral : Dirac_Matrices
```

Here's the functor to create the maps corresponding to a given realization.

```
module Dirac : functor (M : Dirac_Matrices) → Dirac
```

```
end
```

```
module Lorentz : Lorentz =
  struct
```

```
    type index =
      | I of int (* μ_0, μ_1, ..., not 0, 1, 2, 3 *)
      | F of field
```

```
    let map_index fi ff = function
      | I i → I (fi i)
      | F i → F (ff i)
```

```
    let indices = function
      | I i → [i]
      | F _ → []
```

Is the following level of type checks useful or redundant?
TODO: should we also support a *tensor* like $F_{\mu_1 \mu_2}$?

```
    type vector = Vector of index
    type spinor = Spinor of index
    type conjspinor = ConjSpinor of index
```

```
    let map_vector fi ff (Vector i) = Vector (map_index fi ff i)
    let map_spinor fi ff (Spinor i) = Spinor (map_index fi ff i)
    let map_conjspinor fi ff (ConjSpinor i) = ConjSpinor (map_index fi ff i)
```

```
    let vector_ok context = function
      | Vector (I _) →
        (* we could perform additional checks! *)
        true
      | Vector (F i) →
          begin
            match Field.get context.lorentz_reps i with

            |  _  →  false
          end
```

Note that *distinct2 i j* is automatically guaranteed for Dirac spinors, because the $\bar{\psi}$ and $\psi$ can not appear in the same slot. This is however not the case for Weyl and Majorana spinors.

## 14.4   Expression Parser

Right recursion is more convenient for constructing the value. Since the lists will always be short, there is no performace or stack size reason for prefering left recursion.

    **val** $list\_to\_string\ :\ t\ list \to\ string$

Indices are represented by a pair $int\ \times\ \rho$, where $\rho$ denotes the representation the index belongs to. *free indices* returns all free indices in the list *indices*, i.e. all positive indices.

    **val** $free\ :\ (t\ \times\ \rho)\ list \to\ (t\ \times\ \rho)\ list$

*summation indices* returns all summation indices in the list *indices*, i.e. all negative indices.

    **val** $summation\ :\ (t\ \times\ \rho)\ list \to\ (t\ \times\ \rho)\ list$

    **val** $classes\_to\_string\ :\ (\rho\ \to\ string)\ \to\ (t\ \times\ \rho)\ list \to\ string$

Generate summation indices, starting from $-1001$. TODO: check that there are no clashes with explicitly named indices.

    **val** $fresh\_summation\ :\ unit\ \to\ t$
    **val** $named\_summation\ :\ string \to\ unit\ \to\ t$

  **end**

**module** $Index\ :\ Index$

**module type** $Tensor\ =$
  **sig**

    **type** $atom$

A tensor is linear combination of products of *atom*s with rational coefficients.

    **type** $t\ =\ (atom\ list\ \times\ Algebra.QC.t)\ list$

We might need to replace atoms if the syntax is not context free.

    **val** $map\_atoms\ :\ (atom\ \to\ atom)\ \to\ t\ \to\ t$

We need to rename indices to implement permutations . . .

    **val** $map\_indices\ :\ (int \to\ int)\ \to\ t\ \to\ t$

. . . but in order to to clean up inconsistencies in the syntax of `lorentz.py` and `propagators.py` we also need to rename indices without touching the second argument of `P`, the argument of `Mass` etc.

    **val** $rename\_indices\ :\ (int \to\ int)\ \to\ t\ \to\ t$

We need scale coefficients.

    **val** $map\_coef\ :\ (Algebra.QC.t\ \to\ Algebra.QC.t)\ \to\ t\ \to\ t$

Parsing and unparsing. Lists of *string*s are interpreted as sums.

    **val** $of\_expr\ :\ UFOx\_syntax.expr\ \to\ t$
    **val** $of\_string\ :\ string\ \to\ t$
    **val** $of\_strings\ :\ string\ list\ \to\ t$
    **val** $to\_string\ :\ t\ \to\ string$

The supported representations.

    **type** $r$
    **val** $classify\_indices\ :\ t\ \to\ (int\ \times\ r)\ list$
    **val** $rep\_to\_string\ :\ r\ \to\ string$
    **val** $rep\_to\_string\_whizard\ :\ r\ \to\ string$
    **val** $rep\_of\_int\ :\ bool\ \to\ int\ \to\ r$
    **val** $rep\_conjugate\ :\ r\ \to\ r$
    **val** $rep\_trivial\ :\ r\ \to\ bool$

There is not a 1-to-1 mapping between the representations in the model files and the representations used by O'Mega, e. g. in *Coupling.lorentz*. We might need to use heuristics.

  | _ as c { Buffer.add_char sbuf c; string2 sbuf lexbuf }
```

## 14.10   Parser

Right recursion is more convenient for constructing the value. Since the lists will always be short, there is no performace or stack size reason for prefering left recursion.

### Header

## 14.11   Interface of UFO_Lorentz

### 14.11.1   Processed UFO Lorentz Structures

Just like *UFOx.Lorentz_Atom.dirac*, but without the Dirac matrix indices.

```
type dirac = (∗ private ∗)
    | Gamma5
    | ProjM
    | ProjP
    | Gamma of int
    | Sigma of int × int
    | C
    | Minus
```

A sandwich of a string of $\gamma$-matrices. *bra* and *ket* are positions of fields in the vertex, *not* spinor indices.

```
type dirac_string = (∗ private ∗)
    { bra : int;
      ket : int;
      gammas : dirac list }
```

In the case of Majorana spinors, we have to insert charge conjugation matrices.
$\Gamma \to -\Gamma$:

```
val minus : dirac_string → dirac_string
```

$\Gamma \to C\Gamma$:

val *cc_times* : *dirac_string* → *dirac_string*

$\Gamma \rightarrow \Gamma C^{-1}$:

val *times_cc_inv* : *dirac_string* → *dirac_string*

$\Gamma \rightarrow \Gamma^T$:

val *transpose* : *dirac_string* → *dirac_string*

$\Gamma \rightarrow C\Gamma C^{-1}$:

val *conjugate* : *dirac_string* → *dirac_string*

$\Gamma \rightarrow C\Gamma^T C^{-1}$, i.e. the composition of *conjugate* and *transpose*:

val *conjugate_transpose* : *dirac_string* → *dirac_string*

Careful: of the above, *transpose* is currently implemented as *conjugate* to make the tests in `keystones_UFO_bispinors` work. This needs to be changed eventually! *conjugate_transpose* is the real thing, though.

The Lorentz indices appearing in a term are either negative internal summation indices or positive external polarization indices. Note that the external indices are not really indices, but denote the position of the particle in the vertex.

type $\alpha$ *term* = (∗ private ∗)
  { *indices* : *int list*;
    *atom* : $\alpha$ }

Split the list of indices into summation and polarization indices.

val *classify_indices* : *int list* → *int list* × *int list*

Replace the atom keeping the associated indices.

val *map_atom* : ($\alpha$ → $\beta$) → $\alpha$ *term* → $\beta$ *term*

A contraction consists of a (possibly empty) product of Dirac strings and a (possibly empty) product of Lorentz tensors with a rational coefficient.

type *contraction* = (∗ private ∗)
  { *coeff* : *Algebra.QC.t*;
    *dirac* : *dirac_string term list*;
    *vector* : *UFOx.Lorentz_Atom.vector term list*;
    *scalar* : *UFOx.Lorentz_Atom.scalar list*;
    *inverse* : *UFOx.Lorentz_Atom.scalar list* }

A sum of *contraction*s.

type *t* = *contraction list*

Fermion line connections.

val *fermion_lines* : *t* → *Coupling.fermion_lines*

$\Gamma \rightarrow C\Gamma C^{-1}$

val *charge_conjugate* : *int* × *int* → *t* → *t*

*parse spins lorentz* uses the *spins* to parse the UFO *lorentz* structure as a list of *contraction*s.

val *parse* : *Coupling.lorentz list* → *UFOx.Lorentz.t* → *t*

*map_indices f lorentz* applies the map *f* to the free indices in *lorentz*.

val *map_indices* : (*int* → *int*) → *t* → *t*
val *map_fermion_lines* :
  (*int* → *int*) → *Coupling.fermion_lines* → *Coupling.fermion_lines*

Create a readable representation for debugging and documenting generated code.

val *to_string* : *t* → *string*
val *fermion_lines_to_string* : *Coupling.fermion_lines* → *string*

Punting . . .

val *dummy* : *t*

More debugging and documenting.

val *dirac_string_to_string* : *dirac_string* → *string*

*dirac_string_to_matrix substitute ds* take a string of $\gamma$-matrices *ds*, applies *substitute* to the indices and returns the product as a matrix.

val *dirac_string_to_matrix* : (*int* → *int*) → *dirac_string* → *Dirac.Chiral.t*

module type *Test* =
  sig
    val *suite* : *OUnit.test*
  end

module *Test* : *Test*

## 14.12  Implementation of UFO_Lorentz

### 14.12.1  Processed UFO Lorentz Structures

module *Q* = *Algebra.Q*
module *QC* = *Algebra.QC*
module *A* = *UFOx.Lorentz_Atom*
module *D* = *Dirac.Chiral*

Take a *A.t list* and return the corresponding pair *A.dirac list* × *A.vector list* × *A.scalar list* × *A.scalar list*, without preserving the order (currently, the order is reversed).

let *split_atoms atoms* =
  *List.fold_left*
    (fun (*d*, *v*, *s*, *i*) → function
      | *A.Vector v′* → (*d*, *v′* :: *v*, *s*, *i*)
      | *A.Dirac d′* → (*d′* :: *d*, *v*, *s*, *i*)
      | *A.Scalar s′* → (*d*, *v*, *s′* :: *s*, *i*)
      | *A.Inverse i′* → (*d*, *v*, *s*, *i′* :: *i*))
    ([], [], [], []) *atoms*

Just like *UFOx.Lorentz_Atom.dirac*, but without the Dirac matrix indices.

type *dirac* =
  | *Gamma5*
  | *ProjM*
  | *ProjP*
  | *Gamma* of *int*
  | *Sigma* of *int* × *int*
  | *C*
  | *Minus*

let *map_indices_gamma f* = function
  | (*Gamma5* | *ProjM* | *ProjP* | *C* | *Minus* as *g*) → *g*
  | *Gamma mu* → *Gamma* (*f mu*)
  | *Sigma* (*mu*, *nu*) → *Sigma* (*f mu*, *f nu*)

A sandwich of a string of $\gamma$-matrices. *bra* and *ket* are positions of fields in the vertex.

type *dirac_string* =
  { *bra* : *int*;
    *ket* : *int*;
    *gammas* : *dirac list* }

let *map_indices_dirac f d* =
  { *bra* = *f d.bra*;
    *ket* = *f d.ket*;
    *gammas* = *List.map* (*map_indices_gamma f*) *d.gammas* }

Implementation of Dirac couplings using `conjspinor_spinor`

$$\texttt{psibar0 * psi1} = \sum_{\alpha} \bar{\psi}_{0,\alpha}\psi_{1,\alpha} = \bar{\psi}_0\psi_1 \tag{14.1}$$

JRR's implementation of Majorana couplings using `spinor_product`

$$\texttt{chibar0 * chi1} = \sum_{\alpha} \bar{\chi}_{0,\alpha}(C^T\chi_1)_{\beta} = \sum_{\alpha}(C\bar{\chi}_0^T)_{\alpha}\chi_{1,\alpha} = (C\bar{\chi}_0^T)^T\chi_1 = \tilde{\chi}_0^T\chi_1 \tag{14.2}$$

with charge conjugation[1]

$$\tilde{\chi} = C\bar{\chi}^T \tag{14.4a}$$
$$\bar{\chi} = -\chi^T C^{-1}\,. \tag{14.4b}$$

So we write in JRR's implementation

$$\bar{\chi}_0\Gamma\chi_1\phi = \bar{\chi}_0 C^T C\Gamma\chi_1\phi = (C\bar{\chi}_0^T)^T C\Gamma\chi_1\phi = \tilde{\chi}_0^T C\Gamma\chi_1\phi \tag{14.5}$$

using $C^{-1} = C^{\dagger}$, $C^T = -C$ and the representation dependent $C^2 = -1$ that holds in all our representation(s). Analoguously

$$\bar{\chi}_0\Gamma\chi_1\phi = (\bar{\chi}_0\Gamma\chi_1)^T \phi = -\chi_1^T\Gamma^T\bar{\chi}_0^T\phi = \bar{\tilde{\chi}}_1 C\Gamma^T C^{-1}\tilde{\chi}_0\phi = -\chi_1^T C^{-1}C\Gamma^T C^{-1}\tilde{\chi}_0\phi$$
$$= -\chi_1^T\Gamma^T C^{-1}\tilde{\chi}_0\phi = -\chi_1^T\Gamma^T C^T\tilde{\chi}_0\phi = -\chi_1^T(C\Gamma)^T\tilde{\chi}_0\phi \tag{14.6}$$

In the following, we assume to be in a realization with $C^{-1} = -C = C^T$:

let $inv\_C = [Minus;\ C]$

In JRR's implementation of Majorana fermions (see 396), *all* fermion-boson fusions are realized with the `f_bf(g,phi,chi)` functions, where $b \in \{\texttt{v}, \texttt{a}, \dots\}$. This is different from the original Dirac implementation, where *both* `f_bf(g,phi,psi)` and `f_fb(g,psibar,phi)` are used.

However, the latter plays nicer with the permutations in the UFO version of *fuse*. Therefore, we want to automatically map `f_bf(g,phi,chi)` to `f_fb(g,chi,phi)` by an appropriate transformation of the $\gamma$-matrices involved.

Starting from

$$\texttt{f\_bf(g,phi,chi)} \cong \chi'_{\alpha} = \sum_{\mu,\beta} \phi_{\mu}\Gamma^{\mu}_{\alpha\beta}\chi_{\beta} \tag{14.7}$$

with $\Gamma$ an appropriate product of $\gamma$-matrices, we obtain

$$\texttt{f\_fb(g,chi,phi)} \cong \chi'_{\alpha} = \sum_{\mu,\beta} \phi_{\mu}\chi_{\beta}\tilde{\Gamma}^{\mu}_{\beta\alpha} = \sum_{\mu,\beta} \phi_{\mu}\left(\tilde{\Gamma}^{\mu}\right)^T_{\alpha\beta}\chi_{\beta} \tag{14.8}$$

and we should require $\tilde{\Gamma} = \Gamma^T$.
We can now use the standard charge conjugation matrix relations

$$\mathbf{1}^T = \mathbf{1} \tag{14.9a}$$
$$\gamma_{\mu}^T = -C\gamma_{\mu}C^{-1} \tag{14.9b}$$
$$\sigma_{\mu\nu}^T = C\sigma_{\nu\mu}C^{-1} = -C\sigma_{\mu\nu}C^{-1} \tag{14.9c}$$
$$(\gamma_5\gamma_{\mu})^T = \gamma_{\mu}^T\gamma_5^T = -C\gamma_{\mu}\gamma_5 C^{-1} = C\gamma_5\gamma_{\mu}C^{-1} \tag{14.9d}$$
$$\gamma_5^T = C\gamma_5 C^{-1} \tag{14.9e}$$

to perform the transpositions symbolically. For the chiral projectors

$$\gamma_{\pm} = \mathbf{1} \pm \gamma_5 \tag{14.10}$$

---

[1]In detail, to make sure we understand all phases

$$\bar{\tilde{\chi}} = \tilde{\chi}^{\dagger}\gamma_0 = \left(C\bar{\chi}^T\right)^{\dagger}\gamma_0 = \left(C(\chi^{\dagger}\gamma_0)^T\right)^{\dagger}\gamma_0 = \left(C\gamma_0^T\chi^{\dagger T}\right)^{\dagger}\gamma_0 = \left(C\gamma_0^T\chi^{\dagger\dagger}\right)^{\dagger}\gamma_0 = \chi^T\gamma_0^{T\dagger}C^{\dagger}\gamma_0$$
$$= \chi^T\gamma_0^{\dagger T}C^{-1}\gamma_0 = \chi^T\gamma_0^T C^{-1}\gamma_0 = \chi^T C^{-1}C\gamma_0^T C^{-1}\gamma_0 = -\chi^T C^{-1}\gamma_0\gamma_0 = -\chi^T C^{-1}\,. \tag{14.3}$$

this means[2]

$$\gamma_\pm^T = (\mathbf{1} \pm \gamma_5)^T = C(\mathbf{1} \pm \gamma_5)C^{-1} = C\gamma_\pm C^{-1} \tag{14.11a}$$

$$(\gamma_\mu \gamma_\pm)^T = \gamma_\pm^T \gamma_\mu^T = -C\gamma_\pm \gamma_\mu C^{-1} = -C\gamma_\mu \gamma_\mp C^{-1} \tag{14.11b}$$

$$(\gamma_\mu \pm \gamma_\mu \gamma_5)^T = -C(\gamma_\mu \mp \gamma_\mu \gamma_5)C^{-1} \tag{14.11c}$$

and of course

$$C^T = -C . \tag{14.12}$$

let *transpose1* = function
  | (*Gamma5* | *ProjM* | *ProjP* as *g*) → [*C*; *g*] @ *inv_C*
  | (*Gamma* _ | *Sigma* (_, _) as *g*) → [*Minus*] @ [*C*; *g*] @ *inv_C*
  | *C* → [*Minus*; *C*]
  | *Minus* → [*Minus*]

let rec *collect_signs_rev* (*negative*, *acc*) = function
  | [] → (*negative*, *acc*)
  | *Minus* :: *g_list* → *collect_signs_rev* (¬ *negative*, *acc*) *g_list*
  | *g* :: *g_list* → *collect_signs_rev* (*negative*, *g* :: *acc*) *g_list*

let rec *compress_ccs_rev* (*negative*, *acc*) = function
  | [] → (*negative*, *acc*)
  | *C* :: *C* :: *g_list* → *compress_ccs_rev* (¬ *negative*, *acc*) *g_list*
  | *g* :: *g_list* → *compress_ccs_rev* (*negative*, *g* :: *acc*) *g_list*

let *compress_signs* *g_list* =
  let *negative*, *g_list_rev* = *collect_signs_rev* (false, []) *g_list* in
  match *compress_ccs_rev* (*negative*, []) *g_list_rev* with
  | true, *g_list* → *Minus* :: *g_list*
  | false, *g_list* → *g_list*

let *transpose* *d* =
  { *d* with
    *gammas* = *compress_signs* (*ThoList.rev_flatmap transpose1 d.gammas*) }

Regarding the tests in `keystones_UFO_bispinors`, we observe[3]

$$\texttt{chi0 * f\_bf(g,phi1,chi2)} \cong \phi_1^\mu (C\chi_0)^T \Gamma_\mu \chi_2 = \phi_1^\mu \chi_0^T C^T \Gamma_\mu \chi_2 \tag{14.14a}$$

$$\texttt{f\_fb(g,chi0,phi1) * chi2} \cong \phi_1^\mu (C(\chi_0^T \tilde{\Gamma}_\mu)^T)^T \chi_2 = \phi_1 (C\tilde{\Gamma}_\mu^T \chi_0)^T \chi_2 = \phi_1 \chi_0^T \tilde{\Gamma}_\mu C^T \chi_2 \tag{14.14b}$$

$$\texttt{chi2 * f\_fb(g,chi0,phi1)} \cong \phi_1^\mu (C\chi_2)^T (\chi_0^T \tilde{\Gamma}_\mu)^T = \phi_1^\mu \chi_0^T \tilde{\Gamma}_\mu C\chi_2 \tag{14.14c}$$

The natural condition `chi0 * f_bf(g,phi1,chi2) = f_fb(g,chi0,phi1) * chi2` can be satisfied with

$$C^T \Gamma_\mu = \tilde{\Gamma}_\mu C^T , \tag{14.15}$$

i. e.

$$\tilde{\Gamma}_\mu = C\Gamma_\mu C^{-1} . \tag{14.16}$$

This is *not* compatible with with $\tilde{\Gamma}_\mu = \Gamma_\mu^T$, but we can make this work for the `keystones_UFO_bispinors` tests with

let *conjugate* *d* =
  { *d* with *gammas* = *compress_signs* (*C* :: *d.gammas* @ *inv_C*) }

---

[2]The final two equations are two different ways to obtain the same result, of course.
[3]In components:

$$\texttt{chi0 * f\_bf(g,phi1,chi2)} \cong \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} C_{\alpha\alpha'} \chi_{0,\alpha'} \Gamma_{\alpha\beta}^\mu \chi_{2,\beta} = \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} \chi_{0,\alpha'} C_{\alpha'\alpha}^T \Gamma_{\alpha\beta}^\mu \chi_{2,\beta} \tag{14.13a}$$

$$\texttt{f\_fb(g,chi0,phi1) * chi2} \cong \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} C_{\alpha\alpha'} \chi_{0,\beta} \tilde{\Gamma}_{\beta\alpha'}^\mu \chi_{2,\alpha} = \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} \chi_{0,\beta} \tilde{\Gamma}_{\beta\alpha'}^\mu C_{\alpha'\alpha}^T \chi_{2,\alpha} \tag{14.13b}$$

$$\texttt{chi2 * f\_fb(g,chi0,phi1)} \cong \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} C_{\alpha\alpha'} \chi_{2,\alpha'} \chi_{0,\beta} \tilde{\Gamma}_{\beta\alpha}^\mu = \sum_{\mu,\alpha,\alpha',\beta} \phi_{1,\mu} \chi_{0,\beta} \tilde{\Gamma}_{\beta\alpha}^\mu C_{\alpha\alpha'} \chi_{2,\alpha'} \tag{14.13c}$$

let *conjugate_transpose d* =
  *conjugate* (*transpose d*)

The alternative condition `chi0 * f_bf(g,phi1,chi2) = chi2 * f_fb(g,chi0,phi1)` would require

$$C^T \Gamma_\mu = \tilde{\Gamma}_\mu C, \tag{14.17}$$

i. e.

$$\tilde{\Gamma}_\mu = C\Gamma_\mu C = -C\Gamma_\mu C^{-1}. \tag{14.18}$$

⬦ Now make also the fusions work in `fermi_UFO` and `compare_majorana_UFO`?

let *minus d* =
  { *d* with *gammas* = *compress_signs* (*Minus* :: *d.gammas*) }

let *cc_times d* =
  { *d* with *gammas* = *compress_signs* (*C* :: *d.gammas*) }

let *times_cc_inv d* =
  { *d* with *gammas* = *compress_signs* (*d.gammas* @ *inv_C*) }

*dirac_string bind ds* applies the mapping *bind* to the indices of $\gamma_\mu$ and $\sigma_{\mu\nu}$ and multiplies the resulting matrices in order using complex rational arithmetic.

module type *To_Matrix* =
  sig
    val *dirac_string* : (*int* → *int*) → *dirac_string* → *D.t*

Unlike UFO, O'Mega distinguishes bewteen spinors and conjugate spinors. However, we can inspect the particles in the vertices in which a Lorentz structure is used to determine the correct quantum numbers.

Most model files in the real world contain unused Lorentz structures. This is not a problem, we can just ignore them.

If we have reason to belive that a $\delta_{ab}$-vertex is an effective $\mathrm{tr}(T_a T_b)$-vertex generated at loop level, like $gg \to H \ldots$ in the SM, we should interpret it as such and use the expression (6.2) from [16].
AFAIK, there is no way to distinguish these cases directly in a UFO file. Instead we rely in a heuristic, in which each massless color octet vector particle or ghost is a gluon and colorless scalars are potential Higgses.

In case of Majorana spinors, also generate all combinations of charge conjugated fermion lines. The naming convention is to append _c$nm$ if the $\gamma$-matrices of the fermion line $n \to m$ has been charge conjugated (this could become impractical for too many fermions at a vertex, but shouldn't matter in real life).

To be decided: is it better (in the sense of *easier to understand*, not efficiency) to permute first or to charge conjugate first?

```

Transform the Dirac strings if we have Majorana fermions involved, in order to implement the algorithm from JRR's thesis. NB: The following is for reference only, to better understand what JRR was doing...

If the vertex is (suppressing the Lorentz indices of $\phi_2$ and $\Gamma$)

$$\bar{\psi}_1 \Gamma \phi_2 \psi_3 = \Gamma_{\alpha\beta} \bar{\psi}_{1,\alpha} \phi_2 \psi_{3,\beta} \,, \tag{14.19}$$

then this is the version implemented by _fuse_ below.

```
let tho_print_dirac_current f c wf1 wf2 fusion =
  match fusion with
  | [1; 3] → printf "%s_ff(%s,%s,%s)" f c wf1 wf2 (* Γ_αβ ψ̄_1,α ψ_3,β *)
  | [3; 1] → printf "%s_ff(%s,%s,%s)" f c wf2 wf1 (* Γ_αβ ψ̄_1,α ψ_3,β *)
  | [2; 3] → printf "f_%sf(%s,%s,%s)" f c wf1 wf2 (* Γ_αβ φ_2 ψ_3,β *)
  | [3; 2] → printf "f_%sf(%s,%s,%s)" f c wf2 wf1 (* Γ_αβ φ_2 ψ_3,β *)
  | [1; 2] → printf "f_f%s(%s,%s,%s)" f c wf1 wf2 (* Γ_αβ ψ̄_1,α φ_2 *)
  | [2; 1] → printf "f_f%s(%s,%s,%s)" f c wf2 wf1 (* Γ_αβ ψ̄_1,α φ_2 *)
  | _ → ()
```

This is how JRR implemented (see subsection X.26.1) the Dirac matrices that don't change sign under $C\Gamma^T C^{-1} = \Gamma$, i.e. $\mathbf{1}$, $\gamma_5$ and $\gamma_5\gamma_\mu$ (see _Targets.Fortran_Majorana_Fermions.print_fermion_current_)

- In the case of two fermions, the second wave function _wf2_ is always put into the right slot, as described in JRR's thesis.

- In the case of a boson and a fermion, there is no need for both `"f_%sf"` and `"f_f%s"`, since the latter can be obtained by exchanging arguments.

```
let jrr_print_majorana_current_S_P_A f c wf1 wf2 fusion =
  match fusion with
  | [1; 3] → printf "%s_ff(%s,%s,%s)" f c wf1 wf2 (* (CΓ)_αβ ψ̄_1,α ψ_3,β ≅ CΓ *)
  | [3; 1] → printf "%s_ff(%s,%s,%s)" f c wf1 wf2 (* (CΓ)_αβ ψ_3,α ψ̄_1,β ≅ CΓ = C CΓ^T C^{-1} *)
  | [2; 3] → printf "f_%sf(%s,%s,%s)" f c wf1 wf2 (* Γ_αβ φ_2 ψ_3,β ≅ Γ *)
  | [3; 2] → printf "f_%sf(%s,%s,%s)" f c wf2 wf1 (* Γ_αβ φ_2 ψ_3,β ≅ Γ *)
  | [1; 2] → printf "f_%sf(%s,%s,%s)" f c wf2 wf1 (* Γ_αβ φ_2 ψ̄_1,β ≅ Γ = CΓ^T C^{-1} *)
  | [2; 1] → printf "f_%sf(%s,%s,%s)" f c wf1 wf2 (* Γ_αβ φ_2 ψ̄_1,β ≅ Γ = CΓ^T C^{-1} *)
  | _ → ()
```

This is how JRR implemented the Dirac matrices that do change sign under $C\Gamma^T C^{-1} = -\Gamma$, i.e. $\gamma_\mu$ and $\sigma_{\mu\nu}$ (see _Targets.Fortran_Majorana_Fermions.print_fermion_current_vector_).

```
let jrr_print_majorana_current_V f c wf1 wf2 fusion =
  match fusion with
  | [1; 3] → printf "%s_ff(␣%s,%s,%s)" f c wf1 wf2 (* (CΓ)_αβ ψ̄_1,α ψ_3,β ≅ CΓ *)
```

      | [3; 1] → *printf* `"%s_ff(-%s,%s,%s)"` *f c wf1 wf2* $(* -(C\Gamma)_{\alpha\beta}\psi_{3,\alpha}\bar\psi_{1,\beta} \cong -C\Gamma = C\,C\Gamma^T C^{-1} \,*)$
      | [2; 3] → *printf* `"f_%sf(␣%s,%s,%s)"` *f c wf1 wf2* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [3; 2] → *printf* `"f_%sf(␣%s,%s,%s)"` *f c wf2 wf1* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [1; 2] → *printf* `"f_%sf(-%s,%s,%s)"` *f c wf2 wf1* $(* -\Gamma_{\alpha\beta}\phi_2\psi_{1,\beta} \cong -\Gamma = C\Gamma^T C^{-1} \,*)$
      | [2; 1] → *printf* `"f_%sf(-%s,%s,%s)"` *f c wf1 wf2* $(* -\Gamma_{\alpha\beta}\phi_2\bar\psi_{1,\beta} \cong -\Gamma = C\Gamma^T C^{-1} \,*)$
      | _ → ()

These two can be unified, if the `_c` functions implement $\Gamma' = C\Gamma^T C^{-1}$, but we *must* make sure that the multiplication with $C$ from the left happens *after* the transformation $\Gamma \to \Gamma'$.

    let *jrr_print_majorana_current f c wf1 wf2 fusion* =
      match *fusion* with
      | [1; 3] → *printf* `"%s_ff␣␣(%s,%s,%s)"` *f c wf1 wf2* $(* (C\Gamma)_{\alpha\beta}\bar\psi_{1,\alpha}\psi_{3,\beta} \cong C\Gamma \,*)$
      | [3; 1] → *printf* `"%s_ff_c(%s,%s,%s)"` *f c wf1 wf2* $(* (C\Gamma')_{\alpha\beta}\psi_{3,\alpha}\bar\psi_{1,\beta} \cong C\Gamma' = C\,C\Gamma^T C^{-1} \,*)$
      | [2; 3] → *printf* `"f_%sf␣␣(%s,%s,%s)"` *f c wf1 wf2* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [3; 2] → *printf* `"f_%sf␣␣(%s,%s,%s)"` *f c wf2 wf1* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [1; 2] → *printf* `"f_%sf_c(%s,%s,%s)"` *f c wf2 wf1* $(* \Gamma'_{\alpha\beta}\phi_2\psi_{1,\beta} \cong \Gamma' = C\Gamma^T C^{-1} \,*)$
      | [2; 1] → *printf* `"f_%sf_c(%s,%s,%s)"` *f c wf1 wf2* $(* \Gamma'_{\alpha\beta}\phi_2\bar\psi_{1,\beta} \cong \Gamma' = C\Gamma^T C^{-1} \,*)$
      | _ → ()

Since we may assume $C^{-1} = -C = C^T$, this can be rewritten if the `_c` functions implement

$$\Gamma'^{\,T} = \left(C\Gamma^T C^{-1}\right)^T = \left(C^{-1}\right)^T \Gamma \left(C\right)^T = C\Gamma C^{-1} \tag{14.20}$$

instead.

    let *jrr_print_majorana_current_transposing f c wf1 wf2 fusion* =
      match *fusion* with
      | [1; 3] → *printf* `"%s_ff␣␣(%s,%s,%s)"` *f c wf1 wf2* $(* (C\Gamma)_{\alpha\beta}\bar\psi_{1,\alpha}\psi_{3,\beta} \cong C\Gamma \,*)$
      | [3; 1] → *printf* `"%s_ff_c(%s,%s,%s)"` *f c wf2 wf1* $(* (C\Gamma')^T_{\alpha\beta}\bar\psi_{1,\alpha}\psi_{3,\beta} \cong (C\Gamma')^T = -C\Gamma \,*)$
      | [2; 3] → *printf* `"f_%sf␣␣(%s,%s,%s)"` *f c wf1 wf2* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [3; 2] → *printf* `"f_%sf␣␣(%s,%s,%s)"` *f c wf2 wf1* $(* \Gamma_{\alpha\beta}\phi_2\psi_{3,\beta} \cong \Gamma \,*)$
      | [1; 2] → *printf* `"f_f%s_c(%s,%s,%s)"` *f c wf1 wf2* $(* \Gamma'^{\,T}_{\alpha\beta}\bar\psi_{1,\alpha}\phi_2 \cong \Gamma'^{\,T} = C\Gamma C^{-1} \,*)$
      | [2; 1] → *printf* `"f_f%s_c(%s,%s,%s)"` *f c wf2 wf1* $(* \Gamma'^{\,T}_{\alpha\beta}\bar\psi_{1,\alpha}\phi_2 \cong \Gamma'^{\,T} = C\Gamma C^{-1} \,*)$
      | _ → ()

where we have used

$$(C\Gamma')^T = \Gamma'^{,T}C^T = C\Gamma C^{-1}C^T = -C\Gamma \,. \tag{14.21}$$

This puts the arguments in the same slots as *tho_print_dirac_current* above and can be implemented by *fuse*, iff we inject the proper transformations in *dennerize* below.

         g
      else if c  =  − 1 then
         "−" ^ g
      else
         Printf.sprintf "%d*%s" c g

    let scale_coupling z g  =
      format_complex_rational_factor z ^ g
```

As a prototypical example consider the vertex

$$\bar{\psi}A\!\!\!/\psi = \operatorname{tr}\left(\psi \otimes \bar{\psi}A\!\!\!/\right) \tag{14.22}$$

encoded as `FFV` in the SM UFO file. This example is useful, because all three fields have different type and we can use the Fortran compiler to check our implementation.

In this case we need to generate the following function calls with the arguments in the following order

| | | | |
|---|---|---|---|
| F12: | $\psi_1 \bar{\psi}_2 \to A$ | | `FFV_p201(g,psi1,p1,psibar2,p2)` |
| F21: | $\bar{\psi}_1 \psi_2 \to A$ | | `FFV_p201(g,psi2,p2,psibar1,p1)` |
| F23: | $\bar{\psi}_1 A_2 \to \bar{\psi}$ | | `FFV_p012(g,psibar1,p1,A2,p2)` |
| F32: | $A_1 \bar{\psi}_2 \to \bar{\psi}$ | | `FFV_p012(g,psibar2,p2,A1,p1)` |
| F31: | $A_1 \psi_2 \to \psi$ | | `FFV_p120(g,A1,p1,psi2,p2)` |
| F13: | $\psi_1 A_2 \to \psi$ | | `FFV_p120(g,A2,p2,psi1,p1)` |

Fortunately, all Fermi signs have been taken care of by *Fusions* and we can concentrate on injecting the wave functions into the correct slots.

Eventually, we should use the reverted lists everywhere to become a bit more efficient.

```
    module P  =  Permutation.Default

    let factor_cyclic f12__n  =
      let f12__, fn  =  ThoList.split_last f12__n in
      let cyclic  =  ThoList.cycle_until fn (List.sort compare f12__n) in
      (P.of_list (List.map pred cyclic),
       P.of_lists (List.tl cyclic) f12__)

    let ccs_to_string ccs  =
      String.concat "" (List.map (fun (f, i)  →  Printf.sprintf "_c%x%x" i f) ccs)

    let fusion_name v perm ccs  =
      Printf.sprintf "%s_p%s%s" v (P.to_string perm) (ccs_to_string ccs)
```

```
let fuse_dirac c v s fl g wfs ps fusion =
  let g = scale_coupling c g
  and cyclic, factor = factor_cyclic fusion in
  let wfs_ps = List.map2 (fun wf p → (wf, p)) wfs ps in
  let args = P.list (P.inverse factor) wfs_ps in
  let args_string =
    String.concat "," (List.map (fun (wf, p) → wf ^ "," ^ p) args) in
  printf "%s(%s,%s)" (fusion_name v cyclic []) g args_string
```

We need to look at the permuted fermion lines in order to decide wether to apply charge conjugations.
It is not enough to look at the cyclic permutation used to move the fields into the correct arguments of the fusions . . .

```
let map_indices perm unit =
  let pmap = IntPM.of_lists unit (P.list perm unit) in
  IntPM.apply pmap
```

. . . we also need to inspect the full permutation of the fields.

```
let map_indices2 perm unit =
  let pmap =
    IntPM.of_lists unit (1 :: P.list (P.inverse perm) (List.tl unit)) in
  IntPM.apply pmap
```

This is a more direct implementation of the composition of *map_indices2* and *map_indices*, that is used in the unit tests.

```
let map_indices_raw fusion =
  let unit = ThoList.range 1 (List.length fusion) in
  let f12__, fn = ThoList.split_last fusion in
  let fusion = fn :: f12__ in
  let map_index = IntPM.of_lists fusion unit in
  IntPM.apply map_index
```

Map the fermion line indices in *fl* according to *map_index*.

```
let map_fermion_lines map_index fl =
  List.map (fun (i, f) → (map_index i, map_index f)) fl
```

Map the fermion line indices in *fl* according to *map_index*, but keep a copy of the original.

```
let map_fermion_lines2 map_index fl =
  List.map (fun (i, f) → ((i, f), (map_index i, map_index f))) fl

let permute_fermion_lines cyclic unit fl =
  map_fermion_lines (map_indices cyclic unit) fl

let permute_fermion_lines2 cyclic factor unit fl =
  map_fermion_lines2
    (map_indices2 factor unit)
    (map_fermion_lines (map_indices cyclic unit) fl)
```

⚠ TODO: this needs more more work for the fully general case.

```
let charge_conjugations fl2 =
  ThoList.filtermap
    (fun ((i, f), (i', f')) →
      match (i, f), (i', f') with
      | (1, 2), _ | (2, 1), _ → Some (f, i) (* χᵀΓ' *)
      | _, (2, 3) → Some (f, i) (* χᵀ(CΓ')χ *)
      | _ → None)
    fl2

# —15—
## HARDCODED TARGETS

### 15.1   Interface of Format_Fortran

Mimic parts of the *Format* API with support for Fortran style line continuation.

type *formatter*

val *std_formatter* : *formatter*

val *fprintf* : *formatter* → ($\alpha$, *Format.formatter*, *unit*) *format* → $\alpha$
val *printf* : ($\alpha$, *Format.formatter*, *unit*) *format* → $\alpha$

Start a new line, *not* a continuation!

val *pp_newline* : *formatter* → *unit* → *unit*
val *newline* : *unit* → *unit*

val *pp_flush* : *formatter* → *unit* → *unit*
val *flush* : *unit* → *unit*

val *formatter_of_out_channel* : ?*width* :*int* → *out_channel* → *formatter*
val *formatter_of_buffer* : ?*width* :*int* → *Buffer.t* → *formatter*

val *pp_set_formatter_out_channel* : *formatter* → ?*width* :*int* → *out_channel* → *unit*
val *set_formatter_out_channel* : ?*width* :*int* → *out_channel* → *unit*

This must be exposed for the benefit of *Targets.Make_Fortran*().*print_interface*, because somebody decided to use it for the *K*-matrix support. Is this really necessary?

val *pp_switch_line_continuation* : *formatter* → *bool* → *unit*
val *switch_line_continuation* : *bool* → *unit*

module *Test* : sig val *suite* : *OUnit.test* end

### 15.2   Implementation of Format_Fortran

let *default_width* = 80

let *max_clines* = *ref* (−1) (* 255 *)
exception *Continuation_Lines* of *int*

Fortran style line continuation:

type *formatter* =
  { *formatter* : *Format.formatter*;
    mutable *current_cline* : *int*;
    mutable *width* : *int* }

let *formatter_of_formatter* ?(*width* = *default_width*) *ff* =
  { *formatter* = *ff*;
    *current_cline* = 1;
    *width* = *width* }

Default function to output new lines.

let *pp_output_function* *ff* =

*fst* (*Format.pp_get_formatter_output_functions ff.formatter* ())

Default function to output spaces (copied from `format.ml`).

```
let blank_line  =  String.make 80 ’ ’
let rec pp_display_blanks ff  n  =
  if  n  >  0 then
    if  n  ≤  80 then
      pp_output_function ff  blank_line 0 n
    else begin
        pp_output_function ff  blank_line 0 80;
        pp_display_blanks ff  (n  −  80)
      end
```

```
let pp_display_newline ff  =
  pp_output_function ff "\n" 0 1
```

*ff.current_cline*

- ≤ 0: not continuing: print a straight newline,

- > 0: continuing: append "␣&" until we run up to !*max_clines*. NB: !*max_clines*  <  0 means *unlimited* continuation lines.

```
let pp_switch_line_continuation ff  =  function
  | false →  ff.current_cline  ←  0
  | true →  ff.current_cline  ←  1
```

```
let pp_fortran_newline ff  ()  =
  if ff.current_cline  >  0 then
    begin
      if !max_clines  ≥  0 ∧ ff.current_cline  >  !max_clines then
        raise (Continuation_Lines ff.current_cline)
      else
        begin
          pp_output_function ff "␣&" 0 2;
          ff.current_cline  ←  succ ff.current_cline
        end
    end;
  pp_display_newline ff
```

```
let pp_newline ff  ()  =
  pp_switch_line_continuation ff false;
  Format.pp_print_newline ff.formatter ();
  pp_switch_line_continuation ff true
```

Make a formatter with default functions to output spaces and new lines.

```
let pp_setup ff  =
  let out,  flush  =
    Format.pp_get_formatter_output_functions ff.formatter () in
  Format.pp_set_all_formatter_output_functions
    ff.formatter ˜out ˜flush
    ˜newline : (pp_fortran_newline ff ) ˜spaces : (pp_display_blanks ff );
  Format.pp_set_margin ff.formatter (ff.width  −  2)
```

This is bit of a headache, since *out_indent* was added to type *formatter_out_functions* in version 4.06 in an incompatible change.

```
let std_formatter  =
  let ff  =  formatter_of_formatter Format.std_formatter in
  pp_setup ff ;
  ff
```

```
let formatter_of_out_channel ?(width = default_width) oc  =
  let ff  =  formatter_of_formatter ˜width (Format.formatter_of_out_channel oc) in
  pp_setup ff ;
```

```
      ff

let formatter_of_buffer ?(width = default_width) b =
  let ff =
    { formatter = Format.formatter_of_buffer b;
      current_cline = 1;
      width = width } in
  pp_setup ff;
  ff

let pp_set_formatter_out_channel ff ?(width = default_width) oc =
  Format.pp_set_formatter_out_channel ff.formatter oc;
  ff.width ← width;
  pp_setup ff

let set_formatter_out_channel ?(width = default_width) oc =
  Format.pp_set_formatter_out_channel std_formatter.formatter oc;
  std_formatter.width ← width;
  pp_setup std_formatter

let fprintf ff fmt = Format.fprintf ff.formatter fmt
let pp_flush ff = Format.pp_print_flush ff.formatter

```

### Sets and maps

The OVM identifies all objects via integers. Therefore, we need maps which assign the abstract object a unique ID.

I want *int list*s with less elements to come first. Used in conjunction with the int list representation of momenta, this will set the outer particles at first position and allows the OVM to set them without further instructions.

◈ Using the Momentum module might give better performance than integer lists?

```
  let rec int_lst_compare (e1 : int list) (e2 : int list) =
    match e1, e2 with
    | [], [] → 0
```

```
| _, [] → +1
| [], _ → −1
| [_;_], [_] → +1
| [_], [_;_] → −1
| hd1 :: tl1, hd2 :: tl2 →
     let c = compare hd1 hd2 in
     if (c ≢ 0 ∧ List.length tl1 = List.length tl2) then
        c
     else
        int_lst_compare tl1 tl2
```

We need a canonical ordering for the different types of wfs. Copied, and slightly modified to order *wf*s, from `fusion.ml`.

```
let lorentz_ordering wf =
  match CM.lorentz (F.flavor wf) with
  | Scalar → 0
  | Spinor → 1
  | ConjSpinor → 2
  | Majorana → 3
  | Vector → 4
  | Massive_Vector → 5
  | Tensor_2 → 6
  | Tensor_1 → 7
  | Vectorspinor → 8
  | BRS Scalar → 9
  | BRS Spinor → 10
  | BRS ConjSpinor → 11
  | BRS Majorana → 12
  | BRS Vector → 13
  | BRS Massive_Vector → 14
  | BRS Tensor_2 → 15
  | BRS Tensor_1 → 16
  | BRS Vectorspinor → 17
  | Maj_Ghost → invalid_arg "lorentz_ordering:␣not␣implemented"
  | BRS _ → invalid_arg "lorentz_ordering:␣not␣needed"

let wf_compare (wf1, mult1) (wf2, mult2) =
  let c1 = compare (lorentz_ordering wf1) (lorentz_ordering wf2) in
  if c1 ≠ 0 then
     c1
  else
     let c2 = compare wf1 wf2 in
     if c2 ≠ 0 then
        c2
     else
        compare mult1 mult2

let amp_compare amp1 amp2 =
  let cflow a = CM.flow (F.incoming a) (F.outgoing a) in
  let c1 = compare (cflow amp1) (cflow amp2) in
  if c1 ≠ 0 then
     c1
  else
     let process_sans_color a =
        (List.map CM.flavor_sans_color (F.incoming a),
           List.map CM.flavor_sans_color (F.outgoing a)) in
     compare (process_sans_color amp1) (process_sans_color amp2)

let level_compare (f1, amp1) (f2, amp2) =
  let p1 = F.momentum_list (F.lhs f1)
  and p2 = F.momentum_list (F.lhs f2) in
  let c1 = int_lst_compare p1 p2 in
  if c1 ≠ 0 then
```

```
                c1
            else
               let c2  =  compare f1 f2 in
               if  c2  ≠  0 then
                  c2
               else
                  amp_compare amp1 amp2

    module ISet  =  Set.Make (struct type t  =  int list
                                   let compare  =  int_lst_compare end)

    module WFSet  =  Set.Make (struct type t  =  CF.wf  ×  int
                                   let compare  =  wf_compare end)

    module CSet  =  Set.Make (struct type t  =  CM.constant
                                   let compare  =  compare end)

    module FSet  =  Set.Make (struct type t  =  F.fusion  ×  F.amplitude
                                   let compare  =  level_compare end)
```

⬙ It might be preferable to use a *PMap* which maps mom to int, instead of this way. More standard functions like *mem* could be used. Also, *get_ID* would be faster, $\mathcal{O}(\log N)$ instead of $\mathcal{O}(N)$, and simpler. For 8 gluons: N=127 momenta. Minor performance issue.

```
    module IMap  =  Map.Make (struct type t  =  int let compare  =  compare end)
```

For *wf*s it is crucial for the performance to use a different type of *Map*s.

```
    module WFMap  =  Map.Make (struct type t  =  CF.wf  ×  int
                                   let compare  =  wf_compare end)

    type lookups  =  { pmap  :  int list IMap.t;
                        wfmap  :  int WFMap.t;
                        cmap  :  CM.constant IMap.t  ×  CM.constant IMap.t;
                        amap  :  F.amplitude IMap.t;
                        n_wfs  :  int list;
                        amplitudes  :  CF.amplitudes;
                        dict  :  F.amplitude  →  F.wf  →  int }

    let largest_key imap  =
       if (IMap.is_empty imap) then
          failwith "largest_key:␣Map␣is␣empty!"
       else
          fst (IMap.max_binding imap)
```

OCaml's *compare* from pervasives cannot compare functional types, e.g. for type *amplitude*, if no specific equality function is given ("equal: functional value"). Therefore, we allow to specify the ordering.

```
    let get_ID′ comp map elt  :  int =
       let smallmap  =  IMap.filter (fun _ x  →  (comp x elt)  =  0 ) map in
       if IMap.is_empty smallmap then
          raise Not_found
       else
          fst (IMap.min_binding smallmap)
```

⬙ Trying to curry *map* here leads to type errors of the polymorphic function *get_ID*?

```
    let get_ID map  =  match map with
     |  map  →  get_ID′ compare map

    let get_const_ID map x  =  match map with
     |  (map1, map2)  →  try get_ID′ compare map1 x with
                            _  →  try get_ID′ compare map2 x with
                            _  →  failwith "Impossible"
```

Creating an integer map of a list with an optional argument that indicates where the map should start counting.

let *map_of_list* ?*start* : (*st* = 1) *lst* =
  let *g* (*ind*, *map*) *wf* = (*succ ind*, *IMap.add ind wf map*) in
  *lst* |> *List.fold_left g* (*st*, *IMap.empty*) |> *snd*

let *wf_map_of_list* ?*start* : (*st* = 1) *lst* =
  let *g* (*ind*, *map*) *wf* = (*succ ind*, *WFMap.add wf ind map*) in
  *lst* |> *List.fold_left g* (*st*, *WFMap.empty*) |> *snd*

        WFSet.add wf_tpl seen) seen_wfs externals
```

*print_externals* and *print_ext_amp* do in principle the same thing but *print_externals* filters out dublicate external wave functions. Even with *print_externals* the same (numerically) external wave function will be loaded if it belongs to a different color flow, just as in the native Fortran code. For color MC, *print_ext_amp* has to be used (redundant instructions but only one flow is computed) and the filtering of duplicate fusions has to be disabled.

```
  let print_ext_amps lookups =
      let print_external_amp s x = print_externals lookups s x in
      ignore (
        List.fold_left print_external_amp WFSet.empty
          (CF.processes lookups.amplitudes)
        )

(*

                                      Currents

*)
```

Parallelization issues: All fusions have to be completed before the propagation takes place. Preferably each fusion and propagation is done by one thread. Solution: All fusions are subinstructions, i.e. if they are read by the main loop they are skipped. If a propagation occurs, all fusions have to be computed first. The additional control bit is the sign of the first int of an instruction.

      end;
```

Since the OVM knows that we want to propagate a wf, we can send the necessary fusions now.

$$List.iter \ (print\_current \ lookups \ lhs\_wfID \ amplitude) \ (F.rhs \ fusion)$$

```
  let print_all_fusions lookups =
    let fusions = CF.fusions lookups.amplitudes in
    let fset = List.fold_left (fun s x → FSet.add x s) FSet.empty fusions in
    ignore (List.fold_left (fun level (f, amplitude) →
      let wf = F.lhs f in
      let lhs_momID = mom_ID lookups.pmap wf in
      let level' = List.length (F.momentum_list wf) in
      if (level' > level ∧ level' > 2) then break ();
      print_fusion lookups lhs_momID f amplitude;
      level')
    1 (FSet.elements fset) )
```

*Brakets*

```
  let print_braket lookups amplitude braket =
    let bra = F.bra braket
    and ket = F.ket braket in
    let braID = wf_index lookups.wfmap lookups.n_wfs
      (mult_wf lookups.dict amplitude bra) in
    List.iter (print_current lookups braID amplitude) ket
```

$$\mathrm{i}T = \mathrm{i}^{\#\text{vertices}}\mathrm{i}^{\#\text{propagators}} \cdots = \mathrm{i}^{n-2}\mathrm{i}^{n-3} \cdots = -\mathrm{i}(-1)^n \cdots \tag{15.1}$$

All brakets for one cflow amplitude should be calculated by one thread to avoid multiple access on the same memory (amplitude).

```
  let print_brakets lookups (amplitude, i) =
    let n = List.length (F.externals amplitude) in
    let sign = if n mod 2 = 0 then -1 else 1
```

and *sym* $=$ *F.symmetry amplitude* in
*printi ovm_CALC_BRAKET ˜lhs : i ˜rhs1 : sym ˜coupl : sign;*
*amplitude* | $>$ *F.brakets* | $>$ *List.iter* (*print_braket lookups amplitude*)

Fortran arrays/OCaml lists start on 1/0. The amplitude list is sorted by *amp_compare* according to their color flows. In this way the amp array is sorted in the same way as *table_color_factors*.

let *print_all_brakets lookups* $=$
let *g i elt* $=$ *print_brakets lookups* (*elt*, $i + 1$) in
*lookups.amplitudes* | $>$ *CF.processes* | $>$ *List.sort amp_compare*
$\longrightarrow$ *ThoList.iteri g* 0

### Couplings

For now we only care to catch the arrays *gncneu*, *gnclep*, *gncup* and *gncdown* of the SM. This will need an overhaul when it is clear how we store the type information of coupling constants.

let *strip_array_tag* $=$ function

Using a two element array for the combined vector-axial and scalar-pseudo couplings helps to support HELAS as well. Since we will probably never support general boson couplings with HELAS, it might be retired in favor of two separate variables. For this *Model.constant_symbol* has to be generalized.

NB: passing the array instead of two separate constants would be a *bad* idea, because the support for Majorana spinors below will have to flip signs!

```

*print_current* is the most important function that has to match the functions in `omega95` (see appendix <span style="color:red">X</span>). It offers plentiful opportunities for making mistakes, in particular those related to signs. We start with a few auxiliary functions:

```
    let children2 rhs  =
        match F.children rhs with
        | [wf1; wf2]  →  (wf1, wf2)
        | _  →  failwith "Targets.children2:␣can't␣happen"

    let children3 rhs  =
        match F.children rhs with
        | [wf1; wf2; wf3]  →  (wf1, wf2, wf3)
        | _  →  invalid_arg "Targets.children3:␣can't␣happen"
```

Note that it is (marginally) faster to multiply the two scalar products with the coupling constant than the four vector components.

This could be part of `omegalib` as well . . .

```
    let format_coeff  =  function
        | 1  →  ""
        | −1  →  "-"
        | coeff  →  "(" ^ string_of_int coeff ^ ")*"

    let format_coupling coeff c  =
```

```
match coeff with
| 1 → c
| − 1 → "(-" ^ c ^")"
| coeff → string_of_int coeff ^ "*" ^ c
```

⬦ The following is error prone and should be generated automagically.

let *print_vector4 c wf1 wf2 wf3 fusion* (*coeff*, *contraction*) =

Table 9.13 is a bit misleading, since if includes totally antisymmetric structure constants. The space-time part alone is also totally antisymmetric:

> | *Gauge_Gauge_Gauge coeff* →
>    let *c* = *format_coupling coeff c* in
>    begin match *fusion* with
>    | (*F23* | *F31* | *F12*) →
>        *printf* `"g_gg(%s,%s,%s,%s,%s)"` *c wf1 p1 wf2 p2*
>    | (*F32* | *F13* | *F21*) →
>        *printf* `"g_gg(%s,%s,%s,%s,%s)"` *c wf2 p2 wf1 p1*
>    end
>
> | *I_Gauge_Gauge_Gauge coeff* →
>    let *c* = *format_coupling coeff c* in
>    begin match *fusion* with
>    | (*F23* | *F31* | *F12*) →
>        *printf* `"g_gg((0,1)*(%s),%s,%s,%s,%s)"` *c wf1 p1 wf2 p2*
>    | (*F32* | *F13* | *F21*) →
>        *printf* `"g_gg((0,1)*(%s),%s,%s,%s,%s)"` *c wf2 p2 wf1 p1*
>    end

In *Aux_Gauge_Gauge*, we can not rely on antisymmetry alone, because of the different Lorentz representations of the auxialiary and the gauge field. Instead we have to provide the sign in

$$(V_2 \wedge V_3) \cdot T_1 = \begin{cases} V_2 \cdot (T_1 \cdot V_3) = -V_2 \cdot (V_3 \cdot T_1) \\ V_3 \cdot (V_2 \cdot T_1) = -V_3 \cdot (T_1 \cdot V_2) \end{cases} \tag{15.2}$$

ourselves. Alternatively, one could provide `g_xg` mirroring `g_gx`.

> | *Aux_Gauge_Gauge coeff* →
>    let *c* = *format_coupling coeff c* in
>    begin match *fusion* with
>    | *F23* → *printf* `"x_gg(%s,%s,%s)"` *c wf1 wf2*
>    | *F32* → *printf* `"x_gg(%s,%s,%s)"` *c wf2 wf1*
>    | *F12* → *printf* `"g_gx(%s,%s,%s)"` *c wf2 wf1*
>    | *F21* → *printf* `"g_gx(%s,%s,%s)"` *c wf1 wf2*
>    | *F13* → *printf* `"(-1)*g_gx(%s,%s,%s)"` *c wf2 wf1*
>    | *F31* → *printf* `"(-1)*g_gx(%s,%s,%s)"` *c wf1 wf2*
>    end

These cases are symmetric and we just have to juxtapose the correct fields and provide parentheses to minimize the number of multiplications.

> | *Scalar_Vector_Vector coeff* →
>    let *c* = *format_coupling coeff c* in
>    begin match *fusion* with
>    | (*F23* | *F32*) → *printf* `"%s*(%s*%s)"` *c wf1 wf2*
>    | (*F12* | *F13*) → *printf* `"(%s*%s)*%s"` *c wf1 wf2*
>    | (*F21* | *F31*) → *printf* `"(%s*%s)*%s"` *c wf2 wf1*
>    end
>
> | *Aux_Vector_Vector coeff* →
>    let *c* = *format_coupling coeff c* in
>    begin match *fusion* with
>    | (*F23* | *F32*) → *printf* `"%s*(%s*%s)"` *c wf1 wf2*

    | F31  →  printf "s_gravs(%s,%s,%s,-(%s+%s),%s,%s)" c m1 p1 p1 p2 wf2 wf1
    | F23  →  printf "grav_ss(%s,%s,%s,%s,%s,%s)" c m1 p1 p2 wf1 wf2
    | F32  →  printf "grav_ss(%s,%s,%s,%s,%s,%s)" c m1 p2 p1 wf2 wf1
    end
```

In producing a vector in the fusion we always contract the rightmost index with the vector wavefunction from _rhs_. So the first momentum is always the one of the vector boson produced in the fusion, while the second one is that from the _rhs_. This makes the cases _F12_ and _F13_ as well as _F21_ and _F31_ equal. In principle, we could have already done this for the _Graviton_Scalar_Scalar_ case.

```
| Graviton_Vector_Vector coeff  →
    let c = format_coupling coeff c in
    begin match fusion with
    | (F12 | F13)  →  printf "v_gravv(%s,%s,-(%s+%s),%s,%s,%s)" c m2 p1 p2 p2 wf1 wf2

Flip the sign to account for the $i^2$ relative to diagrams with only cubic couplings.

That's an *slightly dangerous* hack!!! How do we accnount for such signs when treating *n*-ary vertices uniformly?

```

⏚ This reproduces the hack on page [475] and gives the correct results up to quartic vertices. Make sure that it is also correct in light of ([15.3]), i.e.

$$\mathrm{i}T = \mathrm{i}^{\#\mathrm{vertices}}\mathrm{i}^{\#\mathrm{propagators}}\cdots = \mathrm{i}^{n-2}\mathrm{i}^{n-3}\cdots = -\mathrm{i}(-1)^n\cdots$$

### Spin, Flavor & Color Tables

The following abomination is required to keep the number of continuation lines as low as possible. FORTRAN77-style `DATA` statements are actually a bit nicer here, but they are nor available for *constant* arrays.

We used to have a more elegant design with a sentinel 0 added to each initializer, but some revisions of the Compaq/Digital Compiler have a bug that causes it to reject this variant.

The actual table writing code using `reshape` should be factored, since it's the same algorithm every time.

*Majorana Fermions*

⚠ *JR sez' (regarding the Majorana Feynman rules):* For this function we need a different approach due to our aim of implementing the fermion vertices with the right line as ingoing (in a calculational sense) and the left line in a fusion as outgoing. In defining all external lines and the fermionic wavefunctions built out of them as ingoing we have to invert the left lines to make them outgoing. This happens by multiplying them with the inverse charge conjugation matrix in an appropriate representation and then transposing it. We must distinguish whether the direction of calculation and the physical direction of the fermion number flow are parallel or antiparallel. In the first case we can use the "normal" Feynman rules for Dirac particles, while in the second, according to the paper of Denner et al., we have to reverse the sign of the vector and antisymmetric bilinears of the Dirac spinors, cf. the *Coupling* module.

Note the subtlety for the left- and righthanded couplings: Only the vector part of these couplings changes in the appropriate cases its sign, changing the chirality to the negative of the opposite. *(JR's probably right, but I need to check myself . . . )*

This function is for the vertices with three particles including two fermions but also a momentum, therefore with a dimensionful coupling constant, e.g. the gravitino vertices. One has to distinguish between the two kinds of canonical orders in the string of gamma matrices. Of course, the direction of the string of gamma matrices is reversed if one goes from the *Gravbar*, _, *Psi* to the *Psibar*, _, *Grav* vertices, and the same is true for the couplings of the gravitino to the Majorana fermions. For more details see the tables in the *coupling* implementation.

We now have to fix the directions of the momenta. For making the compiler happy and because we don't want to make constructions of infinite complexity we list the momentum including vertices without gravitinos here; the pattern matching says that's better. Perhaps we have to find a better name now.

For the cases of $MOM$, $MOM5$, $MOML$ and $MOMR$ which arise only in BRST transformations we take the mass as a coupling constant. For $VMOM$ we don't need a mass either. These vertices are like kinetic terms and so need not have a coupling constant. By this we avoid a strange and awful construction with a new variable. But be careful with a generalization if you want to use these vertices for other purposes.

</div>

We need support for dimension-5 vertices with two fermions and two bosons, appearing in theories of supergravity and also together with in insertions of the supersymmetric current. There is a canonical order *fermionbar*, *boson_1*, *boson_2*, *fermion*, so what one has to do is a mapping from the fusions *F123* etc. to the order of the three wave functions *wf1*, *wf2* and *wf3*.

The function $d\_p$ (for distinct the particle) distinguishes which particle (scalar or vector) must be fused to in the special functions.

## 16.1  Interface of Phasespace

```
module type  T  =
  sig
    type momentum

    type α t
    type α decay
```

Sort individual decays and complete phasespaces in a canonical order to determine topological equivalence classes.

```
    val sort  :  (α  →  α  →  int)  →  α t  →  α t
    val sort_decay  :  (α  →  α  →  int)  →  α decay  →  α decay
```

Functionals:

```
    val map  :  (α  →  β)  →  α t  →  β t
    val map_decay  :  (α  →  β)  →  α decay  →  β decay

    val eval  :  (α  →  β)  →  (α  →  β)  →  (α  →  β  →  β  →  β)  →  α t  →  β t
    val eval_decay  :  (α  →  β)  →  (α  →  β  →  β  →  β)  →  α decay  →  β decay
```

*of_momenta f1 f2 plist* constructs the phasespace parameterization for a process $f_1 f_2 \to X$ with flavor decoration from pairs of outgoing momenta and flavors *plist* and initial flavors *f1* and *f2*

```
    val of_momenta  :  α  →  α  →  (momentum  ×  α) list  →  (momentum  ×  α) t
    val decay_of_momenta  :  (momentum  ×  α) list  →  (momentum  ×  α) decay

    exception Duplicate of momentum
    exception Unordered of momentum
    exception Incomplete of momentum

  end
```

```
module Make (M  :  Momentum.T)  :  T with type momentum  =  M.t
```

## 16.2  Implementation of Phasespace

### 16.2.1  Tools

These are candidates for *ThoList* and not specific to phase space.

```
let rec first_match' mismatch f  =  function
  | []  →  None
  | x  ::  rest  →
      if f x then
        Some (x, List.rev_append mismatch rest)
      else
        first_match' (x  ::  mismatch) f rest
```

Returns $(x, X \setminus \{x\})$ if $\exists x \in X : f(x)$.

```
let first_match f l  =  first_match' [] f l
```

```
let rec first_pair' mismatch1 f l1 l2  =
    match l1 with
    | []  →  None
    | x1  ::  rest1  →
        begin match first_match (f x1) l2 with
        | None  →  first_pair' (x1 :: mismatch1) f rest1 l2
        | Some (x2, rest2)  →
            Some ((x1, x2), (List.rev_append mismatch1 rest1, rest2))
        end
```

Returns $((x, y), (X \setminus \{x\}, Y \setminus \{y\}))$ if $\exists x \in X : \exists y \in Y : f(x, y)$.

```
let first_pair f l1 l2  =  first_pair' [] f l1 l2
```

### 16.2.2    Phase Space Parameterization Trees

```
module type T  =
    sig
        type momentum
        type α t
        type α decay
        val sort  :  (α → α → int) → α t → α t
        val sort_decay  :  (α → α → int) → α decay → α decay
        val map  :  (α → β) → α t → β t
        val map_decay  :  (α → β) → α decay → β decay
        val eval  :  (α → β) → (α → β) → (α → β → β → β) → α t → β t
        val eval_decay  :  (α → β) → (α → β → β → β) → α decay → β decay
        val of_momenta  :  α → α → (momentum × α) list → (momentum × α) t
        val decay_of_momenta  :  (momentum × α) list → (momentum × α) decay
        exception Duplicate of momentum
        exception Unordered of momentum
        exception Incomplete of momentum
    end

module Make (M  :  Momentum.T)  =
    struct

        type momentum  =  M.t
```

⚠ Finally, we came back to binary trees . . .

### Cascade Decays

```
        type α decay  =
            | Leaf of α
            | Branch of α × α decay × α decay
```

⚠ Trees of type $(momentum \times \alpha \ option) \ decay$ can be build easily and mapped to $(momentum \times \alpha) \ decay$ later, once all the $\alpha$ slots are filled. A more elegant functor operating on $\beta \ decay$ directly (with *Momentum* style functions defined for $\beta$) would not allow holes in the $\beta \ decay$ during the construction.

```
        let label  =  function
            | Leaf p  →  p
            | Branch (p, _, _)  →  p

        let rec sort_decay cmp  =  function
            | Leaf _ as l  →  l
            | Branch (p, d1, d2)  →
                let d1'  =  sort_decay cmp d1
                and d2'  =  sort_decay cmp d2 in
                if cmp (label d1') (label d2')  ≤  0 then
```

```
              Branch (p, d1', d2')
          else
              Branch (p, d2', d1')

let rec map_decay f = function
  | Leaf p → Leaf (f p)
  | Branch (p, d1, d2) → Branch (f p, map_decay f d1, map_decay f d2)

let rec eval_decay fl fb = function
  | Leaf p → Leaf (fl p)
  | Branch (p, d1, d2) →
      let d1' = eval_decay fl fb d1
      and d2' = eval_decay fl fb d2 in
      Branch (fb p (label d1') (label d2'), d1', d2')
```

Assuming that $p > p_D \lor p = p_D \lor p < p_D$, where $p_D$ is the overall momentum of a decay tree $D$, we can add $p$ to $D$ at the top or somewhere in the middle. Note that '$<$' is not a total ordering and the operation can fail (raise exceptions) if the set of momenta does not correspond to a tree. Also note that a momentum can already be present without flavor as a complement in a branching entered earlier.

```
exception Duplicate of momentum
exception Unordered of momentum

let rec embed_in_decay (p, f as pf) = function
  | Leaf (p', f' as pf') as d' →
      if M.less p' p then
          Branch ((p, Some f), d', Leaf (M.sub p p', None))
      else if M.less p p' then
          Branch (pf', Leaf (p, Some f), Leaf (M.sub p' p, None))
      else if p = p' then
          begin match f' with
          | None → Leaf (p, Some f)
          | Some _ → raise (Duplicate p)
          end
      else
          raise (Unordered p)
  | Branch ((p', f' as pf'), d1, d2) as d' →
      let p1, _ = label d1
      and p2, _ = label d2 in
      if M.less p' p then
          Branch ((p, Some f), d', Leaf (M.sub p p', None))
      else if M.lesseq p p1 then
          Branch (pf', embed_in_decay pf d1, d2)
      else if M.lesseq p p2 then
          Branch (pf', d1, embed_in_decay pf d2)
      else if p = p' then
          begin match f' with
          | None → Branch ((p, Some f), d1, d2)
          | Some _ → raise (Duplicate p)
          end
      else
          raise (Unordered p)
```

⚠ Note that both *embed_in_decay* and *embed_in_decays* below do *not* commute, and should process 'bigger' momenta first, because disjoint sub-momenta will create disjoint subtrees in the latter and raise exceptions in the former.

```
exception Incomplete of momentum

let finalize1 = function
  | p, Some f → (p, f)
  | p, None → raise (Incomplete p)

let finalize_decay t = map_decay finalize1 t
```

Figure 16.1: Phasespace parameterization for $2 \to n$ scattering by a sequence of cascade decays.

Process the momenta starting in with the highest $M.rank$:

> let *sort_momenta plist* =
>   *List.sort* (fun $(p1, \, \_)$ $(p2, \, \_)$ $\to$ *M.compare p1 p2*) *plist*

> let *decay_of_momenta plist* =
>   match *sort_momenta plist* with
>   | $(p, \, f)$ :: *rest* $\to$
>       *finalize_decay* (*List.fold_right embed_in_decay rest* (*Leaf* $(p, \, Some \, f)$))
>   | [] $\to$ *invalid_arg* `"Phasespace.decay_of_momenta:␣empty"`

<center>$2 \to n$ *Scattering*</center>

A general $2 \to n$ scattering process can be parameterized by a sequence of cascade decays. The most symmetric representation is a little bit redundant and enters each $t$-channel momentum twice.

> type $\alpha \ t$ = $(\alpha \ \times \ \alpha \ decay \ \times \ \alpha)$ *list*

⚠ let *topology* = *map snd* has type $(momentum \ \times \ \alpha) \ t \ \to \ \alpha \ t$ and can be used to define topological equivalence classes "up to permutations of momenta," which are useful for calculating Whizard "groves"[1] [11].

> let *sort cmp* = *List.map* (fun $(l, \, d, \, r)$ $\to$ $(l, \, sort\_decay \ cmp \ d, \, r)$)
> let *map f* = *List.map* (fun $(l, \, d, \, r)$ $\to$ $(f \ l, \, map\_decay \ f \ d, \, f \ r)$)
> let *eval ft fl fb* = *List.map* (fun $(l, \, d, \, r)$ $\to$ $(ft \ l, \, eval\_decay \ fl \ fb \ d, \, ft \ r)$)

Find a tree with a defined ordering relation with respect to $p$ or create a new one at the end of the list.

> let rec *embed_in_decays* $(p, \, f \ as \ pf)$ = function
>   | [] $\to$ $[Leaf \ (p, \, Some \, f)]$
>   | $d'$ :: *rest* $\to$
>       let $p', \, \_$ = *label* $d'$ in
>       if *M.lesseq* $p' \ p$ $\lor$ *M.less* $p \ p'$ then
>         *embed_in_decay pf* $d'$ :: *rest*
>       else
>         $d'$ :: *embed_in_decays pf rest*

<center>*Collecting Ingredients*</center>

> type $\alpha$ *unfinished_decays* =
>     { $n$ : *int*;
>       *t_channel* : $(momentum \ \times \ \alpha \ option)$ *list*;
>       *decays* : $(momentum \ \times \ \alpha \ option)$ *decay list* }

> let *empty n* = { $n \ = \ n$; *t_channel* = []; *decays* = [] }

———————————————

[1]Not to be confused with gauge invariant classes of Feynman diagrams [12].

let *insert_in_unfinished_decays* (*p*, *f* as *pf*) *d* =
  if *M.Scattering.spacelike p* then
    { *d* with *t_channel* = (*p*, *Some f*) :: *d.t_channel* }
  else
    { *d* with *decays* = *embed_in_decays pf d.decays* }

let *flip_incoming plist* =
  *List.map* (fun (*p′*, *f′*) → (*M.Scattering.flip_s_channel_in p′*, *f′*)) *plist*

let *unfinished_decays_of_momenta n f2 p* =
  *List.fold_right insert_in_unfinished_decays*
    (*sort_momenta* (*flip_incoming* ((*M.of_ints n* [2], *f2*) :: *p*))) (*empty n*)

### Assembling Ingredients

let *sort3 compare x y z* =
  let *a* = [| *x*; *y*; *z* |] in
  *Array.sort compare a*;
  (*a*.(0), *a*.(1), *a*.(2))

Take advantage of the fact that sorting with *M.compare* sorts with *rising* values of *M.rank*:

let *allows_momentum_fusion* (*p*, _) (*p1*, _) (*p2*, _) =
  let *p2′*, *p1′*, *p′* = *sort3 M.compare p p1 p2* in
  match *M.try_fusion p′ p1′ p2′* with
  | *Some* _ → true
  | *None* → false

let *allows_fusion p1 p2 d* = *allows_momentum_fusion* (*label d*) *p1 p2*

let rec *thread_unfinished_decays′ p acc tlist dlist* =
  match *first_pair* (*allows_fusion p*) *tlist dlist* with
  | *None* → (*p*, *acc*, *tlist*, *dlist*)
  | *Some* ((*t*, _ as *td*), (*tlist′*, *dlist′*)) →
    *thread_unfinished_decays′ t* (*td* :: *acc*) *tlist′ dlist′*

let *thread_unfinished_decays p c* =
  match *thread_unfinished_decays′ p* [] *c.t_channel c.decays* with
  | _, *pairs*, [], [] → *pairs*
  | _ → *failwith* "thread_unfinished_decays"

let rec *combine_decays* = function
  | [] → []
  | ((*t*, *f* as *tf*), *d*) :: *rest* →
    let *p*, _ = *label d* in
    begin match *M.try_sub t p* with
    | *Some p′* → (*tf*, *d*, (*p′*, *f*)) :: *combine_decays rest*
    | *None* → (*tf*, *d*, (*M.sub* (*M.neg t*) *p*, *f*)) :: *combine_decays rest*
    end

let *finalize t* = *map finalize1 t*

let *of_momenta f1 f2* = function
  | (*p*, _) :: _ as *l* →
    let *n* = *M.dim p* in
    *finalize* (*combine_decays*
          (*thread_unfinished_decays* (*M.of_ints n* [1], *Some f1*)
            (*unfinished_decays_of_momenta n f2 l*)))
  | [] → []

### Diagnostics

let *p_to_string p* =
  *String.concat* "" (*List.map string_of_int* (*M.to_ints* (*M.abs p*)))

```
let rec to_string1 = function
   | Leaf p → "(" ^ p_to_string p ^ ")"
   | Branch (_, d1, d2) → "(" ^ to_string1 d1 ^ to_string1 d2 ^ ")"

let to_string ps =
   String.concat "/"
      (List.map (fun (p1, d, p2) →
         p_to_string p1 ^ to_string1 d ^ p_to_string p2) ps)
```

*Examples*

```
let try_thread_unfinished_decays p c =
   thread_unfinished_decays' p [] c.t_channel c.decays

let try_of_momenta f = function
   | (p, _) :: _ as l →
      let n = M.dim p in
      try_thread_unfinished_decays
         (M.of_ints n [1], None) (unfinished_decays_of_momenta n f l)
   | [] → invalid_arg "try_of_momenta"

end
```

Talk to [11].

## 17.1  Interface of Whizard

```
module type T  =
  sig
    type t
    type amplitude
    val trees  :  amplitude  →  t
    val merge  :  t  →  t
    val write  :  out_channel  →  string →  t  →  unit

  end

module Make (FM  :  Fusion.Maker) (P  :  Momentum.T)
    (PW  :  Momentum.Whizard with type t  =  P.t) (M  :  Model.T)  :
    T with type amplitude  =  FM(P)(M).amplitude

val write_interface  :  out_channel  →  string list  →  unit
val write_makefile  :  out_channel  →  α  →  unit
val write_makefile_processes  :  out_channel  →  string list  →  unit
```

## 17.2  Implementation of Whizard

```
open Printf

module type T  =
  sig
    type t
    type amplitude
    val trees  :  amplitude  →  t
    val merge  :  t  →  t
    val write  :  out_channel  →  string →  t  →  unit

  end

module Make (FM  :  Fusion.Maker) (P  :  Momentum.T)
    (PW  :  Momentum.Whizard with type t  =  P.t) (M  :  Model.T)  =
  struct
    module F  =  FM(P)(M)

    type tree  =  (P.t  ×  F.flavor list) list

    module Poles  =  Map.Make
        (struct
          type t  =  int  ×  int
          let compare (s1,  t1) (s2,  t2)  =
            let c  =  compare s2 s1 in
            if c  ≠  0 then
              c
```

```
        else
            compare t1 t2
      end)

let add_tree maps tree trees =
    Poles.add maps
        (try tree :: (Poles.find maps trees) with Not_found → [tree]) trees

type t =
    { in1 : F.flavor;
       in2 : F.flavor;
       out : F.flavor list;
       trees : tree list Poles.t }

type amplitude = F.amplitude
```

### 17.2.1   Building Trees

A singularity is to be mapped if it is timelike and not the overall $s$-channel.

```
let timelike_map c = P.Scattering.timelike c ∧ ¬ (P.Scattering.s_channel c)

let count_maps n clist =
    List.fold_left (fun (s, t as cnt) (c, _) →
        if timelike_map c then
            (succ s, t)
        else if P.Scattering.spacelike c then
            (s, succ t)
        else
            cnt) (0, 0) clist

let poles_to_whizard n trees poles =
    let tree = List.map (fun wf →
        (P.Scattering.flip_s_channel_in (F.momentum wf), [F.flavor wf])) poles in
    add_tree (count_maps n tree) tree trees
```

I must reinstate the *conjugate* eventually!

```
let trees a =
    match F.externals a with
    | in1 :: in2 :: out →
        let n = List.length out + 2 in
        { in1 = F.flavor in1;
           in2 = F.flavor in2;
           out = List.map (fun f → (* M.conjugate *) (F.flavor f)) out;
           trees = List.fold_left
              (poles_to_whizard n) Poles.empty (F.poles a) }
    | _ → invalid_arg "Whizard().trees"
```

### 17.2.2   Merging Homomorphic Trees

```
module Pole_Map =
    Map.Make (struct type t = P.t list let compare = compare end)
module Flavor_Set =
    Set.Make (struct type t = F.flavor let compare = compare end)

let add_flavors flist fset =
    List.fold_right Flavor_Set.add flist fset

let set_of_flavors flist =
    List.fold_right Flavor_Set.add flist Flavor_Set.empty

let pack_tree map t =
    let c, f =
```

```
        List.split (List.sort (fun (c1, _) (c2, _) →
          compare (PW.of_momentum c2) (PW.of_momentum c1)) t) in
      let f' =
        try
          List.map2 add_flavors f (Pole_Map.find c map)
        with
        | Not_found → List.map set_of_flavors f in
      Pole_Map.add c f' map

  let pack_map trees = List.fold_left pack_tree Pole_Map.empty trees

  let merge_sets clist flist =
    List.map2 (fun c f → (c, Flavor_Set.elements f)) clist flist

  let unpack_map map =
    Pole_Map.fold (fun c f l → (merge_sets c f) :: l) map []
```

If a singularity is to be mapped (i. e. if it is timelike and not the overall *s*-channel), expand merged particles again:

```
  let unfold1 (c, f) =
    if timelike_map c then
      List.map (fun f' → (c, [f'])) f
    else
      [(c, f)]

  let unfold_tree tree = Product.list (fun x → x) (List.map unfold1 tree)

  let unfold trees = ThoList.flatmap unfold_tree trees

  let merge t =
    { t with trees = Poles.map
        (fun t' → unfold (unpack_map (pack_map t'))) t.trees }
```

### 17.2.3   Printing Trees

```
  let flavors_to_string f =
    String.concat "/" (List.map M.flavor_to_string f)

  let whizard_tree t =
    "tree␣" ^
    (String.concat "␣" (List.rev_map (fun (c, _) →
      (string_of_int (PW.of_momentum c))) t)) ^
    "␣!␣" ^
    (String.concat ",␣" (List.rev_map (fun (_, f) → flavors_to_string f) t))

  let whizard_tree_debug t =
    "tree␣" ^
    (String.concat "␣" (List.rev_map (fun (c, _) →
      ("[" ^ (String.concat "+" (List.map string_of_int (P.to_ints c))) ^ "]"))
                          (List.sort (fun (t1,_) (t2,_) →
                            let c =
                              compare
                                (List.length (P.to_ints t2))
                                (List.length (P.to_ints t1)) in
                            if c ≠ 0 then
                              c
                            else
                              compare t1 t2) t))) ^
    "␣!␣" ^
    (String.concat ",␣" (List.rev_map (fun (_, f) → flavors_to_string f) t))

  let format_maps = function
    | (0, 0) → "neither␣mapped␣timelike␣nor␣spacelike␣poles"
    | (0, 1) → "no␣mapped␣timelike␣poles,␣one␣spacelike␣pole"
    | (0, n) → "no␣mapped␣timelike␣poles,␣" ^
```

```
            string_of_int n ^ "␣spacelike␣poles"
    | (1, 0) → "one␣mapped␣timelike␣pole,␣no␣spacelike␣pole"
    | (1, 1) → "one␣mapped␣timelike␣and␣spacelike␣pole␣each"
    | (1, n) → "one␣mapped␣timelike␣and␣" ^
            string_of_int n ^ "␣spacelike␣poles"
    | (n, 0) → string_of_int n ^
            "␣mapped␣timelike␣poles␣and␣no␣spacelike␣pole"
    | (n, 1) → string_of_int n ^
            "␣mapped␣timelike␣poles␣and␣one␣spacelike␣pole"
    | (n, n') → string_of_int n ^ "␣mapped␣timelike␣and␣" ^
            string_of_int n' ^ "␣spacelike␣poles"
```

let *format_flavor f* =
  match *flavors_to_string f* with
  | "d" → "d" | "dbar" → "D"
  | "u" → "u" | "ubar" → "U"
  | "s" → "s" | "sbar" → "S"
  | "c" → "c" | "cbar" → "C"
  | "b" → "b" | "bbar" → "B"

# —18—
## APPLICATIONS

## *18.1   Sample*

## *18.2   Interface of Omega*

```
module type T  =
  sig
    val main  :  unit →  unit
```

This used to be only intended for debugging O'Giga, but might live longer . . .

```
    type flavor
    val diagrams : flavor  →  flavor  →  flavor list →
      ((flavor  ×  Momentum.Default.t)  ×
          (flavor  ×  Momentum.Default.t,
            flavor  ×  Momentum.Default.t) Tree.t) list
  end

module Make (FM  :  Fusion.Maker) (TM  :  Target.Maker) (M  :  Model.T)  :
    T with type flavor  =  M.flavor
```

## *18.3   Implementation of Omega*

```
let (<<) f  g  x  =  f (g x)
let (>>) f  g  x  =  g (f x)

module P  =  Momentum.Default
module P_Whizard  =  Momentum.DefaultW

module type T  =
  sig
    val main  :  unit →  unit
    type flavor
    val diagrams : flavor  →  flavor  →  flavor list →
      ((flavor  ×  Momentum.Default.t)  ×
          (flavor  ×  Momentum.Default.t,
            flavor  ×  Momentum.Default.t) Tree.t) list
  end

module Make (Fusion_Maker  :  Fusion.Maker) (Target_Maker  :  Target.Maker) (M  :  Model.T)  =
  struct

    module CM  =  Colorize.It(M)

    type flavor  =  M.flavor

    module Proc  =  Process.Make(M)
```

We must have initialized the vertices *before* applying *Fusion_Maker*, at least if we want to continue using the vertex cache!

NB: this causes the constant initializers in *Fusion_Maker* more than once. Such side effects must be avoided if the initializers involve expensive computations. *Relying on the fact that the functor will be called only once is not a good idea!*

```
module F  =  Fusion_Maker(P)(M)
module CF  =  Fusion.Multi(Fusion_Maker)(P)(M)
module T  =  Target_Maker(Fusion_Maker)(P)(M)
module W  =  Whizard.Make(Fusion_Maker)(P)(P_Whizard)(M)
module C  =  Cascade.Make(M)(P)

module VSet  =
    Set.Make (struct type t  =  F.constant Coupling.t let compare  =  compare end)
```

For the phase space, we need asymmetric DAGs.

HACK: since we will not use this to compute amplitudes, there's no need to supply the proper statistics module and we may assume Dirac fermions.

HACK: for the phase space, we should be able to work on the uncolored model.

```
module PHS  =
    Fusion.Helac(struct let max_arity ()  =  pred (M.max_degree ()) end)(P)(M)
```

Form a $\alpha$ *list* from a $\alpha$ *option array*, containing the elements that are not *None* in order.

```
let opt_array_to_list a  =
    let rec opt_array_to_list' acc i a  =
        if i  <  0 then
            acc
        else
            begin match a.(i) with
            | None  →  opt_array_to_list' acc (pred i) a
            | Some x  →  opt_array_to_list' (x :: acc) (pred i) a
            end in
    opt_array_to_list' [] (Array.length a  −  1) a
```

Return a list of *CF.amplitude list*s, corresponig to the diagrams for a specific color flow for each flavor combination.

```
let amplitudes_by_flavor amplitudes  =
    List.map opt_array_to_list (Array.to_list (CF.process_table amplitudes))
```

If we plan to distiguish different couplings later on, we can no long map all instances of *coupling option* in the tree to *None*. In this case, we will need to normalize different fusion orders *Coupling.fuse2*, *Coupling.fuse3* or *Coupling.fusen*, because they would otherwise lead to inequivalent diagrams. Unfortunately, this stuff packaged deep in *Fusion.Tagged_Coupling*.

The *Tree.canonicalize* below should be necessary to remove topologically equivalent duplicates.

Take a *CF.amplitude list* assumed to correspond to the same external states after stripping the color and return a pair of the list of external particles and the corresponding Feynman diagrams without color.

```
let wf1 amplitude  =
    match F.externals amplitude with
    | wf :: _  →  wf
    | []  →  failwith "Omega.forest_sans_color:␣no␣external␣particles"

let uniq l  =

## Autotools

## A.1  Interface of Config

val *version* : *string*
val *date* : *string*
val *status* : *string*

val *default\_UFO\_dir* : *string*

Cache writing is attempted in the order [*system\_cache\_dir*], [*user\_cache\_dir*], ["."] and cache reading in the opposite order.

val *system\_cache\_dir* : *string*
val *user\_cache\_dir* : *string*

val *cache\_prefix* : *string*
val *cache\_suffix* : *string*

val *openmp* : *bool*

## A.2  Implementation of Config

let *version* = "2.8.5"
let *date* = "Sep␣16␣2020"
let *status* = "release"

let *default\_UFO\_dir* = "/home/reuter/local/packages/whizard/devel/3.0.0\_alpha/\_inst/omega/share/UFO"

let *system\_cache\_dir* = "@OMEGA_SYSTEM_CACHE_DIR@"
let *user\_cache\_dir* = "@OMEGA_USER_CACHE_DIR@"

This relies on the assumption that executable names are unique, which is not true for the UFO version.

let *cache\_prefix* =
  let *basename* = *Filename.basename Sys.executable\_name* in
  try *Filename.chop\_extension basename* with | \_ → *basename*

let *cache\_suffix* = "@OMEGA_CACHE_SUFFIX@"

let *openmp* = false

# —B—
## Textual Options

### B.1   Interface of Options

type $t$

val $empty$ : $t$
val $create$ : $(string \times Arg.spec \times string)$ $list$ $\rightarrow$ $t$

val $extend$ : $t$ $\rightarrow$ $(string \times Arg.spec \times string)$ $list$ $\rightarrow$ $t$

val $cmdline$ : $string$ $\rightarrow$ $t$ $\rightarrow$ $(string \times Arg.spec \times string)$ $list$

This is a clone of *Arg.parse* with a delayed usage string.

val $parse$ : $(string \times Arg.spec \times string)$ $list$ $\rightarrow$
  $(string \rightarrow unit)$ $\rightarrow$ $(unit \rightarrow string)$ $\rightarrow$ $unit$

### B.2   Implementation of Options

module $A$ = $Map.Make$ (struct type $t$ = $string$ let $compare$ = $compare$ end)

type $t$ =
    { $actions$ : $Arg.spec$ $A.t$;
      $raw$ : $(string \times Arg.spec \times string)$ $list$ }

let $empty$ = { $actions$ = $A.empty$; $raw$ = $[\,]$ }

let $extend$ $old$ $options$ =
  { $actions$ = $List.fold\_left$
      (fun $a$ $(s,\ f,\ \_)$ $\rightarrow$ $A.add$ $s$ $f$ $a$) $old.actions$ $options$;
    $raw$ = $options$ @ $old.raw$ }

let $create$ = $extend$ $empty$

let $cmdline$ $prefix$ $options$ =
  $List.map$ (fun $(o,\ f,\ d)$ $\rightarrow$ $(prefix$ ˆ $o,\ f,\ d))$ $options.raw$

Starting with O'Caml version 3.12.1 we can provide a better help* option using *Arg.usage_string*. Alas, we must disable it if we want to remain compatible with O'Caml versions up to 3.12.0.

let $parse$ $specs$ $anonymous$ $usage$ =
  let $help$ () =
    $raise$ $(Arg.Help$ $(usage$ $()))$ in
  let $specs'$ =
    [("-usage", $Arg.Unit$ $help$, "Display␣the␣external␣particles");
     ("--usage", $Arg.Unit$ $help$, "Display␣the␣external␣particles")] @ $specs$ in
  try
    $Arg.parse\_argv$ $Sys.argv$ $specs'$ $anonymous$ $(usage$ $())$
  with
  | $Arg.Bad$ $msg$ $\rightarrow$ $Printf.eprintf$ "%s\n" $msg$; $exit$ 2;
  | $Arg.Help$ $msg$ $\rightarrow$ $Printf.printf$ "%s\n" $msg$; $exit$ 0

## More On Lists

### F.1    Interface of ThoList

*splitn n l* = (*hdn l*, *tln l*), but more efficient.

**val** *hdn* : *int* → *α list* → *α list*
**val** *tln* : *int* → *α list* → *α list*
**val** *splitn* : *int* → *α list* → *α list* × *α list*

*split_last* (*l* @ [*a*]) = (*l*, *a*)

**val** *split_last* : *α list* → *α list* × *α*

*chop n l* chops *l* into pieces of size *n* (except for the last one, which contains th remainder).

**val** *chopn* : *int* → *α list* → *α list list*

*cycle_until a l* finds a member *a* in the list *l* and returns the cyclically permuted list with *a* as head. Raises *Not_found* if *a* is not in *l*.

**val** *cycle_until* : *α* → *α list* → *α list*

*cycle n l* cyclically permute the list *l* by *n* ≥ 0 positions. Raises *Not_found List.length l* > *n*. NB: *cycle n l* = *tln n l* @ *hdn n l*, but more efficient.

**val** *cycle* : *int* → *α list* → *α list*

*of_subarray n m a* is [*a.*(*n*); *a.*(*n*+1); . . . ; *a.*(*m*)]. Values of *n* and *m* out of bounds are silently shifted towards these bounds.

**val** *of_subarray* : *int* → *int* → *α array* → *α list*

*range s n m* is [*n*; *n* + *s*; *n* + 2*s*; . . . ; *m* − ((*m* − *n*) mod *s*)]

**val** *range* : ?*stride* :*int* → *int* → *int* → *int list*

*enumerate s n* [*a1*; *a2*; ...] *is* [(*n*, *a1*); (*n* + *s*, *a2*); ...]

**val** *enumerate* : ?*stride* :*int* → *int* → *α list* → (*int* × *α*) *list*

*alist_of_list ˜predicate ˜offset list* takes the elements of *list* that satisfy *predicate* and forms a list of pairs of an offset into the original *list* and the element with the offsets starting from *offset*. NB: the order of the returned alist is not specified!

**val** *alist_of_list* :
    ?*predicate* : (*α* → *bool*) → ?*offset* :*int* → *α list* → (*int* × *α*) *list*

Compress identical elements in a sorted list. Identity is determined using the polymorphic equality function *Pervasives.*(=).

**val** *uniq* : *α list* → *α list*

Test if all members of a list are structurally identical (actually *homogeneous l* and *List.length* (*uniq l*) ≤ 1 are equivalent, but the former is more efficient if a mismatch comes early).

**val** *homogeneous* : *α list* → *bool*

If all elements of the list *l* appear exactly twice, *pairs l* returns a sorted list with these elements appearing once. Otherwise *Invalid_argument* is raised.

**val** *pairs* : *α list* → *α list*

*compare cmp l1 l2* compare two lists *l1* and *l2* according to *cmp*. *cmp* defaults to the polymorphic *Pervasives.compare*.

val *compare* : *?cmp* : $(\alpha \rightarrow \alpha \rightarrow int) \rightarrow \alpha \ list \rightarrow \alpha \ list \rightarrow int$

Collect and count identical elements in a list. Identity is determined using the polymorphic equality function *Pervasives.(=)*. *classify* does not assume that the list is sorted. However, it is $O(n)$ for sorted lists and $O(n^2)$ in the worst case.

val *classify* : $\alpha \ list \rightarrow (int \times \alpha) \ list$

Collect the second factors with a common first factor in lists.

val *factorize* : $(\alpha \times \beta) \ list \rightarrow (\alpha \times \beta \ list) \ list$

*flatmap f* is equivalent to *flatten* ∘ (*map f*), but more efficient, because no intermediate lists are built. Unfortunately, it is not tail recursive.

val *flatmap* : $(\alpha \rightarrow \beta \ list) \rightarrow \alpha \ list \rightarrow \beta \ list$

*rev_flatmap f* is equivalent to *flatten* ∘ (*rev_map* (*rev* ∘ *f*)) = *rev* ∘ (*flatmap f*), but more efficient, because no intermediate lists are built. It is tail recursive.

val *rev_flatmap* : $(\alpha \rightarrow \beta \ list) \rightarrow \alpha \ list \rightarrow \beta \ list$

*clone n a* builds a list from *n* copies of the element *a*.

val *clone* : $int \rightarrow \alpha \rightarrow \alpha \ list$

*multiply n l* concatenates *n* copies of the list *l*.

val *multiply* : $int \rightarrow \alpha \ list \rightarrow \alpha \ list$

*filtermap f l* applies *f* to each element of *l* and drops the results *None*.

val *filtermap* : $(\alpha \rightarrow \beta \ option) \rightarrow \alpha \ list \rightarrow \beta \ list$

*power a_list* computes the list of all sublists of *a_list*, i.e. the power set. The elements of the sublists are *not* required to have been sequential in *a_list*.

val *power* : $\alpha \ list \rightarrow \alpha \ list \ list$

⚠ Invent other names to avoid confusions with *List.fold_left2* and *List.fold_right2*.

val *fold_right2* : $(\alpha \rightarrow \beta \rightarrow \beta) \rightarrow \alpha \ list \ list \rightarrow \beta \rightarrow \beta$
val *fold_left2* : $(\beta \rightarrow \alpha \rightarrow \beta) \rightarrow \beta \rightarrow \alpha \ list \ list \rightarrow \beta$

*iteri f n [a; b; c]* evaluates *f n a*, *f* $(n + 1)$ *b* and *f* $(n + 2)$ *c*.

val *iteri* : $(int \rightarrow \alpha \rightarrow unit) \rightarrow int \rightarrow \alpha \ list \rightarrow unit$
val *mapi* : $(int \rightarrow \alpha \rightarrow \beta) \rightarrow int \rightarrow \alpha \ list \rightarrow \beta \ list$

*iteri2 f n m [[aa; ab]; [ba; bb]]* evaluates *f n m aa*, *f n* $(m + 1)$ *ab*, *f* $(n + 1)$ *m ba* and *f* $(n + 1)$ $(m + 1)$ *bb*. NB: the nested lists need not be rectangular.

val *iteri2* : $(int \rightarrow int \rightarrow \alpha \rightarrow unit) \rightarrow int \rightarrow int \rightarrow \alpha \ list \ list \rightarrow unit$

Just like *List.map3*:

val *map3* : $(\alpha \rightarrow \beta \rightarrow \gamma \rightarrow \delta) \rightarrow \alpha \ list \rightarrow \beta \ list \rightarrow \gamma \ list \rightarrow \delta \ list$

Transpose a *rectangular* list of lists like a matrix.

val *transpose* : $\alpha \ list \ list \rightarrow \alpha \ list \ list$

*interleave f list* walks through *list* and inserts the result of *f* applied to the reversed list of elements before and the list of elements after. The empty lists at the beginning and end are included!

val *interleave* : $(\alpha \ list \rightarrow \alpha \ list \rightarrow \alpha \ list) \rightarrow \alpha \ list \rightarrow \alpha \ list$

*interleave_nearest f list* is like *interleave f list*, but *f* looks only at the nearest neighbors.

val *interleave_nearest* : $(\alpha \rightarrow \alpha \rightarrow \alpha \ list) \rightarrow \alpha \ list \rightarrow \alpha \ list$

*partitioned_sort cmp index_sets list* sorts the sublists of *list* specified by the *index_sets* and the complement of their union. **NB:** the sorting follows to order in the lists in *index_sets*. **NB:** the indices are 0-based.

val *partitioned_sort* : $(\alpha \rightarrow \alpha \rightarrow int) \rightarrow int \ list \ list \rightarrow \alpha \ list \rightarrow \alpha \ list$

exception *Overlapping_indices*
exception *Out_of_bounds*

*ariadne_sort cmp list* sorts *list* according to *cmp* (default *Pervasives.compare*) keeping track of the original order by a 0-based list of indices.

val *ariadne_sort* : ?*cmp* : (α → α → *int*) → α *list* → α *list* × *int list*

*ariadne_unsort* (*ariadne_sort cmp list*) returns *list*.

val *ariadne_unsort* : α *list* × *int list* → α *list*

*lexicographic cmp list1 list2* compares *list1* and *list2* lexicographically.

val *lexicographic* : ?*cmp* : (α → α → *int*) → α *list* → α *list* → *int*

*common l1 l2* returns the elements common to the lists *l1* and *l2*. The lists are not required to be ordered and the result will also not be ordered.

val *common* : α *list* → α *list* → α *list*

*complement l1 l2* returns the list *l1* with elements of list *l2* removed. The lists are not required to be ordered. Raises *Invalid_argument* "ThoList.complement", if a member of *l1* is not in *l1*.

val *complement* : α *list* → α *list* → α *list*

val *to_string* : (α → *string*) → α *list* → *string*

module *Test* : sig val *suite* : *OUnit.test* end

## F.2   Implementation of ThoList

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare* = *compare*

let rec *hdn n l* =
  if *n* ≤ 0 then
    [ ]
  else
    match *l* with
    | *x* :: *rest* → *x* :: *hdn* (*pred n*) *rest*
    | [ ] → *invalid_arg* "ThoList.hdn"

let rec *tln n l* =
  if *n* ≤ 0 then
    *l*
  else
    match *l* with

# —G—
## More On Arrays

### G.1    Interface of ThoArray

Compressed arrays, i. e. arrays with only unique elements and an embedding that allows to recover the original array. NB: in the current implementation, compressing saves space, if *and only if* objects of type $\alpha$ require more storage than integers. The main use of $\alpha$ *compressed* is *not* for saving space, anyway, but for avoiding the repetition of hard calculations.

type $\alpha$ *compressed*
val *uniq* : $\alpha$ *compressed* $\rightarrow$ $\alpha$ *array*
val *embedding* : $\alpha$ *compressed* $\rightarrow$ *int array*

These two are inverses of each other:

val *compress* : $\alpha$ *array* $\rightarrow$ $\alpha$ *compressed*
val *uncompress* : $\alpha$ *compressed* $\rightarrow$ $\alpha$ *array*

One can play the same game for matrices.

type $\alpha$ *compressed2*
val *uniq2* : $\alpha$ *compressed2* $\rightarrow$ $\alpha$ *array array*
val *embedding1* : $\alpha$ *compressed2* $\rightarrow$ *int array*
val *embedding2* : $\alpha$ *compressed2* $\rightarrow$ *int array*

Again, these two are inverses of each other:

val *compress2* : $\alpha$ *array array* $\rightarrow$ $\alpha$ *compressed2*
val *uncompress2* : $\alpha$ *compressed2* $\rightarrow$ $\alpha$ *array array*

*compare cmp a1 a2* compare two arrays *a1* and *a2* according to *cmp*. *cmp* defaults to the polymorphic *Pervasives.compare*.

val *compare* : ?*cmp* : $(\alpha \rightarrow \alpha \rightarrow int) \rightarrow \alpha$ *array* $\rightarrow \alpha$ *array* $\rightarrow int$

Searching arrays

val *find_first* : $(\alpha \rightarrow bool) \rightarrow \alpha$ *array* $\rightarrow int$
val *match_first* : $\alpha \rightarrow \alpha$ *array* $\rightarrow int$
val *find_all* : $(\alpha \rightarrow bool) \rightarrow \alpha$ *array* $\rightarrow int$ *list*
val *match_all* : $\alpha \rightarrow \alpha$ *array* $\rightarrow int$ *list*

val *num_rows* : $\alpha$ *array array* $\rightarrow int$
val *num_columns* : $\alpha$ *array array* $\rightarrow int$

*exists p* [|*a1*; ...; *an*|] checks if at least one element of the array satisfies the predicate *p*. That is, it returns $(p\ a1) \vee (p\ a2) \vee ... \vee (p\ an)$. Has been *Array.exists* since 4.03.0.

val *exists* : $(\alpha \rightarrow bool) \rightarrow \alpha$ *array* $\rightarrow bool$

module *Test* : sig val *suite* : *OUnit.test* end

### G.2    Implementation of ThoArray

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare* = *compare*

```
type α compressed =
    { uniq : α array;
      embedding : int array }

let uniq a = a.uniq
let embedding a = a.embedding

# —H—
## More On Strings

### H.1   Interface of ThoString

This is a very simple library if stroing manipulation functions missing in O'Caml's standard library.
*strip_prefix prefix string* returns *string* with 0 or 1 occurences of a leading *prefix* removed.

val *strip_prefix* : *string* → *string* → *string*

*strip_prefix_star prefix string* returns *string* with any number of leading occurences of *prefix* removed.

val *strip_prefix_star* : *char* → *string* → *string*

*strip_prefix prefix string* returns *string* with a leading *prefix* removed, raises *Invalid_argument* if there's no match.

val *strip_required_prefix* : *string* → *string* → *string*

*strip_from_first c s* returns *s* with everything starting from the first *c* removed. *strip_from_last c s* returns *s* with everything starting from the last *c* removed.

val *strip_from_first* : *char* → *string* → *string*
val *strip_from_last* : *char* → *string* → *string*

*index_string pattern string* returns the index of the first occurence of *pattern* in *string*, if any. Raises *Not_found*, if *pattern* is not in *string*.

val *index_string* : *string* → *string* → *int*

This silently fails if the argument contains both single and double quotes!

val *quote* : *string* → *string*

The corresponding functions from *String* have become obsolescent with O'Caml 4.0.3. Quanrantine them here.

val *uppercase* : *string* → *string*
val *lowercase* : *string* → *string*

Ignore the case in comparisons.

val *compare_caseless* : *string* → *string* → *int*

### H.2   Implementation of ThoString

# —I—
## Polymorphic Maps

From [9].

## I.1  Interface of Pmap

Module *Pmap*: association tables over a polymorphic type[1].

```
module type T =
  sig
    type ('key, α) t
    val empty : ('key, α) t
    val is_empty : ('key, α) t → bool
    val singleton : 'key → α → ('key, α) t
    val add : ('key → 'key → int) → 'key → α → ('key, α) t → ('key, α) t
    val update : ('key → 'key → int) → (α → α → α) →
      'key → α → ('key, α) t → ('key, α) t
    val cons : ('key → 'key → int) → (α → α → α option) →
      'key → α → ('key, α) t → ('key, α) t
    val find : ('key → 'key → int) → 'key → ('key, α) t → α
    val find_opt : ('key → 'key → int) → 'key → ('key, α) t → α option
    val choose : ('key, α) t → 'key × α
    val choose_opt : ('key, α) t → ('key × α) option
    val uncons : ('key, α) t → 'key × α × ('key, α) t
    val uncons_opt : ('key, α) t → ('key × α × ('key, α) t) option
    val elements : ('key, α) t → ('key × α) list
    val mem : ('key → 'key → int) → 'key → ('key, α) t → bool
    val remove : ('key → 'key → int) → 'key → ('key, α) t → ('key, α) t
    val union : ('key → 'key → int) → (α → α → α) →
      ('key, α) t → ('key, α) t → ('key, α) t
    val compose : ('key → 'key → int) → (α → α → α option) →
      ('key, α) t → ('key, α) t → ('key, α) t
    val iter : ('key → α → unit) → ('key, α) t → unit
    val map : (α → β) → ('key, α) t → ('key, β) t
    val mapi : ('key → α → β) → ('key, α) t → ('key, β) t
    val fold : ('key → α → β → β) → ('key, α) t → β → β
    val compare : ('key → 'key → int) → (α → α → int) →
      ('key, α) t → ('key, α) t → int
    val canonicalize : ('key → 'key → int) → ('key, α) t → ('key, α) t
  end
```

Balanced trees: logarithmic access, but representation not unique.

```
module Tree : T
```

Sorted lists: representation unique, but linear access.

```
module List : T
```

        | Empty → invalid_arg "Map.bal"
        | Node (rl, rv, rd, rr, _) →
            if height rr ≥ height rl then
              create (create l x d rl) rv rd rr
            else begin
              match rl with
              | Empty → invalid_arg "Map.bal"
              | Node (rll, rlv, rld, rlr, _) →
                  create (create l x d rll) rlv rld (create rlr rv rd rr)
            end
      end else
        Node (l, x, d, r, (if hl ≥ hr then hl + 1 else hr + 1))

  let rec join l x d r =
    match bal l x d r with
    | Empty → invalid_arg "Pmap.join"
    | Node (l', x', d', r', _) as t' →
        let d = height l' − height r' in
        if d < − 2 ∨ d > 2 then
          join l' x' d' r'
        else
          t'
```

Merge two trees *t1* and *t2* into one. All elements of *t1* must precede the elements of *t2*. Assumes *height t1 − height t2* ≤ 2.

```
  let rec merge t1 t2 =
    match t1, t2 with
    | Empty, t → t
    | t, Empty → t
    | Node (l1, v1, d1, r1, h1), Node (l2, v2, d2, r2, h2) →
        bal l1 v1 d1 (bal (merge r1 l2) v2 d2 r2)
```

Same as merge, but does not assume anything about *t1* and *t2*.

```
  let rec concat t1 t2 =
    match t1, t2 with
    | Empty, t → t
    | t, Empty → t
    | Node (l1, v1, d1, r1, h1), Node (l2, v2, d2, r2, h2) →
        join l1 v1 d1 (join (concat r1 l2) v2 d2 r2)
```

Splitting

```
  let rec split cmp x = function

```

# I.3   Interface of *Partial*

Partial maps that are constructed from assoc lists.

```
module type T  =
  sig
```

The domain of the map. It needs to be compatible with *Map.OrderedType.t*

```
    type domain
```

The codomain $\alpha$ can be anything we want.

```
type α t
```

A list of argument-value pairs is mapped to a partial map. If an argument appears twice, the later value takes precedence.

```
val of_list : (domain × α) list → α t
```

Two lists of arguments and values (both must have the same length) are mapped to a partial map. Again the later value takes precedence.

```
val of_lists : domain list → α list → α t
```

If domain and codomain disagree, we must raise an exception or provide a fallback.

```
exception Undefined of domain
val apply : α t → domain → α
val apply_with_fallback : (domain → α) → α t → domain → α
```

Iff domain and codomain of the map agree, we can fall back to the identity map.

```
val auto : domain t → domain → domain

end
```

```
module Make : functor (D : Map.OrderedType) → T with type domain = D.t
module Test : sig val suite : OUnit.test end
```

## I.4  Implementation of Partial

```
module type T =
  sig
    type domain
    type α t
    val of_list : (domain × α) list → α t
    val of_lists : domain list → α list → α t
    exception Undefined of domain
    val apply : α t → domain → α
    val apply_with_fallback : (domain → α) → α t → domain → α
    val auto : domain t → domain → domain
  end
module Make (D : Map.OrderedType) : T with type domain = D.t =
  struct

    module M = Map.Make (D)

    type domain = D.t
    type α t = α M.t

    let of_list l =
      List.fold_left (fun m (d, v) → M.add d v m) M.empty l

    let of_lists domain values =
      of_list
        (try
           List.map2 (fun d v → (d, v)) domain values
         with
           | Invalid_argument "List.map2" →
             invalid_arg "Partial.of_lists:␣length␣mismatch")

    let auto partial d =
      try
        M.find d partial
      with
      | Not_found → d

    exception Undefined of domain
```

```
let apply partial d =
  try
    M.find d partial
  with
  | Not_found → raise (Undefined d)

let apply_with_fallback fallback partial d =
  try

# —J—
## TRIES

From [4], extended for [9].

## J.1 Interface of Trie

### J.1.1 Monomorphically

```
module type T =
  sig

    type key
    type (+α) t
    val empty : α t
    val is_empty : α t → bool
```

Standard trie interface:

```
    val add : key → α → α t → α t
    val find : key → α t → α
```

Functionals:

```
    val remove : key → α t → α t
    val mem : key → α t → bool
    val map : (α → β) → α t → β t
    val mapi : (key → α → β) → α t → β t
    val iter : (key → α → unit) → α t → unit
    val fold : (key → α → β → β) → α t → β → β
```

Try to match a longest prefix and return the unmatched rest.

```
    val longest : key → α t → α option × key
```

Try to match a shortest prefix and return the unmatched rest.

```
    val shortest : key → α t → α option × key
```

### J.1.2 New in O'Caml 3.08

```
    val compare : (α → α → int) → α t → α t → int
    val equal : (α → α → bool) → α t → α t → bool
```

### J.1.3 O'Mega customization

*export f_open f_close f_descend f_match trie* allows us to export the trie *trie* as source code to another programming language.

```
    val export : (int → unit) → (int → unit) →
      (int → key → unit) → (int → key → α → unit) → α t → unit

  end
```

O'Caml's *Map.S* prior to Version 3.12:

```
module type Map_S  =
  sig
    type key
    type (+α) t
    val empty :  α t
    val is_empty :  α t  →  bool
    val add :  key  →  α  →  α t  →  α t
    val find :  key  →  α t  →  α
    val remove :  key  →  α t  →  α t
    val mem :  key  →  α t  →  bool
    val iter :  (key  →  α  →  unit)  →  α t  →  unit
    val map :  (α  →  β)  →  α t  →  β t
    val mapi :  (key  →  α  →  β)  →  α t  →  β t
    val fold :  (key  →  α  →  β  →  β)  →  α t  →  β  →  β
    val compare :  (α  →  α  →  int)  →  α t  →  α t  →  int
    val equal :  (α  →  α  →  bool)  →  α t  →  α t  →  bool
  end

module Make (M  :  Map_S)  :  T with type key  =  M.key list
module MakeMap (M  :  Map_S)  :  Map_S with type key  =  M.key list
```

## J.1.4   Polymorphically

```
module type Poly  =
  sig

    type (α,  β) t
    val empty  :  (α,  β) t
```

Standard trie interface:

```
    val add  :  (α  →  α  →  int)  →  α list →  β  →  (α, β) t  →  (α, β) t
    val find  :  (α  →  α  →  int)  →  α list →  (α, β) t  →  β
```

Functionals:

```
    val remove  :  (α  →  α  →  int)  →  α list →  (α, β) t  →  (α, β) t
    val mem  :  (α  →  α  →  int)  →  α list →  (α, β) t  →  bool
    val map  :  (β  →  γ)  →  (α, β) t  →  (α, γ) t
    val mapi  :  (α list →  β  →  γ)  →  (α, β) t  →  (α, γ) t
    val iter  :  (α list →  β  →  unit)  →  (α, β) t  →  unit
    val fold  :  (α list →  β  →  γ  →  γ)  →  (α, β) t  →  γ  →  γ
```

Try to match a longest prefix and return the unmatched rest.

```
    val longest  :  (α  →  α  →  int)  →  α list →  (α, β) t  →  β option × α list
```

Try to match a shortest prefix and return the unmatched rest.

```
    val shortest  :  (α  →  α  →  int)  →  α list →  (α, β) t  →  β option × α list
```

## J.1.5   O'Mega customization

*export f_open f_close f_descend f_match trie* allows us to export the trie *trie* as source code to another programming language.

```
    val export  :  (int  →  unit)  →  (int  →  unit)  →
      (int  →  α list  →  unit)  →  (int  →  α list  →  β  →  unit)  →  (α, β) t  →  unit

  end

module MakePoly (M  :  Pmap.T)  :  Poly
```

## J.2  Implementation of Trie

### J.2.1  Monomorphically

```
module type T  =
  sig
    type key
    type (+α) t
    val empty  :  α t
    val is_empty  :  α t  →  bool
    val add  :  key  →  α  →  α t  →  α t
    val find  :  key  →  α t  →  α
    val remove  :  key  →  α t  →  α t
    val mem  :  key  →  α t  →  bool
    val map  :  (α  →  β)  →  α t  →  β t
    val mapi  :  (key  →  α  →  β)  →  α t  →  β t
    val iter  :  (key  →  α  →  unit)  →  α t  →  unit
    val fold  :  (key  →  α  →  β  →  β)  →  α t  →  β  →  β
    val longest  :  key  →  α t  →  α option × key
    val shortest  :  key  →  α t  →  α option × key
    val compare  :  (α  →  α  →  int)  →  α t  →  α t  →  int
    val equal  :  (α  →  α  →  bool)  →  α t  →  α t  →  bool
    val export  :  (int →  unit)  →  (int →  unit)  →
      (int →  key  →  unit)  →  (int →  key  →  α  →  unit)  →  α t  →  unit

  end
```

O'Caml's *Map.S* prior to Version 3.12:

```
module type Map_S  =
  sig
    type key
    type (+α) t
    val empty :  α t

    f_close n

let export f_open f_close f_descend f_match =
    export′ 0 [] f_open f_close f_descend f_match

end
```

# TENSOR PRODUCTS

From [9].

## K.1   Interface of Product

### K.1.1   Lists

Since April 2001, we preserve lexicographic ordering.

val $fold2$ : $(\alpha \to \beta \to \gamma \to \gamma) \to \alpha\ list \to \beta\ list \to \gamma \to \gamma$
val $fold3$ : $(\alpha \to \beta \to \gamma \to \delta \to \delta) \to \alpha\ list \to \beta\ list \to \gamma\ list \to \delta \to \delta$
val $fold$ : $(\alpha\ list \to \beta \to \beta) \to \alpha\ list\ list \to \beta \to \beta$

val $list2$ : $(\alpha \to \beta \to \gamma) \to \alpha\ list \to \beta\ list \to \gamma\ list$
val $list3$ : $(\alpha \to \beta \to \gamma \to \delta) \to \alpha\ list \to \beta\ list \to \gamma\ list \to \delta\ list$
val $list$ : $(\alpha\ list \to \beta) \to \alpha\ list\ list \to \beta\ list$

Suppress all *None* in the results.

val $list2\_opt$ :
  $(\alpha \to \beta \to \gamma\ option) \to \alpha\ list \to \beta\ list \to \gamma\ list$
val $list3\_opt$ :
  $(\alpha \to \beta \to \gamma \to \delta\ option) \to \alpha\ list \to \beta\ list \to \gamma\ list \to \delta\ list$
val $list\_opt$ :
  $(\alpha\ list \to \beta\ option) \to \alpha\ list\ list \to \beta\ list$

val $power$ : $int \to \alpha\ list \to \alpha\ list\ list$

val $thread$ : $\alpha\ list\ list \to \alpha\ list\ list$

### K.1.2   Sets

'a_set is actually $\alpha$ set for a suitable *set*, but this relation can not be expressed polymorphically (in *set*) in O'Caml. The two sets can be of different type, but we provide a symmetric version as syntactic sugar.

type $\alpha$ set

type $(\alpha,\ 'a\_set,\ \beta)\ fold = (\alpha \to \beta \to \beta) \to 'a\_set \to \beta \to \beta$
type $(\alpha,\ 'a\_set,\ \beta,\ 'b\_set,\ \gamma)\ fold2 =$
    $(\alpha \to \beta \to \gamma \to \gamma) \to 'a\_set \to 'b\_set \to \gamma \to \gamma$

val $outer$ : $(\alpha,\ 'a\_set,\ \gamma)\ fold \to (\beta,\ 'b\_set,\ \gamma)\ fold \to$
  $(\alpha,\ 'a\_set,\ \beta,\ 'b\_set,\ \gamma)\ fold2$
val $outer\_self$ : $(\alpha,\ 'a\_set,\ \beta)\ fold \to (\alpha,\ 'a\_set,\ \alpha,\ 'a\_set,\ \beta)\ fold2$

## K.2   Implementation of Product

### K.2.1   Lists

We use the tail recursive *List.fold_left* over *List.fold_right* for efficiency, but revert the argument lists in order to preserve lexicographic ordering. The argument lists are much shorter than the results, so the cost of the *List.rev* is negligible.

```
let fold2_rev f l1 l2 acc =
  List.fold_left (fun acc1 x1 →
    List.fold_left (fun acc2 x2 → f x1 x2 acc2) acc1 l2) acc l1

let fold2 f l1 l2 acc =
  fold2_rev f (List.rev l1) (List.rev l2) acc

let fold3_rev f l1 l2 l3 acc =
  List.fold_left (fun acc1 x1 → fold2 (f x1) l2 l3 acc1) acc l1

let fold3 f l1 l2 l3 acc =
  fold3_rev f (List.rev l1) (List.rev l2) (List.rev l3) acc
```

If all lists have the same type, there's also

```
let rec fold_rev f ll acc =
  match ll with
  | [] → acc
  | [l] → List.fold_left (fun acc' x → f [x] acc') acc l
  | l :: rest →
      List.fold_left (fun acc' x → fold_rev (fun xr → f (x :: xr)) rest acc') acc l

let fold f ll acc = fold_rev f (List.map List.rev ll) acc

let list2 op l1 l2 =
  fold2 (fun x1 x2 c → op x1 x2 :: c) l1 l2 []

let list3 op l1 l2 l3 =
  fold3 (fun x1 x2 x3 c → op x1 x2 x3 :: c) l1 l2 l3 []

let list op ll =
  fold (fun l c → op l :: c) ll []

let list2_opt op l1 l2 =
  fold2
    (fun x1 x2 c →
      match op x1 x2 with
      | None → c
      | Some op_x1_x2 → op_x1_x2 :: c)
    l1 l2 []

let list3_opt op l1 l2 l3 =
  fold3
    (fun x1 x2 x3 c →
      match op x1 x2 x3 with
      | None → c
      | Some op_x1_x2_x3 → op_x1_x2_x3 :: c)
    l1 l2 l3 []

let list_opt op ll =
  fold
    (fun l c →
      match op l with
      | None → c
      | Some op_l → op_l :: c)
    ll []

let power n l =
  list (fun x → x) (ThoList.clone n l)
```

Reshuffling lists:

$$[[a_1; \ldots; a_k]; [b_1; \ldots; b_k]; [c_1; \ldots; c_k]; \ldots] \rightarrow [[a_1; b_1; c_1; \ldots]; [a_2; b_2; c_2; \ldots]; \ldots] \tag{K.1}$$

⬙ *tho* : Is this really an optimal implementation?

```
let thread = function
  | head :: tail →
```

```
    List.map List.rev
      (List.fold_left (fun i acc → List.map2 (fun a b → b :: a) i acc)
        (List.map (fun i → [i]) head) tail)
  | [] → []
```

## *K.2.2 Sets*

The implementation is amazingly simple:

type $\alpha$ *set*

type $(\alpha,\ 'a\_set,\ \beta)\ fold\ =\ (\alpha\ \to\ \beta\ \to\ \beta)\ \to\ 'a\_set\ \to\ \beta\ \to\ \beta$
type $(\alpha,\ 'a\_set,\ \beta,\ 'b\_set,\ \gamma)\ fold2\ =$
$\quad\quad (\alpha\ \to\ \beta\ \to\ \gamma\ \to\ \gamma)\ \to\ 'a\_set\ \to\ 'b\_set\ \to\ \gamma\ \to\ \gamma$

let *outer fold1 fold2 f l1 l2* $=$ *fold1* (fun *x1* $\to$ *fold2* (*f x1*) *l2*) *l1*
let *outer_self fold f l1 l2* $=$ *fold* (fun *x1* $\to$ *fold* (*f x1*) *l2*) *l1*

# —L—
## (Fiber) Bundles

### L.1   Interface of Bundle

See figure L.1 for the geometric intuition behind the bundle structure.

⬦ Does the current implementation support faithful projections with a forgetful comparison in the base?

```
module type Elt_Base  =
  sig
    type elt
    type base
    val compare_elt  :  elt  →  elt  →  int
    val compare_base  :  base  →  base  →  int
  end

module type Projection  =
  sig
    include Elt_Base
```

$\pi : E \to B$

```
    val pi  :  elt  →  base

  end
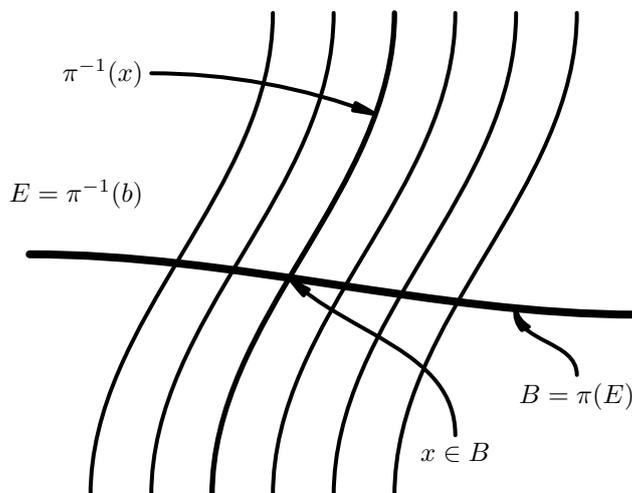

module type T  =
  sig
```

Figure L.1:   The bundle structure implemented by *Bundle.T*

```
    type t

    type elt
    type fiber = elt list
    type base

    val add : elt → t → t
    val of_list : elt list → t
```

$\pi : E \to B$

```
    val pi : elt → base
```

$\pi^{-1} : B \to E$

```
    val inv_pi : base → t → fiber

    val base : t → base list
```

$\pi^{-1} \circ \pi$

```
    val fiber : elt → t → fiber

    val fibers : t → (base × fiber) list
  end
```

module *Make* (*P* : *Projection*) : *T* with type *elt* = *P.elt* and type *base* = *P.base*

The same thing again, but with a projection that is not hardcoded, but passed as an argument at runtime.

```
module type Dyn =
  sig
    type t
    type elt
    type fiber = elt list
    type base
    val add : (elt → base) → elt → t → t
    val of_list : (elt → base) → elt list → t
    val inv_pi : base → t → fiber
    val base : t → base list
    val fiber : (elt → base) → elt → t → fiber
    val fibers : t → (base × fiber) list
  end
```

module *Dyn* (*P* : *Elt_Base*) : *Dyn* with type *elt* = *P.elt* and type *base* = *P.base*

## L.2   Implementation of Bundle

```
module type Elt_Base =
  sig
    type elt
    type base
    val compare_elt : elt → elt → int
    val compare_base : base → base → int
  end

module type Dyn =
  sig
    type t
    type elt
    type fiber = elt list
    type base
    val add : (elt → base) → elt → t → t
    val of_list : (elt → base) → elt list → t
    val inv_pi : base → t → fiber
    val base : t → base list
    val fiber : (elt → base) → elt → t → fiber
```

```
      val fibers : t → (base × fiber) list
   end
module Dyn (P : Elt_Base) =
   struct

      type elt = P.elt
      type base = P.base

      type fiber = elt list

      module InvPi = Map.Make (struct type t = P.base let compare = P.compare_base end)
      module Fiber = Set.Make (struct type t = P.elt let compare = P.compare_elt end)

      type t = Fiber.t InvPi.t

      let add pi element fibers =
         let base = pi element in
         let fiber =
            try InvPi.find base fibers with Not_found → Fiber.empty in
         InvPi.add base (Fiber.add element fiber) fibers

      let of_list pi list =
         List.fold_right (add pi) list InvPi.empty

      let fibers bundle =
         InvPi.fold
            (fun base fiber acc → (base, Fiber.elements fiber) :: acc) bundle []

      let base bundle =
         InvPi.fold
            (fun base fiber acc → base :: acc) bundle []

      let inv_pi base bundle =
         try
            Fiber.elements (InvPi.find base bundle)
         with
         | Not_found → []

      let fiber pi elt bundle =
         inv_pi (pi elt) bundle

   end
module type Projection =
   sig
      include Elt_Base
      val pi : elt → base
   end
module type T =
   sig
      type t
      type elt
      type fiber = elt list
      type base
      val add : elt → t → t
      val of_list : elt list → t
      val pi : elt → base
      val inv_pi : base → t → fiber
      val base : t → base list
      val fiber : elt → t → fiber
      val fibers : t → (base × fiber) list
   end
module Make (P : Projection) =
   struct

      module D = Dyn (P)
```

```
type elt  =  D.elt
type base  =  D.base
type fiber  =  D.fiber
type t  =  D.t

let pi  =  P.pi

let add  =  D.add pi
let of_list  =  D.of_list pi
let base  =  D.base
let inv_pi  =  D.inv_pi
let fibers  =  D.fibers

let fiber elt bundle  =
    inv_pi (pi elt) bundle

end
```

# —M—
# Power Sets

## M.1  Interface of PowSet

Manipulate the power set, i. e. the set of all subsets, of an set *Ordered_Type*. The concrete order is actually irrelevant, we just need it to construct *Set.S*s in the implementation. In fact, what we are implementating is the *free semilattice* generated from the set of subsets of *Ordered_Type*, where the join operation is the set union.

The non trivial operation is *basis*, which takes a set of subsets and returns the smallest set of disjoint subsets from which the argument can be reconstructed by forming unions. It is used in O'Mega for finding coarsest partitions of sets of partiticles.

Eventually, this could be generalized from *power set* or *semi lattice* to *lattice* with a notion of subtraction.

```
module type Ordered_Type  =
  sig
    type t
    val compare  :  t  →  t  →  int
```
Debugging ...
```
    val to_string  :  t  →  string
  end
```
```
module type T  =
  sig
    type elt
    type t

    val empty  :  t
    val is_empty  :  t  →  bool
```
Set union (a. k. a. join).
```
    val union  :  t list →  t
```
Construct the abstract type from a list of subsets represented as lists and the inverse operation.
```
    val of_lists  :  elt list list  →  t
    val to_lists  :  t  →  elt list list
```
The smallest set of disjoint subsets that generates the given subset.
```
    val basis  :  t  →  t
```
Debugging ...
```
    val to_string  :  t  →  string
  end
```
```
module Make (E  :  Ordered_Type)  :  T with type elt  =  E.t
```

## M.2  Implementation of PowSet

```
module type Ordered_Type  =
  sig
```

```
    type t
    val compare : t → t → int
    val to_string : t → string
  end

module type T =
  sig
    type elt
    type t
    val empty : t
    val is_empty : t → bool
    val union : t list → t
    val of_lists : elt list list → t
    val to_lists : t → elt list list
    val basis : t → t
    val to_string : t → string
  end

module Make (E : Ordered_Type) =
  struct

    type elt = E.t

    module ESet = Set.Make (E)
    type set = ESet.t

    module EPowSet = Set.Make (ESet)
    type t = EPowSet.t

    let empty = EPowSet.empty
    let is_empty = EPowSet.is_empty

    let union s_list =
      List.fold_right EPowSet.union s_list EPowSet.empty

    let set_to_string set =
      "{" ^ String.concat "," (List.map E.to_string (ESet.elements set)) ^ "}"

    let to_string powset =
      "{" ^ String.concat "," (List.map set_to_string (EPowSet.elements powset)) ^ "}"

    let of_lists lists =
      List.fold_right
        (fun list acc → EPowSet.add (ESet.of_list list) acc)
        lists EPowSet.empty

    let to_lists ps =
      List.map ESet.elements (EPowSet.elements ps)
```

$product\ (s_1, s_2) = s_1 \circ s_2 = \{s_1 \setminus s_2, s_1 \cap s_2, s_2 \setminus s_1\} \setminus \{\emptyset\}$

```
    let product s1 s2 =
      List.fold_left
        (fun pset set → if ESet.is_empty set then pset else EPowSet.add set pset)
        EPowSet.empty [ESet.diff s1 s2; ESet.inter s1 s2; ESet.diff s2 s1]

    let disjoint s1 s2 =
      ESet.is_empty (ESet.inter s1 s2)
```

In $augment\_basis\_overlapping\ (s, \{s_i\}_i)$, we are guaranteed that

$$\forall_i : s \cap s_i \neq \emptyset \tag{M.1a}$$

$$\forall_{i \neq j} : s_i \cap s_j = \emptyset \,. \tag{M.1b}$$

Therefore from (M.1b)

$$\forall_{i \neq j} : (s \cap s_i) \cap (s \cap s_j) = s \cap (s_i \cap s_j) = s \cap \emptyset = \emptyset \tag{M.2a}$$

$$\forall_{i \neq j} : (s_i \setminus s) \cap (s_j \setminus s) \subset s_i \cap s_j = \emptyset \tag{M.2b}$$

$$\forall_{i \neq j} : (s \setminus s_i) \cap (s_j \setminus s) \subset s \cap \bar{s} = \emptyset \tag{M.2c}$$

$$\forall_{i \neq j} : (s \cap s_i) \cap (s_j \setminus s) \subset s \cap \bar{s} = \emptyset \,, \tag{M.2d}$$

but in general

$$\exists_{i \neq j} : (s \setminus s_i) \cap (s \setminus s_j) \neq \emptyset \tag{M.3a}$$

$$\exists_{i \neq j} : (s \setminus s_i) \cap (s \cap s_j) \neq \emptyset \,, \tag{M.3b}$$

because, e. g., for $s_i = \{i\}$ and $s = \{1, 2, 3\}$

$$(s \setminus s_1) \cap (s \setminus s_2) = \{2, 3\} \cap \{1, 3\} = \{3\} \tag{M.4a}$$

$$(s \setminus s_1) \cap (s \cap s_2) = \{2, 3\} \cap \{2\} = \{2\} \,. \tag{M.4b}$$

Summarizing:

| $\forall_{i \neq j} : A_i \cap A_j$ | $s_j \setminus s$ | $s \cap s_j$ | $s \setminus s_j$ |
|:---:|:---:|:---:|:---:|
| $s_i \setminus s$ | $\emptyset$ | $\emptyset$ | $\emptyset$ |
| $s \cap s_i$ | $\emptyset$ | $\emptyset$ | $\neq \emptyset$ |
| $s \setminus s_i$ | $\emptyset$ | $\neq \emptyset$ | $\neq \emptyset$ |

Fortunately, we also know from (M.1a) that

$$\forall_i : |s \setminus s_i| < |s| \tag{M.5a}$$

$$\forall_i : |s \cap s_i| < \min(|s|, |s_i|) \tag{M.5b}$$

$$\forall_i : |s_i \setminus s| < |s_i| \tag{M.5c}$$

and can call *basis* recursively without risking non-termination.

```
let rec basis ps  =
    EPowSet.fold augment_basis ps EPowSet.empty

and augment_basis s ps  =
    if EPowSet.mem s ps then
        ps
    else
        let no_overlaps, overlaps  =  EPowSet.partition (disjoint s) ps in
        if EPowSet.is_empty overlaps then
            EPowSet.add s ps
        else
            EPowSet.union no_overlaps (augment_basis_overlapping s overlaps)

and augment_basis_overlapping s ps  =
    basis (EPowSet.fold (fun s′  →  EPowSet.union (product s s′)) ps EPowSet.empty)

end
```

# —N—

## Combinatorics

## *N.1   Interface of Combinatorics*

This type is defined just for documentation. Below, most functions will construct a (possibly nested) *list* of partitions or permutations of a $\alpha$ *seq*.

type $\alpha$ *seq* $=$ $\alpha$ *list*

### *N.1.1   Simple Combinatorial Functions*

The functions

$$factorial : n \rightarrow n! \tag{N.1a}$$

$$binomial : (n, k) \rightarrow \binom{n}{k} = \frac{n!}{k!(n-k)!} \tag{N.1b}$$

$$multinomial : [n_1; n_2; \ldots; n_k] \rightarrow \binom{n_1 + n_2 + \ldots + n_k}{n_1, n_2, \ldots, n_k} = \frac{(n_1 + n_2 + \ldots + n_k)!}{n_1! n_2! \cdots n_k!} \tag{N.1c}$$

have not been optimized. They can quickly run out of the range of native integers.

val *factorial* : *int* $\rightarrow$ *int*
val *binomial* : *int* $\rightarrow$ *int* $\rightarrow$ *int*
val *multinomial* : *int list* $\rightarrow$ *int*

*symmetry l* returns the size of the symmetric group on *l*, i.e. the product of the factorials of the numbers of identical elements.

val *symmetry* : $\alpha$ *list* $\rightarrow$ *int*

### *N.1.2   Partitions*

*partitions* $[n_1; n_2; \ldots; n_k] [x_1; x_2; \ldots; x_n]$, where $n = n_1 + n_2 + \ldots + n_k$, returns all inequivalent partitions of $[x_1; x_2; \ldots; x_n]$ into parts of size $n_1$, $n_2$, $\ldots$, $n_k$. The order of the $n_i$ is not respected. There are

$$\frac{1}{S(n_1, n_2, \ldots, n_k)} \binom{n_1 + n_2 + \ldots + n_k}{n_1, n_2, \ldots, n_k} \tag{N.2}$$

such partitions, where the symmetry factor $S(n_1, n_2, \ldots, n_k)$ is the size of the permutation group of $[n_1; n_2; \ldots; n_k]$ as determined by the function *symmetry*.

val *partitions* : *int list* $\rightarrow$ $\alpha$ *seq* $\rightarrow$ $\alpha$ *seq list list*

*ordered_partitions* is identical to *partitions*, except that the order of the $n_i$ is respected. There are

$$\binom{n_1 + n_2 + \ldots + n_k}{n_1, n_2, \ldots, n_k} \tag{N.3}$$

such partitions.

val *ordered_partitions* : *int list* $\rightarrow$ $\alpha$ *seq* $\rightarrow$ $\alpha$ *seq list list*

*keystones m l* is equivalent to *partitions m l*, except for the special case when the length of *l* is even and *m* contains a part that has exactly half the length of *l*. In this case only the half of the partitions is created that has the head of *l* in the longest part.

636

val *keystones* : *int list* → *α seq* → *α seq list list*

It can be beneficial to factorize a common part in the partitions and keystones:

val *factorized_partitions* : *int list* → *α seq* → (*α seq* × *α seq list list*) *list*
val *factorized_keystones* : *int list* → *α seq* → (*α seq* × *α seq list list*) *list*

### Special Cases

*partitions* is built from components that can be convenient by themselves, even thepugh they are just special cases of *partitions*.

split $k$ $l$ returns the list of all inequivalent splits of the list $l$ into one part of length $k$ and the rest. There are

$$\frac{1}{S(|l| - k, k)} \binom{|l|}{k} \tag{N.4}$$

such splits. After replacing the pairs by two-element lists, *split* $k$ $l$ is equivalent to *partitions* $[k;\ length\ l\ -\ k]\ l$.

val *split* : *int* → *α seq* → (*α seq* × *α seq*) *list*

Create both equipartitions of lists of even length. There are

$$\binom{|l|}{k} \tag{N.5}$$

such splits. After replacing the pairs by two-element lists, the result of *ordered_split* $k$ $l$ is equivalent to *ordered_partitions* $[k;\ length\ l\ -\ k]\ l$.

val *ordered_split* : *int* → *α seq* → (*α seq* × *α seq*) *list*

multi_split $n$ $k$ $l$ returns the list of all inequivalent splits of the list $l$ into $n$ parts of length $k$ and the rest.

val *multi_split* : *int* → *int* → *α seq* → (*α seq list* × *α seq*) *list*
val *ordered_multi_split* : *int* → *int* → *α seq* → (*α seq list* × *α seq*) *list*

### N.1.3   Choices

choose $n$ $[x_1; x_2; \ldots; x_n]$ returns the list of all $n$-element subsets of $[x_1; x_2; \ldots; x_n]$. *choose* $n$ is equivalent to (*map fst*) ∘ (*ordered_split n*).

val *choose* : *int* → *α seq* → *α seq list*

multi_choose $n$ $k$ is equivalent to (*map fst*) ∘ (*multi_split n k*).

val *multi_choose* : *int* → *int* → *α seq* → *α seq list list*
val *ordered_multi_choose* : *int* → *int* → *α seq* → *α seq list list*

### N.1.4   Permutations

val *permute* : *α seq* → *α seq list*

#### Graded Permutations

val *permute_signed* : *α seq* → (*int* × *α seq*) *list*
val *permute_even* : *α seq* → *α seq list*
val *permute_odd* : *α seq* → *α seq list*
val *permute_cyclic* : *α seq* → *α seq list*

#### Tensor Products of Permutations

In other words: permutations which respect compartmentalization.

val *permute_tensor* : *α seq list* → *α seq list list*
val *permute_tensor_signed* : *α seq list* → (*int* × *α seq list*) *list*
val *permute_tensor_even* : *α seq list* → *α seq list list*
val *permute_tensor_odd* : *α seq list* → *α seq list list*

val *sign* : ?*cmp* : (*α* → *α* → *int*) → *α seq* → *int*

val *sort_signed* : ?*cmp* : ($\alpha \rightarrow \alpha \rightarrow int$) $\rightarrow \alpha$ *seq* $\rightarrow int \times \alpha$ *seq*

*Unit Tests*

module *Test* : sig val *suite* : *OUnit.test* end

## N.2   Implementation of Combinatorics

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare* = *compare*

type $\alpha$ *seq* = $\alpha$ *list*

### N.2.1   Simple Combinatorial Functions

let rec *factorial'* *fn* *n* =
  if $n$ < 1 then
    *fn*
  else
    *factorial'* ($n \times fn$) (*pred n*)

let *factorial* *n* =
  let *result* = *factorial'* 1 *n* in
  if *result* < 0 then
    *invalid_arg* "Combinatorics.factorial␣overflow"
  else
    *result*

$$\binom{n}{k} = \frac{n!}{k!(n-k)!} = \frac{n(n-1)\cdots(n-k+1)}{k(k-1)\cdots 1}$$

$$= \frac{n(n-1)\cdots(k+1)}{(n-k)(n-k-1)\cdots 1} = \begin{cases} B_{n-k+1}(n,k) & \text{for } k \leq \lfloor n/2 \rfloor \\ B_{k+1}(n,n-k) & \text{for } k > \lfloor n/2 \rfloor \end{cases} \quad \text{(N.6)}$$

where

$$B_{n_{\min}}(n,k) = \begin{cases} nB_{n_{\min}}(n-1,k) & \text{for } n \geq n_{\min} \\ \frac{1}{k}B_{n_{\min}}(n,k-1) & \text{for } k > 1 \\ 1 & \text{otherwise} \end{cases} \quad \text{(N.7)}$$

let rec *binomial'* *n_min* *n* *k* *acc* =
  if $n \geq$ *n_min* then
    *binomial'* *n_min* (*pred n*) *k* ($n \times acc$)
  else if $k$ > 1 then
    *binomial'* *n_min* *n* (*pred k*) (*acc / k*)
  else
    *acc*

let *binomial* *n* *k* =
  if $k$ > $n$ / 2 then
    *binomial'* ($k$ + 1) $n$ ($n$ − $k$) 1
  else
    *binomial'* ($n$ − $k$ + 1) $n$ $k$ 1

Overflows later, but takes much more time:

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1} \quad \text{(N.8)}$$

```
let rec slow_binomial n k =
  if n < 0 ∨ k < 0 then
    invalid_arg "Combinatorics.binomial"
  else if k = 0 ∨ k = n then
    1
  else
    slow_binomial (pred n) k + slow_binomial (pred n) (pred k)

let multinomial n_list =
  List.fold_left (fun acc n → acc / (factorial n))
    (factorial (List.fold_left (+) 0 n_list)) n_list

let symmetry l =
  List.fold_left (fun s (n, _) → s × factorial n) 1 (ThoList.classify l)
```

## N.2.2   Partitions

The inner steps of the recursion (i. e. $n = 1$) are expanded as follows

$$split'(1, [p_k; p_{k-1}; \ldots; p_1], [x_l; x_{l-1}; \ldots; x_1], [x_{l+1}; x_{l+2}; \ldots; x_m]) =$$
$$[(([p_1; \ldots; p_k; x_{l+1}], [x_1; \ldots; x_l; x_{l+2}; \ldots; x_m]);$$
$$([p_1; \ldots; p_k; x_{l+2}], [x_1; \ldots; x_l; x_{l+1}; x_{l+3} \ldots; x_m]); \ldots;$$
$$([p_1; \ldots; p_k; x_m], [x_1; \ldots; x_l; x_{l+1}; \ldots; x_{m-1}])] \quad \text{(N.9)}$$

while the outer steps (i. e. $n > 1$) perform the same with one element moved from the last argument to the first argument. At the $n$th level we have

$$split'(n, [p_k; p_{k-1}; \ldots; p_1], [x_l; x_{l-1}; \ldots; x_1], [x_{l+1}; x_{l+2}; \ldots; x_m]) =$$
$$[(([p_1; \ldots; p_k; x_{l+1}; x_{l+2}; \ldots; x_{l+n}], [x_1; \ldots; x_l; x_{l+n+1}; \ldots; x_m]); \ldots;$$
$$([p_1; \ldots; p_k; x_{m-n+1}; x_{m-n+2}; \ldots; x_m], [x_1; \ldots; x_l; x_{l+1}; \ldots; x_{m-n}])] \quad \text{(N.10)}$$

where the order of the $[x_1; x_2; \ldots; x_m]$ is maintained in the partitions. Variations on this multiple recursion idiom are used many times below.

```
let rec split' n rev_part rev_head = function
  | [] → []
  | x :: tail →
      let rev_part' = x :: rev_part
      and parts = split' n rev_part (x :: rev_head) tail in
      if n < 1 then
        failwith "Combinatorics.split':␣can't␣happen"
      else if n = 1 then
        (List.rev rev_part', List.rev_append rev_head tail) :: parts
      else
        split' (pred n) rev_part' rev_head tail @ parts
```

Kick off the recursion for $0 < n < |l|$ and handle the cases $n \in \{0, |l|\}$ explicitely. Use reflection symmetry for a small optimization.

```
let ordered_split_unsafe n abs_l l =
  let abs_l = List.length l in
  if n = 0 then
    [[], l]
  else if n = abs_l then
    [l, []]
  else if n ≤ abs_l / 2 then
    split' n [] [] l
  else
    List.rev_map (fun (a, b) → (b, a)) (split' (abs_l − n) [] [] l)
```

Check the arguments and call the workhorse:

```
let ordered_split n l =
```

```
let abs_l  =  List.length l in
if n  <  0  ∨  n  >  abs_l then
    invalid_arg "Combinatorics.ordered_split"
else
    ordered_split_unsafe n abs_l l
```

Handle equipartitions specially:

```
let split n l  =
  let abs_l  =  List.length l in
  if n  <  0  ∨  n  >  abs_l then
    invalid_arg "Combinatorics.split"
  else begin
    if 2 × n  =  abs_l then
      match l with
      | []  →  failwith "Combinatorics.split:␣can't␣happen"
      | x  ::  tail  →
          List.map (fun (p1, p2)  →  (x :: p1, p2)) (split' (pred n) [] [] tail)
    else
        ordered_split_unsafe n abs_l l
  end
```

If we chop off parts repeatedly, we can either keep permutations or suppress them. Generically, *attach_to_fst* has type

$$(\alpha \ \times \ \beta) \ list \ \rightarrow \ \alpha \ list \ \rightarrow \ (\alpha \ list \ \times \ \beta) \ list \ \rightarrow \ (\alpha \ list \ \times \ \beta) \ list$$

and semantics

$$attach\_to\_fst([(a_1, b_1), (a_2, b_2), \ldots, (a_m, b_m)], [a'_1, a'_2, \ldots]) =$$
$$[([a_1, a'_1, \ldots], b_1), ([a_2, a'_1, \ldots], b_2), \ldots, ([a_m, a'_1, \ldots], b_m)] \quad \text{(N.11)}$$

(where some of the result can be filtered out), assumed to be prepended to the final argument.

```
let rec multi_split' attach_to_fst n size splits  =
  if n  ≤  0 then
    splits
  else
    multi_split' attach_to_fst (pred n) size
      (List.fold_left (fun acc (parts, tail)  →
         attach_to_fst (ordered_split size tail) parts acc) [] splits)
```

```
let attach_to_fst_unsorted splits parts acc  =
  List.fold_left (fun acc' (p, rest)  →  (p :: parts, rest) :: acc') acc splits
```

Similarly, if the secod argument is a list of lists:

```
let prepend_to_fst_unsorted splits parts acc  =
  List.fold_left (fun acc' (p, rest)  →  (p @ parts, rest) :: acc') acc splits
```

```
let attach_to_fst_sorted splits parts acc  =
  match parts with
  | []  →  List.fold_left (fun acc' (p, rest)  →  ([p], rest) :: acc') acc splits
  | p  ::  _ as parts  →
      List.fold_left (fun acc' (p', rest)  →
        if p'  >  p then
          (p' :: parts, rest) :: acc'
        else
          acc') acc splits
```

```
let multi_split n size l  =
  multi_split' attach_to_fst_sorted n size [([], l)]
```

```
let ordered_multi_split n size l  =
  multi_split' attach_to_fst_unsorted n size [([], l)]
```

```
let rec partitions' splits  = function
```

```
    | []  →  List.map (fun (h, r)  →  (List.rev h, r)) splits
    | (1, size) :: more  →
        partitions'
          (List.fold_left (fun acc (parts, rest)  →
             attach_to_fst_unsorted (split size rest) parts acc)
               [] splits) more
    | (n, size) :: more  →
        partitions'
          (List.fold_left (fun acc (parts, rest)  →
             prepend_to_fst_unsorted (multi_split n size rest) parts acc)
               [] splits) more
let partitions multiplicities l  =
  if List.fold_left (+) 0 multiplicities  ≠  List.length l then
    invalid_arg "Combinatorics.partitions"
  else
    List.map fst (partitions' [([], l)]
                      (ThoList.classify (List.sort compare multiplicities)))

let rec ordered_partitions' splits  = function
  | []  →  List.map (fun (h, r)  →  (List.rev h, r)) splits
  | size :: more  →
      ordered_partitions'
        (List.fold_left (fun acc (parts, rest)  →
           attach_to_fst_unsorted (ordered_split size rest) parts acc)
             [] splits) more
let ordered_partitions multiplicities l  =
  if List.fold_left (+) 0 multiplicities  ≠  List.length l then
    invalid_arg "Combinatorics.ordered_partitions"
  else
    List.map fst (ordered_partitions' [([], l)] multiplicities)

let hdtl  = function
  | []  →  invalid_arg "Combinatorics.hdtl"
  | h :: t  →  (h, t)

let factorized_partitions multiplicities l  =
  ThoList.factorize (List.map hdtl (partitions multiplicities l))
```

In order to construct keystones (cf. chapter 3), we must eliminate reflectionsc consistently. For this to work, the lengths of the parts *must not* be reordered arbitrarily. Ordering with monotonously fallings lengths would be incorrect however, because then some remainders could fake a reflection symmetry and partitions would be dropped erroneously. Therefore we put the longest first and order the remaining with rising lengths:

```
let longest_first l  =
  match ThoList.classify (List.sort (fun n1 n2  →  compare n2 n1) l) with
  | []  →  []
  | longest :: rest  →  longest :: List.rev rest

let keystones multiplicities l  =
  if List.fold_left (+) 0 multiplicities  ≠  List.length l then
    invalid_arg "Combinatorics.keystones"
  else
    List.map fst (partitions' [([], l)] (longest_first multiplicities))

let factorized_keystones multiplicities l  =
  ThoList.factorize (List.map hdtl (keystones multiplicities l))
```

### N.2.3  Choices

The implementation is very similar to *split'*, but here we don't have to keep track of the complements of the chosen sets.

```
let rec choose' n rev_choice  = function
  | []  →  []
```

```
  | x :: tail →
      let rev_choice' = x :: rev_choice
      and choices = choose' n rev_choice tail in
      if n < 1 then
        failwith "Combinatorics.choose':␣can't␣happen"
      else if n = 1 then
        List.rev rev_choice' :: choices
      else
        choose' (pred n) rev_choice' tail @ choices
```

*choose n* is equivalent to $(List.map\ fst) \circ (split\_ordered\ n)$, but more efficient.

```
let choose n l =
  let abs_l = List.length l in
  if n < 0 then
    invalid_arg "Combinatorics.choose"
  else if n > abs_l then
    []
  else if n = 0 then
    [[]]
  else if n = abs_l then
    [l]
  else
    choose' n [] l
```

```
let multi_choose n size l =
  List.map fst (multi_split n size l)
```

```
let ordered_multi_choose n size l =
  List.map fst (ordered_multi_split n size l)
```

### N.2.4   Permutations

```
let rec insert x = function
  | [] → [[x]]
  | h :: t as l →
      (x :: l) :: List.rev_map (fun l' → h :: l') (insert x t)
```

```
let permute l =
  List.fold_left (fun acc x → ThoList.rev_flatmap (insert x) acc) [[]] l
```

#### *Graded Permutations*

```
let rec insert_signed x = function
  | (eps, []) → [(eps, [x])]
  | (eps, h :: t) → (eps, x :: h :: t) ::
      (List.map (fun (eps', l') → (−eps', h :: l')) (insert_signed x (eps, t)))
```

```
let rec permute_signed' = function
  | (eps, []) → [(eps, [])]
  | (eps, h :: t) → ThoList.flatmap (insert_signed h) (permute_signed' (eps, t))
```

```
let permute_signed l =
  permute_signed' (1, l)
```

The following are wasting at most a factor of two and there's probably no point in improving on this ...

```
let filter_sign s l =
  List.map snd (List.filter (fun (eps, _) → eps = s) l)
```

```
let permute_even l =
  filter_sign 1 (permute_signed l)
```

```
let permute_odd l =
  filter_sign (−1) (permute_signed l)
```

We have a slight inconsistency here: *permute* [] = [[]], while *permute_cyclic* [] = []. I don't know if it is worth fixing.

```
let permute_cyclic l =
  let rec permute_cyclic' acc l1 = function
    | [] → List.rev acc
    | x :: rest as l2 →
        permute_cyclic' ((l2 @ List.rev l1) :: acc) (x :: l1) rest
  in
  permute_cyclic' [] [] l
```

### Tensor Products of Permutations

```
let permute_tensor ll =
  Product.list (fun l → l) (List.map permute ll)

let join_signs l =
  let el, pl = List.split l in
  (List.fold_left (fun acc x → x × acc) 1 el, pl)

let permute_tensor_signed ll =
  Product.list join_signs (List.map permute_signed ll)

let permute_tensor_even l =
  filter_sign 1 (permute_tensor_signed l)

let permute_tensor_odd l =
  filter_sign (−1) (permute_tensor_signed l)
```

### Sorting

```
let insert_inorder_signed order x (eps, l) =
  let rec insert eps' accu = function
    | [] → (eps × eps', List.rev_append accu [x])
    | h :: t →
        if order x h = 0 then
          invalid_arg
            "Combinatorics.insert_inorder_signed:␣identical␣elements"
        else if order x h < 0 then
          (eps × eps', List.rev_append accu (x :: h :: t))
        else
          insert (−eps') (h :: accu) t
  in
  insert 1 [] l

let sort_signed ?(cmp = pcompare) l =
  List.fold_right (insert_inorder_signed cmp) l (1, [])

let sign ?(cmp = pcompare) l =
  let eps, _ = sort_signed ˜cmp l in
  eps

let sign2 ?(cmp = pcompare) l =
  let a = Array.of_list l in
  let eps = ref 1 in
  for j = 0 to Array.length a − 1 do
    for i = 0 to j − 1 do
      if cmp a.(i) a.(j) > 0 then
        eps := − !eps
    done
  done;
  !eps
```

```
module Test =
  struct

    open OUnit

    let to_string =
      ThoList.to_string (ThoList.to_string string_of_int)

    let assert_equal_perms =
      assert_equal ~printer : to_string

    let count_permutations n =
      let factorial_n = factorial n
      and range = ThoList.range 1 n in
      let sorted = List.sort compare (permute range) in
      (* Verify the count ... *)
      assert_equal factorial_n (List.length sorted);
      (* ... check that they're all different ... *)
      assert_equal factorial_n (List.length (ThoList.uniq sorted));
      (* ... make sure that they a all permutations. *)
      assert_equal_perms
        [range] (ThoList.uniq (List.map (List.sort compare) sorted))

    let suite_permute =
      "permute" >:::
        [ "permute␣[]" >::
            (fun () →
              assert_equal_perms [[]] (permute []));
          "permute␣[1]" >::
            (fun () →
              assert_equal_perms [[1]] (permute [1]));

## N.3   Interface of Permutation

```
module type T =
  sig

    type t
```

The argument list $[p_1; \ldots; p_n]$ must contain every integer from 0 to $n - 1$ exactly once.

```
    val of_list  :  int list →  t
    val of_array  :  int array →  t
```

$list \ (of\_lists \ l \ l') \ l \ = \ l'$

```
    val of_lists  :  α list →  α list →  t

    val inverse  :  t  →  t
    val compose  :  t  →  t  →  t
```

$compose\_inv \ p \ q \ = \ compose \ p \ (inverse \ q)$, but more efficient.

```
    val compose_inv  :  t  →  t  →  t
```

If $p$ is $of\_list \ [p_1; \ldots; p_n]$, then $list \ p \ [a_1; \ldots; a_n]$ reorders the list $[a_1; \ldots; a_n]$ in the sequence given by $[p_1; \ldots; p_n]$. Thus the $[p_1; \ldots; p_n]$ are _not_ used as a map of the indices reshuffling an array. Instead they denote the new positions of the elements of $[a_1; \ldots; a_n]$. However $list \ (inverse \ p) \ [a_1; \ldots; a_n]$ is $[a_{p_1}; \ldots; a_{p_n}]$, by duality.

```
    val list : t  →  α list →  α list
    val array : t  →  α array →  α array

    val all  :  int →  t list
    val even  :  int →  t list
    val odd  :  int →  t list
    val cyclic  :  int →  t list
    val signed  :  int →  (int × t) list
```

Assuming fewer than 10 elements!

```
    val to_string  :  t  →  string

  end
```

```
module Using_Lists  :  T
module Using_Arrays  :  T
```

```
module Default  :  T
```

```
module Test  :  functor (P  :  T)  →
  sig val suite  :  OUnit.test val time  :  unit →  unit end
```

    []
  else
    List.fold_right (fun l ll → (n :: l) :: ll)
```

$(tuples\ (pred\ d)\ (sum\ -\ n)\ (max\ n\_min\ n)\ n\_max)$
$(tuples'\ d\ sum\ n\_min\ n\_max\ (succ\ n))$

When I find a little spare time, I can provide a dedicated implementation, but we *know* that *Impossible* is *never* raised and the present approach is just as good (except for a possible tiny inefficiency).

```
exception Impossible of string
let impossible name  =  raise (Impossible name)

let triples sum n_min n_max  =
    List.map (function [n1; n2; n3] → (n1, n2, n3) | _ → impossible "triples")
      (tuples 3 sum n_min n_max)
```

# —P—
## TREES

From [10]: Trees with one root admit a straightforward recursive definition

$$T(N, L) = L \cup N \times T(N, L) \times T(N, L) \tag{P.1}$$

that is very well adapted to mathematical reasoning. Such recursive definitions are useful because they allow us to prove properties of elements by induction

$$\forall l \in L : p(l) \wedge (\forall n \in N : \forall t_1, t_2 \in T(N, L) : p(t_1) \wedge p(t_2) \Rightarrow p(n \times t_1 \times t_2))$$
$$\implies \forall t \in T(N, L) : p(t) \tag{P.2}$$

i.e. establishing a property for all leaves and showing that a node automatically satisfies the property if it is true for all children proves the property for *all* trees. This induction is of course modelled after standard mathematical induction

$$p(1) \wedge (\forall n \in \mathbf{N} : p(n) \Rightarrow p(n+1)) \implies \forall n \in \mathbf{N} : p(n) \tag{P.3}$$

The recursive definition (P.1) is mirrored by the two tree construction functions[1]

$$leaf : \nu \times \lambda \to (\nu, \lambda)T \tag{P.4a}$$
$$node : \nu \times (\nu, \lambda)T \times (\nu, \lambda)T \to (\nu, \lambda)T \tag{P.4b}$$

Renaming leaves and nodes leaves the structure of the tree invariant. Therefore, morphisms $L \to L'$ and $N \to N'$ of the sets of leaves and nodes induce natural homomorphisms $T(N, L) \to T(N', L')$ of trees

$$map : (\nu \to \nu') \times (\lambda \to \lambda') \times (\nu, \lambda)T \to (\nu', \lambda')T \tag{P.5}$$

The homomorphisms constructed by *map* are trivial, but ubiquitous. More interesting are the morphisms

$$fold : (\nu \times \lambda \to \alpha) \times (\nu \times \alpha \times \alpha \to \alpha) \times (\nu, \lambda)T \to \alpha$$
$$(f_1, f_2, l \in L) \mapsto f_1(l) \tag{P.6}$$
$$(f_1, f_2, (n, t_1, t_2)) \mapsto f_2(n, fold(f_1, f_2, t_1), fold(f_1, f_2, t_2))$$

and

$$fan : (\nu \times \lambda \to \{\alpha\}) \times (\nu \times \alpha \times \alpha \to \{\alpha\}) \times (\nu, \lambda)T \to \{\alpha\}$$
$$(f_1, f_2, l \in L) \mapsto f_1(l) \tag{P.7}$$
$$(f_1, f_2, (n, t_1, t_2)) \mapsto f_2(n, fold(f_1, f_2, t_1) \otimes fold(f_1, f_2, t_2))$$

where the tensor product notation means that $f_2$ is applied to all combinations of list members in the argument:

$$\phi(\{x\} \otimes \{y\}) = \{\phi(x, y) | x \in \{x\} \wedge y \in \{y\}\} \tag{P.8}$$

But note that due to the recursive nature of trees, *fan* is *not* a morphism from $T(N, L)$ to $T(N \otimes N, L)$.

If we identify singleton sets with their members, *fold* could be viewed as a special case of *fan*, but that is probably more confusing than helpful. Also, using the special case $\alpha = (\nu', \lambda')T$, the homomorphism *map* can be expressed in terms of *fold* and the constructors

$$map : (\nu \to \nu') \times (\lambda \to \lambda') \times (\nu, \lambda)T \to (\nu', \lambda')T$$
$$(f, g, t) \mapsto fold(leaf \circ (f \times g), node \circ (f \times id \times id), t) \tag{P.9}$$

---

[1]To make the introduction more accessible to non-experts, I avoid the 'curried' notation for functions with multiple arguments and use tuples instead. The actual implementation takes advantage of curried functions, however. Experts can read $\alpha \to \beta \to \gamma$ for $\alpha \times \beta \to \gamma$.

*fold* is much more versatile than *map*, because it can be used with constructors for other tree representations to translate among different representations. The target type can also be a mathematical expression. This is used extensively below for evaluating Feynman diagrams.

Using *fan* with $\alpha = (\nu', \lambda')T$ can be used to construct a multitude of homomorphic trees. In fact, below it will be used extensively to construct all Feynman diagrams $\{(\nu, \{p_1, \ldots, p_n\})T\}$ of a given topology $t \in (\emptyset, \{1, \ldots, n\})T$.

> The physicist in me guesses that there is another morphism of trees that is related to *fan* like a Lie-algebra is related to the it's Lie-group. I have not been able to pin it down, but I guess that it is a generalization of *grow* below.

## P.1   Interface of *Tree*

This module provides utilities for generic decorated trees, such as FeynMF output.

### P.1.1   Abstract Data Type

type $(\nu, \lambda)$ *t*

*leaf n l* returns a tree consisting of a single leaf node of type *n* with a label *l*.

val *leaf* : $\nu \to \lambda \to (\nu, \lambda)$ *t*

*cons n ch* returns a tree node.

val *cons* : $\nu \to (\nu, \lambda)$ *t list* $\to (\nu, \lambda)$ *t*

Note that *cons node* [ ] constructs a terminal node, but *not* a leaf, since the latter *must* have a label!

> This approach was probably tailored to Feynman diagrams, where we have external propagators as nodes with additional labels (cf. the function *to_feynmf* on page 657 below). I'm not so sure anymore that this was a good choice.

*node t* returns the top node of the tree *t*.

val *node* : $(\nu, \lambda)$ *t* $\to \nu$

*leafs t* returns a list of all leaf labels *in order*.

val *leafs* : $(\nu, \lambda)$ *t* $\to \lambda$ *list*

*nodes t* returns a list of all nodes that are not leafs in post-order. This guarantees that the root node can be stripped from the result by *List.tl*.

val *nodes* : $(\nu, \lambda)$ *t* $\to \nu$ *list*

*fuse conjg root contains_root trees* joins the *trees*, using the leaf *root* in one of the trees as root of the new tree. *contains_root* guides the search for the subtree containing *root* as a leaf. fun $t \to List.mem\ root\ (leafs\ t)$ is acceptable, but more efficient solutions could be available in special circumstances.

val *fuse* : $(\nu \to \nu) \to \lambda \to ((\nu, \lambda)\ t \to bool) \to (\nu, \lambda)\ t\ list \to (\nu, \lambda)\ t$

*sort lesseq t* return a sorted copy of the tree *t*: node labels are ignored and nodes are according to the supremum of the leaf labels in the corresponding subtree.

val *sort* : $(\lambda \to \lambda \to bool) \to (\nu, \lambda)\ t \to (\nu, \lambda)\ t$
val *canonicalize* : $(\nu, \lambda)\ t \to (\nu, \lambda)\ t$

### P.1.2   Homomorphisms

val *map* : $('n1 \to 'n2) \to ('l1 \to 'l2) \to ('n1, 'l1)\ t \to ('n2, 'l2)\ t$
val *fold* : $(\nu \to \lambda \to \alpha) \to (\nu \to \alpha\ list \to \alpha) \to (\nu, \lambda)\ t \to \alpha$
val *fan* : $(\nu \to \lambda \to \alpha\ list) \to (\nu \to \alpha\ list \to \alpha\ list) \to$
  $(\nu, \lambda)\ t \to \alpha\ list$

### P.1.3  Output

val *to_string* : (*string*, *string*) *t* → *string*

<div align="center"><em>Feynmf</em></div>

## P.2  Implementation of Tree

### P.2.1  Abstract Data Type

type ($\nu$, $\lambda$) *t* =
   | *Leaf* of $\nu$ $\times$ $\lambda$
   | *Node* of $\nu$ $\times$ ($\nu$, $\lambda$) *t list*

let *leaf n l* = *Leaf* (*n*, *l*)

let *cons n children* = *Node* (*n*, *children*)

Presenting the leafs *in order* comes naturally, but will be useful below.

let rec *leafs* = function
   | *Leaf* (_, *l*) $\to$ [*l*]
   | *Node* (_, *ch*) $\to$ *ThoList.flatmap leafs ch*

let *node* = function
   | *Leaf* (*n*, _) $\to$ *n*
   | *Node* (*n*, _) $\to$ *n*

This guarantees that the root node can be stripped from the result by *List.tl*.

let rec *nodes* = function
   | *Leaf* _ $\to$ []
   | *Node* (*n*, *ch*) $\to$ *n* :: *ThoList.flatmap nodes ch*

*first_match p list* returns (*x*, *list'*), where *x* is the first element of *list* for which *p x* = true and *list'* is *list* sans *x*.

let *first_match p list* =
   let rec *first_match' no_match* = function
      | [] $\to$ *invalid_arg* "Tree.fuse:␣prospective␣root␣not␣found"
      | *t* :: *rest* when *p t* $\to$ (*t*, *List.rev_append no_match rest*)
      | *t* :: *rest* $\to$ *first_match'* (*t* :: *no_match*) *rest* in
   *first_match'* [] *list*

One recursion step in *fuse'* rotates the topmost tree node, moving the prospective root up:

(P.10)
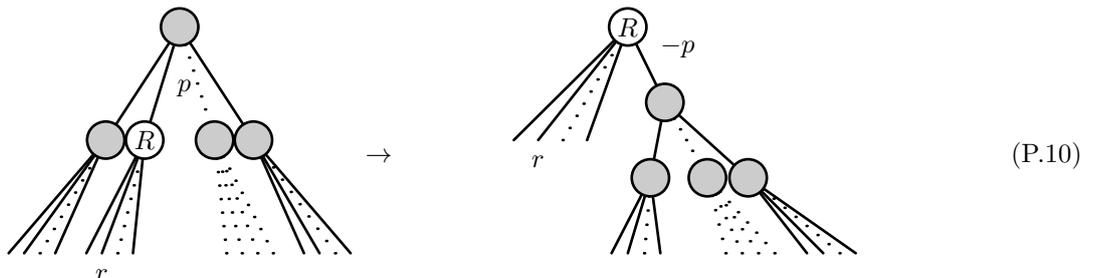

let *fuse conjg root contains_root trees* =
   let rec *fuse' subtrees* =
      match *first_match contains_root subtrees* with

If the prospective root is contained in a leaf, we have either found the root—in which case we're done—or have failed catastrophically:

```
| Leaf (n, l), children →
    if l = root then
       Node (conjg n, children)
    else
       invalid_arg "Tree.fuse:␣root␣predicate␣inconsistent"
```

Otherwise, we perform a rotation as in (P.10) and connect all nodes that do not contain the root to a new node. For efficiency, we append the new node at the end and prevent *first_match* from searching for the root in it in vain again. Since *root_children* is probably rather short, this should be a good strategy.

```
    | Node (n, root_children), other_children →
        fuse′ (root_children @ [Node (conjg n, other_children)]) in
  fuse′ trees
```

Sorting is also straightforward, we only have to keep track of the suprema of the subtrees:

```
type (α, β) with_supremum = { sup : α; data : β }
```

Since the lists are rather short, *List.sort* could be replaced by an optimized version, but we're not (yet) dealing with the most important speed bottleneck here:

```
let rec sort′ lesseq = function
  | Leaf (_, l) as e → { sup = l; data = e }
  | Node (n, ch) →
      let ch′ = List.sort
          (fun x y → compare x.sup y.sup) (List.map (sort′ lesseq) ch) in
      { sup = (List.hd (List.rev ch′)).sup;
        data = Node (n, List.map (fun x → x.data) ch′) }
```

finally, throw away the overall supremum:

```
let sort lesseq t = (sort′ lesseq t).data
```

```
let rec canonicalize = function
  | Leaf (_, _) as l → l
  | Node (n, ch) →
    Node (n, List.sort compare (List.map canonicalize ch))
```

## P.2.2   Homomorphisms

Isomophisms are simple:

```
let rec map fn fl = function
  | Leaf (n, l) → Leaf (fn n, fl l)
  | Node (n, ch) → Node (fn n, List.map (map fn fl) ch)
```

homomorphisms are not more complicated:

```
let rec fold leaf node = function
  | Leaf (n, l) → leaf n l
  | Node (n, ch) → node n (List.map (fold leaf node) ch)
```

and tensor products are fun:

```
let rec fan leaf node = function
  | Leaf (n, l) → leaf n l
  | Node (n, ch) → Product.fold
        (fun ch′ t → node n ch′ @ t) (List.map (fan leaf node) ch) []
```

## P.2.3   Output

```
let leaf_to_string n l =
  if n = "" then
    l
```

```
  else if l  =  "" then
    n
  else
    n ^ "(" ^ l ^ ")"
```

```
let node_to_string n ch  =
  "(" ^ (if n  =  "" then "" else n ^ ":") ^ (String.concat "," ch) ^ ")"
```

```
let to_string t  =
  fold leaf_to_string node_to_string t
```

<div align="center"><em>Feynmf</em></div>

Add a value that is greater than all suprema

```
type α supremum_or_infinity  =  Infinity  |  Sup of α
```

```
type (α, β) with_supremum_or_infinity  =
    { sup  :  α supremum_or_infinity; data  :  β }
```

```
let with_infinity cmp x y  =
  match x.sup,  y.sup with
  | Infinity,  _  →  1
  | _,  Infinity  →  − 1
  | Sup x',  Sup y'  →  cmp x' y'
```

Using this, we can sort the tree in another way that guarantees that a particular leaf (*i2*) is moved as far to the end as possible. We can then flip this leaf from outgoing to incoming without introducing a crossing:

```
let rec sort_2i' lesseq i2  =  function
  | Leaf (_, l) as e  →
      { sup  =  if l  =  i2 then Infinity else Sup l; data  =  e }
  | Node (n,  ch)  →
      let ch'  =  List.sort (with_infinity compare)
            (List.map (sort_2i' lesseq i2) ch) in
      { sup  =  (List.hd (List.rev ch')).sup;
        data  =  Node (n,  List.map (fun x  →  x.data) ch') }
```

again, throw away the overall supremum:

```
let sort_2i lesseq i2 t  =  (sort_2i' lesseq i2 t).data
```

```
type feynmf  =
    { style  :  (string × string) option;
      rev  :  bool;
      label  :  string option;
      tension  :  float option }
```

```
open Printf
```

```
let style prop  =
  match prop.style with
  | None  →  ("plain","")
  | Some s  →  s
```

```
let species prop  =  fst (style prop)
let tex_lbl prop  =  snd (style prop)
```

```
let leaf_label tex io leaf lab  =  function
  | None  →  fprintf tex "␣␣␣␣\\fmflabel{${%s}$}{%s%s}\n" lab io leaf
  | Some s  →
      fprintf tex "␣␣␣␣\\fmflabel{${%s{}^{(%s)}}$}{%s%s}\n" s lab io leaf
```

```
let leaf_label tex io leaf lab label  =
  ()
```

We try to draw diagrams more symmetrically by reducing the tension on the outgoing external lines.

⚠ This is insufficient for asymmetrical cascade decays.

```ocaml
let rec leaf_node tex to_label i2 n prop leaf =
  let io, tension, rev =
    if leaf = i2 then
      ("i", "", ¬ prop.rev)
    else
      ("o", ",tension=0.5", prop.rev) in
  leaf_label tex io (to_label leaf) (tex_lbl prop) prop.label ;
  fprintf tex "␣␣␣␣\\fmfdot{v%d}\n" n;
  if rev then
    fprintf tex "␣␣␣␣\\fmf{%s%s}{%s%s,v%d}\n"
      (species prop) tension io (to_label leaf) n
  else

### P.2.4 Least Squares Layout

$$L = \frac{1}{2} \sum_{i \neq i'} T_{ii'} \left(x_i - x_{i'}\right)^2 + \frac{1}{2} \sum_{i,j} T'_{ij} \left(x_i - e_j\right)^2 \tag{P.11}$$

and thus

$$0 = \frac{\partial L}{\partial x_i} = \sum_{i' \neq i} T_{ii'} \left(x_i - x_{i'}\right) + \sum_j T'_{ij} \left(x_i - e_j\right) \tag{P.12}$$

or

$$\left( \sum_{i' \neq i} T_{ii'} + \sum_j T'_{ij} \right) x_i - \sum_{i' \neq i} T_{ii'} x_{i'} = \sum_j T'_{ij} e_j \tag{P.13}$$

where we can assume that

$$T_{ii'} = T_{i'i} \tag{P.14a}$$

$$T_{ii} = 0 \tag{P.14b}$$

type $\alpha$ *node_with_tension* = { *node* : $\alpha$; *tension* : *float* }

let *unit_tension t* =
 *map* (fun *n* → { *node* = *n*; *tension* = 1.0 }) (fun *l* → *l*) *t*

let *leafs_and_nodes i2 t* =
 let *t'* = *sort_2i* (≤) *i2 t* in

 | [] → *failwith* "Tree.nodes_and_leafs:␣impossible"
 | *i1* :: _ as *n* → (*i1*, *i2*, *List.filter* (fun *l* → *l* ≠ *i2*) (*leafs t'*), *n*)

Not tail recursive, but they're unlikely to meet any deep trees:

let rec *internal_edges_from n* = function
 | *Leaf* _ → []
 | *Node* (*n'*, *ch*) → (*n'*, *n*) :: (*ThoList.flatmap* (*internal_edges_from n'*) *ch*)

The root node of the tree represents a vertex (node) and an external line (leaf) of the Feynman diagram simultaneously. Thus it requires special treatment:

let *internal_edges* = function
 | *Leaf* _ → []
 | *Node* (*n*, *ch*) → *ThoList.flatmap* (*internal_edges_from n*) *ch*

let rec *external_edges_from n* = function
 | *Leaf* (*n'*, _) → [(*n'*, *n*)]
 | *Node* (*n'*, *ch*) → *ThoList.flatmap* (*external_edges_from n'*) *ch*

let *external_edges* = function
 | *Leaf* (*n*, _) → [(*n*, *n*)]
 | *Node* (*n*, *ch*) → (*n*, *n*) :: *ThoList.flatmap* (*external_edges_from n*) *ch*

## Dependency Trees

### Q.1    Interface of Tree2

Dependency trees for wavefunctions.

```
type (ν, ε) t
val cons : (ε × ν × (ν, ε) t list) list → (ν, ε) t
val leaf : ν → (ν, ε) t

val is_singleton : (ν, ε) t → bool
val to_string : (ν → string) → (ε → string) → (ν, ε) t → string
val to_channel :
    out_channel → (ν → string) → (ε → string) → (ν, ε) t → unit
```

### Q.2    Implementation of Tree2

Dependency trees for wavefunctions.

```
type (ν, ε) t =
    | Node of (ε × ν × (ν, ε) t list) list
    | Leaf of ν

let leaf node = Leaf node

let sort_children (edge, node, children) =
  (edge, node, List.sort compare children)

let cons fusions = Node (List.sort compare (List.map sort_children fusions))

let is_singleton = function
    | Leaf _ → true
    | _ → false

let rec to_string n2s e2s = function
    | Leaf n → n2s n
    | Node [children] →
      children_to_string n2s e2s children
    | Node children2 →
      "{␣" ^
        String.concat "␣|␣" (List.map (children_to_string n2s e2s) children2) ^
          "␣}"

and children_to_string n2s e2s (e, n, children) =
    "(" ^ (match e2s e with "" → "" | s → s ^ ">") ^ n2s n ^ ":" ^
      (String.concat "," (List.map (to_string n2s e2s) children)) ^ ")"

let rec to_channel ch n2s e2s = function
    | Leaf n → Printf.fprintf ch "%s" (n2s n)
    | Node [] → Printf.fprintf ch "{␣}";
    | Node [children] → children_to_channel ch n2s e2s children
    | Node (children :: children2) →
      Printf.fprintf ch "{␣";
      children_to_channel ch n2s e2s children;
```

```
      List.iter
        (fun children →
           Printf.fprintf ch "␣\\\n␣␣␣|␣";
           children_to_channel ch n2s e2s children)
        children2;
      Printf.fprintf ch "␣}"

and children_to_channel ch n2s e2s (e, n, children) =
  Printf.fprintf ch "(";
  begin match e2s e with
  | "" → ()
  | s → Printf.fprintf ch "%s>" s
  end;
  Printf.fprintf ch "%s:" (n2s n);
  begin match children with
  | [] → ()
  | [child] → to_channel ch n2s e2s child
  | child :: children →
    to_channel ch n2s e2s child;
    List.iter
      (fun child →
         Printf.fprintf ch ",";
         to_channel ch n2s e2s child)
      children
  end;
  Printf.fprintf ch ")"
```

# —R—
## Consistency Checks

⚠ *Application `count.ml` unavailable!*

# —S—
## Complex Numbers

*Interface* `complex.mli` *unavailable!*

*Implementation* `complex.ml` *unavailable!*

# —T—
## Algebra

### T.1   Interface of Algebra

```
module type Test =
  sig
    val suite : OUnit.test
  end
```

#### T.1.1   Coefficients

For our algebra, we need coefficient rings.

```
module type CRing =
  sig
    type t
    val null : t
    val unit : t
    val mul : t → t → t
    val add : t → t → t
    val sub : t → t → t
    val neg : t → t
    val to_string : t → string
  end
```

And rational numbers provide a particularly important example:

```
module type Rational =
  sig
    include CRing
    val is_null : t → bool
    val is_unit : t → bool
    val is_positive : t → bool
    val is_negative : t → bool
    val is_integer : t → bool
    val make : int → int → t
    val abs : t → t
    val inv : t → t
    val div : t → t → t
    val pow : t → int → t
    val sum : t list → t
    val to_ratio : t → int × int
    val to_float : t → float
    val to_integer : t → int
    module Test : Test
  end
```

#### T.1.2   Naive Rational Arithmetic

⚠ This *is* dangerous and will overflow even for simple applications. The production code will have to be linked to a library for large integer arithmetic.

module *Small_Rational* : *Rational*
module *Q* : *Rational*

## T.1.3 Rational Complex Numbers

module type *QComplex* =
  sig

    type $q$
    type $t$

    val *make* : $q \rightarrow q \rightarrow t$
    val *null* : $t$
    val *unit* : $t$

    val *real* : $t \rightarrow q$
    val *imag* : $t \rightarrow q$

    val *conj* : $t \rightarrow t$
    val *neg* : $t \rightarrow t$

    val *add* : $t \rightarrow t \rightarrow t$
    val *sub* : $t \rightarrow t \rightarrow t$
    val *mul* : $t \rightarrow t \rightarrow t$
    val *inv* : $t \rightarrow t$
    val *div* : $t \rightarrow t \rightarrow t$

    val *pow* : $t \rightarrow int \rightarrow t$
    val *sum* : $t \ list \rightarrow t$

    val *is_null* : $t \rightarrow bool$
    val *is_unit* : $t \rightarrow bool$
    val *is_positive* : $t \rightarrow bool$
    val *is_negative* : $t \rightarrow bool$
    val *is_integer* : $t \rightarrow bool$
    val *is_real* : $t \rightarrow bool$

    val *to_string* : $t \rightarrow string$

    module *Test* : *Test*

  end

module *QComplex* : functor (*Q'* : *Rational*) $\rightarrow$ *QComplex* with type $q = Q'.t$
module *QC* : *QComplex* with type $q = Q.t$

## T.1.4 Laurent Polynomials

module type *Laurent* =
  sig
    type $c$
    type $t$
    val *null* : $t$
    val *unit* : $t$
    val *is_null* : $t \rightarrow bool$
    val *atom* : $c \rightarrow int \rightarrow t$
    val *const* : $c \rightarrow t$
    val *scale* : $c \rightarrow t \rightarrow t$
    val *add* : $t \rightarrow t \rightarrow t$
    val *diff* : $t \rightarrow t \rightarrow t$
    val *sum* : $t \ list \rightarrow t$
    val *mul* : $t \rightarrow t \rightarrow t$

```
    val product  :  t list →  t
    val pow  :  int →  t  →  t
    val eval  :  c  →  t  →  c
    val to_string  :  string →  t  →  string
    val compare  :  t  →  t  →  int
    val pp  :  Format.formatter  →  t  →  unit
    module Test  :  Test
  end
```

Could (should?) be functorialized over *QComplex*, but wait until we upgrade our O'Caml requirements to 4.02 ...

```
module Laurent  :  Laurent with type c  =  QC.t
```

### T.1.5   Expressions: Terms, Rings and Linear Combinations

The tensor algebra will be spanned by an abelian monoid:

```
module type Term  =
  sig
    type α t
    val unit : unit →  α t
    val is_unit  :  α t  →  bool
    val atom  :  α  →  α t
    val power  :  int →  α t  →  α t
    val mul  :  α t  →  α t  →  α t
    val map  :  (α  →  β)  →  α t  →  β t
    val to_string  :  (α  →  string)  →  α t  →  string
```

The derivative of a term is *not* a term, but a sum of terms instead:

$$D(f_1^{p_1} f_2^{p_2} \cdots f_n^{p_n}) = \sum_i (Df_i) p_i f_1^{p_1} f_2^{p_2} \cdots f_i^{p_i-1} \cdots f_n^{p_n} \tag{T.1}$$

The function returns the sum as a list of triples $(Df_i, p_i, f_1^{p_1} f_2^{p_2} \cdots f_i^{p_i-1} \cdots f_n^{p_n})$. Summing the terms is left to the calling module and the $Df_i$ are *not* guaranteed to be different. NB: The function implementating the inner derivative, is supposed to return *Some* $Df_i$ and *None*, iff $Df_i$ vanishes.

```
    val derive  :  (α  →  β option)  →  α t  →  (β  ×  int × α t) list
```

convenience function

```
    val product  :  α t list →  α t
    val atoms  :  α t  →  α list
  end

module type Ring  =
  sig
    module C  :  Rational
    type α t
    val null  :  unit →  α t
    val unit : unit →  α t
    val is_null  :  α t  →  bool
    val is_unit  :  α t  →  bool
    val atom  :  α  →  α t
    val scale  :  C.t  →  α t  →  α t
    val add  :  α t  →  α t  →  α t
    val sub  :  α t  →  α t  →  α t
    val mul  :  α t  →  α t  →  α t
    val neg  :  α t  →  α t
```

Again

$$D(f_1^{p_1} f_2^{p_2} \cdots f_n^{p_n}) = \sum_i (Df_i) p_i f_1^{p_1} f_2^{p_2} \cdots f_i^{p_i-1} \cdots f_n^{p_n} \tag{T.2}$$

674

but, iff $Df_i$ can be identified with a $f'$, we know how to perform the sum.

> val *derive_inner* : $(\alpha \rightarrow \alpha\ t) \rightarrow \alpha\ t \rightarrow \alpha\ t$ (* this? *)
> val *derive_inner'* : $(\alpha \rightarrow \alpha\ t\ option) \rightarrow \alpha\ t \rightarrow \alpha\ t$ (* or that? *)

Below, we will need partial derivatives that lead out of the ring: *derive_outer derive_atom term* returns a list of partial derivatives $\beta$ with non-zero coefficients $\alpha\ t$:

> val *derive_outer* : $(\alpha \rightarrow \beta\ option) \rightarrow \alpha\ t \rightarrow (\beta \times \alpha\ t)\ list$

convenience functions

> val *sum* : $\alpha\ t\ list \rightarrow \alpha\ t$
> val *product* : $\alpha\ t\ list \rightarrow \alpha\ t$

The list of all generators appearing in an expression:

> val *atoms* : $\alpha\ t \rightarrow \alpha\ list$
>
> val *to_string* : $(\alpha \rightarrow string) \rightarrow \alpha\ t \rightarrow string$

>   end

module type *Linear* =
>   sig
>     module $C$ : *Ring*
>     type $(\alpha,\ \gamma)\ t$
>     val *null* : $unit \rightarrow (\alpha,\ \gamma)\ t$
>     val *atom* : $\alpha \rightarrow (\alpha,\ \gamma)\ t$
>     val *singleton* : $\gamma\ C.t \rightarrow \alpha \rightarrow (\alpha,\ \gamma)\ t$
>     val *scale* : $\gamma\ C.t \rightarrow (\alpha,\ \gamma)\ t \rightarrow (\alpha,\ \gamma)\ t$
>     val *add* : $(\alpha,\ \gamma)\ t \rightarrow (\alpha,\ \gamma)\ t \rightarrow (\alpha,\ \gamma)\ t$
>     val *sub* : $(\alpha,\ \gamma)\ t \rightarrow (\alpha,\ \gamma)\ t \rightarrow (\alpha,\ \gamma)\ t$

A partial derivative w. r. t. a vector maps from a coefficient ring to the dual vector space.

> val *partial* : $(\gamma \rightarrow (\alpha,\ \gamma)\ t) \rightarrow \gamma\ C.t \rightarrow (\alpha,\ \gamma)\ t$

A linear combination of vectors

$$linear[(v_1, c_1); (v_2, c_2); \ldots; (v_n, c_n)] = \sum_{i=1}^{n} c_i \cdot v_i \tag{T.3}$$

> val *linear* : $((\alpha,\ \gamma)\ t \times \gamma\ C.t)\ list \rightarrow (\alpha,\ \gamma)\ t$

Some convenience functions

> val *map* : $(\alpha \rightarrow \gamma\ C.t \rightarrow (\beta,\ \delta)\ t) \rightarrow (\alpha,\ \gamma)\ t \rightarrow (\beta,\ \delta)\ t$
> val *sum* : $(\alpha,\ \gamma)\ t\ list \rightarrow (\alpha,\ \gamma)\ t$

The list of all generators and the list of all generators of coefficients appearing in an expression:

> val *atoms* : $(\alpha,\ \gamma)\ t \rightarrow \alpha\ list \times \gamma\ list$
>
> val *to_string* : $(\alpha \rightarrow string) \rightarrow (\gamma \rightarrow string) \rightarrow (\alpha,\ \gamma)\ t \rightarrow string$

>   end

module *Term* : *Term*

module *Make_Ring* ($C$ : *Rational*) ($T$ : *Term*) : *Ring*
module *Make_Linear* ($C$ : *Ring*) : *Linear* with module $C = C$

## T.2   Implementation of *Algebra*

Avoid refering to *Pervasives.compare*, because *Pervasives* will become *Stdlib.Pervasives* in O'Caml 4.07 and *Stdlib* in O'Caml 4.08.

let *pcompare* = *compare*

module type *Test* =
>   sig

```
    val suite  :  OUnit.test
  end
```

The terms will be small and there's no need to be fancy and/or efficient. It's more important to have a unique representation.

module *PM*  =  *Pmap.List*

## T.2.1   Coefficients

For our algebra, we need coefficient rings.

```
module type CRing  =
  sig
    type t
    val null  :  t
    val unit :  t
    val mul  :  t  →  t  →  t
    val add  :  t  →  t  →  t
    val sub  :  t  →  t  →  t
    val neg  :  t  →  t
    val to_string  :  t  →  string
  end
```

And rational numbers provide a particularly important example:

```
module type Rational  =
  sig
    include CRing
    val is_null  :  t  →  bool
    val is_unit  :  t  →  bool
    val is_positive  :  t  →  bool
    val is_negative  :  t  →  bool
    val is_integer  :  t  →  bool
    val make  :  int →  int →  t
    val abs  :  t  →  t
    val inv  :  t  →  t
    val div  :  t  →  t  →  t
    val pow  :  t  →  int →  t
    val sum  :  t list →  t
    val to_ratio  :  t  →  int × int
    val to_float  :  t  →  float
    val to_integer  :  t  →  int
    module Test  :  Test
  end
```

## T.2.2   Naive Rational Arithmetic

This *is* dangerous and will overflow even for simple applications. The production code will have to be linked to a library for large integer arithmetic.

Anyway, here's Euclid's algorithm:

```
let rec gcd i1 i2  =
  if i2  =  0 then
    abs i1
  else
    gcd i2 (i1 mod i2)

let lcm i1 i2  =  (i1 / gcd i1 i2)  ×  i2

module Small_Rational  :  Rational  =
  struct
    type t  =  int × int
```

```ocaml
let is_null (n, _) = (n = 0)
let is_unit (n, d) = (n ≠ 0) ∧ (n = d)
let is_positive (n, d) = n × d > 0
let is_negative (n, d) = n × d < 0
let is_integer (n, d) = (gcd n d = d)
let null = (0, 1)
let unit = (1, 1)
let make n d =
  let c = gcd n d in
  (n / c, d / c)
let abs (n, d) = (abs n, abs d)
let inv (n, d) = (d, n)
let mul (n1, d1) (n2, d2) = make (n1 × n2) (d1 × d2)
let div q1 q2 = mul q1 (inv q2)
let add (n1, d1) (n2, d2) = make (n1 × d2 + n2 × d1) (d1 × d2)

val *solve_many*  :  *float array array* → *float array list* → *float array list*

### U.2   Implementation of Linalg

This is not a functional implementations, but uses imperative array in Fotran style for maximimum speed.

exception *Singular*
exception *Not_Square*

let *copy_matrix a* =
  *Array.init* (*Array.length a*)
    (fun *i* → *Array.copy a.(i)*)

let *matmul a b* =
  let *ni* = *Array.length a*
  and *nj* = *Array.length b.(0)*
  and *n* = *Array.length b* in
  let *ab* = *Array.make_matrix ni nj* 0.0 in
  for *i* = 0 to *pred ni* do
    for *j* = 0 to *pred nj* do
      for *k* = 0 to *pred n* do
        *ab.(i).(j)* ← *ab.(i).(j)* +. *a.(i).(k)* *. *b.(k).(j)*
      done
    done
  done;
  *ab*

let *matmulv a v* =
  let *na* = *Array.length a* in
  let *nv* = *Array.length v* in
  let *v'* = *Array.make na* 0.0 in
  for *i* = 0 to *pred na* do
    for *j* = 0 to *pred nv* do
      *v'.(i)* ← *v'.(i)* +. *a.(i).(j)* *. *v.(j)*
    done
  done;
  *v'*

let *maxabsval a*  :  *float* =

```
let x = ref (abs_float a.(0)) in
for i = 1 to Array.length a − 1 do
  x := max !x (abs_float a.(i))
done;
!x
```

### U.2.1   LU Decomposition

$$A = LU \tag{U.1a}$$

In more detail

$$
\begin{pmatrix}
a_{00} & a_{01} & \cdots & a_{0(n-1)} \\
a_{10} & a_{11} & \cdots & a_{1(n-1)} \\
\vdots & \vdots & \vdots & \vdots \\
a_{(n-1)0} & a_{(n-1)1} & \cdots & a_{(n-1)(n-1)}
\end{pmatrix} =
$$

$$
\begin{pmatrix}
1 & 0 & \cdots & 0 \\
l_{10} & 1 & \cdots & 0 \\
\vdots & \vdots & \vdots & \vdots \\
l_{(n-1)0} & l_{(n-1)1} & \cdots & 1
\end{pmatrix}
\begin{pmatrix}
u_{00} & u_{01} & \cdots & u_{0(n-1)} \\
0 & u_{11} & \cdots & u_{1(n-1)} \\
\vdots & \vdots & \vdots & \vdots \\
0 & 0 & \cdots & u_{(n-1)(n-1)}
\end{pmatrix} \tag{U.1b}
$$

Rewriting (U.1) in block matrix notation

$$
\begin{pmatrix} a_{00} & a_{0\cdot} \\ a_{\cdot 0} & A \end{pmatrix} =
\begin{pmatrix} 1 & 0 \\ l_{\cdot 0} & L \end{pmatrix}
\begin{pmatrix} u_{00} & u_{0\cdot} \\ 0 & U \end{pmatrix} =
\begin{pmatrix} u_{00} & u_{0\cdot} \\ l_{\cdot 0} u_{00} & l_{\cdot 0} \otimes u_{0\cdot} + LU \end{pmatrix} \tag{U.2}
$$

we can solve it easily

$$u_{00} = a_{00} \tag{U.3a}$$

$$u_{0\cdot} = a_{0\cdot} \tag{U.3b}$$

$$l_{\cdot 0} = \frac{a_{\cdot 0}}{a_{00}} \tag{U.3c}$$

$$LU = A - \frac{a_{\cdot 0} \otimes a_{0\cdot}}{a_{00}} \tag{U.3d}$$

and (U.3c) and (U.3d) define a simple iterative algorithm if we work from the outside in. It just remains to add pivoting.

```
let swap a i j =
  let a_i = a.(i) in
  a.(i) ← a.(j);
  a.(j) ← a_i

# —V—
# Partial Maps

## V.1  Interface of Partial

Partial maps that are constructed from assoc lists.

module type $T$ =
  sig

The domain of the map. It needs to be compatible with *Map.OrderedType.t*

    type *domain*

The codomain $\alpha$ can be anything we want.

    type $\alpha$ *t*

A list of argument-value pairs is mapped to a partial map. If an argument appears twice, the later value takes precedence.

    val *of_list* : (*domain* $\times$ $\alpha$) *list* $\rightarrow$ $\alpha$ *t*

Two lists of arguments and values (both must have the same length) are mapped to a partial map. Again the later value takes precedence.

    val *of_lists* : *domain list* $\rightarrow$ $\alpha$ *list* $\rightarrow$ $\alpha$ *t*

If domain and codomain disagree, we must raise an exception or provide a fallback.

    exception *Undefined* of *domain*
    val *apply* : $\alpha$ *t* $\rightarrow$ *domain* $\rightarrow$ $\alpha$
    val *apply_with_fallback* : (*domain* $\rightarrow$ $\alpha$) $\rightarrow$ $\alpha$ *t* $\rightarrow$ *domain* $\rightarrow$ $\alpha$

Iff domain and codomain of the map agree, we can fall back to the identity map.

    val *auto* : *domain t* $\rightarrow$ *domain* $\rightarrow$ *domain*

  end

module *Make* : functor (*D* : *Map.OrderedType*) $\rightarrow$ *T* with type *domain* = *D.t*
module *Test* : sig val *suite* : *OUnit.test* end

## V.2  Implementation of Partial

well, the Intel Fortran Compiler chokes on these with an internal error:

⟨intrinsic :: abs⟩≡

⟨intrinsic :: conjg⟩≡

To reenable the pure functions that have been removed for OpenMP, one should set this chunk to `pure &`

⟨pure *unless OpenMP*⟩≡

## X.1.1  Inner Product

⟨*Declaration of operations for spinors*⟩≡
```
  interface operator (*)
     module procedure conjspinor_spinor
  end interface
  private :: conjspinor_spinor
```

$$\bar{\psi}\psi' \tag{X.1}$$

NB: `dot_product` conjugates its first argument, we can either cancel this or inline `dot_product`:

⟨*Implementation of operations for spinors*⟩≡

```
pure function conjspinor_spinor (psibar, psi) result (psibarpsi)
  complex(kind=default) :: psibarpsi
  type(conjspinor), intent(in) :: psibar
  type(spinor), intent(in) :: psi
  psibarpsi = psibar%a(1)*psi%a(1) + psibar%a(2)*psi%a(2) &
            + psibar%a(3)*psi%a(3) + psibar%a(4)*psi%a(4)
end function conjspinor_spinor
```

## X.1.2   Spinor Vector Space

end subroutine random_momentum
```

## X.5  Polarization vectors

⟨`omega_polarizations.f90`⟩≡
```
  ⟨Copyleft⟩
  module omega_polarizations
    use kinds
    use constants
    use omega_vectors
    implicit none
    private
    ⟨Declaration of polarization vectors⟩
    integer, parameter, public :: omega_polarizations_2010_01_A = 0
  contains
    ⟨Implementation of polarization vectors⟩
  end module omega_polarizations
```

Here we use a phase convention for the polarization vectors compatible with the angular momentum coupling to spin 3/2 and spin 2.

$$\epsilon_1^\mu(k) = \frac{1}{|\vec{k}|\sqrt{k_x^2 + k_y^2}} \left(0; k_z k_x, k_y k_z, -k_x^2 - k_y^2\right) \tag{X.12a}$$

$$\epsilon_2^\mu(k) = \frac{1}{\sqrt{k_x^2 + k_y^2}} \left(0; -k_y, k_x, 0\right) \tag{X.12b}$$

$$\epsilon_3^\mu(k) = \frac{k_0}{m|\vec{k}|} \left(\vec{k}^2/k_0; k_x, k_y, k_z\right) \tag{X.12c}$$

and

$$\epsilon_\pm^\mu(k) = \frac{1}{\sqrt{2}} (\epsilon_1^\mu(k) \pm \mathrm{i}\epsilon_2^\mu(k)) \tag{X.13a}$$

$$\epsilon_0^\mu(k) = \epsilon_3^\mu(k) \tag{X.13b}$$

i. e.

$$\epsilon_+^\mu(k) = \frac{1}{\sqrt{2}\sqrt{k_x^2 + k_y^2}} \left(0; \frac{k_z k_x}{|\vec{k}|} - \mathrm{i}k_y, \frac{k_y k_z}{|\vec{k}|} + \mathrm{i}k_x, -\frac{k_x^2 + k_y^2}{|\vec{k}|}\right) \tag{X.14a}$$

$$\epsilon_-^\mu(k) = \frac{1}{\sqrt{2}\sqrt{k_x^2 + k_y^2}} \left(0; \frac{k_z k_x}{|\vec{k}|} + \mathrm{i}k_y, \frac{k_y k_z}{|\vec{k}|} - \mathrm{i}k_x, -\frac{k_x^2 + k_y^2}{|\vec{k}|}\right) \tag{X.14b}$$

$$\epsilon_0^\mu(k) = \frac{k_0}{m|\vec{k}|} \left(\vec{k}^2/k_0; k_x, k_y, k_z\right) \tag{X.14c}$$

Determining the mass from the momenta is a numerically haphazardous for light particles. Therefore, we accept some redundancy and pass the mass explicitely.

## X.6   *Polarization vectors revisited*

⟨omega_polarizations_madgraph.f90⟩≡
  ⟨*Copyleft*⟩
  module omega_polarizations_madgraph
    use kinds
    use constants
    use omega_vectors
    implicit none
    private
    ⟨*Declaration of polarization vectors for madgraph*⟩
    integer, parameter, public :: omega_pols_madgraph_2010_01_A = 0
  contains
    ⟨*Implementation of polarization vectors for madgraph*⟩
  end module omega_polarizations_madgraph

This set of polarization vectors is compatible with HELAS [5]:

$$\epsilon_1^\mu(k) = \frac{1}{|\vec{k}|\sqrt{k_x^2 + k_y^2}} \left(0; k_z k_x, k_y k_z, -k_x^2 - k_y^2\right) \tag{X.15a}$$

$$\epsilon_2^\mu(k) = \frac{1}{\sqrt{k_x^2 + k_y^2}} \left(0; -k_y, k_x, 0\right) \tag{X.15b}$$

$$\epsilon_3^\mu(k) = \frac{k_0}{m|\vec{k}|} \left(\vec{k}^2/k_0; k_x, k_y, k_z\right) \tag{X.15c}$$

and

$$\epsilon_\pm^\mu(k) = \frac{1}{\sqrt{2}}(\mp\epsilon_1^\mu(k) - \mathrm{i}\epsilon_2^\mu(k)) \tag{X.16a}$$

$$\epsilon_0^\mu(k) = \epsilon_3^\mu(k) \tag{X.16b}$$

i. e.

$$\epsilon_+^\mu(k) = \frac{1}{\sqrt{2}\sqrt{k_x^2 + k_y^2}} \left(0; -\frac{k_z k_x}{|\vec{k}|} + \mathrm{i}k_y, -\frac{k_y k_z}{|\vec{k}|} - \mathrm{i}k_x, \frac{k_x^2 + k_y^2}{|\vec{k}|}\right) \tag{X.17a}$$

$$\epsilon_-^\mu(k) = \frac{1}{\sqrt{2}\sqrt{k_x^2 + k_y^2}} \left(0; \frac{k_z k_x}{|\vec{k}|} + \mathrm{i}k_y, \frac{k_y k_z}{|\vec{k}|} - \mathrm{i}k_x, -\frac{k_x^2 + k_y^2}{|\vec{k}|}\right) \tag{X.17b}$$

$$\epsilon_0^\mu(k) = \frac{k_0}{m|\vec{k}|} \left(\vec{k}^2/k_0; k_x, k_y, k_z\right) \tag{X.17c}$$

Fortunately, for comparing with squared matrix generated by Madgraph we can also use the modified version, since the difference is only a phase and does *not* mix helicity states. Determining the mass from the momenta

is a numerically haphazardous for light particles. Therefore, we accept some redundancy and pass the mass explicitely.

# X.7   Symmetric Tensors

Spin-2 polarization tensors are symmetric, transversal and traceless

$$\epsilon_m^{\mu\nu}(k) = \epsilon_m^{\nu\mu}(k) \tag{X.18a}$$

$$k_\mu \epsilon_m^{\mu\nu}(k) = k_\nu \epsilon_m^{\mu\nu}(k) = 0 \tag{X.18b}$$

$$\epsilon_{m,\mu}^\mu(k) = 0 \tag{X.18c}$$

with $m = 1, 2, 3, 4, 5$. Our current representation is redundant and does *not* enforce symmetry or tracelessness.

## X.8   Symmetric Polarization Tensors

$$\epsilon_{+2}^{\mu\nu}(k) = \epsilon_+^\mu(k)\epsilon_+^\nu(k) \tag{X.19a}$$

$$\epsilon_{+1}^{\mu\nu}(k) = \frac{1}{\sqrt{2}}\left(\epsilon_+^\mu(k)\epsilon_0^\nu(k) + \epsilon_0^\mu(k)\epsilon_+^\nu(k)\right) \tag{X.19b}$$

$$\epsilon_0^{\mu\nu}(k) = \frac{1}{\sqrt{6}}\left(\epsilon_+^\mu(k)\epsilon_-^\nu(k) + \epsilon_-^\mu(k)\epsilon_+^\nu(k) - 2\epsilon_0^\mu(k)\epsilon_0^\nu(k)\right) \tag{X.19c}$$

$$\epsilon_{-1}^{\mu\nu}(k) = \frac{1}{\sqrt{2}}\left(\epsilon_-^\mu(k)\epsilon_0^\nu(k) + \epsilon_0^\mu(k)\epsilon_-^\nu(k)\right) \tag{X.19d}$$

$$\epsilon_{-2}^{\mu\nu}(k) = \epsilon_-^\mu(k)\epsilon_-^\nu(k) \tag{X.19e}$$

Note that $\epsilon_{\pm2,\mu}^\mu(k) = \epsilon_\pm^\mu(k)\epsilon_{\pm,\mu}(k) \propto \epsilon_\pm^\mu(k)\epsilon_{\mp,\mu}^*(k) = 0$ and that the sign in $\epsilon_0^{\mu\nu}(k)$ insures its tracelessness[1].

[1] On the other hand, with the shift operator $L_-\,|+\rangle = \mathrm{e}^{\mathrm{i}\phi}\,|0\rangle$ and $L_-\,|0\rangle = \mathrm{e}^{\mathrm{i}\chi}\,|-\rangle$, we find

$$L_-^2\,|++\rangle = 2\mathrm{e}^{2\mathrm{i}\phi}\,|00\rangle + \mathrm{e}^{\mathrm{i}(\phi+\chi)}(|+-\rangle + |-+\rangle)$$

i. e. $\chi - \phi = \pi$, if we want to identify $\epsilon_{-,0,+}^\mu$ with $|-, 0, +\rangle$.

end module omega_spinor_couplings
```

See table X.1 for the names of Fortran functions. We could have used long names instead, but this would increase the chance of running past continuation line limits without adding much to the legibility.

### X.25.1  Fermionic Vector and Axial Couplings

There's more than one chiral representation. This one is compatible with HELAS [5].

$$\gamma^0 = \begin{pmatrix} 0 & \mathbf{1} \\ \mathbf{1} & 0 \end{pmatrix},\ \gamma^i = \begin{pmatrix} 0 & \sigma^i \\ -\sigma^i & 0 \end{pmatrix},\ \gamma_5 = i\gamma^0\gamma^1\gamma^2\gamma^3 = \begin{pmatrix} -\mathbf{1} & 0 \\ 0 & \mathbf{1} \end{pmatrix} \tag{X.96}$$

Therefore

$$g_S + g_P\gamma_5 = \begin{pmatrix} g_S - g_P & 0 & 0 & 0 \\ 0 & g_S - g_P & 0 & 0 \\ 0 & 0 & g_S + g_P & 0 \\ 0 & 0 & 0 & g_S + g_P \end{pmatrix} \tag{X.97a}$$

$$g_V\gamma^0 - g_A\gamma^0\gamma_5 = \begin{pmatrix} 0 & 0 & g_V - g_A & 0 \\ 0 & 0 & 0 & g_V - g_A \\ g_V + g_A & 0 & 0 & 0 \\ 0 & g_V + g_A & 0 & 0 \end{pmatrix} \tag{X.97b}$$

$$g_V\gamma^1 - g_A\gamma^1\gamma_5 = \begin{pmatrix} 0 & 0 & 0 & g_V - g_A \\ 0 & 0 & g_V - g_A & 0 \\ 0 & -g_V - g_A & 0 & 0 \\ -g_V - g_A & 0 & 0 & 0 \end{pmatrix} \tag{X.97c}$$

$$g_V\gamma^2 - g_A\gamma^2\gamma_5 = \begin{pmatrix} 0 & 0 & 0 & -\mathrm{i}(g_V - g_A) \\ 0 & 0 & \mathrm{i}(g_V - g_A) & 0 \\ 0 & \mathrm{i}(g_V + g_A) & 0 & 0 \\ -\mathrm{i}(g_V + g_A) & 0 & 0 & 0 \end{pmatrix} \tag{X.97d}$$

$$g_V\gamma^3 - g_A\gamma^3\gamma_5 = \begin{pmatrix} 0 & 0 & g_V - g_A & 0 \\ 0 & 0 & 0 & -g_V + g_A \\ -g_V - g_A & 0 & 0 & 0 \\ 0 & g_V + g_A & 0 & 0 \end{pmatrix} \tag{X.97e}$$

  end function chi_minus
```

$$u_\pm(p, |m|) = \begin{pmatrix} \sqrt{p_0 \mp |\vec{p}|} \cdot \chi_\pm(\vec{p}) \\ \sqrt{p_0 \pm |\vec{p}|} \cdot \chi_\pm(\vec{p}) \end{pmatrix} \qquad u_\pm(p, -|m|) = \begin{pmatrix} -i\sqrt{p_0 \mp |\vec{p}|} \cdot \chi_\pm(\vec{p}) \\ +i\sqrt{p_0 \pm |\vec{p}|} \cdot \chi_\pm(\vec{p}) \end{pmatrix} \tag{X.102}$$

Determining the mass from the momenta is a numerically haphazardous for light particles. Therefore, we accept some redundancy and pass the mass explicitly. Even if the mass is not used in the chiral representation, we do so for symmetry with polarization vectors and to be prepared for other representations.

⟨*Implementation of spinor on shell wave functions*⟩+≡

## *X.25.4 Off Shell Wave Functions*

I've just taken this over from Christian Schwinn's version.

⟨*Declaration of spinor off shell wave functions*⟩≡
```
  public :: brs_u, brs_ubar, brs_v, brs_vbar
```

The off-shell wave functions needed for gauge checking are obtained from the LSZ-formulas:

$$\langle \text{Out}|d^\dagger|\text{In}\rangle = i \int d^4x\, \bar{v} e^{-ikx} (i\slashed{\partial} - m)\, \langle \text{Out}|\psi|\text{In}\rangle \tag{X.104a}$$

$$\langle \text{Out}|b|\text{In}\rangle = -i \int d^4x\, \bar{u} e^{ikx} (i\slashed{\partial} - m)\, \langle \text{Out}|\psi|\text{In}\rangle \tag{X.104b}$$

$$\langle \text{Out}|d|\text{In}\rangle = i \int d^4x\, \langle \text{Out}|\bar{\psi}|\text{In}\rangle\, (-i\overleftarrow{\slashed{\partial}} - m) v e^{ikx} \tag{X.104c}$$

$$\langle \text{Out}|b^\dagger|\text{In}\rangle = -i \int d^4x\, \langle \text{Out}|\bar{\psi}|\text{In}\rangle\, (-i\overleftarrow{\slashed{\partial}} - m) u e^{-ikx} \tag{X.104d}$$

Since the relative sign between fermions and antifermions is ignored for on-shell amplitudes we must also ignore it here, so all wavefunctions must have a $(-i)$ factor. In momentum space we have:

$$brsu(p) = (-i)(\slashed{p} - m)u(p) \tag{X.105}$$

⟨*Implementation of spinor off shell wave functions*⟩≡
```
  pure function brs_u (m, p, s) result (dpsi)
     type(spinor) :: dpsi,psi
     real(kind=default), intent(in) :: m
     type(momentum), intent(in) :: p
     integer, intent(in) :: s
     type (vector)::vp
     complex(kind=default), parameter :: one = (1, 0)
     vp=p
     psi=u(m,p,s)
     dpsi=cmplx(0.0,-1.0)*(f_vf(one,vp,psi)-m*psi)
  end function brs_u
```

$$brsv(p) = i(\slashed{p} + m)v(p) \tag{X.106}$$

⟨*Implementation of spinor off shell wave functions*⟩+≡

```
pure function brs_v (m, p, s) result (dpsi)
    type(spinor) :: dpsi, psi
    real(kind=default), intent(in) :: m
    type(momentum), intent(in) :: p
    integer, intent(in) ::   s
    type (vector)::vp
    complex(kind=default), parameter :: one = (1, 0)
    vp=p
    psi=v(m,p,s)
    dpsi=cmplx(0.0,1.0)*(f_vf(one,vp,psi)+m*psi)
end function brs_v
```

$$brs\bar{u}(p) = (-i)\bar{u}(p)(\not{p} - m) \tag{X.107}$$

⟨_Implementation of spinor off shell wave functions_⟩+≡
```
pure function brs_ubar (m, p, s)result (dpsibar)
    type(conjspinor) :: dpsibar, psibar
    real(kind=default), intent(in) :: m
    type(momentum), intent(in) :: p
    integer, intent(in) :: s
    type (vector)::vp
    complex(kind=default), parameter :: one = (1, 0)
     vp=p
     psibar=ubar(m,p,s)
    dpsibar=cmplx(0.0,-1.0)*(f_fv(one,psibar,vp)-m*psibar)
  end function brs_ubar
```

$$brs\bar{v}(p) = (i)\bar{v}(p)(\not{p} + m) \tag{X.108}$$

⟨_Implementation of spinor off shell wave functions_⟩+≡
```
pure function brs_vbar (m, p, s) result (dpsibar)
    type(conjspinor) :: dpsibar,psibar
    real(kind=default), intent(in) :: m
    type(momentum), intent(in) :: p
    integer, intent(in) :: s
    type(vector)::vp
    complex(kind=default), parameter :: one = (1, 0)
    vp=p
    psibar=vbar(m,p,s)
    dpsibar=cmplx(0.0,1.0)*(f_fv(one,psibar,vp)+m*psibar)
end function brs_vbar
```

NB: The remarks on momentum flow in the propagators don't apply here since the incoming momenta are flipped for the wave functions.

## X.25.5   Propagators

NB: the common factor of i is extracted:

⟨_Declaration of spinor propagators_⟩≡
```
 public :: pr_psi, pr_psibar
 public :: pj_psi, pj_psibar
 public :: pg_psi, pg_psibar
```

$$\frac{i(-\not{p} + m)}{p^2 - m^2 + im\Gamma}\psi \tag{X.109}$$

NB: the sign of the momentum comes about because all momenta are treated as _outgoing_ and the particle charge flow is therefore opposite to the momentum.

⟨_Implementation of spinor propagators_⟩≡
```
 pure function pr_psi (p, m, w, cms, psi) result (ppsi)
   type(spinor) :: ppsi
   type(momentum), intent(in) :: p
   real(kind=default), intent(in) :: m, w
   type(spinor), intent(in) :: psi
   logical, intent(in) :: cms
   type(vector) :: vp
```

```
complex(kind=default), parameter :: one = (1, 0)
complex(kind=default) :: num_mass
vp = p
if (cms) then
   num_mass = sqrt(cmplx(m**2, -m*w, kind=default))
else
   num_mass = cmplx (m, 0, kind=default)
end if
ppsi = (1 / cmplx (p*p - m**2, m*w, kind=default)) &
     * (- f_vf (one, vp, psi) + num_mass * psi)
end function pr_psi
```

$$\sqrt{\frac{\pi}{M\Gamma}}(-\not{p} + m)\psi \tag{X.110}$$

⟨*Implementation of spinor propagators*⟩+≡
```
pure function pj_psi (p, m, w, psi) result (ppsi)
   type(spinor) :: ppsi
   type(momentum), intent(in) :: p
   real(kind=default), intent(in) :: m, w
   type(spinor), intent(in) :: psi
   type(vector) :: vp
   complex(kind=default), parameter :: one = (1, 0)
   vp = p
   ppsi = (0, -1) * sqrt (PI / m / w) * (- f_vf (one, vp, psi) + m * psi)
end function pj_psi
```

⟨*Implementation of spinor propagators*⟩+≡
```
pure function pg_psi (p, m, w, psi) result (ppsi)
   type(spinor) :: ppsi
   type(momentum), intent(in) :: p
   real(kind=default), intent(in) :: m, w
   type(spinor), intent(in) :: psi
   type(vector) :: vp
   complex(kind=default), parameter :: one = (1, 0)
   vp = p
   ppsi = gauss(p*p, m, w) *  (- f_vf (one, vp, psi) + m * psi)
end function pg_psi
```

$$\bar{\psi}\frac{i(\not{p} + m)}{p^2 - m^2 + im\Gamma} \tag{X.111}$$

NB: the sign of the momentum comes about because all momenta are treated as *outgoing* and the antiparticle charge flow is therefore parallel to the momentum.

⟨*Implementation of spinor propagators*⟩+≡
```
pure function pr_psibar (p, m, w, cms, psibar) result (ppsibar)
   type(conjspinor) :: ppsibar

     ⟨*Implementation of bispinor on shell wave functions*⟩
     ⟨*Implementation of bispinor off shell wave functions*⟩
     ⟨*Implementation of bispinor currents*⟩
     ⟨*Implementation of bispinor propagators*⟩
  end module omega_bispinor_couplings

See table X.1 for the names of Fortran functions. We could have used long names instead, but this would increase the chance of running past continuation line limits without adding much to the legibility.

### X.26.1    Fermionic Vector and Axial Couplings

There's more than one chiral representation. This one is compatible with HELAS [5].

$$\gamma^0 = \begin{pmatrix} 0 & \mathbf{1} \\ \mathbf{1} & 0 \end{pmatrix}, \; \gamma^i = \begin{pmatrix} 0 & \sigma^i \\ -\sigma^i & 0 \end{pmatrix}, \; \gamma_5 = i\gamma^0\gamma^1\gamma^2\gamma^3 = \begin{pmatrix} -\mathbf{1} & 0 \\ 0 & \mathbf{1} \end{pmatrix}, \tag{X.115a}$$

$$C = \begin{pmatrix} \epsilon & 0 \\ 0 & -\epsilon \end{pmatrix}, \qquad \epsilon = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}. \tag{X.115b}$$

Therefore

$$g_S + g_P\gamma_5 = \begin{pmatrix} g_S - g_P & 0 & 0 & 0 \\ 0 & g_S - g_P & 0 & 0 \\ 0 & 0 & g_S + g_P & 0 \\ 0 & 0 & 0 & g_S + g_P \end{pmatrix} \tag{X.116a}$$

$$g_V\gamma^0 - g_A\gamma^0\gamma_5 = \begin{pmatrix} 0 & 0 & g_V - g_A & 0 \\ 0 & 0 & 0 & g_V - g_A \\ g_V + g_A & 0 & 0 & 0 \\ 0 & g_V + g_A & 0 & 0 \end{pmatrix} \tag{X.116b}$$

$$g_V\gamma^1 - g_A\gamma^1\gamma_5 = \begin{pmatrix} 0 & 0 & 0 & g_V - g_A \\ 0 & 0 & g_V - g_A & 0 \\ 0 & -g_V - g_A & 0 & 0 \\ -g_V - g_A & 0 & 0 & 0 \end{pmatrix} \tag{X.116c}$$

$$g_V\gamma^2 - g_A\gamma^2\gamma_5 = \begin{pmatrix} 0 & 0 & 0 & -\mathrm{i}(g_V - g_A) \\ 0 & 0 & \mathrm{i}(g_V - g_A) & 0 \\ 0 & \mathrm{i}(g_V + g_A) & 0 & 0 \\ -\mathrm{i}(g_V + g_A) & 0 & 0 & 0 \end{pmatrix} \tag{X.116d}$$

$$g_V\gamma^3 - g_A\gamma^3\gamma_5 = \begin{pmatrix} 0 & 0 & g_V - g_A & 0 \\ 0 & 0 & 0 & -g_V + g_A \\ -g_V - g_A & 0 & 0 & 0 \\ 0 & g_V + g_A & 0 & 0 \end{pmatrix} \tag{X.116e}$$

and

$$C(g_S + g_P\gamma_5) = \begin{pmatrix} 0 & g_S - g_P & 0 & 0 \\ -g_S + g_P & 0 & 0 & 0 \\ 0 & 0 & 0 & -g_S - g_P \\ 0 & 0 & g_S + g_P & 0 \end{pmatrix} \tag{X.117a}$$

$$C(g_V\gamma^0 - g_A\gamma^0\gamma_5) = \begin{pmatrix} 0 & 0 & 0 & g_V - g_A \\ 0 & 0 & -g_V + g_A & 0 \\ 0 & -g_V - g_A & 0 & 0 \\ g_V + g_A & 0 & 0 & 0 \end{pmatrix} \tag{X.117b}$$

$$C(g_V\gamma^1 - g_A\gamma^1\gamma_5) = \begin{pmatrix} 0 & 0 & g_V - g_A & 0 \\ 0 & 0 & 0 & -g_V + g_A \\ g_V + g_A & 0 & 0 & 0 \\ 0 & -g_V - g_A & 0 & 0 \end{pmatrix} \tag{X.117c}$$

$$C(g_V\gamma^2 - g_A\gamma^2\gamma_5) = \begin{pmatrix} 0 & 0 & \mathrm{i}(g_V - g_A) & 0 \\ 0 & 0 & 0 & \mathrm{i}(g_V - g_A) \\ \mathrm{i}(g_V + g_A) & 0 & 0 & 0 \\ 0 & \mathrm{i}(g_V + g_A) & 0 & 0 \end{pmatrix} \tag{X.117d}$$

$$C(g_V\gamma^3 - g_A\gamma^3\gamma_5) = \begin{pmatrix} 0 & 0 & 0 & -g_V + g_A \\ 0 & 0 & -g_V + g_A & 0 \\ 0 & -g_V - g_A & 0 & 0 \\ -g_V - g_A & 0 & 0 & 0 \end{pmatrix} \tag{X.117e}$$

The needed construction of gamma matrices involving the commutator of two gamma matrices. For the slashed terms we use as usual the abbreviations $k_\pm = k_0 \pm k_3$, $k = k_1 + \mathrm{i}k_2$, $k^* = k_1 - \mathrm{i}k_2$ and analogous expressions for the vector $v^\mu$. We remind you that $\cdot^*$ is *not* complex conjugation for complex $k_\mu$. Furthermore we introduce (in what follows the brackets around the vector indices have the usual meaning of antisymmetrizing with respect to the indices inside the brackets, here without a factor two in the denominator)

$$a_+ = k_+ v_- + k v^* - k_- v_+ - k^* v = 2(k_{[3}v_{0]} + \mathrm{i}k_{[2}v_{1]}) \tag{X.124a}$$

$$a_- = k_- v_+ + k v^* - k_+ v_- - k^* v = 2(-k_{[3}v_{0]} + \mathrm{i}k_{[2}v_{1]}) \tag{X.124b}$$

$$b_+ = 2(k_+ v - k v_+) \qquad = 2(k_{[0}v_{1]} + k_{[3}v_{1]} + \mathrm{i}k_{[0}v_{2]} + \mathrm{i}k_{[3}v_{2]}) \tag{X.124c}$$

$$b_- = 2(k_- v - k v_-) \qquad = 2(k_{[0}v_{1]} - k_{[3}v_{1]} + \mathrm{i}k_{[0}v_{2]} - \mathrm{i}k_{[3}v_{2]}) \tag{X.124d}$$

$$b_{+*} = 2(k_+ v^* - k^* v_+) \qquad = 2(k_{[0}v_{1]} + k_{[3}v_{1]} - \mathrm{i}k_{[0}v_{2]} - \mathrm{i}k_{[3}v_{2]}) \tag{X.124e}$$

$$b_{-*} = 2(k_- v^* - k^* v_-) \qquad = 2(k_{[0}v_{1]} - k_{[3}v_{1]} - \mathrm{i}k_{[0}v_{2]} + \mathrm{i}k_{[3}v_{2]}) \tag{X.124f}$$

Of course, one could introduce a more advanced notation, but we don't want to become confused.

$$[\slashed{k}, \gamma^0] = \begin{pmatrix} -2k_3 & -2k^* & 0 & 0 \\ -2k & 2k_3 & 0 & 0 \\ 0 & 0 & 2k_3 & 2k^* \\ 0 & 0 & 2k & -2k_3 \end{pmatrix} \tag{X.125a}$$

$$[\slashed{k}, \gamma^1] = \begin{pmatrix} -2\mathrm{i}k_2 & -2k_- & 0 & 0 \\ -2k_+ & 2\mathrm{i}k_2 & 0 & 0 \\ 0 & 0 & -2\mathrm{i}k_2 & 2k_+ \\ 0 & 0 & 2k_- & 2\mathrm{i}k_2 \end{pmatrix} \tag{X.125b}$$

$$[\slashed{k}, \gamma^2] = \begin{pmatrix} 2\mathrm{i}k_1 & 2\mathrm{i}k_- & 0 & 0 \\ -2\mathrm{i}k_+ & -2\mathrm{i}k_1 & 0 & 0 \\ 0 & 0 & 2\mathrm{i}k_1 & -2\mathrm{i}k_+ \\ 0 & 0 & 2\mathrm{i}k_- & -2\mathrm{i}k_1 \end{pmatrix} \tag{X.125c}$$

$$[\not{k}, \gamma^3] = \begin{pmatrix} -2k_0 & -2k^* & 0 & 0 \\ 2k & 2k_0 & 0 & 0 \\ 0 & 0 & 2k_0 & -2k^* \\ 0 & 0 & 2k & -2k_0 \end{pmatrix} \tag{X.125d}$$

$$[\not{k}, \not{V}] = \begin{pmatrix} a_- & b_{-*} & 0 & 0 \\ b_+ & -a_- & 0 & 0 \\ 0 & 0 & a_+ & -b_{+*} \\ 0 & 0 & -b_- & -a_+ \end{pmatrix} \tag{X.125e}$$

$$\gamma^5\gamma^0[\not{k}, \not{V}] = \begin{pmatrix} 0 & 0 & -a_+ & b_{+*} \\ 0 & 0 & b_- & a_+ \\ a_- & b_{-*} & 0 & 0 \\ b_+ & -a_- & 0 & 0 \end{pmatrix} \tag{X.125f}$$

## X.27   Polarization vectorspinors

Here we construct the wavefunctions for (massive) gravitinos out of the wavefunctions of (massive) vectorbosons and (massive) Majorana fermions.

$$\psi^{\mu}_{(u;3/2)}(k) = \epsilon^{\mu}_{+}(k) \cdot u(k,+) \tag{X.138a}$$

$$\psi^{\mu}_{(u;1/2)}(k) = \sqrt{\frac{1}{3}}\,\epsilon^{\mu}_{+}(k) \cdot u(k,-) + \sqrt{\frac{2}{3}}\,\epsilon^{\mu}_{0}(k) \cdot u(k,+) \tag{X.138b}$$

$$\psi^{\mu}_{(u;-1/2)}(k) = \sqrt{\frac{2}{3}}\,\epsilon^{\mu}_{0}(k) \cdot u(k,-) + \sqrt{\frac{1}{3}}\,\epsilon^{\mu}_{-}(k) \cdot u(k,+) \tag{X.138c}$$

$$\psi^{\mu}_{(u;-3/2)}(k) = \epsilon^{\mu}_{-}(k) \cdot u(k,-) \tag{X.138d}$$

and in the same manner for $\psi^{\mu}_{(v;s)}$ with $u$ replaced by $v$ and with the conjugated polarization vectors. These gravitino wavefunctions obey the Dirac equation, they are transverse and they fulfill the irreducibility condition

$$\gamma_{\mu}\psi^{\mu}_{(u/v;s)} = 0. \tag{X.139}$$

⟨omega_vspinor_polarizations.f90⟩≡

    ⟨*Implementation of polarization vectorspinors*⟩
  end module omega_vspinor_polarizations

⟨*Declaration of polarization vectorspinors*⟩≡
  public :: ueps, veps
  private :: eps
  private :: outer_product

Here we implement the polarization vectors for vectorbosons with trigonometric functions, without the rotating of components done in HELAS [5]. These are only used for generating the polarization vectorspinors.

$$\epsilon_+^\mu(k) = \frac{-e^{+\mathrm{i}\phi}}{\sqrt{2}} \left(0; \cos\theta\cos\phi - \mathrm{i}\sin\phi, \cos\theta\sin\phi + \mathrm{i}\cos\phi, -\sin\theta\right) \tag{X.140a}$$

$$\epsilon_-^\mu(k) = \frac{e^{-\mathrm{i}\phi}}{\sqrt{2}} \left(0; \cos\theta\cos\phi + \mathrm{i}\sin\phi, \cos\theta\sin\phi - \mathrm{i}\cos\phi, -\sin\theta\right) \tag{X.140b}$$

$$\epsilon_0^\mu(k) = \frac{1}{m} \left(|\vec{k}|; k^0\sin\theta\cos\phi, k^0\sin\theta\sin\phi, k^0\cos\theta\right) \tag{X.140c}$$

Determining the mass from the momenta is a numerically haphazardous for light particles. Therefore, we accept some redundancy and pass the mass explicitly. For the case that the momentum lies totally in the $z$-direction we take the convention $\cos\phi = 1$ and $\sin\phi = 0$.

# X.28   Color

⟨`omega_color.f90`⟩≡
```
  ⟨Copyleft⟩
  module omega_color
    use kinds
    implicit none
    private
    ⟨Declaration of color types⟩
    ⟨Declaration of color functions⟩
    integer, parameter, public :: omega_color_2010_01_A = 0
  contains
    ⟨Implementation of color functions⟩
  end module omega_color
```

## X.28.1   Color Sum

⟨*Declaration of color types*⟩≡
```
  public :: omega_color_factor
  type omega_color_factor
    integer :: i1, i2
    real(kind=default) :: factor
  end type omega_color_factor
```

⟨*Declaration of color functions*⟩≡
```
public :: omega_color_sum
```

The `!$omp` instruction will result in parallel code if compiled with support for OpenMP otherwise it is ignored.

⟨*Implementation of color functions*⟩≡
```
⟨pure unless OpenMP⟩
function omega_color_sum (flv, hel, amp, cf) result (amp2)
  complex(kind=default) :: amp2
  integer, intent(in) :: flv, hel
  complex(kind=default), dimension(:,:,:), intent(in) :: amp
  type(omega_color_factor), dimension(:), intent(in) :: cf
  integer :: n
  amp2 = 0
  !$omp parallel do reduction(+:amp2)
  do n = 1, size (cf)
     amp2 = amp2 + cf(n)%factor * &
                amp(flv,cf(n)%i1,hel) * conjg (amp(flv,cf(n)%i2,hel))
  end do
  !$omp end parallel do
end function omega_color_sum
```

In the bytecode for the OVM, we only save the symmetric part of the color factor table. This almost halves the size of $n$ gluon amplitudes for $n > 6$. For $2 \to (5,6)\,g$ the reduced color factor table still amounts for $\sim (75, 93)\%$ of the bytecode, making it desirable to omit it completely by computing it dynamically to reduce memory requirements. Note that $2\mathrm{Re}(A_{i_1}A_{i_2}^*) = A_{i_1}A_{i_2}^* + A_{i_2}A_{i_1}^*$.

  end subroutine omega_report_helicity_selection
```

⟨*Declaration of utility functions*⟩+≡
```
  public :: omega_ward_warn, omega_ward_panic
```

The O'Mega amplitudes have only one particle off shell and are the sum of *all* possible diagrams with the other particles on-shell.

⚠ The problem with these gauge checks is that are numerically very small amplitudes that vanish analytically and that violate transversality. The hard part is to determine the thresholds that make threse tests usable.

## X.29.3  Obsolete Summation

### Spin/Helicity Summation

⟨*Declaration of obsolete utility functions*⟩≡
```
  public :: omega_sum, omega_sum_nonzero, omega_nonzero
  private :: state_index
```

⟨*Implementation of obsolete utility functions*⟩≡
```
  pure function omega_sum (omega, p, states, fixed) result (sigma)
    real(kind=default) :: sigma
    real(kind=default), dimension(0:,:), intent(in) :: p
    integer, dimension(:), intent(in), optional :: states, fixed
    ⟨interface for O'Mega Amplitude⟩
    integer, dimension(size(p,dim=2)) :: s, nstates
    integer :: j
    complex(kind=default) :: a
    if (present (states)) then
       nstates = states
    else
       nstates = 2
    end if
    sigma = 0
    s = -1
    sum_spins: do
       if (present (fixed)) then
          !!! print *, 's = ', s, ', fixed = ', fixed, ', nstates = ', nstates, &
          !!!     ', fixed|s = ', merge (fixed, s, mask = nstates == 0)
          a = omega (p, merge (fixed, s, mask = nstates == 0))
       else
          a = omega (p, s)
       end if
       sigma = sigma + a * conjg(a)
       ⟨Step s like a n-ary number and terminate when all (s == -1)⟩
    end do sum_spins
    sigma = sigma / num_states (2, nstates(1:2))
  end function omega_sum
```

We're looping over all spins like a $n$-ary numbers $(-1, \ldots, -1, -1)$, $(-1, \ldots, -1, 0)$, $(-1, \ldots, -1, 1)$, $(-1, \ldots, 0, -1)$, $\ldots$, $(1, \ldots, 1, 0)$, $(1, \ldots, 1, 1)$:

⟨*Step* s *like a n-ary number and terminate when* `all (s == -1)`⟩≡
```
  do j = size (p, dim = 2), 1, -1
     select case (nstates (j))
     case (3) ! massive vectors
        s(j) = modulo (s(j) + 2, 3) - 1
     case (2) ! spinors, massless vectors
        s(j) = - s(j)
     case (1) ! scalars
        s(j) = -1
     case (0) ! fixed spin
        s(j) = -1
     case default ! ???
        s(j) = -1
     end select
     if (s(j) /= -1) then
        cycle sum_spins
     end if
  end do
  exit sum_spins
```

The dual operation evaluates an $n$-number:

⟨*Implementation of obsolete utility functions*⟩+≡
```
  pure function state_index (s, states) result (n)
    integer, dimension(:), intent(in) :: s
    integer, dimension(:), intent(in), optional :: states
    integer :: n
    integer :: j, p
    n = 1
    p = 1
    if (present (states)) then
       do j = size (s), 1, -1
          select case (states(j))
          case (3)
             n = n + p * (s(j) + 1)
          case (2)
```

```
                  n = n + p * (s(j) + 1) / 2
              end select
              p = p * states(j)
           end do
        else
           do j = size (s), 1, -1
              n = n + p * (s(j) + 1) / 2
              p = p * 2
           end do
        end if
     end function state_index

Quantify the agreement of two real or complex numbers

$$\text{agreement}(x, y) = \frac{\ln \Delta(x, y)}{\ln \epsilon} \in [0, 1] \tag{X.141}$$

with

$$\Delta(x, y) = \frac{|x - y|}{\max(|x|, |y|)} \tag{X.142}$$

and values outside $[0, 1]$ replaced the closed value in the interval. In other words

- 1 for $x - y = \max(|x|, |y|) \cdot \mathcal{O}(\epsilon)$ and

- 0 for $x - y = \max(|x|, |y|) \cdot \mathcal{O}(1)$

with logarithmic interpolation. The cases $x = 0$ and $y = 0$ must be treated separately.

## X.33    O'Mega Virtual Machine

This module defines the O'Mega Virtual Machine (OVM) completely, whereby all environmental dependencies like masses, widths and couplings have to be given to the constructor `vm%init` at runtime.

    Support for Majorana particles and vectorspinors is only partially, especially all fusions are missing. Maybe it would be easier to make an additional `omegavm95_bispinors` to avoid namespace issues. Non-type specific chunks could be reused

⟨omegavm95.f90⟩≡
  ⟨Copyleft⟩
```
  module omegavm95
    use kinds, only: default
    use constants
    use iso_varying_string, string_t => varying_string
    use, intrinsic :: iso_fortran_env, only : input_unit, output_unit, error_unit
    use omega95
    use omega95_bispinors, only: bispinor, vectorspinor, veps, pr_grav
    use omega95_bispinors, only: bi_u => u
    use omega95_bispinors, only: bi_v => v
    use omega95_bispinors, only: bi_pr_psi => pr_psi
    use omega_bispinors, only: operator (*), operator (+)
    use omega_color, only: ovm_color_sum, OCF => omega_color_factor
    implicit none
    private
```
    ⟨Utilities Declarations⟩
    ⟨OVM Data Declarations⟩
    ⟨OVM Instructions⟩
```
  contains
```
    ⟨OVM Procedure Implementations⟩
    ⟨Utilities Procedure Implementations⟩
```
  end module omegavm95
```

This might not be the proper place but I don't know where to put it

⟨Utilities Declarations⟩≡
```
  integer, parameter, public :: stdin = input_unit
  integer, parameter, public :: stdout = output_unit
  integer, parameter, public :: stderr = error_unit
  integer, parameter :: MIN_UNIT = 11, MAX_UNIT = 99
```

⟨OVM Procedure Implementations⟩≡
```
  subroutine find_free_unit (u, iostat)
    integer, intent(out) :: u
    integer, intent(out), optional :: iostat
    logical :: exists, is_open
    integer :: i, status
```

```
     do i = MIN_UNIT, MAX_UNIT
        inquire (unit = i, exist = exists, opened = is_open, &
             iostat = status)
        if (status == 0) then
           if (exists .and. .not. is_open) then
              u = i
              if (present (iostat)) then
                 iostat = 0
              end if
              return
           end if
        end if
     end do
     if (present (iostat)) then
        iostat = -1
     end if
     u = -1
  end subroutine find_free_unit
```

These abstract data types would ideally be the interface to communicate quantum numbers between O'Mega and Whizard. This gives full flexibility to change the representation at any time

## X.33.1   Memory Layout

Some internal parameters
⟨*OVM Data Declarations*⟩≡
```
  integer, parameter :: len_instructions = 8
  integer, parameter :: N_version_lines = 2
  ! Comment lines including the first header description line
  integer, parameter :: N_comments = 6
  ! Actual data lines plus intermediate description lines
  ! 'description \n 1 2 3 \n description \n 3 2 1' would count as 3
  integer, parameter :: N_header_lines = 5
  real(default), parameter, public :: N_ = three
```

This is the basic type of a VM
⟨*OVM Data Declarations*⟩+≡
```
  type :: basic_vm_t
     private
     logical :: verbose
     type(string_t) :: bytecode_file
     integer :: bytecode_fh, out_fh
     integer :: N_instructions, N_levels
     integer :: N_table_lines
     integer, dimension(:, :), allocatable :: instructions
     integer, dimension(:), allocatable :: levels
  end type
```

To allow for a lazy evaluation of amplitudes, we have to keep track whether a wave function has already been computed, to avoid multiple-computing that would arise when the bytecode has redundant fusions, which is necessary for flavor and color MC (and helicity MC when we use Weyl-van-der-Waerden-spinors)

⟨*OVM Data Declarations*⟩+≡
```
type :: vm_scalar
   logical :: c
   complex(kind=default) :: v

## X.33.2   Controlling the VM

These type-bound procedures steer the VM

⟨ *VM: TBP* ⟩≡

```
      procedure :: init => vm_init
      procedure :: write => vm_write
      procedure :: reset => vm_reset
      procedure :: run => vm_run
      procedure :: final => vm_final
```

The `init` completely sets the environment for the OVM. Parameters can be changed with `reset` without reloading the bytecode.

⟨ *OVM Procedure Implementations* ⟩+≡

```
   subroutine vm_init (vm, bytecode_file, version, model, &
        coupl_real, coupl_real2, coupl_cmplx, coupl_cmplx2, &
        mass, width, verbose, out_fh, openmp)
      class(vm_t), intent(out) :: vm
      type(string_t), intent(in) :: bytecode_file
      type(string_t), intent(in) :: version

      !    sizeof(vm%table_ghost_flags)
  end subroutine vm_write
```

Most of this is redundant (Fortran will deallocate when we leave the scope) but when we change from `allocatables` to `pointers`, it is necessary to avoid leaks

⟨*OVM Procedure Implementations*⟩+≡
```
  subroutine vm_final (vm)
    class(vm_t), intent(inout) :: vm
    deallocate (vm%table_flavor)
    deallocate (vm%table_color_flows)
    deallocate (vm%table_spin)
    deallocate (vm%table_ghost_flags)
    deallocate (vm%table_color_factors)
    deallocate (vm%table_flv_col_is_allowed)
    if (allocated (vm%coupl_real)) then
       deallocate (vm%coupl_real)
    end if
    if (allocated (vm%coupl_real2)) then
       deallocate (vm%coupl_real2)
    end if
    if (allocated (vm%coupl_cmplx)) then
       deallocate (vm%coupl_cmplx)
    end if
    if (allocated (vm%coupl_cmplx2)) then
       deallocate (vm%coupl_cmplx2)
    end if
    if (allocated (vm%mass)) then
       deallocate (vm%mass)
    end if
    if (allocated (vm%width)) then
       deallocate (vm%width)
    end if
    deallocate (vm%momenta)
    deallocate (vm%flavor)
    deallocate (vm%color)
    deallocate (vm%helicity)
    deallocate (vm%amplitudes)
    deallocate (vm%table_amplitudes)
    deallocate (vm%scalars)
    deallocate (vm%spinors)
    deallocate (vm%conjspinors)
    deallocate (vm%bispinors)
    deallocate (vm%vectors)
    deallocate (vm%tensors_2)
    deallocate (vm%tensors_1)
    deallocate (vm%vectorspinors)
  end subroutine vm_final
```

Handing over the polymorph object helicity didn't work out as planned. A work-around is the use of `pointers`. `flavor` and `color` are not yet used but would have to be changed to `pointers` as well. At least this potentially avoids copying. Actually, neither the allocatable nor the pointer version works in `gfortran 4.7` due to the broken `select type`. Back to Stone Age, i.e. integers.

⟨*OVM Procedure Implementations*⟩+≡
```
  subroutine vm_run (vm, mom, flavor, color, helicity)
    class(vm_t), intent(inout) :: vm
    real(default), dimension(0:3, *), intent(in) :: mom
    class(flavor_t), dimension(:), optional, intent(in) :: flavor
    class(color_t), dimension(:), optional, intent(in) :: color
    ! gfortran 4.7
    !class(helicity_t), dimension(:), optional, target, intent(in) :: helicity
    integer, dimension(:), optional, intent(in) :: helicity
    integer :: i, h, hi
```

```
      do i = 1, vm%N_particles
        if (i <= vm%N_prt_in) then
          vm%momenta(i) = - mom(:, i)            ! incoming, crossing symmetry
        else
          vm%momenta(i) = mom(:, i)              ! outgoing
        end if
      end do
      if (present (flavor)) then
        allocate(vm%flavor(size(flavor)), source=flavor)
      else
        if (.not. (allocated (vm%flavor))) then
          allocate(flv_discrete::vm%flavor(vm%N_particles))
        end if
      end if
      if (present (color)) then
        allocate(vm%color(size(color)), source=color)
      else
        if (.not. (allocated (vm%color))) then
          allocate(col_discrete::vm%color(vm%N_col_flows))
        end if
      end if
      ! gfortran 4.7
      if (present (helicity)) then
        !vm%helicity => helicity
        vm%helicity = helicity
        call vm_run_one_helicity (vm, 1)
      else
        !if (.not. (associated (vm%helicity))) then
          !allocate(hel_discrete::vm%helicity(vm%N_particles))
        !end if
        if (.not. (allocated (vm%helicity))) then
          allocate(vm%helicity(vm%N_particles))
        end if
        if (vm%hel_finite == 0) return
        do hi = 1, vm%hel_finite
          h = vm%hel_map(hi)
          !<Work around [[gfortran 4.7 Bug 56731]] Implementation>>
          vm%helicity = vm%table_spin(:,h)
          call vm_run_one_helicity (vm, h)
        end do
      end if
  end subroutine vm_run
```

This only removes the ICE but still leads to a segmentation fault in gfortran 4.7. I am running out of ideas how to make this compiler work with arrays of polymorph datatypes.

### X.33.5 Helper functions

Factoring out these parts helps a lot to keep sane but might hurt the performance of the VM noticably. In that case, we have to copy & paste to avoid the additional function calls. Note that with preprocessor macros, we could maintain this factorized form (and factor out even more since types don't have to match), in case we would decide to allow this

⟨*load outer wave function*⟩≡

```
  !select type (h)
  !type is (hel_trigonometric)
     !wf%v = (cos (h%theta) * load_wf (m, p, + 1) + &
          !sin (h%theta) * load_wf (m, p, - 1)) * sqrt2
  !type is (hel_exponential)
     !wf%v = exp (+ imago * h%phi) * load_wf (m, p, + 1) + &
          !exp (- imago * h%phi) * load_wf (m, p, - 1)
  !type is (hel_spherical)
     !wf%v = (exp (+ imago * h%phi) * cos (h%theta) * load_wf (m, p, + 1) + &
          !exp (- imago * h%phi) * sin (h%theta) * load_wf (m, p, - 1)) * &
          !sqrt2
