The normalization factor  $\sqrt{2N(N-1)}/N$  that enters the Bloch representation.

*<Bloch vectors: procedures>*≡

```
function bloch_factor (s) result (f)
  real(default) :: f
  integer, intent(in) :: s
  select case (s)
    case (SCALAR)
      f = 0
    case (SPINOR)
      f = 1
    case (VECTOR)
      f = 2 * sqrt (3._default) / 3
    case (VECTORSPINOR)
      f = 2 * sqrt (6._default) / 4
    case (TENSOR)
      f = 2 * sqrt (10._default) / 5
```

```

    case default
        f = 0
    end select
end function bloch_factor

```

### 15.2.2 The basic polarization type

The basic polarization object holds just the entries of the Bloch vector as an allocatable array.

Bloch is active whenever the coefficient array is allocated. For convenience, we store the spin type ( $2s$ ) and the multiplicity ( $N$ ) together with the coefficient array ( $\alpha$ ). We have to allow for the massless case where  $s$  is arbitrary  $> 0$  but  $N = 2$ , and furthermore the chiral massless case where  $N = 1$ . In the latter case, the array remains deallocated but the chirality is set to  $\pm 1$ .

In the Bloch vector implementation, we do not distinguish between particle and antiparticle. If the distinction applies, it must be made by the caller when transforming between density matrix and Bloch vector.

```

<Bloch vectors: public>≡
    public :: bloch_vector_t
<Bloch vectors: types>≡
    type :: bloch_vector_t
        private
            integer :: spin_type = UNKNOWN
            real(default), dimension(:), allocatable :: a
        contains
            <Bloch vectors: bloch vector: TBP>
    end type bloch_vector_t

```

### 15.2.3 Direct Access

This basic initializer just sets the spin type, leaving the Bloch vector unallocated. The object therefore does not support nonzero polarization.

```

<Bloch vectors: bloch vector: TBP>≡
    procedure :: init_unpolarized => bloch_vector_init_unpolarized
<Bloch vectors: procedures>+≡
    subroutine bloch_vector_init_unpolarized (pol, spin_type)
        class(bloch_vector_t), intent(out) :: pol
        integer, intent(in) :: spin_type
        pol%spin_type = spin_type
    end subroutine bloch_vector_init_unpolarized

```

The standard initializer allocates the Bloch vector and initializes with zeros, so we can define a polarization later. We make sure that this works only for the supported spin type. Initializing with UNKNOWN spin type resets the Bloch vector to undefined, i.e., unpolarized state.

```

<Bloch vectors: bloch vector: TBP>+≡
    generic :: init => bloch_vector_init
    procedure, private :: bloch_vector_init

```

```

<Bloch vectors: procedures>+≡
subroutine bloch_vector_init (pol, spin_type)
  class(bloch_vector_t), intent(out) :: pol
  integer, intent(in) :: spin_type
  pol%spin_type = spin_type
  select case (spin_type)
  case (SCALAR, SPINOR, VECTOR, VECTORSPINOR, TENSOR)
    allocate (pol%a (algebra_dimension (spin_type)), source = 0._default)
  end select
end subroutine bloch_vector_init

```

Fill the Bloch vector from an array, no change of normalization. No initialization and no check, we assume that the shapes do match.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: from_array => bloch_vector_from_array

<Bloch vectors: procedures>+≡
subroutine bloch_vector_from_array (pol, a)
  class(bloch_vector_t), intent(inout) :: pol
  real(default), dimension(:), allocatable, intent(in) :: a
  pol%a(:) = a
end subroutine bloch_vector_from_array

```

Transform to an array of reals, i.e., extract the Bloch vector as-is.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: to_array => bloch_vector_to_array

<Bloch vectors: procedures>+≡
subroutine bloch_vector_to_array (pol, a)
  class(bloch_vector_t), intent(in) :: pol
  real(default), dimension(:), allocatable, intent(out) :: a
  if (pol%is_defined ()) allocate (a (size (pol%a)), source = pol%a)
end subroutine bloch_vector_to_array

```

## 15.2.4 Raw I/O

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: write_raw => bloch_vector_write_raw
  procedure :: read_raw => bloch_vector_read_raw

<Bloch vectors: procedures>+≡
subroutine bloch_vector_write_raw (pol, u)
  class(bloch_vector_t), intent(in) :: pol
  integer, intent(in) :: u
  write (u) pol%spin_type
  write (u) allocated (pol%a)
  if (allocated (pol%a)) then
    write (u) pol%a
  end if
end subroutine bloch_vector_write_raw

subroutine bloch_vector_read_raw (pol, u, iostat)
  class(bloch_vector_t), intent(out) :: pol

```

```

integer, intent(in) :: u
integer, intent(out) :: iostat
integer :: s
logical :: polarized
read (u, iostat=iostat) s
read (u, iostat=iostat) polarized
if (iostat /= 0) return
if (polarized) then
  call pol%init (s)
  read (u, iostat=iostat) pol%a
else
  call pol%init_unpolarized (s)
end if
end subroutine bloch_vector_read_raw

```

### 15.2.5 Properties

Re-export algebra functions that depend on the spin type. These functions do not depend on the Bloch vector being allocated.

```

(Bloch vectors: bloch vector: TBP)+≡
  procedure :: get_n_states
  procedure :: get_length
  procedure :: hel_index => bv_helicity_index
  procedure :: hel_value => bv_helicity_value
  procedure :: bloch_factor => bv_factor

(Bloch vectors: procedures)+≡
  function get_n_states (pol) result (n)
    class(bloch_vector_t), intent(in) :: pol
    integer :: n
    n = fundamental_dimension (pol%spin_type)
  end function get_n_states

  function get_length (pol) result (n)
    class(bloch_vector_t), intent(in) :: pol
    integer :: n
    n = algebra_dimension (pol%spin_type)
  end function get_length

  function bv_helicity_index (pol, h) result (i)
    class(bloch_vector_t), intent(in) :: pol
    integer, intent(in) :: h
    integer :: i
    i = helicity_index (pol%spin_type, h)
  end function bv_helicity_index

  function bv_helicity_value (pol, i) result (h)
    class(bloch_vector_t), intent(in) :: pol
    integer, intent(in) :: i
    integer :: h
    h = helicity_value (pol%spin_type, i)
  end function bv_helicity_value

```

```

function bv_factor (pol) result (f)
  class(bloch_vector_t), intent(in) :: pol
  real(default) :: f
  f = bloch_factor (pol%spin_type)
end function bv_factor

```

If the Bloch vector object is defined, the spin type is anything else but UNKNOWN. This allows us to provide the representation-specific functions above.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: is_defined => bloch_vector_is_defined

<Bloch vectors: procedures>+≡
  function bloch_vector_is_defined (pol) result (flag)
    class(bloch_vector_t), intent(in) :: pol
    logical :: flag
    flag = pol%spin_type /= UNKNOWN
  end function bloch_vector_is_defined

```

If the Bloch vector object is (technically) polarized, it is defined, and the vector coefficient array has been allocated. However, the vector value may be zero.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: is_polarized => bloch_vector_is_polarized

<Bloch vectors: procedures>+≡
  function bloch_vector_is_polarized (pol) result (flag)
    class(bloch_vector_t), intent(in) :: pol
    logical :: flag
    flag = allocated (pol%a)
  end function bloch_vector_is_polarized

```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are on the diagonal. This is equivalent to requiring that only Cartan generator coefficients are nonzero in the Bloch vector.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: is_diagonal => bloch_vector_is_diagonal

<Bloch vectors: procedures>+≡
  function bloch_vector_is_diagonal (pol) result (diagonal)
    class(bloch_vector_t), intent(in) :: pol
    logical :: diagonal
    integer :: s, i
    s = pol%spin_type
    diagonal = .true.
    if (pol%is_polarized ()) then
      do i = 1, size (pol%a)
        if (is_cartan_generator (s, i)) cycle
        if (pol%a(i) /= 0) then
          diagonal = .false.
          return
        end if
      end do
    end if
  end function bloch_vector_is_diagonal

```

Return the Euclidean norm of the Bloch vector. This is equal to the Killing form value of the corresponding algebra generator. We assume that the polarization object has been initialized.

For a pure state, the norm is unity. All other allowed states have a norm less than unity. (For  $s \geq 1$ , this is a necessary but not sufficient condition.)

```

(Bloch vectors: bloch vector: TBP)+≡
  procedure :: get_norm => bloch_vector_get_norm

(Bloch vectors: procedures)+≡
  function bloch_vector_get_norm (pol) result (norm)
    class(bloch_vector_t), intent(in) :: pol
    real(default) :: norm
    select case (pol%spin_type)
    case (SPINOR, VECTOR, VECTORSPINOR, TENSOR)
      norm = sqrt (dot_product (pol%a, pol%a))
    case default
      norm = 1
    end select
  end function bloch_vector_get_norm

```

### 15.2.6 Diagonal density matrix

This initializer takes a diagonal density matrix, represented by a real-valued array. We assume that the trace is unity, and that the array has the correct shape for the given `spin_type`.

The `bloch_factor` renormalization is necessary such that a pure state maps to a Bloch vector with unit norm.

```

(Bloch vectors: bloch vector: TBP)+≡
  generic :: init => bloch_vector_init_diagonal
  procedure, private :: bloch_vector_init_diagonal

(Bloch vectors: procedures)+≡
  subroutine bloch_vector_init_diagonal (pol, spin_type, rd)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
    real(default), dimension(:), intent(in) :: rd
    call pol%init (spin_type)
    call pol%set (rd)
  end subroutine bloch_vector_init_diagonal

```

Set a Bloch vector, given a diagonal density matrix as a real array. The Bloch vector must be initialized with correct characteristics.

```

(Bloch vectors: bloch vector: TBP)+≡
  generic :: set => bloch_vector_set_diagonal
  procedure, private :: bloch_vector_set_diagonal

(Bloch vectors: procedures)+≡
  subroutine bloch_vector_set_diagonal (pol, rd)
    class(bloch_vector_t), intent(inout) :: pol
    real(default), dimension(:), intent(in) :: rd
    integer :: s
    s = pol%spin_type

```

```

select case (s)
case (SCALAR,SPINOR,VECTOR,VECTORSPINOR,TENSOR)
  pol%a(:) = cartan_coeff (s, rd) / bloch_factor (s)
end select
end subroutine bloch_vector_set_diagonal

```

### 15.2.7 Massless density matrix

This is a specific variant which initializes an equipartition for the maximum helicity, corresponding to an unpolarized massless particle.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: init_max_weight => bloch_vector_init_max_weight

<Bloch vectors: procedures>+≡
  subroutine bloch_vector_init_max_weight (pol, spin_type)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
    call pol%init (spin_type)
    select case (spin_type)
    case (VECTOR)
      call pol%set ([0.5_default, 0._default, 0.5_default])
    case (VECTORSPINOR)
      call pol%set ([0.5_default, 0._default, 0._default, 0.5_default])
    case (TENSOR)
      call pol%set ([0.5_default, 0._default, 0._default, 0._default, 0.5_default])
    end select
  end subroutine bloch_vector_init_max_weight

```

Initialize the maximum-weight submatrix with a three-component Bloch vector. This is not as trivial as it seems because we need the above initialization for the generalized Bloch in order to remove the lower weights from the density matrix.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: init_vector => bloch_vector_init_vector
  procedure :: to_vector => bloch_vector_to_vector

<Bloch vectors: procedures>+≡
  subroutine bloch_vector_init_vector (pol, s, a)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: s
    real(default), dimension(3), intent(in) :: a
    call pol%init_max_weight (s)
    select case (s)
    case (SPINOR, VECTOR, VECTORSPINOR, TENSOR)
      pol%a(1:3) = a / bloch_factor (s)
    end select
  end subroutine bloch_vector_init_vector

  subroutine bloch_vector_to_vector (pol, a)
    class(bloch_vector_t), intent(in) :: pol
    real(default), dimension(3), intent(out) :: a
    integer :: s
    s = pol%spin_type

```

```

select case (s)
case (SPINOR, VECTOR, VECTORSPINOR, TENSOR)
  a = pol%a(1:3) * bloch_factor (s)
case default
  a = 0
end select
end subroutine bloch_vector_to_vector

```

## 15.2.8 Arbitrary density matrix

Initialize the Bloch vector from a density matrix. We assume that the density is valid. In particular, the shape should match, the matrix should be hermitian, and the trace should be unity.

We first fill the diagonal, then add the off-diagonal parts.

```

<Bloch vectors: bloch vector: TBP>+=
  generic :: init => bloch_vector_init_matrix
  procedure, private :: bloch_vector_init_matrix

<Bloch vectors: procedures>+=
  subroutine bloch_vector_init_matrix (pol, spin_type, r)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
    complex(default), dimension(:,:), intent(in) :: r
    select case (spin_type)
    case (SCALAR, SPINOR, VECTOR, VECTORSPINOR, TENSOR)
      call pol%init (spin_type)
      call pol%set (r)
    case default
      call pol%init (UNKNOWN)
    end select
  end subroutine bloch_vector_init_matrix

```

Set a Bloch vector, given an arbitrary density matrix as a real array. The Bloch vector must be initialized with correct characteristics.

```

<Bloch vectors: bloch vector: TBP>+=
  generic :: set => bloch_vector_set_matrix
  procedure, private :: bloch_vector_set_matrix

<Bloch vectors: procedures>+=
  subroutine bloch_vector_set_matrix (pol, r)
    class(bloch_vector_t), intent(inout) :: pol
    complex(default), dimension(:,:), intent(in) :: r
    real(default), dimension(:), allocatable :: rd
    integer :: s, d, i, j, h1, h2, ir, ii
    s = pol%spin_type
    select case (s)
    case (SCALAR, SPINOR, VECTOR, VECTORSPINOR, TENSOR)
      d = fundamental_dimension (s)
      allocate (rd (d))
      do i = 1, d
        rd(i) = r(i,i)
      end do
    end case
  end subroutine bloch_vector_set_matrix

```

```

call pol%set (rd)
do i = 1, d
  h1 = helicity_value (s, i)
  do j = i+1, d
    h2 = helicity_value (s, j)
    ir = root_index (s, h1, h2, .true.)
    ii = root_index (s, h1, h2, .false.)
    pol%a(ir) = real (r(j,i) + r(i,j)) / bloch_factor (s)
    pol%a(ii) = aimag (r(j,i) - r(i,j)) / bloch_factor (s)
  end do
end do
end select
end subroutine bloch_vector_set_matrix

```

Allocate and fill the density matrix  $r$  (with the index ordering as defined in `su_algebra`) that corresponds to a given Bloch vector.

If the optional `only_max_weight` is set, the resulting matrix has entries only for  $\pm h_{\max}$ , as appropriate for a massless particle (for  $\text{spin} \geq 1$ ). Note that we always add the unit matrix, as this is part of the Bloch-vector definition.

*(Bloch vectors: bloch vector: TBP)+≡*

```

procedure :: to_matrix => bloch_vector_to_matrix

```

*(Bloch vectors: procedures)+≡*

```

subroutine bloch_vector_to_matrix (pol, r, only_max_weight)

## 15.3 Polarization

Using generalized Bloch vectors and the  $su(N)$  algebra (see above) for the internal representation, we can define various modes of polarization. For spin-1/2, and analogously for massless spin- $s$  particles, we introduce

1. Trivial polarization:  $\vec{\alpha} = 0$ . [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]
2. Circular polarization:  $\vec{\alpha}$  points in  $\pm z$  direction.
3. Transversal polarization:  $\vec{\alpha}$  points orthogonal to the  $z$  direction, with a phase  $\phi$  that is 0 for the  $x$  axis, and  $\pi/2 = 90^\circ$  for the  $y$  axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.
4. Axis polarization, where we explicitly give  $\vec{\alpha}$ .

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. In effect, we concentrate on the first three entries in the  $\alpha^a$  array. For massless particles, this is sufficient. For massive particles, we then add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.
6. Diagonal polarization: Explicitly specify all components in the helicity basis. The  $su(N)$  representation consists of diagonal generators only, the Cartan subalgebra.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover practical applications.

```

### 15.3.1 The polarization type

Polarization is active whenever the coefficient array is allocated. For convenience, we store the spin type ( $2s$ ) and the multiplicity ( $N$ ) together with the coefficient array ( $\alpha$ ). We have to allow for the massless case where  $s$  is arbitrary  $> 0$  but  $N = 2$ , and furthermore the chiral massless case where  $N = 1$ . In the latter case, the array remains deallocated but the chirality is set to  $\pm 1$ .

There is a convention that an antiparticle transforms according to the complex conjugate representation. We apply this only when transforming from/to polarization defined by a three-vector. For antiparticles, the two-component flips sign in that case. When transforming from/to a state matrix or `pmatrix` representation, we do not apply this sign flip.

```
<Polarizations: public>≡

        type(bloch_vector_t) :: bv
    contains
    <Polarizations: polarization: TBP>
end type polarization_t
```

### 15.3.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The Bloch vector is left undefined, so this initializer (in two versions) creates an unpolarized particle. Exception: a chiral particle is always polarized with definite helicity, it doesn't need a Bloch vector.

This is private.

```

```

A finalizer is no longer necessary.

### 15.3.3 I/O

The default setting produces a tabular output of the polarization vector entries. Optionally, we can create a state matrix and write its contents, emulating the obsolete original implementation.

If `all_states` is true (default), we generate all helicity combinations regardless of the matrix-element value. Otherwise, skip helicities with zero entry, or absolute value less than `tolerance`, if also given.

```

<Polarizations: polarization: TBP>+≡
    procedure :: write => polarization_write

<Polarizations: procedures>+≡
    subroutine polarization_write (pol, unit, state_matrix, all_states, tolerance)

### 15.3.4 Accessing contents

Return true if the particle is technically polarized. The particle is either chiral, or its Bloch vector has been defined. The function returns true even if the Bloch vector is zero or the particle is scalar.

```

(Polarizations: polarization: TBP)+≡
    procedure :: is_polarized => polarization_is_polarized

```

```

(Polarizations: procedures)+≡
function polarization_is_polarized (pol) result (polarized)
  class(polarization_t), intent(in) :: pol
  logical :: polarized
  polarized = pol%chirality /= 0 .or. pol%bv%is_polarized ()
end function polarization_is_polarized

```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are diagonal. For an unpolarized particle, we also return `.true.` since the density matrix is proportional to the unit matrix.

```

(Polarizations: polarization: TBP)+≡
  procedure :: is_diagonal => polarization_is_diagonal

(Polarizations: procedures)+≡
function polarization_is_diagonal (pol) result (diagonal)
  class(polarization_t), intent(in) :: pol
  logical :: diagonal
  select case (pol%chirality)
  case (0)
    diagonal = pol%bv%is_diagonal ()
  case default
    diagonal = .true.
  end select
end function polarization_is_diagonal

```

### 15.3.5 Mapping between polarization and state matrix

Create the polarization object that corresponds to a state matrix. The state matrix is not necessarily normalized. The result will be either unpolarized, or a generalized Bloch vector that we compute in terms of the appropriate spin generator basis. To this end, we first construct the complete density matrix, then set the Bloch vector with this input.

For a naturally chiral particle (i.e., neutrino), we do not set the polarization vector, it is implied.

Therefore, we cannot account for any sign flip and transform as-is.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_state_matrix => polarization_init_state_matrix

(Polarizations: procedures)+≡
subroutine polarization_init_state_matrix (pol, state)
  class(polarization_t), intent(out) :: pol
  type(state_matrix_t), intent(in), target :: state
  type(state_iterator_t) :: it
  type(flavor_t) :: flv
  type(helicity_t) :: hel
  integer :: d, h1, h2, i, j
  complex(default), dimension(:,,:), allocatable :: r
  complex(default) :: me
  real(default) :: trace
  call it%init (state)
  flv = it%get_flavor (1)
  hel = it%get_helicity (1)

```

```

if (hel%is_defined ()) then
  call pol%init_generic (flv)
  select case (pol%chirality)
  case (0)
    trace = 0
    d = pol%bv%get_n_states ()
    allocate (r (d, d), source = (0._default, 0._default))
    do while (it%is_valid ())
      hel = it%get_helicity (1)
      call hel%get_indices (h1, h2)
      i = pol%bv%hel_index (h1)
      j = pol%bv%hel_index (h2)
      me = it%get_matrix_element ()
      r(i,j) = me
      if (i == j) trace = trace + real (me)
      call it%advance ()
    end do
    if (trace /= 0) call pol%bv%set (r / trace)
  end select
else
  call pol%init (flv)
end if
end subroutine polarization_init_state_matrix

```

Create the state matrix that corresponds to a given polarization. We make use of the polarization iterator as defined below, which should iterate according to the canonical helicity ordering.

*(Polarizations: polarization: TBP)+≡*

```

procedure :: to_state => polarization_to_state_matrix

```

*(Polarizations: procedures)+≡*

```

subroutine polarization_to_state_matrix (pol, state, all_states, tolerance)
  class(polarization_t), intent(in), target :: pol
  type(state_matrix_t), intent(out) :: state
  logical, intent(in), optional :: all_states
  real(default), intent(in), optional :: tolerance
  type(polarization_iterator_t) :: it
  type(quantum_numbers_t), dimension(1) :: qn
  complex(default) :: value
  call it%init (pol, all_states, tolerance)
  call state%init (store_values = .true.)
  do while (it%is_valid ())
    value = it%get_value ()
    qn(1) = it%get_quantum_numbers ()
    call state%add_state (qn, value = value)
    call it%advance ()
  end do
  call state%freeze ()
end subroutine polarization_to_state_matrix

```

### 15.3.6 Specific initializers

Unpolarized particle, no nontrivial entries in the density matrix. This is the default initialization mode.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_unpolarized => polarization_init_unpolarized
(Polarizations: procedures)+≡
  subroutine polarization_init_unpolarized (pol, flv)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    call pol%init (flv)
  end subroutine polarization_init_unpolarized

```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1 - |f|}{2} \mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, & f < 0, \end{cases}$$

In the generalized Bloch representation, this is an entry for the  $T^3$  generator only, regardless of the spin representation.

A chiral particle is not affected.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_circular => polarization_init_circular
(Polarizations: procedures)+≡
  subroutine polarization_init_circular (pol, flv, f)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: f
    call pol%init (flv)
    select case (pol%chirality)
    case (0)
      call pol%bv%init_vector (pol%spin_type, &
        [0._default, 0._default, f])
    end select
  end subroutine polarization_init_circular

```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2} \mathbf{1} + \frac{|f|}{2} \begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

for the highest-weight subspace. The lower weights are unaffected. The phase is  $\phi = 0$  for the  $x$ -axis,  $\phi = 90^\circ$  for the  $y$  axis as polarization vector.

For an antiparticle, the phase switches sign, and for  $f < 0$ , the off-diagonal elements switch sign.

A chiral particle is not affected.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_transversal => polarization_init_transversal

```

```

<Polarizations: procedures>+≡
subroutine polarization_init_transversal (pol, flv, phi, f)
  class(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  real(default), intent(in) :: phi, f
  call pol%init (flv)
  select case (pol%chirality)
  case (0)
    if (pol%anti) then
      call pol%bv%init_vector (pol%spin_type, &
        [f * cos (phi), f * sin (phi), 0._default])
    else
      call pol%bv%init_vector (pol%spin_type, &
        [f * cos (phi), -f * sin (phi), 0._default])
    end if
  end select
end subroutine polarization_init_transversal

```

For axis polarization, we again set only the entries with maximum weight, which for spin 1/2 means

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle, the imaginary part proportional to  $\alpha_2$  switches sign (complex conjugate). A chiral particle is not affected.

In the generalized Bloch representation, this translates into coefficients for  $T^{1,2,3}$ , all others stay zero.

```

<Polarizations: polarization: TBP>+≡
procedure :: init_axis => polarization_init_axis

<Polarizations: procedures>+≡
subroutine polarization_init_axis (pol, flv, alpha)
  class(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  real(default), dimension(3), intent(in) :: alpha
  call pol%init (flv)
  select case (pol%chirality)
  case (0)
    if (pol%anti) then
      call pol%bv%init_vector (pol%spin_type, &
        [alpha(1), alpha(2), alpha(3)])
    else
      call pol%bv%init_vector (pol%spin_type, &
        [alpha(1), -alpha(2), alpha(3)])
    end if
  end select
end subroutine polarization_init_axis

```

This version specifies the polarization axis in terms of  $r$  (polarization degree) and  $\theta, \phi$  (polar and azimuthal angles).

If one of the angles is a nonzero multiple of  $\pi$ , roundoff errors typically will result in tiny contributions to unwanted components. Therefore, include a catch

for small numbers.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_angles => polarization_init_angles

(Polarizations: procedures)+≡
  subroutine polarization_init_angles (pol, flv, r, theta, phi)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: r, theta, phi
    real(default), dimension(3) :: alpha
    real(default), parameter :: eps = 10 * epsilon (1._default)

    alpha(1) = r * sin (theta) * cos (phi)
    alpha(2) = r * sin (theta) * sin (phi)
    alpha(3) = r * cos (theta)
    where (abs (alpha) < eps) alpha = 0
    call pol%init_axis (flv, alpha)
  end subroutine polarization_init_angles

```

Longitudinal polarization is defined only for massive bosons. Only the zero component is filled. Otherwise, unpolarized.

In the generalized Bloch representation, the zero component corresponds to a linear combination of all diagonal (Cartan) generators.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_longitudinal => polarization_init_longitudinal

(Polarizations: procedures)+≡
  subroutine polarization_init_longitudinal (pol, flv, f)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: f
    real(default), dimension(:), allocatable :: rd
    integer :: s, d
    s = flv%get_spin_type ()
    select case (s)
    case (VECTOR, TENSOR)
      call pol%init_generic (flv)
      if (pol%bv%is_polarized ()) then
        d = pol%bv%get_n_states ()
        allocate (rd (d), source = 0._default)
        rd(pol%bv%hel_index (0)) = f
        call pol%bv%set (rd)
      end if
    case default
      call pol%init_unpolarized (flv)
    end select
  end subroutine polarization_init_longitudinal

```

This is diagonal polarization: we specify all components explicitly. `rd` is the array of diagonal elements of the density matrix. We assume that the length of `rd` is equal to the particle multiplicity.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_diagonal => polarization_init_diagonal

```

```

<Polarizations: procedures>+≡
subroutine polarization_init_diagonal (pol, flv, rd)
  class(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  real(default), dimension(:), intent(in) :: rd
  real(default) :: trace
  call pol%init_generic (flv)
  if (pol%bv%is_polarized ()) then
    trace = sum (rd)
    if (trace /= 0) call pol%bv%set (rd / trace)
  end if
end subroutine polarization_init_diagonal

```

### 15.3.7 Operations

Combine polarization states by computing the outer product of the state matrices.

```

<Polarizations: public>+≡
public :: combine_polarization_states

<Polarizations: procedures>+≡
subroutine combine_polarization_states (pol, state)
  type(polarization_t), dimension(:), intent(in), target :: pol
  type(state_matrix_t), intent(out) :: state
  type(state_matrix_t), dimension(size(pol)), target :: pol_state
  integer :: i
  do i = 1, size (pol)
    call pol(i)%to_state (pol_state(i))
  end do
  call outer_multiply (pol_state, state)
  do i = 1, size (pol)
    call pol_state(i)%final ()
  end do
end subroutine combine_polarization_states

```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance. The norm of the returned axis is the polarization fraction for the highest-weight subspace. For a scalar particle, we return a zero vector. The same result applies if the highest-weight component vanishes.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

For an antiparticle, the `alpha(2)` coefficient flips sign.

```

<Polarizations: polarization: TBP>+≡
procedure :: get_axis => polarization_get_axis

<Polarizations: procedures>+≡
function polarization_get_axis (pol) result (alpha)
  class(polarization_t), intent(in), target :: pol
  real(default), dimension(3) :: alpha

```

```

select case (pol%chirality)
case (0)
  call pol%bv%to_vector (alpha)
  if (.not. pol%anti) alpha(2) = - alpha(2)
case (-1)
  alpha = [0._default, 0._default, -1._default]
case (1)
  alpha = [0._default, 0._default, 1._default]
end select
end function polarization_get_axis

```

This function returns polarization degree and polar and azimuthal angles ( $\theta, \phi$ ) of the polarization axis. The same restrictions apply as above.

Since we call the `get_axis` method, the phase flips sign for an antiparticle.

```

<Polarizations: polarization: TBP>+≡
  procedure :: to_angles => polarization_to_angles
<Polarizations: procedures>+≡
  subroutine polarization_to_angles (pol, r, theta, phi)
    class(polarization_t), intent(in) :: pol
    real(default), intent(out) :: r, theta, phi
    real(default), dimension(3) :: alpha
    real(default) :: norm, r12
    alpha = pol%get_axis ()
    norm = sum (alpha**2)
    r = sqrt (norm)
    if (norm > 0) then
      r12 = sqrt (alpha(1)**2 + alpha(2)**2)
      theta = atan2 (r12, alpha(3))
      if (any (alpha(1:2) /= 0)) then
        phi = atan2 (alpha(2), alpha(1))
      else
        phi = 0
      end if
    else
      theta = 0
      phi = 0
    end if
  end subroutine polarization_to_angles

```

### 15.3.8 Polarization Iterator

The iterator acts like a state matrix iterator, i.e., it points to one helicity combination at a time and can return the corresponding helicity object and matrix-element value.

Since the polarization is stored as a Bloch vector, we recover the whole density matrix explicitly upon initialization, store it inside the iterator object, and then just return its elements one at a time.

For an unpolarized particle, the iterator returns a single state with undefined helicity. The value is the value of any diagonal density matrix element,  $1/n$  where  $n$  is the multiplicity.

```

<Polarizations: public>+≡

```

```

public :: polarization_iterator_t
<Polarizations: types>+≡
type :: polarization_iterator_t
private
type(polarization_t), pointer :: pol => null ()
logical :: polarized = .false.
integer :: h1 = 0
integer :: h2 = 0
integer :: i = 0

complex(default), dimension(:, :), allocatable :: r
complex(default) :: value = 1._default
real(default) :: tolerance = -1._default
logical :: valid = .false.
contains
<Polarizations: polarization iterator: TBP>
end type polarization_iterator_t

```

Output for debugging purposes only, therefore no format for real/complex.

```

<Polarizations: polarization iterator: TBP>≡
procedure :: write => polarization_iterator_write
<Polarizations: procedures>+≡
subroutine polarization_iterator_write (it, unit)
class(polarization_iterator_t), intent(in) :: it
integer, intent(in), optional :: unit
integer :: u, i
u = given_output_unit (unit)
write (u, "(1X,A)") "Polarization iterator:"
write (u, "(3X,A,L1)") "assigned = ", associated (it%pol)
write (u, "(3X,A,L1)") "valid    = ", it%valid
if (it%valid) then
write (u, "(3X,A,2(1X,I2))") "i, j    = ", it%i, it%j
write (u, "(3X,A,2(1X,I2))") "h1, h2  = ", it%h1, it%h2
write (u, "(3X,A)", advance="no") "value    = "
write (u, *) it%value
if (allocated (it%r)) then
do i = 1, size (it%r, 2)
write (u, *) it%r(i, :)
end do
end if
end if
end subroutine polarization_iterator_write

```

Initialize, i.e., (virtually) point to the first helicity state supported by the polarization object. If the density matrix is nontrivial, we calculate it here.

Following the older state-matrix conventions, the iterator sequence starts at the lowest helicity value. In the current internal representation, this corresponds to the highest index value.

If the current matrix-element value is zero, advance the iterator. Advancing will stop at a nonzero value or if the iterator becomes invalid.

If `tolerance` is given, any state matrix entry less or equal will be treated as zero, causing the iterator to skip an entry. By default, the value is negative, so no entry is skipped.

```

(Polarizations: polarization iterator: TBP)+≡
  procedure :: init => polarization_iterator_init

(Polarizations: procedures)+≡
  subroutine polarization_iterator_init (it, pol, all_states, tolerance)
    class(polarization_iterator_t), intent(out) :: it

### 15.3.9 Sparse Matrix

We introduce a simple implementation of a sparse matrix that can represent polarization (or similar concepts) for transfer to I/O within the program. It consists of an integer array that represents the index values, and a complex array that represents the nonvanishing entries. The number of nonvanishing entries must be known for initialization, but the entries are filled one at a time.

Here is a base type without the special properties of a spin-density matrix.

```

(Polarizations: public)+≡
  public :: smatrix_t

(Polarizations: types)+≡
  type :: smatrix_t
    private
    integer :: dim = 0
    integer :: n_entry = 0
    integer, dimension(:,:), allocatable :: index
    complex(default), dimension(:), allocatable :: value
  contains
    (Polarizations: smatrix: TBP)
  end type smatrix_t

```

Output.

```

(Polarizations: smatrix: TBP)≡
  procedure :: write => smatrix_write

(Polarizations: procedures)+≡
  subroutine smatrix_write (object, unit, indent)
    class(smatrix_t), intent(in) :: object
    integer, intent(in), optional :: unit, indent
    integer :: u, i, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    if (allocated (object%value)) then
      if (size (object%value) > 0) then
        do i = 1, object%n_entry
          write (u, "(1x,A,'@(')", advance="no") repeat (" ", ind)
          write (u, "(SP,9999(I2.1,':',1x))", advance="no") &
            object%index(:,i)
          write (u, "('((', " // FMT_19 // ",','," // FMT_19 // &
            ",'))')") object%value(i)
        end do
      else
        write (u, "(1x,A)", advance="no") repeat (" ", ind)
        write (u, "(A)") "[empty matrix]"
      end if
    else
      write (u, "(1x,A)", advance="no") repeat (" ", ind)
      write (u, "(A)") "[undefined matrix]"
    end if
  end subroutine smatrix_write

```

Initialization: allocate arrays to the correct size. We specify both the dimension of the matrix (if different from two, this is rather a generic tensor) and the number of nonvanishing entries.

```

(Polarizations: smatrix: TBP)+≡
  procedure :: init => smatrix_init

(Polarizations: procedures)+≡

    exist = .not. all (smatrix%value == 0)
  end function smatrix_exists

```

### 15.3.10 Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper spin-density matrix. After the matrix has been filled, we can fix spin type and multiplicity for a particle, check the matrix for consistency, and normalize it if necessary.

This implementation does not have an antiparticle flag, just like the state matrix object. We therefore cannot account for sign flips when using this object.

TODO: The `pure` flag is for informational purposes only, and it only represents a necessary condition if spin is greater than 1/2. We may either check purity for all spins or drop this.

```

<Polarizations: public>+≡
  public :: pmatrix_t

<Polarizations: types>+≡
  type, extends (smatrix_t) :: pmatrix_t
    private
    integer :: spin_type = 0
    integer :: multiplicity = 0
    logical :: massive = .true.
    integer :: chirality = 0
    real(default) :: degree = 1
    logical :: pure = .false.
  contains
    <Polarizations: pmatrix: TBP>
  end type pmatrix_t

```

Output, including extra data. (The `indent` argument is ignored.)

```

<Polarizations: pmatrix: TBP>≡
  procedure :: write => pmatrix_write

<Polarizations: procedures>+≡
  subroutine pmatrix_write (object, unit, indent)
    class(pmatrix_t), intent(in) :: object
    integer, intent(in), optional :: unit, indent

```

```

integer :: u
u = given_output_unit (unit)
write (u, "(1x,A)") "Polarization: spin density matrix"
write (u, "(3x,A,I0)") "spin type      = ", object%spin_type
write (u, "(3x,A,I0)") "multiplicity = ", object%multiplicity
write (u, "(3x,A,L1)") "massive      = ", object%massive
write (u, "(3x,A,I0)") "chirality    = ", object%chirality
write (u, "(3x,A,F10.7)") "pol.degree   = ", object%degree
write (u, "(3x,A,L1)") "pure state   = ", object%pure
call object%smatrix_t%write (u, 1)
end subroutine pmatrix_write

```

This assignment is trivial, but must be coded explicitly.

```

<Polarizations: pmatrix: TBP>+≡
generic :: assignment(=) => pmatrix_assign_from_smatrix
procedure, private :: pmatrix_assign_from_smatrix

```

```

<Polarizations: procedures>+≡
subroutine pmatrix_assign_from_smatrix (pmatrix, smatrix)
  class(pmatrix_t), intent(out) :: pmatrix
  type(smatrix_t), intent(in) :: smatrix
  pmatrix%smatrix_t = smatrix
end subroutine pmatrix_assign_from_smatrix

```

Declare spin, multiplicity, and polarization degree. Check whether all entries fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type
2. the diagonal is real
3. only the upper of corresponding off-diagonal elements is specified, i.e., the row index is less than the column index
4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)
5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree.
6. If the trace of the matrix square and the trace of the matrix are unity, we may have a pure state. (For spin up to  $1/2$ , this is actually sufficient.)

```

### 15.3.11 Data Transformation

Create a `polarization_t` object from the contents of a normalized `pmatrix_t` object. We scan the entries as present in `pmatrix` and transform them into a density matrix, if necessary. The density matrix then initializes the Bloch vector. This is analogous to `polarization_init_state_matrix`.

There is a subtlety associated with massless particles. Since the `pmatrix` doesn't contain the full density matrix but just the nontrivial part, we have to initialize the polarization object with the massless equipartition, which contains nonzero entries for the Cartan generators. The `set` method therefore should not erase those initial contents. This is a constraint for the implementation of `set`, as applied to the Bloch vector.

As mentioned above, `pmatrix_t` does not support an antiparticle flag.

```

<Polarizations: polarization: TBP>+≡
    procedure :: init_pmatrix => polarization_init_pmatrix

```

```

<Polarizations: procedures>+≡
subroutine polarization_init_pmatrix (pol, pmatrix)

### 15.4.1 The particle type

#### Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

```

(Particles: parameters)≡
  integer, parameter, public :: PRT_UNPOLARIZED = 0
  integer, parameter, public :: PRT_DEFINITE_HELICITY = 1
  integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2

```

## Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, **hel** and **pol** are unspecified. If it has a definite helicity, the **hel** component is defined. If it has a generic polarization, the **pol** component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events. The **vertex** is an optional component that consists of a Lorentz 4-vector, denoting the position and time of the vertex (displaced vertex/time). **lifetime** is an optional component that accounts for the finite lifetime  $\tau$  of a decaying particle. In case there is no magnetic field etc., the true decay vertex of a particle in the detector would be  $\vec{v}' = \vec{v} + \tau \times \vec{p}/p^0$ , where  $p^0$  and  $\vec{p}$  are the energy and 3-momentum of the particle.

```

(Particles: public)≡

### Setting contents

Reset the status code. Where applicable, set  $p^2$  assuming that the particle is on-shell.

```

<Particles: particle: TBP>+≡
  procedure :: reset_status => particle_reset_status

<Particles: procedures>+≡
  elemental subroutine particle_reset_status (prt, status)
    class(particle_t), intent(inout) :: prt
    integer, intent(in) :: status
    prt%status = status
    select case (status)
    case (PRT_BEAM, PRT_INCOMING, PRT_OUTGOING)
      prt%p2 = prt%flv%get_mass () ** 2
    end select
  end subroutine particle_reset_status

```

The color can be given explicitly.

```

<Particles: particle: TBP>+≡
  procedure :: set_color => particle_set_color

<Particles: procedures>+≡
  elemental subroutine particle_set_color (prt, col)
    class(particle_t), intent(inout) :: prt
    type(color_t), intent(in) :: col
    prt%col = col
  end subroutine particle_set_color

```

The flavor can be given explicitly.

```

<Particles: particle: TBP>+≡
  procedure :: set_flavor => particle_set_flavor

<Particles: procedures>+≡
  subroutine particle_set_flavor (prt, flv)
    class(particle_t), intent(inout) :: prt
    type(flavor_t), intent(in) :: flv
    prt%flv = flv
  end subroutine particle_set_flavor

```

As can the helicity.

```

<Particles: particle: TBP>+≡
  procedure :: set_helicity => particle_set_helicity

<Particles: procedures>+≡
  subroutine particle_set_helicity (prt, hel)
    class(particle_t), intent(inout) :: prt
    type(helicity_t), intent(in) :: hel
    prt%hel = hel
  end subroutine particle_set_helicity

```

And the polarization.

```

<Particles: particle: TBP>+≡
  procedure :: set_pol => particle_set_pol

```

```

<Particles: procedures>+≡

### 15.4.2 Particle sets

A particle set is what is usually called an event: an array of particles. The individual particle entries carry momentum, quantum numbers, polarization, and optionally connections. There is (also optionally) a correlated state-density matrix that maintains spin correlations that are lost in the individual particle entries.

```

⟨Particles: public⟩+≡
    public :: particle_set_t

⟨Particles: types⟩+≡
    type :: particle_set_t
        ! private !!!
        integer :: n_beam = 0
        integer :: n_in = 0
        integer :: n_vir = 0
        integer :: n_out = 0
        integer :: n_tot = 0
        integer :: factorization_mode = FM_IGNORE_HELICITY
        type(particle_t), dimension(:), allocatable :: prt
        type(state_matrix_t) :: correlated_state
    contains
        ⟨Particles: particle set: TBP⟩
    end type particle_set_t

```

A particle set can be initialized from an interaction or from a HepMC event record.

```

⟨Particles: particle set: TBP⟩≡
    generic :: init => init_interaction
    procedure :: init_interaction => particle_set_init_interaction

```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number  $x$ . The `mode` determines whether the individual particles become unpolarized,

or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag `keep_correlations` tells whether the spin-correlation matrix is to be calculated and stored in addition to the particles. The flag `keep_virtual` tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. `int` has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. `int_flows` contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

`int` and `int_flows` may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, `x(1)` can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

  end subroutine particle_set_basic_init

```

Build a particle set from scratch. This is used for testing purposes. The ordering of particles in the result is beam-incoming-remnant-virtual-outgoing.

Parent-child relations:

- Beams are parents of incoming and beam remnants. The assignment is alternating (first beam, second beam).
- Incoming are parents of virtual and outgoing, collectively.

More specific settings, such as resonance histories, cannot be set this way.

Beam-remnant particles are counted as virtual, but have a different status code.

We assume that the `pdg` array has the correct size.

  end subroutine particle_set_transfer

```

Insert a new particle as an intermediate into a previously empty position.

Flavor and status are just set. Color is not set (but see below). The complicated part is reassigning parent-child relations. The inserted particle comes with an array `child` of its children which are supposed to be existing particles.

We first scan all particles that come before the new insertion. Whenever a particle has children that coincide with the children of the new particle, those child entries are removed. (a) If the new particle has no parent entry yet, those child entries are replaced by the index of the new particle and simultaneously, the particle is registered as a parent of the new particle. (b) If the current particle already has a parent entry, those child entries are removed.

When this is done, the new particle is registered as the (only) parent of its children.

```

Assigning particles manually may result in color mismatches. This is checked here for all particles in the set. The color object is compared against the color type that belongs to the flavor object. The return value is an allocatable array which consists of the particles with invalid color assignments. If the array size is zero, all is fine.

### 15.4.5 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

#### Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

Transform a particle set into HEPEVT-compatible form. In this form, for each particle, the parents and the children are contiguous in the particle array. Usually, this requires to clone some particles.

We do not know in advance how many particles the canonical form will have. To be on the safe side, allocate four times the original size.

This procedure aims at reconstructing the momenta of an interaction, given a particle set. The main task is to find the original hard process, by following the event history.

In-state: take those particles which are flagged as `PRT_INCOMING`

Out-state: try to be smart by checking the immediate children of the incoming particles. If the `state_flv` table is present, check any `PRT_RESONANT` particles that we get this way, whether they are potential out-particles by their PDG codes. If not, replace them by their children, recursively. (Resonances may have been inserted by the corresponding event transform.)

[WK 21-02-16] Revised the algorithm for the case `recover_beams = false`, i.e., the particle set contains beams and radiation. This does not mean that the particle set contains the complete radiation history. To make up for missing information, we follow the history in the interaction one step backwards and do a bit of guesswork to match this to the possibly incomplete history in the particle set. [The current implementation allows only for one stage of radiation; this could be improved by iterating the procedure!]

[WK 21-03-21] Amended the `find_hard_process_in_pset` algorithm as follows: Occasionally, PYTHIA adds a stepchild to the decay of a resonance that WHIZARD has inserted, a shower object that also has other particles in the event as parents. Such objects must not enter the hard-process record. Therefore, resonance child particle objects are ignored if they have more than one parent.

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

Furthermore, we assign to each vertex the vertex position from the parent(s).

We check that these vertex positions coincide, and if not return a null vector.

### 15.4.6 Expression interface

This converts a `particle_set` object as defined here to a more concise `subevt` object that can be used as the event root of an expression. In particular, the latter lacks virtual particles, spin correlations and parent-child relations.

We keep beam particles, incoming partons, and outgoing partons. Furthermore, we keep radiated particles (a.k.a. beam remnants) if they have no children in the current particle set, and mark them as outgoing particles.

If `colorize` is set and true, mark all particles in the subevent as colorized, and set color/anticolor flow indices where they are defined. Colorless particles do not get indices but are still marked as colorized, for consistency.

This routines orders the outgoing particles into clusters of colorless particles and such of particles ordered corresponding to the indices of the color lines. All outgoing particles in the ordered set appear as child of the corresponding

outgoing particle in the unordered set, including colored beam remnants. We always start continue via the anti-color line, such that color flows within each Lund string system is always continued from the anticolor of one particle to the identical color index of another particle.

## Chapter 16

# Beams

These modules implement beam configuration and beam structure, the latter in abstract terms.

**beam\_structures** The `beam_structure_t` type is a messenger type that communicates the user settings to the **WHIZARD** core.

**beams** Beam configuration.

**sf\_aux** Tools for handling structure functions and splitting

**sf\_mappings** Mapping functions, useful for structure function implementation

**sf\_base** The abstract structure-function interaction and structure-function chain types.

These are the implementation modules, the concrete counterparts of **sf\_base**:

**sf\_isr** ISR structure function (photon radiation inclusive and resummed in collinear and IR regions).

**sf\_epa** Effective Photon Approximation.

**sf\_ewa** Effective  $W$  (and  $Z$ ) approximation.

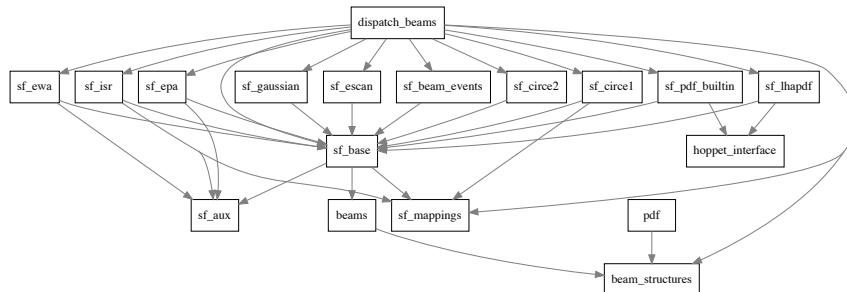

Figure 16.1: Module dependencies in `src/beams`.

**sf\_escan** Energy spectrum that emulates a uniform energy scan.

**sf\_gaussian** Gaussian beam spread

**sf\_beam\_events** Beam-event generator that reads its input from an external file.

**sf\_circe1** CIRCE1 beam spectra for electrons and photons.

**sf\_circe2** CIRCE2 beam spectra for electrons and photons.

**hoppet\_interface** Support for *b*-quark matching, addon to PDF modules.

**sf\_pdf\_builtin** Direct support for selected hadron PDFs.

**sf\_lhapdf** LHAPDF library support.

## 16.1 Beam structure

This module stores the beam structure definition as it is declared in the SIN-DARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

```
(beam_structures.f90)≡
  <File header>

  module beam_structures

    <Use kinds>
    <Use strings>
    use io_units
    use format_defs, only: FMT_19
    use diagnostics
    use lorentz
    use polarizations

    <Standard module head>

    <Beam structures: public>

    <Beam structures: types>

    <Beam structures: interfaces>

    contains

    <Beam structures: procedures>

  end module beam_structures
```

### 16.1.1 Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

```
<Beam structures: types>≡
  type :: beam_structure_entry_t
    logical :: is_valid = .false.
    type(string_t) :: name
  contains
    <Beam structures: beam structure entry: TBP>
  end type beam_structure_entry_t
```

Output.

```
<Beam structures: beam structure entry: TBP>≡
  procedure :: to_string => beam_structure_entry_to_string

<Beam structures: procedures>≡
  function beam_structure_entry_to_string (object) result (string)
    class(beam_structure_entry_t), intent(in) :: object
```

```

type(string_t) :: string
if (object%is_valid) then
    string = object%name
else
    string = "none"
end if
end function beam_structure_entry_to_string

```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

```

⟨Beam structures: types⟩+≡
    type :: beam_structure_record_t
        type(beam_structure_entry_t), dimension(:), allocatable :: entry
    end type beam_structure_record_t

```

### 16.1.2 Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

```

⟨Beam structures: public⟩≡
    public :: beam_structure_t

⟨Beam structures: types⟩+≡
    type :: beam_structure_t
        private
        integer :: n_beam = 0
        type(string_t), dimension(:), allocatable :: prt
        type(beam_structure_record_t), dimension(:), allocatable :: record
        type(smatrix_t), dimension(:), allocatable :: smatrix
        real(default), dimension(:), allocatable :: pol_f
        real(default), dimension(:), allocatable :: p
        real(default), dimension(:), allocatable :: theta
        real(default), dimension(:), allocatable :: phi
    contains
        ⟨Beam structures: beam structure: TBP⟩
    end type beam_structure_t

```

The finalizer deletes all contents explicitly, so we can continue with an empty beam record. (It is not needed for deallocation.) We have distinct finalizers for the independent parts of the beam structure.

```

⟨Beam structures: beam structure: TBP⟩≡
    procedure :: final_sf => beam_structure_final_sf

⟨Beam structures: procedures⟩+≡
    subroutine beam_structure_final_sf (object)
        class(beam_structure_t), intent(inout) :: object
        if (allocated (object%prt)) deallocate (object%prt)
        if (allocated (object%record)) deallocate (object%record)
        object%n_beam = 0
    end subroutine beam_structure_final_sf

```

Output. The actual information fits in a single line, therefore we can provide a `to_string` method. The `show` method also lists the current values of relevant global variables.

```

            do i = 1, size (dim_array)
                allocate (beam_structure%record(i)%entry (dim_array(i)))
            end do
        else
            allocate (beam_structure%record (0))
        end if
    end subroutine beam_structure_init_sf

```

Set an entry, specified by record number and entry number.

```

<Beam structures: beam structure: TBP>+≡
    procedure :: set_sf => beam_structure_set_sf

<Beam structures: procedures>+≡
    subroutine beam_structure_set_sf (beam_structure, i, j, name)
        class(beam_structure_t), intent(inout) :: beam_structure

```

```

integer, intent(in) :: i, j
type(string_t), intent(in) :: name
associate (entry => beam_structure%record(i)%entry(j))
    entry%name = name
    entry%is_valid = .true.
end associate
end subroutine beam_structure_set_sf

```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

*(Beam structures: interfaces)*≡

```

abstract interface
    function strfun_mode_fun (name) result (n)
        import
        type(string_t), intent(in) :: name
        integer :: n
    end function strfun_mode_fun
end interface

```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

*(Beam structures: beam structure: TBP)*+≡

    call move_alloc (from = new, to = beam_structure%record)
end subroutine beam_structure_expand

```

### 16.1.3 Polarization

To record polarization, we provide an allocatable array of `smatrix` objects, sparse matrices. The polarization structure is independent of the structure-function setup, they are combined only when an actual beam object is constructed.

```

<Beam structures: beam structure: TBP>+=
  procedure :: final_pol => beam_structure_final_pol
  procedure :: init_pol => beam_structure_init_pol

<Beam structures: procedures>+=
  subroutine beam_structure_final_pol (beam_structure)
    class(beam_structure_t), intent(inout) :: beam_structure
    if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
    if (allocated (beam_structure%pol_f)) deallocate (beam_structure%pol_f)
  end subroutine beam_structure_final_pol

  subroutine beam_structure_init_pol (beam_structure, n)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: n
    if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
    allocate (beam_structure%smatrix (n))
    if (.not. allocated (beam_structure%pol_f)) &
      allocate (beam_structure%pol_f (n), source = 1._default)
  end subroutine beam_structure_init_pol

```

Check if polarized beams are used.

```

<Beam structures: beam structure: TBP>+=
  procedure :: has_polarized_beams => beam_structure_has_polarized_beams

<Beam structures: procedures>+=
  elemental function beam_structure_has_polarized_beams (beam_structure) result (pol)
    logical :: pol
    class(beam_structure_t), intent(in) :: beam_structure
    if (allocated (beam_structure%pol_f)) then
      pol = any (beam_structure%pol_f /= 0)
    else
      pol = .false.
    end if
  end function beam_structure_has_polarized_beams

```

Directly copy the spin density matrices.

```

<Beam structures: beam structure: TBP>+=
  procedure :: set_smatrix => beam_structure_set_smatrix

<Beam structures: procedures>+=
  subroutine beam_structure_set_smatrix (beam_structure, i, smatrix)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i
    type(smatrix_t), intent(in) :: smatrix
    beam_structure%smatrix(i) = smatrix
  end subroutine beam_structure_set_smatrix

```

Initialize one of the spin density matrices manually.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: init_smatrix => beam_structure_init_smatrix

<Beam structures: procedures>+≡
  subroutine beam_structure_init_smatrix (beam_structure, i, n_entry)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i
    integer, intent(in) :: n_entry
    call beam_structure%smatrix(i)%init (2, n_entry)
  end subroutine beam_structure_init_smatrix

```

Set a polarization entry.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: set_sentry => beam_structure_set_sentry

<Beam structures: procedures>+≡
  subroutine beam_structure_set_sentry &
    (beam_structure, i, i_entry, index, value)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i
    integer, intent(in) :: i_entry
    integer, dimension(:), intent(in) :: index
    complex(default), intent(in) :: value
    call beam_structure%smatrix(i)%set_entry (i_entry, index, value)
  end subroutine beam_structure_set_sentry

```

Set the array of polarization fractions.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: set_pol_f => beam_structure_set_pol_f

<Beam structures: procedures>+≡
  subroutine beam_structure_set_pol_f (beam_structure, f)
    class(beam_structure_t), intent(inout) :: beam_structure
    real(default), dimension(:), intent(in) :: f
    if (allocated (beam_structure%pol_f)) deallocate (beam_structure%pol_f)
    allocate (beam_structure%pol_f (size (f)), source = f)
  end subroutine beam_structure_set_pol_f

```

#### 16.1.4 Beam momenta

By default, beam momenta are deduced from the `sqrts` value or from the mass of the decaying particle, assuming a c.m. setup. Here we set them explicitly.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: final_mom => beam_structure_final_mom

<Beam structures: procedures>+≡
  subroutine beam_structure_final_mom (beam_structure)
    class(beam_structure_t), intent(inout) :: beam_structure
    if (allocated (beam_structure%p)) deallocate (beam_structure%p)
    if (allocated (beam_structure%theta)) deallocate (beam_structure%theta)
    if (allocated (beam_structure%phi)) deallocate (beam_structure%phi)
  end subroutine beam_structure_final_mom

```

```

<Beam structures: beam structure: TBP>+=
  procedure :: set_momentum => beam_structure_set_momentum
  procedure :: set_theta => beam_structure_set_theta
  procedure :: set_phi => beam_structure_set_phi

<Beam structures: procedures>+=
  subroutine beam_structure_set_momentum (beam_structure, p)
    class(beam_structure_t), intent(inout) :: beam_structure
    real(default), dimension(:), intent(in) :: p
    if (allocated (beam_structure%p)) deallocate (beam_structure%p)
    allocate (beam_structure%p (size (p)), source = p)
  end subroutine beam_structure_set_momentum

  subroutine beam_structure_set_theta (beam_structure, theta)
    class(beam_structure_t), intent(inout) :: beam_structure
    real(default), dimension(:), intent(in) :: theta
    if (allocated (beam_structure%theta)) deallocate (beam_structure%theta)
    allocate (beam_structure%theta (size (theta)), source = theta)
  end subroutine beam_structure_set_theta

  subroutine beam_structure_set_phi (beam_structure, phi)
    class(beam_structure_t), intent(inout) :: beam_structure
    real(default), dimension(:), intent(in) :: phi
    if (allocated (beam_structure%phi)) deallocate (beam_structure%phi)
    allocate (beam_structure%phi (size (phi)), source = phi)
  end subroutine beam_structure_set_phi

```

### 16.1.5 Get contents

Look at the incoming particles. We may also have the case that beam particles are not specified, but polarization.

```

<Beam structures: beam structure: TBP>+=
  procedure :: is_set => beam_structure_is_set
  procedure :: get_n_beam => beam_structure_get_n_beam
  procedure :: get_prt => beam_structure_get_prt

<Beam structures: procedures>+=
  function beam_structure_is_set (beam_structure) result (flag)
    class(beam_structure_t), intent(in) :: beam_structure
    logical :: flag
    flag = beam_structure%n_beam > 0 .or. beam_structure%asymmetric ()
  end function beam_structure_is_set

```

Check for a complete beam structure. The `applies` flag tells if the beam structure should actually be used for a process with the given `n_in` number of incoming particles.

It is set if the beam structure matches the process as either decay or scattering. It is unset if beam structure references a scattering setup but the process is a decay. It is also unset if the beam structure itself is empty.

If the beam structure cannot be used, terminate with fatal error.

```

### 16.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy `sqrts`, the Lorentz transformation `L` that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

```

⟨Beams: public⟩≡
  public :: beam_data_t

```

```

(Beams: types)≡
  type :: beam_data_t
    logical :: initialized = .false.
    integer :: n = 0
    type(flavor_t), dimension(:), allocatable :: flv
    real(default), dimension(:), allocatable :: mass
    type(pmatrix_t), dimension(:), allocatable :: pmatrix
    logical :: lab_is_cm = .true.
    type(vector4_t), dimension(:), allocatable :: p_cm
    type(vector4_t), dimension(:), allocatable :: p
    type(lorentz_transformation_t), allocatable :: L_cm_to_lab
    real(default) :: sqrts = 0
    character(32) :: md5sum = ""
  contains
    (Beams: beam data: TBP)
  end type beam_data_t

```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

```

(Beams: procedures)≡

            end if
        case default
            call msg_bug ("Beam data: invalid beam structure object")
        end select
    end if
end if

```

```
end subroutine beam_data_init_structure
```

### 16.2.3 Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color is inferred from flavor. Beam momenta and c.m. momenta coincide.

*(Beams: beam data: TBP)+≡*

```
procedure :: init_sqrts => beam_data_init_sqrts
```

*(Beams: procedures)+≡*

```
subroutine beam_data_init_sqrts (beam_data, sqrts, flv, smatrix, pol_f)
  class(beam_data_t), intent(out) :: beam_data
  real(default), intent(in) :: sqrts
  type(flavor_t), dimension(:), intent(in) :: flv
  type(smatrix_t), dimension(:), intent(in), optional :: smatrix
  real(default), dimension(:), intent(in), optional :: pol_f
  real(default), dimension(size(flv)) :: E, p
  call beam_data_init (beam_data, size (flv))
  beam_data%sqrts = sqrts
  beam_data%lab_is_cm = .true.
  select case (beam_data%n)
  case (1)
    E = sqrts; p = 0
    beam_data%p_cm = vector4_moving (E, p, 3)
    beam_data%p = beam_data%p_cm
  case (2)
    beam_data%p_cm = colliding_momenta (sqrts, flv%get_mass ())
    beam_data%p = colliding_momenta (sqrts, flv%get_mass ())
  end select
  call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
end subroutine beam_data_init_sqrts
```

This version sets beam momenta directly, assuming that they are asymmetric, i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a common initializer.

The Lorentz transformation that we compute here is not actually used in the calculation; instead, it will be recomputed for each event in the subroutine `phs_set_incoming_momenta`. We compute it here for the nominal beam setup nevertheless, so we can print it and, in particular, include it in the MD5 sum.

*(Beams: beam data: TBP)+≡*

```
procedure :: init_momenta => beam_data_init_momenta
```

*(Beams: procedures)+≡*

```
subroutine beam_data_init_momenta (beam_data, p3, flv, smatrix, pol_f)

    end subroutine beam_data_init_decay

```

## 16.2.5 The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

```

(Beams: public)+≡
    public :: beam_t

(Beams: types)+≡
    type :: beam_t
    private
        type(interaction_t) :: int
    end type beam_t

```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together with the associated values from the spin density matrix into the `interaction_t` object.

Calling the `add_state` method of the interaction object, we keep the entries of the helicity density matrix without adding them up. This ensures that for unpolarized states, we do not normalize but end up with an  $1/N$  entry, where  $N$  is the initial-state multiplicity.

```

(Beams: public)+≡
    public :: beam_init

(Beams: procedures)+≡

        module procedure interaction_set_source_link_beam
    end interface

<Beams: procedures>+≡
    subroutine interaction_set_source_link_beam (int, i, beam1, i1)
        type(interaction_t), intent(inout) :: int
        type(beam_t), intent(in), target :: beam1
        integer, intent(in) :: i, i1
        call int%set_source_link (i, beam1%int, i1)
    end subroutine interaction_set_source_link_beam

```

### 16.2.7 Accessing contents

Return the interaction component – as a pointer, to avoid any copying.

```

<Beams: public>+≡
    public :: beam_get_int_ptr

<Beams: procedures>+≡
    function beam_get_int_ptr (beam) result (int)
        type(interaction_t), pointer :: int
        type(beam_t), intent(in), target :: beam
        int => beam%int
    end function beam_get_int_ptr

```

Set beam momenta directly. (Used for cascade decays.)

```
<Beams: public>+≡
    public :: beam_set_momenta

<Beams: procedures>+≡
    subroutine beam_set_momenta (beam, p)
        type(beam_t), intent(inout) :: beam
        type(vector4_t), dimension(:), intent(in) :: p
        call beam%int%set_momenta (p)
    end subroutine beam_set_momenta
```

### 16.2.8 Unit tests

Test module, followed by the corresponding implementation module.

```
<beams_ut.f90>≡
    <File header>

    module beams_ut
        use unit_tests
        use beams_uti

    <Standard module head>

    <Beams: public test>

    contains

    <Beams: test driver>

    end module beams_ut

<beams_uti.f90>≡
    <File header>

    module beams_uti

    <Use kinds>
        use lorentz
        use flavors
        use interactions, only: reset_interaction_counter
        use polarizations, only: smatrix_t
        use model_data
        use beam_structures

        use beams

    <Standard module head>

    <Beams: test declarations>

    contains

    <Beams: tests>
```

```
end module beams_util
```

API: driver for the unit tests below.

```
<Beams: public test>≡
```

```
public :: beams_test
```

```
<Beams: test driver>≡
```

```
subroutine beams_test (u, results)
```

```
integer, intent(in) :: u
```

```

  ⟨SF aux: parameters⟩

  ⟨SF aux: types⟩

contains

  ⟨SF aux: procedures⟩

end module sf_aux

```

### 16.3.1 Momentum splitting

Let us consider first an incoming parton with momentum  $k$  and invariant mass squared  $s = k^2$  that splits into two partons with momenta  $q, p$  and invariant masses  $t = q^2$  and  $u = p^2$ . (This is an abuse of the Mandelstam notation.  $t$  is actually the momentum transfer, assuming that  $p$  is radiated and  $q$  initiates

the hard process.) The energy is split among the partons such that if  $E = k^0$ , we have  $q^0 = xE$  and  $p^0 = \bar{x}E$ , where  $\bar{x} \equiv 1 - x$ .

We define the angle  $\theta$  as the polar angle of  $p$  w.r.t. the momentum axis of the incoming momentum  $k$ . Ignoring azimuthal angle, we can write the four-momenta in the basis  $(E, p_T, p_L)$  as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \quad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p} \sin \theta \\ \bar{x}\bar{p} \cos \theta \end{pmatrix}, \quad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p} \sin \theta \\ p - \bar{x}\bar{p} \cos \theta \end{pmatrix}, \quad (16.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \quad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \quad (16.2)$$

The second condition implies that, for positive  $u$ ,  $\bar{x}^2 > u/E^2$ , or equivalently

$$x < 1 - \sqrt{u}/E. \quad (16.3)$$

We are interested in the third mass-shell conditions:  $s$  and  $u$  are fixed, so we need  $t$  as a function of  $\cos \theta$ :

$$t = -2\bar{x} (E^2 - p\bar{p} \cos \theta) + s + u. \quad (16.4)$$

Solving for  $\cos \theta$ , we get

$$\cos \theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \quad (16.5)$$

We can compute  $\sin \theta$  numerically as  $\sin^2 \theta = 1 - \cos^2 \theta$ , but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for  $t$ . The cosine must be between  $-1$  and  $1$ , so the bounds are

$$t_0 = -2\bar{x} (E^2 + p\bar{p}) + s + u, \quad (16.6)$$

$$t_1 = -2\bar{x} (E^2 - p\bar{p}) + s + u. \quad (16.7)$$

Computing  $\sin^2 \theta$  from  $\cos \theta$  above, we observe that the numerator is a quadratic polynomial in  $t$  which has the zeros  $t_0$  and  $t_1$ , while the common denominator is given by  $(2\bar{x}p\bar{p})^2$ . Hence, we can write

$$\sin^2 \theta = -\frac{(t - t_0)(t - t_1)}{(2\bar{x}p\bar{p})^2} \quad \text{and} \quad \cos \theta = \frac{(t - t_0) + (t - t_1)}{4\bar{x}p\bar{p}}, \quad (16.8)$$

which is free of large cancellations near  $t = t_0$  or  $t = t_1$ .

If all is massless, i.e.,  $s = u = 0$ , this simplifies to

$$t_0 = -4\bar{x}E^2, \quad t_1 = 0, \quad (16.9)$$

$$\sin^2 \theta = -\frac{t}{\bar{x}E^2} \left( 1 + \frac{t}{4\bar{x}E^2} \right), \quad \cos \theta = 1 + \frac{t}{2\bar{x}E^2}. \quad (16.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

Note: contents are public only for easy access in unit test.

  end subroutine splitting_data_write

```

### 16.3.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated

particle.  $m_2$  is the *physical* mass squared of the outgoing particle. The  $t$  bounds depend on the chosen  $x$  value and cannot be determined yet.

```

<SF aux: splitting data: TBP>+≡
  procedure :: init => splitting_data_init

<SF aux: procedures>+≡
  subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
    class(splitting_data_t), intent(out) :: d
    type(vector4_t), intent(in) :: k
    real(default), intent(in) :: mk2, mr2, mo2
    logical, intent(in), optional :: collinear
    if (present (collinear)) d%collinear = collinear
    d%E = energy (k)
    d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
    d%p = sqrt (d%E**2 - mk2)
    d%s = mk2
    d%u = mr2
    d%m2 = mo2
  end subroutine splitting_data_init

```

Retrieve the  $x$  bounds, if needed for  $x$  sampling. Generating an  $x$  value is done by the caller, since this is the part that depends on the nature of the structure function.

```

<SF aux: splitting data: TBP>+≡
  procedure :: get_x_bounds => splitting_get_x_bounds

<SF aux: procedures>+≡
  function splitting_get_x_bounds (d) result (x)
    class(splitting_data_t), intent(in) :: d
    real(default), dimension(2) :: x
    x = [ d%x0, d%x1 ]
  end function splitting_get_x_bounds

```

Now set the momentum fraction and compute  $t_0$  and  $t_1$ .

[The calculation of  $t_1$  is subject to numerical problems. The exact formula is ( $s = m_i^2$ ,  $u = m_r^2$ )

$$t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\sqrt{E^2 - m_r^2/\bar{x}^2}. \quad (16.11)$$

The structure-function paradigm is useful only if  $E \gg m_i, m_r$ . In a Taylor expansion for large  $E$ , the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \quad (16.12)$$

There are two cases of interest:  $m_i = m_o$  and  $m_r = 0$ ,

$$t_1 = xm_o^2 \quad (16.13)$$

and  $m_i = m_r$  and  $m_o = 0$ ,

$$t_1 = -\frac{x^2}{\bar{x}}m_i^2. \quad (16.14)$$

In both cases,  $t_1 \leq m_o^2$ ]

That said, it turns out that taking the  $t_1$  evaluation at face value leads to less problems than the approximation. We express the angles in terms of  $t - t_0$  and  $t - t_1$ . Numerical noise in  $t_1$  can then be tolerated.

```

<SF aux: splitting data: TBP>+≡
  procedure :: set_t_bounds => splitting_set_t_bounds

<SF aux: procedures>+≡
  elemental subroutine splitting_set_t_bounds (d, x, xb)

    else
      if (.not. vanishes (d%xb)) then
        d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
      else
        d%pb = 0
      end if
    end if
    tp = -2 * d%xb * d%E**2 + d%s + d%u
    tm = -2 * d%xb * d%p * d%pb
    d%t0 = tp + tm
    d%t1 = tp - tm
    d%t = d%t1
  end subroutine splitting_set_t_bounds

```

### 16.3.3 Sampling recoil

Compute a value for the momentum transfer  $t$ , using a random number  $r$ . We assume a logarithmic distribution for  $t - m^2$ , corresponding to the propagator  $1/(t - m^2)$  with the physical mass  $m$  for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for  $t$  is zero. In that case, the  $t$  value is set to zero and the splitting will be collinear.

```

<SF aux: splitting data: TBP>+≡
  procedure :: sample_t => splitting_sample_t

<SF aux: procedures>+≡
  subroutine splitting_sample_t (d, r, t0, t1)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    real(default), intent(in), optional :: t0, t1
    real(default) :: tt0, tt1, tt0m, tt1m
    if (d%collinear) then
      d%t = d%t1
    else
      tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
      tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
    end if
  end subroutine splitting_sample_t

```

```

    tt0m = tt0 - d%m2
    tt1m = tt1 - d%m2
    if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
        epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
        d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
    else
        d%t = tt1
    end if
end if
end subroutine splitting_sample_t

```

The inverse operation: Given  $t$ , we recover the value of  $r$  that would have produced this value.

```

<SF aux: splitting data: TBP>+≡
    procedure :: inverse_t => splitting_inverse_t

<SF aux: procedures>+≡
    subroutine splitting_inverse_t (d, r, t0, t1)
        class(splitting_data_t), intent(in) :: d
        real(default), intent(out) :: r
        real(default), intent(in), optional :: t0, t1
        real(default) :: tt0, tt1, tt0m, tt1m
        if (d%collinear) then
            r = 0
        else
            tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
            tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
            tt0m = tt0 - d%m2
            tt1m = tt1 - d%m2
            if (tt0m < 0 .and. tt1m < 0) then
                r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
            else
                r = 0
            end if
        end if
    end subroutine splitting_inverse_t

```

This is trivial, but provided for convenience:

```

<SF aux: splitting data: TBP>+≡
    procedure :: sample_phi => splitting_sample_phi

<SF aux: procedures>+≡
    subroutine splitting_sample_phi (d, r)
        class(splitting_data_t), intent(inout) :: d
        real(default), intent(in) :: r
        if (d%collinear) then
            d%phi = 0
        else
            d%phi = (1-r) * d%phi0 + r * d%phi1
        end if
    end subroutine splitting_sample_phi

```

Inverse:

```

<SF aux: splitting data: TBP>+≡
  procedure :: inverse_phi => splitting_inverse_phi

<SF aux: procedures>+≡
  subroutine splitting_inverse_phi (d, r)
    class(splitting_data_t), intent(in) :: d
    real(default), intent(out) :: r
    if (d%collinear) then
      r = 0
    else
      r = (d%phi - d%phi0) / (d%phi1 - d%phi0)
    end if
  end subroutine splitting_inverse_phi

```

### 16.3.4 Splitting

In this function, we actually perform the splitting. The incoming momentum  $k$  is split into (if no recoil)  $q_1 = (1 - x)k$  and  $q_2 = xk$ .

Apart from the splitting data, we need the incoming momentum  $k$ , the momentum transfer  $t$ , and the azimuthal angle  $\phi$ . The momentum fraction  $x$  is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit  $t_1$ , so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

```

<SF aux: splitting data: TBP>+≡
  procedure :: split_momentum => splitting_split_momentum

<SF aux: procedures>+≡
  function splitting_split_momentum (d, k) result (q)
    class(splitting_data_t), intent(in) :: d
    type(vector4_t), dimension(2) :: q
    type(vector4_t), intent(in) :: k
    real(default) :: st2, ct2, st, ct, cp, sp
    type(lorentz_transformation_t) :: rot
    real(default) :: tt0, tt1, den
    type(vector3_t) :: kk, q1, q2
    if (d%collinear) then
      if (vanishes(d%s) .and. vanishes(d%u)) then
        q(1) = d%xb * k
        q(2) = d%x * k
      else
        kk = space_part (k)
        q1 = d%xb * (d%pb / d%p) * kk
        q2 = kk - q1
        q(1) = vector4_moving (d%xb * d%E, q1)
        q(2) = vector4_moving (d%x * d%E, q2)
      end if
    else
      den = 2 * d%xb * d%p * d%pb
    end if
  end function splitting_split_momentum

```

```

tt0 = max (d%t - d%t0, 0._default)
tt1 = min (d%t - d%t1, 0._default)
if (den**2 <= epsilon(den)) then
  st2 = 0
else
  st2 = - (tt0 * tt1) / den ** 2
end if
if (st2 > 1) then
  st2 = 1
end if
ct2 = 1 - st2
st = sqrt (max (st2, 0._default))
ct = sqrt (max (ct2, 0._default))
if ((d%t - d%t0 + d%t - d%t1) < 0) then
  ct = - ct
end if
sp = sin (d%phi)
cp = cos (d%phi)
rot = rotation_to_2nd (3, space_part (k))
q1 = vector3_moving (d%xb * d%pb * [st * cp, st * sp, ct])
q2 = vector3_moving (d%p, 3) - q1
q(1) = rot * vector4_moving (d%xb * d%E, q1)
q(2) = rot * vector4_moving (d%x * d%E, q2)
end if
end function splitting_split_momentum

```

Momenta generated by splitting will in general be off-shell. They are on-shell only if they are collinear and massless. This subroutine puts them on shell by brute force, violating either momentum or energy conservation. The direction of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

```

<SF aux: parameters>≡

      E = energy (p)
      E2 = E ** 2
      if (E2 >= m2) then
        pn = sqrt (E2 - m2)
        p = vector4_moving (E, pn * direction (space_part (p)))
      else
        p = vector4_null
      end if
    case (KEEP_MOMENTUM)

```

```

      E = sqrt (space_part (p) ** 2 + m2)
      p = vector4_moving (E, space_part (p))
    end select
  end subroutine on_shell

```

### 16.3.5 Recovering the splitting

This is the inverse problem. We have on-shell momenta and want to deduce the splitting parameters  $x$ ,  $t$ , and  $\phi$ .

Update 2018-08-22: As a true inverse to `splitting_split_momentum`, we now use not just a single momentum `q2` as before, but the momentum pair `q1`, `q2` for recovering  $x$  and  $\bar{x}$  separately. If  $x$  happens to be close to 1, we would completely lose the tiny  $\bar{x}$  value, otherwise, and thus get a meaningless result.

```

<SF aux: splitting data: TBP>+≡

    <SF aux: execute tests>  
  end subroutine sf_aux_test
```

### Momentum splitting: massless radiation

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds (this

can be directly seen from the logarithmic distribution in the function `sample_t` for  $r \equiv x = 1 - x = 0.5$ ), we arrive at an exact number  $t = -0.15$  for the given input values.

```

### Momentum splitting: massless parton

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds, we arrive at an exact number  $t = -0.36$  for the given input values.

```

### Endpoint stability

Compute momentum splitting for collinear kinematics close to both endpoints. In particular, check both directions  $x \rightarrow$  momenta and momenta  $\rightarrow x$ .

For purely massless collinear splitting, the KEEP\_XXX flag is irrelevant. We choose KEEP\_ENERGY here.

```

## 16.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of  $x_1, x_2, \dots$  as parameters for the beams, we generate one parameter that is equal, or related to, the product  $x_1 x_2 \dots$  (so it directly corresponds to  $\sqrt{s}$ ). The other parameters describe the distribution of energy (loss) between beams and radiations.

`<sf_mappings.f90>`≡

*<File header>*

```
module sf_mappings
```

*<Use kinds>*

```

use kinds, only: double
use io_units
use constants, only: pi, zero, one
use numeric_utils
use diagnostics

```

*<Standard module head>*

```

    <SF mappings: public>

    <SF mappings: parameters>

    <SF mappings: types>

    <SF mappings: interfaces>

contains

    <SF mappings: procedures>

end module sf_mappings

```

### 16.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

```

<SF mappings: public>≡
    public :: sf_mapping_t

<SF mappings: types>≡
    type, abstract :: sf_mapping_t
        integer, dimension(:), allocatable :: i
    contains
        <SF mappings: sf mapping: TBP>
    end type sf_mapping_t

```

The output routine is deferred:

```

<SF mappings: sf mapping: TBP>≡
    procedure (sf_mapping_write), deferred :: write

<SF mappings: interfaces>≡
    abstract interface
        subroutine sf_mapping_write (object, unit)
            import
            class(sf_mapping_t), intent(in) :: object
            integer, intent(in), optional :: unit
        end subroutine sf_mapping_write
    end interface

```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: base_init => sf_mapping_base_init

<SF mappings: procedures>≡
    subroutine sf_mapping_base_init (mapping, n_par)
        class(sf_mapping_t), intent(out) :: mapping
        integer, intent(in) :: n_par
        allocate (mapping%i (n_par))
        mapping%i = 0
    end subroutine

```

```
end subroutine sf_mapping_base_init
```

Set an index value.

```
<SF mappings: sf mapping: TBP>+≡
  procedure :: set_index => sf_mapping_set_index

<SF mappings: procedures>+≡
  subroutine sf_mapping_set_index (mapping, j, i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j, i
    mapping%i(j) = i
  end subroutine sf_mapping_set_index
```

Retrieve an index value.

```
<SF mappings: sf mapping: TBP>+≡
  procedure :: get_index => sf_mapping_get_index

<SF mappings: procedures>+≡
  function sf_mapping_get_index (mapping, j) result (i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j
    integer :: i
    i = mapping%i(j)
  end function sf_mapping_get_index
```

Return the dimensionality, i.e., the number of parameters.

```
<SF mappings: sf mapping: TBP>+≡
  procedure :: get_n_dim => sf_mapping_get_n_dim

<SF mappings: procedures>+≡
  function sf_mapping_get_n_dim (mapping) result (n)
    class(sf_mapping_t), intent(in) :: mapping
    integer :: n
    n = size (mapping%i)
  end function sf_mapping_get_n_dim
```

Computation: the values **p** are the input parameters, the values **r** are the output parameters. The values **rb** are defined as  $\bar{r} = 1 - r$ , but provided explicitly. They allow us to avoid numerical problems near  $r = 1$ .

The extra parameter **x\_free** indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is **f**. We modify only the two parameters indicated by the indices **i**.

```
<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_compute), deferred :: compute

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
      import
      class(sf_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(out) :: r, rb
```

```

        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: p, pb
        real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_compute
end interface

```

The inverse mapping. Use **r** and/or **rb** to reconstruct **p** and also compute **f**.

```

<SF mappings: sf mapping: TBP>+≡
    procedure (sf_mapping_inverse), deferred :: inverse

<SF mappings: interfaces>+≡
    abstract interface
        subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
            import
            class(sf_mapping_t), intent(inout) :: mapping
            real(default), dimension(:), intent(in) :: r, rb
            real(default), intent(out) :: f
            real(default), dimension(:), intent(out) :: p, pb
            real(default), intent(inout), optional :: x_free
        end subroutine sf_mapping_inverse
    end interface

```

## 16.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: check => sf_mapping_check

<SF mappings: procedures>+≡
    subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
        class(sf_mapping_t), intent(inout) :: mapping
        integer, intent(in) :: u
        real(default), dimension(:), intent(in) :: p_in, pb_in
        character(*), intent(in) :: fmt_p
        character(*), intent(in), optional :: fmt_f
        real(default), dimension(size(p_in)) :: p, pb, r, rb
        real(default) :: f, tolerance
        tolerance = 1.5E-17
        p = p_in
        pb = pb_in
        call mapping%compute (r, rb, f, p, pb)
        call pacify (p, tolerance)
        call pacify (pb, tolerance)
        call pacify (r, tolerance)
        call pacify (rb, tolerance)
        write (u, "(3x,A,9(1x," // fmt_p // "))" ) "p =", p
        write (u, "(3x,A,9(1x," // fmt_p // "))" ) "pb=", pb
        write (u, "(3x,A,9(1x," // fmt_p // "))" ) "r =", r
        write (u, "(3x,A,9(1x," // fmt_p // "))" ) "rb=", rb
        if (present (fmt_f)) then

```

```

        write (u, "(3x,A,9(1x," // fmt_f // "))") "f =", f
    else
        write (u, "(3x,A,9(1x," // fmt_p // "))") "f =", f
    end if
    write (u, *)
    call mapping%inverse (r, rb, f, p, pb)
    call pacify (p, tolerance)
    call pacify (pb, tolerance)
    call pacify (r, tolerance)
    call pacify (rb, tolerance)
    write (u, "(3x,A,9(1x," // fmt_p // "))") "p =", p
    write (u, "(3x,A,9(1x," // fmt_p // "))") "pb=", pb

    if (present (fmt_f)) then
        write (u, "(3x,A,9(1x," // fmt_f // "))") "f =", f
    else
        write (u, "(3x,A,9(1x," // fmt_p // "))") "f =", f
    end if
    write (u, *)
    write (u, "(3x,A,9(1x," // fmt_p // "))") "*r=", product (r)
end subroutine sf_mapping_check

```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: integral => sf_mapping_integral

<SF mappings: procedures>+≡
    function sf_mapping_integral (mapping, n_calls) result (integral)
        class(sf_mapping_t), intent(inout) :: mapping

#### 16.4.4 Implementation: resonance pair mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio, then it maps  $p_1$  to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in  $p_1$  results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

```

## 16.4.8 Implementation: endpoint mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ . The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in  $r_1$  and/or  $r_2$ . The singularity is smeared to an interval of width  $\epsilon$ . If nonzero, we distinguish the kinematical momentum fractions  $r_i$  from effective values  $x_i$ , which should go into the structure-function evaluation. A bin of width  $\epsilon$  in  $r$  is mapped to  $x = 1$  exactly, while the interval  $(0, 1 - \epsilon)$  is mapped to  $(0, 1)$  in  $x$ . The Jacobian reflects this distinction, and the logical `in_peak` allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

#### 16.4.9 Implementation: endpoint mapping with resonance

Like the endpoint mapping for  $p_2$ , but replace the endpoint mapping by a Breit-Wigner mapping for  $p_1$ . This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter  $p_1$  remains equal to  $r_1 r_2$ , as in the standard s-channel mapping.

```

<SF mappings: public>+≡
  public :: sf_epr_mapping_t

<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_epr_mapping_t
    real(default) :: a = 1
    real(default) :: m = 0
    real(default) :: w = 0
    logical :: resonance = .true.
  contains
    <SF mappings: sf endpoint/res mapping: TBP>
  end type sf_epr_mapping_t

```

Output.

```

<SF mappings: sf endpoint/res mapping: TBP>≡
  procedure :: write => sf_epr_mapping_write

<SF mappings: procedures>+≡
  subroutine sf_epr_mapping_write (object, unit)
    class(sf_epr_mapping_t), intent(in) :: object

#### 16.4.11 Implementation: ISR endpoint mapping

Similar to the endpoint mapping above: This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ .

The enhancement is such that ISR singularity  $(1 - x)^{-1+\epsilon}$  is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

```

### 16.4.16 Implementation: Endpoint + ISR power mapping, on-shell

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping. The first two parameters apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. On top of that, we map the first and third parameter such that the product is constant. From the outside, the first parameter is irrelevant while the third parameter describes the distribution of energy (loss) among beamstrahlung and ISR.

## 16.4.17 Basic formulas

### Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ( $\ln x$  which is zero at  $x = 1$ ), corresponding to an initial concentration of sampling points at the maximum energy. If **power** is greater than one (the default), points are also concentrated at the lower end.

The formula is (**power**= $\alpha$ ):

$$r_1 = (p_1^{p_2})^\alpha \quad (16.15)$$

$$r_2 = (p_1^{1-p_2})^\alpha \quad (16.16)$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \quad (16.17)$$

and for the default case  $\alpha = 1$ :

$$r_1 = p_1^{p_2} \quad (16.18)$$

$$r_2 = p_1^{1-p_2} \quad (16.19)$$

$$f = |\log p_1| \quad (16.20)$$

*(SF mappings: procedures)* +≡

```

subroutine map_unit_square (r, factor, p, power)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p

        end if
    else
        p = 0
    end if
end subroutine map_unit_square_inverse

```

### Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be numerically stable near  $x = 1$  and  $y = 0, 1$ . The formulas are again

$$r_1 = p_1^{p_2}, \quad r_2 = p_1^{\bar{p}_2}, \quad f = -\log p_1 \quad (16.21)$$

but we compute both  $r_i$  and  $\bar{r}_i$  simultaneously and make direct use of both  $p_i$  and  $\bar{p}_i$  as appropriate.

```

⟨SF mappings: procedures⟩+≡
subroutine map_unit_square_prec (r, rb, factor, p, pb)

        call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
    end if
end subroutine map_unit_square_prec

```

```

        factor = - log_prec (p(1), pb(1))
    else if (.not. vanishes (p(1))) then
        call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
        call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
        factor = - log_prec (p(1), pb(1))
    else
        r  = 0
        rb = 1
        factor = 0
    end if
end subroutine map_unit_square_prec

```

This is the inverse mapping.

*(SF mappings: procedures)+≡*

```

subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
    real(default), dimension(2), intent(in) :: r
    real(default), dimension(2), intent(in) :: rb
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(out) :: p
    real(default), dimension(2), intent(out) :: pb
    call inverse_prec_x (r, rb, p(1), pb(1))
    if (all (r > 0)) then
        if (rb(1) < rb(2)) then
            call inverse_prec_y (r, rb, p(2), pb(2))
        else
            call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
        end if
        factor = - log_prec (p(1), pb(1))
    else
        p(1) = 0
        pb(1) = 1
        p(2) = 0.5_default
        pb(2) = 0.5_default
        factor = 0
    end if
end subroutine map_unit_square_inverse_prec

```

This is an auxiliary function: evaluate the expression  $\bar{z} = 1 - x^y$  in a numerically stable way. Instabilities occur for  $y = 0$  and  $x = 1$ . The idea is to replace the bracket by the first terms of its Taylor expansion around  $x = 1$  (read  $\bar{x} \equiv 1 - x$ )

$$1 - x^y = y\bar{x} \left( 1 + \frac{1}{2}(1 - y)\bar{x} + \frac{1}{6}(2 - y)(1 - y)\bar{x}^2 \right) \quad (16.22)$$

whenever this is the better approximation. Actually, the relative numerical error of the exact formula is about  $\eta/(y\bar{x})$  where  $\eta$  is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by  $(y\bar{x})$ .

The first subroutine computes  $z$  and  $\bar{z}$  near  $x = 1$  where  $\log x$  should be expanded, the second one near  $x = 0$  where  $\log x$  can be kept.

    z = x ** y
    zb = 1 - z
end if
end subroutine compute_prec_xy_0

```

For the inverse calculation, we evaluate  $x = r_1 r_2$  in a stable way. Since it is just a polynomial, the expansion near  $x = 1$  is analytically exact, and we don't need to choose based on precision.

*(SF mappings: procedures)*+≡

```

subroutine inverse_prec_x (r, rb, x, xb)
real(default), dimension(2), intent(in) :: r, rb
real(default), intent(out) :: x, xb
real(default) :: a0, a1
a0 = rb(1) + rb(2)
a1 = rb(1) * rb(2)
if (a0 > 0.5_default) then
    xb = a0 - a1
    x = 1 - xb
else
    x = r(1) * r(2)
    xb = 1 - x
end if
end subroutine inverse_prec_x

```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \quad (16.23)$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near  $r_i = 1$ . A series expansion is required if  $r_1 \ll r_2$ , since then  $y$  becomes small. (We assume  $r_1 < r_2$  here; for the opposite case, the arguments can be exchanged.)

```

(SF mappings: procedures)+≡
subroutine inverse_prec_y (r, rb, y, yb)
  real(default), dimension(2), intent(in) :: r, rb
  real(default), intent(out) :: y, yb

```

### Mapping for on-shell s-channel

The limiting case, if the product  $r_1 r_2$  is fixed for on-shell production. The parameter  $p_1$  is ignored. In the inverse mapping, it is returned zero.

The parameter `x_free`, if present, rescales the total energy. If it is less than one, the rescaled mass parameter  $m^2$  should be increased accordingly.

Public for access in unit test.

```

(SF mappings: public)+≡
public :: map_on_shell
public :: map_on_shell_inverse

(SF mappings: procedures)+≡
subroutine map_on_shell (r, factor, p, lm2, x_free)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p

```

```

    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2; if (present (x_free)) lx = lx + log (x_free)
    r(1) = exp (- p(2) * lx)
    r(2) = exp (- (1 - p(2)) * lx)
    factor = lx
end subroutine map_on_shell

subroutine map_on_shell_inverse (r, factor, p, lm2, x_free)
    real(default), dimension(2), intent(in) :: r
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(out) :: p
    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2; if (present (x_free)) lx = lx + log (x_free)
    p(1) = 0
    p(2) = abs (log (r(1))) / lx
    factor = lx
end subroutine map_on_shell_inverse

```

### Mapping for on-shell s-channel, single parameter

This is a pseudo-mapping which applies if there is actually just one parameter  $p$ . The output parameter  $r$  is fixed for on-shell production. The lone parameter  $p_1$  is ignored. In the inverse mapping, it is returned zero.

The parameter  $x\_free$ , if present, rescales the total energy. If it is less than one, the rescaled mass parameter  $m^2$  should be increased accordingly.

Public for access in unit test.

```

<SF mappings: public>+≡
    public :: map_on_shell_single
    public :: map_on_shell_single_inverse

<SF mappings: procedures>+≡
    subroutine map_on_shell_single (r, factor, p, lm2, x_free)
        real(default), dimension(1), intent(out) :: r
        real(default), intent(out) :: factor
        real(default), dimension(1), intent(in) :: p
        real(default), intent(in) :: lm2
        real(default), intent(in), optional :: x_free
        real(default) :: lx
        lx = lm2; if (present (x_free)) lx = lx + log (x_free)
        r(1) = exp (- lx)
        factor = 1
    end subroutine map_on_shell_single

    subroutine map_on_shell_single_inverse (r, factor, p, lm2, x_free)
        real(default), dimension(1), intent(in) :: r
        real(default), intent(out) :: factor
        real(default), dimension(1), intent(out) :: p
        real(default), intent(in) :: lm2
        real(default), intent(in), optional :: x_free
    end subroutine map_on_shell_single_inverse

```

```

real(default) :: lx
lx = lm2; if (present (x_free)) lx = lx + log (x_free)
p(1) = 0
factor = 1
end subroutine map_on_shell_single_inverse

```

### Mapping for a Breit-Wigner resonance

This is the standard Breit-Wigner mapping. We apply it to a single variable, independently of or in addition to a unit-square mapping. We assume here that the limits for the variable are 0 and 1, and that the mass  $m$  and width  $w$  are rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If `x_free` is set, it rescales the total energy and thus mass and width, since these are defined with respect to the total energy.

*(SF mappings: procedures)+≡*

```

subroutine map_breit_wigner (r, factor, p, m, w, x_free)
  real(default), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), intent(in) :: p
  real(default), intent(in) :: m
  real(default), intent(in) :: w
  real(default), intent(in), optional :: x_free
  real(default) :: m2, mw, a1, a2, a3, z, tmp
  m2 = m ** 2
  mw = m * w
  if (present (x_free)) then
    m2 = m2 / x_free
    mw = mw / x_free
  end if
  a1 = atan (- m2 / mw)
  a2 = atan ((1 - m2) / mw)
  a3 = (a2 - a1) * mw
  z = (1-p) * a1 + p * a2
  if (-pi/2 < z .and. z < pi/2) then
    tmp = tan (z)
    r = max (m2 + mw * tmp, 0._default)
    factor = a3 * (1 + tmp ** 2)
  else
    r = 0
    factor = 0
  end if
end subroutine map_breit_wigner

subroutine map_breit_wigner_inverse (r, factor, p, m, w, x_free)
  real(default), intent(in) :: r
  real(default), intent(out) :: factor
  real(default), intent(out) :: p
  real(default), intent(in) :: m
  real(default), intent(in) :: w
  real(default) :: m2, mw, a1, a2, a3, tmp
  real(default), intent(in), optional :: x_free
  m2 = m ** 2

```

```

mw = m * w
if (present (x_free)) then
  m2 = m2 / x_free
  mw = mw / x_free
end if
a1 = atan (- m2 / mw)
a2 = atan ((1 - m2) / mw)
a3 = (a2 - a1) * mw
tmp = (r - m2) / mw
p = (atan (tmp) - a1) / (a2 - a1)
factor = a3 * (1 + tmp ** 2)
end subroutine map_breit_wigner_inverse

```

### Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the endpoint(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2}x)) \quad (16.24)$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

```

<SF mappings: procedures>+≡
subroutine map_endpoint_1 (x3, factor, x1, a)
  real(default), intent(out) :: x3, factor
  real(default), intent(in) :: x1
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x1) < 1) then
    x2 = tan (x1 * pi / 2)
    x3 = tanh (a * x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
  else
    x3 = x1
    factor = 0
  end if
end subroutine map_endpoint_1

subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
  real(default), intent(in) :: x3
  real(default), intent(out) :: x1, factor
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x3) < 1) then
    x2 = atanh (x3) / a
    x1 = 2 / pi * atan (x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
  else
    x1 = x3
    factor = 0
  end if

```

```

end subroutine map_endpoint_inverse_1

subroutine map_endpoint_01 (x4, factor, x0, a)
  real(default), intent(out) :: x4, factor
  real(default), intent(in) :: x0
  real(default), intent(in) :: a
  real(default) :: x1, x3
  x1 = 2 * x0 - 1
  call map_endpoint_1 (x3, factor, x1, a)
  x4 = (x3 + 1) / 2
end subroutine map_endpoint_01

subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
  real(default), intent(in) :: x4
  real(default), intent(out) :: x0, factor
  real(default), intent(in) :: a
  real(default) :: x1, x3
  x3 = 2 * x4 - 1
  call map_endpoint_inverse_1 (x3, factor, x1, a)
  x0 = (x1 + 1) / 2
end subroutine map_endpoint_inverse_01

```

### Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity which is of power type at  $x = 1$ , i.e., if

$$\sigma = \int_0^1 dx f(x) G(x) = \int_0^1 dx \epsilon (1-x)^{-1+\epsilon} G(x), \quad (16.25)$$

we replace this by

$$r = x^\epsilon \implies \sigma = \int_0^1 dr G(1 - (1-r)^{1/\epsilon}). \quad (16.26)$$

We expect that  $\epsilon$  is small.

The actual mapping is  $r \rightarrow x$  (so  $x$  emerges closer to 1). The Jacobian that we return is thus  $1/f(x)$ . We compute the mapping in terms of  $\bar{x} \equiv 1 - x$ , so we can achieve the required precision. Because some compilers show quite wild numeric fluctuations, we internally convert numeric types to explicit `double` precision.

```

<SF mappings: public>+≡
  public :: map_power_1
  public :: map_power_inverse_1

<SF mappings: procedures>+≡
  subroutine map_power_1 (xb, factor, rb, eps)
    real(default), intent(out) :: xb, factor
    real(default), intent(in) :: rb
    real(double) :: rb_db, factor_db, eps_db, xb_db
    real(default), intent(in) :: eps
    rb_db = real (rb, kind=double)
    eps_db = real (eps, kind=double)

```

```

xb_db = rb_db ** (1 / eps_db)
if (rb_db > 0) then
    factor_db = xb_db / rb_db / eps_db
    factor = real (factor_db, kind=default)
else
    factor = 0
end if
xb = real (xb_db, kind=default)
end subroutine map_power_1

subroutine map_power_inverse_1 (xb, factor, rb, eps)
    real(default), intent(in) :: xb
    real(default), intent(out) :: rb, factor
    real(double) :: xb_db, factor_db, eps_db, rb_db
    real(default), intent(in) :: eps
    xb_db = real (xb, kind=double)
    eps_db = real (eps, kind=double)
    rb_db = xb_db ** eps_db
    if (xb_db > 0) then
        factor_db = xb_db / rb_db / eps_db
        factor = real (factor_db, kind=default)
    else
        factor = 0
    end if
    rb = real (rb_db, kind=default)
end subroutine map_power_inverse_1

```

Here we apply a power mapping to both endpoints. We divide the interval in two equal halves and apply the power mapping for the nearest endpoint, either 0 or 1.

*(SF mappings: procedures)* +≡

```

subroutine map_power_01 (y, yb, factor, r, eps)
    real(default), intent(out) :: y, yb, factor
    real(default), intent(in) :: r
    real(default), intent(in) :: eps
    real(default) :: u, ub, zp, zm
    u = 2 * r - 1
    if (u > 0) then
        ub = 2 * (1 - r)
        call map_power_1 (zm, factor, ub, eps)
        zp = 2 - zm
    else if (u < 0) then
        ub = 2 * r
        call map_power_1 (zp, factor, ub, eps)
        zm = 2 - zp
    else
        factor = 1 / eps
        zp = 1
        zm = 1
    end if
    y = zp / 2
    yb = zm / 2
end subroutine map_power_01

```

```

subroutine map_power_inverse_01 (y, yb, factor, r, eps)
  real(default), intent(in) :: y, yb
  real(default), intent(out) :: r, factor
  real(default), intent(in) :: eps
  real(default) :: ub, zp, zm
  zp = 2 * y
  zm = 2 * yb
  if (zm < zp) then
    call map_power_inverse_1 (zm, factor, ub, eps)
    r = 1 - ub / 2
  else if (zp < zm) then
    call map_power_inverse_1 (zp, factor, ub, eps)
    r = ub / 2
  else
    factor = 1 / eps
    ub = 1
    r = ub / 2
  end if
end subroutine map_power_inverse_01

```

### Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping that applies to multiple structure functions. This is described by an extension of the `sf_mapping_t` type. In addition, it may contain mappings that apply to (other) individual structure functions. The details of these mappings are implementation-specific.

The `sf_channel_t` type combines this information. It contains an array of map codes, one for each structure-function entry. The code values are:

**none** MC input parameters  $r$  directly become energy fractions  $x$

**single** default mapping for a single structure-function entry

**multi/s** map  $r \rightarrow x$  such that one MC input parameter is  $\hat{s}/s$

**multi/resonance** as before, adapted to s-channel resonance

**multi/on-shell** as before, adapted to an on-shell particle in the s channel

**multi/endpoint** like multi/s, but enhance the region near  $r_i = 1$

**multi/endpoint/res** endpoint mapping with resonance

**multi/endpoint/os** endpoint mapping for on-shell

**multi/power/os** like multi/endpoint, regulating a power singularity

$\langle SF \text{ mappings: parameters} \rangle \equiv$

```

integer, parameter :: SFMAP_NONE = 0
integer, parameter :: SFMAP_SINGLE = 1
integer, parameter :: SFMAP_MULTI_S = 2
integer, parameter :: SFMAP_MULTI_RES = 3

```

```

integer, parameter :: SFMAP_MULTI_ONS = 4
integer, parameter :: SFMAP_MULTI_EP = 5
integer, parameter :: SFMAP_MULTI_EPR = 6
integer, parameter :: SFMAP_MULTI_EPO = 7
integer, parameter :: SFMAP_MULTI_IP = 8
integer, parameter :: SFMAP_MULTI_IPR = 9
integer, parameter :: SFMAP_MULTI_IPO = 10
integer, parameter :: SFMAP_MULTI_EI = 11
integer, parameter :: SFMAP_MULTI_SRS = 13
integer, parameter :: SFMAP_MULTI_SON = 14

```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

```

<SF mappings: public>+≡
  public :: sf_channel_t

<SF mappings: types>+≡
  type :: sf_channel_t
    integer, dimension(:), allocatable :: map_code
    class(sf_mapping_t), allocatable :: multi_mapping
    contains
    <SF mappings: sf channel: TBP>
  end type sf_channel_t

```

The output format prints a single character for each structure-function entry and, if applicable, an account of the mapping parameters.

```

write (u, "(A)") "* Test output end: sf_mappings_3"

end subroutine sf_mappings_3

```

### Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by  $|\log m^2|$ , so this is also the value of the integral. The factor results from the variable change in the  $\delta$  function  $\delta(m^2 - x_1 x_2)$  which multiplies the cross section for the case at hand.

For the test, the (rescaled) resonance mass is set at  $1/2$  the energy.

```

### 16.5.1 Abstract rescale data-type

NLO calculations require the treatment of initial state parton radiation. The radiation of a parton rescales the energy fraction which enters the hard process. We allow for different rescale settings by extending the abstract. `sf_rescale_t` data type.

```

<SF base: public>≡
    public :: sf_rescale_t
<SF base: types>≡
    type, abstract :: sf_rescale_t
        integer :: i_beam = 0
    contains
    <SF base: rescaling function: TBP>
    end type sf_rescale_t

<SF base: rescaling function: TBP>≡
    procedure (sf_rescale_apply), deferred :: apply
<SF base: interfaces>≡
    abstract interface
        subroutine sf_rescale_apply (func, x)
            import
            class(sf_rescale_t), intent(in) :: func
            real(default), intent(inout) :: x
        end subroutine sf_rescale_apply
    end interface

<SF base: rescaling function: TBP>+≡
    procedure :: set_i_beam => sf_rescale_set_i_beam
<SF base: procedures>≡
    subroutine sf_rescale_set_i_beam (func, i_beam)
        class(sf_rescale_t), intent(inout) :: func
        integer, intent(in) :: i_beam
        func%i_beam = i_beam
    end subroutine sf_rescale_set_i_beam

<SF base: public>+≡
    public :: sf_rescale_collinear_t
<SF base: types>+≡
    type, extends (sf_rescale_t) :: sf_rescale_collinear_t
        real(default) :: xi_tilde
    contains
    <SF base: rescale collinear: TBP>
    end type sf_rescale_collinear_t

```

For the subtraction terms we need to rescale the Born  $x$  of both beams in the collinear limit. This leaves one beam unaffected and rescales the other according to

$$x = \frac{\bar{x}}{1 - \xi} \quad (16.27)$$

which is the collinear limit of `sf_rescale_real_apply`.

```

<SF base: rescale collinear: TBP>≡
  procedure :: apply => sf_rescale_collinear_apply

<SF base: procedures>+≡
  subroutine sf_rescale_collinear_apply (func, x)
    class(sf_rescale_collinear_t), intent(in) :: func
    real(default), intent(inout) :: x
    real(default) :: xi
    if (debug2_active (D_BEAMS)) then
      print *, 'Rescaling function - Collinear: '
      print *, 'Input, unscaled x: ', x
      print *, 'xi_tilde: ', func%xi_tilde
    end if
    xi = func%xi_tilde * (one - x)
    x = x / (one - xi)
    if (debug2_active (D_BEAMS)) print *, 'rescaled x: ', x
  end subroutine sf_rescale_collinear_apply

<SF base: rescale collinear: TBP>+≡
  procedure :: set => sf_rescale_collinear_set

<SF base: procedures>+≡
  subroutine sf_rescale_collinear_set (func, xi_tilde)
    class(sf_rescale_collinear_t), intent(inout) :: func
    real(default), intent(in) :: xi_tilde
    func%xi_tilde = xi_tilde
  end subroutine sf_rescale_collinear_set

<SF base: public>+≡
  public :: sf_rescale_real_t

<SF base: types>+≡
  type, extends (sf_rescale_t) :: sf_rescale_real_t
    real(default) :: xi, y
  contains
    <SF base: rescale real: TBP>
  end type sf_rescale_real_t

```

In case of IS Splittings, the beam  $x$  changes from Born to real and thus needs to be rescaled according to

$$x_{\oplus} = \frac{\bar{x}_{\oplus}}{\sqrt{1 - \xi}} \sqrt{\frac{2 - \xi(1 - y)}{2 - \xi(1 + y)}}, \quad x_{\ominus} = \frac{\bar{x}_{\ominus}}{\sqrt{1 - \xi}} \sqrt{\frac{2 - \xi(1 + y)}{2 - \xi(1 - y)}} \quad (16.28)$$

```

### 16.5.3 Structure-function chain configuration

This is the data type that the `process` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

```

(SF base: public)+≡
  public :: sf_config_t

(SF base: types)+≡
  type :: sf_config_t
    integer, dimension(:), allocatable :: i
    class(sf_data_t), allocatable :: data
  contains
    (SF base: sf config: TBP)
  end type sf_config_t

```

Output:

```

(SF base: sf config: TBP)≡
  procedure :: write => sf_config_write

(SF base: procedures)+≡
  subroutine sf_config_write (object, unit, verbose)
    class(sf_config_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
  end subroutine sf_config_write

```

```

    if (allocated (object%i)) then
        write (u, "(1x,A,2(1x,I0))") "Structure-function configuration: &
            &beam(s)", object%i
        if (allocated (object%data)) &
            call object%data%write (u, verbose = verbose)
    else
        write (u, "(1x,A)") "Structure-function configuration: [undefined]"
    end if
end subroutine sf_config_write

```

Initialize.

```

<SF base: sf config: TBP>+≡

    end function sf_config_get_beam_file

```

#### 16.5.4 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

```

<SF base: public>+≡
  public :: sf_int_t

<SF base: types>+≡
  type, abstract, extends (interaction_t) :: sf_int_t
    integer :: status = SF_UNDEFINED
    real(default), dimension(:), allocatable :: mi2
    real(default), dimension(:), allocatable :: mr2
    real(default), dimension(:), allocatable :: mo2
    integer :: on_shell_mode = KEEP_ENERGY
    logical :: qmin_defined = .false.
    logical :: qmax_defined = .false.
    real(default), dimension(:), allocatable :: qmin
    real(default), dimension(:), allocatable :: qmax
    integer, dimension(:), allocatable :: beam_index
    integer, dimension(:), allocatable :: incoming
    integer, dimension(:), allocatable :: radiated
    integer, dimension(:), allocatable :: outgoing
    integer, dimension(:), allocatable :: par_index
    integer, dimension(:), allocatable :: par_primary
  contains
    <SF base: sf_int: TBP>
  end type sf_int_t

```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

```

<SF base: parameters>≡
  integer, parameter, public :: SF_UNDEFINED = 0
  integer, parameter, public :: SF_INITIAL = 1
  integer, parameter, public :: SF_DONE_LINKS = 2
  integer, parameter, public :: SF_FAILED_MASK = 3
  integer, parameter, public :: SF_DONE_MASK = 4
  integer, parameter, public :: SF_FAILED_CONNECTIONS = 5

```

```

integer, parameter, public :: SF_DONE_CONNECTIONS = 6
integer, parameter, public :: SF_SEED_KINEMATICS = 10
integer, parameter, public :: SF_FAILED_KINEMATICS = 11
integer, parameter, public :: SF_DONE_KINEMATICS = 12
integer, parameter, public :: SF_FAILED_EVALUATION = 13
integer, parameter, public :: SF_EVALUATED = 20

```

Write a string version of the status code:

```

<SF base: procedures>+=
subroutine write_sf_status (status, u)
  integer, intent(in) :: status
  integer, intent(in) :: u
  select case (status)
  case (SF_UNDEFINED)
    write (u, "(1x,'[',A,']')") "undefined"
  case (SF_INITIAL)
    write (u, "(1x,'[',A,']')") "initialized"
  case (SF_DONE_LINKS)
    write (u, "(1x,'[',A,']')") "links set"
  case (SF_FAILED_MASK)
    write (u, "(1x,'[',A,']')") "mask mismatch"
  case (SF_DONE_MASK)
    write (u, "(1x,'[',A,']')") "mask set"
  case (SF_FAILED_CONNECTIONS)
    write (u, "(1x,'[',A,']')") "connections failed"
  case (SF_DONE_CONNECTIONS)
    write (u, "(1x,'[',A,']')") "connections set"
  case (SF_SEED_KINEMATICS)
    write (u, "(1x,'[',A,']')") "incoming momenta set"
  case (SF_FAILED_KINEMATICS)
    write (u, "(1x,'[',A,']')") "kinematics failed"
  case (SF_DONE_KINEMATICS)
    write (u, "(1x,'[',A,']')") "kinematics set"
  case (SF_FAILED_EVALUATION)
    write (u, "(1x,'[',A,']')") "evaluation failed"
  case (SF_EVALUATED)
    write (u, "(1x,'[',A,']')") "evaluated"
  end select
end subroutine write_sf_status

```

This is the basic output routine. Display status and interaction.

```

<SF base: sf int: TBP>=
procedure :: base_write => sf_int_base_write

<SF base: procedures>+=
subroutine sf_int_base_write (object, unit, testflag)

      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
    end subroutine sf_int_write
  end interface

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually

required for non-collinear splitting.

```

<SF base: sf_int: TBP>+=
  procedure :: base_init => sf_int_base_init

<SF base: procedures>+=
  subroutine sf_int_base_init &
    (sf_int, mask, mi2, mr2, mo2, qmin, qmax, hel_lock)

  integer, dimension(:), intent(in) :: outgoing
  allocate (sf_int%outgoing (size (outgoing)))
  sf_int%outgoing = outgoing
end subroutine sf_int_set_outgoing

```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

```

<SF base: sf_int: TBP>+≡
  procedure (sf_int_init), deferred :: init

<SF base: interfaces>+≡
  abstract interface
    subroutine sf_int_init (sf_int, data)
      import
      class(sf_int_t), intent(out) :: sf_int
      class(sf_data_t), intent(in), target :: data
    end subroutine sf_int_init
  end interface

```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

The `target` attribute is formally required since some overriding implementations use a temporary pointer (iterator) to the state-matrix component. It doesn't appear to make a real difference, though.

```

<SF base: sf_int: TBP>+≡
  procedure :: setup_constants => sf_int_setup_constants

<SF base: procedures>+≡
  subroutine sf_int_setup_constants (sf_int)
    class(sf_int_t), intent(inout), target :: sf_int
  end subroutine sf_int_setup_constants

```

Set beam indices, i.e., the beam(s) on which this structure function applies.

```

<SF base: sf_int: TBP>+≡
  procedure :: set_beam_index => sf_int_set_beam_index

<SF base: procedures>+≡
  subroutine sf_int_set_beam_index (sf_int, beam_index)
    class(sf_int_t), intent(inout) :: sf_int

    integer :: j
    if (sf_int%status >= SF_INITIAL) then
      allocate (k (size (E)))
      if (all (E**2 >= sf_int%mi2)) then
        do j = 1, size (E)

```

```

        k(j) = vector4_moving (E(j), &
            (3-2*j) * sqrt (E(j)**2 - sf_int%mi2(j)), 3)
    end do
    call sf_int%seed_kinematics (k)
end if
end if
end subroutine sf_int_seed_energies

```

Tell if in generator mode. By default, this is false. To be overridden where appropriate; we may refer to the `is_generator` method of the `data` component in the concrete type.

```

⟨SF base: sf_int: TBP⟩+=
    procedure :: is_generator => sf_int_is_generator

⟨SF base: procedures⟩+=
    function sf_int_is_generator (sf_int) result (flag)
        class(sf_int_t), intent(in) :: sf_int
        logical :: flag
        flag = .false.
    end function sf_int_is_generator

```

Generate free parameters `r`. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value `x_free` is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

```

⟨SF base: sf_int: TBP⟩+=
    procedure :: generate_free => sf_int_generate_free

⟨SF base: procedures⟩+=
    subroutine sf_int_generate_free (sf_int, r, rb, x_free)
        class(sf_int_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: r, rb
        real(default), intent(inout) :: x_free
        r = 0
        rb = 1
    end subroutine sf_int_generate_free

```

Complete the structure-function kinematics, derived from an input parameter (array) `r` between 0 and 1. The interaction momenta are calculated, and we return `x` (the momentum fraction), and `f` (the Jacobian factor for the map  $r \rightarrow x$ ), if `map` is set.

If the `map` flag is unset, `r` and `x` values will coincide, and `f` will become unity. If it is set, the structure-function implementation chooses a convenient mapping from `r` to `x` with Jacobian `f`.

In the `inverse_kinematics` variant, we exchange the intent of `x` and `r`. The momenta are calculated only if the optional flag `set_momenta` is present and set.

Internal parameters of `sf_int` are calculated only if the optional flag `set_x` is present and set.

Update 2018-08-22: Throughout this algorithm, we now carry  $xb=1-x$  together with  $x$  values, as we did for  $r$  before. This allows us to handle unstable endpoint numerics wherever necessary. The only place where the changes actually did matter was for inverse kinematics in the ISR setup, with a very soft photon, but it might be most sensible to apply the extension with  $xb$  everywhere.

```

The inverse procedure: we compute the  $x$  array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

Update 2017-08-22: recover also  $xb$ , using the updated `recover` method of the `splitting-data` object. Th

```

### 16.5.5 Accessing the structure function

Return metadata. Once `interaction_t` is rewritten in OO, some of this will be inherited.

The number of outgoing particles is equal to the number of incoming particles. The radiated particles are the difference.

```

<SF base: sf_int: TBP>+=
    procedure :: get_n_in => sf_int_get_n_in
    procedure :: get_n_rad => sf_int_get_n_rad
    procedure :: get_n_out => sf_int_get_n_out

<SF base: procedures>+=
    pure function sf_int_get_n_in (object) result (n_in)
        class(sf_int_t), intent(in) :: object
        integer :: n_in
        n_in = object%interaction_t%get_n_in ()
    end function sf_int_get_n_in

    pure function sf_int_get_n_rad (object) result (n_rad)
        class(sf_int_t), intent(in) :: object
        integer :: n_rad
        n_rad = object%interaction_t%get_n_out () &
            - object%interaction_t%get_n_in ()

```

```

end function sf_int_get_n_rad

pure function sf_int_get_n_out (object) result (n_out)
  class(sf_int_t), intent(in) :: object
  integer :: n_out
  n_out = object%interaction_t%get_n_in ()
end function sf_int_get_n_out

```

Number of matrix element entries in the interaction:

```

<SF base: sf_int: TBP>+≡
  procedure :: get_n_states => sf_int_get_n_states

<SF base: procedures>+≡
  function sf_int_get_n_states (sf_int) result (n_states)
    class(sf_int_t), intent(in) :: sf_int
    integer :: n_states
    n_states = sf_int%get_n_matrix_elements ()
  end function sf_int_get_n_states

```

Return a specific state as a quantum-number array.

```

<SF base: sf_int: TBP>+≡
  procedure :: get_state => sf_int_get_state

<SF base: procedures>+≡
  function sf_int_get_state (sf_int, i) result (qn)
    class(sf_int_t), intent(in) :: sf_int
    type(quantum_numbers_t), dimension(:), allocatable :: qn
    integer, intent(in) :: i
    allocate (qn (sf_int%get_n_tot ()))
    qn = sf_int%get_quantum_numbers (i)
  end function sf_int_get_state

```

Return the matrix-element values for all states. We can assume that the matrix elements are real, so we take the real part.

```

<SF base: sf_int: TBP>+≡
  procedure :: get_values => sf_int_get_values

<SF base: procedures>+≡
  subroutine sf_int_get_values (sf_int, value)
    class(sf_int_t), intent(in) :: sf_int
    real(default), dimension(:), intent(out) :: value
    integer :: i
    if (sf_int%status >= SF_EVALUATED) then
      do i = 1, size (value)
        value(i) = real (sf_int%get_matrix_element (i))
      end do
    else
      value = 0
    end if
  end subroutine sf_int_get_values

```

### 16.5.6 Direct calculations

Compute a structure function value (array) directly, given an array of  $x$  values and a scale. If the energy is also given, we initialize the kinematics for that energy, otherwise take it from a previous run.

We assume that the  $E$  array has dimension  $n\_in$ , and the  $x$  array has  $n\_par$ .

Note: the output  $x$  values ( $xx$  and  $xxb$ ) are unused in this use case.

```

<SF base: sf_int: TBP>+=
  procedure :: compute_values => sf_int_compute_values

<SF base: procedures>+=
  subroutine sf_int_compute_values (sf_int, value, x, xb, scale, E)
    class(sf_int_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: value
    real(default), dimension(:), intent(in) :: x
    real(default), dimension(:), intent(in) :: xb
    real(default), intent(in) :: scale
    real(default), dimension(:), intent(in), optional :: E
    real(default), dimension(size (x)) :: xx, xxb
    real(default) :: f
    if (present (E)) call sf_int%seed_kinematics (E)
    if (sf_int%status >= SF_SEED_KINEMATICS) then
      call sf_int%complete_kinematics (xx, xxb, f, x, xb, map=.false.)
      call sf_int%apply (scale)
      call sf_int%get_values (value)
      value = value * f
    else
      value = 0
    end if
  end subroutine sf_int_compute_values

```

Compute just a single value for one of the states, i.e., throw the others away.

```

<SF base: sf_int: TBP>+=
  procedure :: compute_value => sf_int_compute_value

<SF base: procedures>+=
  subroutine sf_int_compute_value &
    (sf_int, i_state, value, x, xb, scale, E)
    class(sf_int_t), intent(inout) :: sf_int
    integer, intent(in) :: i_state
    real(default), intent(out) :: value
    real(default), dimension(:), intent(in) :: x
    real(default), dimension(:), intent(in) :: xb
    real(default), intent(in) :: scale
    real(default), dimension(:), intent(in), optional :: E
    real(default), dimension(:), allocatable :: value_array
    if (sf_int%status >= SF_INITIAL) then
      allocate (value_array (sf_int%get_n_states ()))
      call sf_int%compute_values (value_array, x, xb, scale, E)
      value = value_array(i_state)
    else
      value = 0
    end if
  end subroutine sf_int_compute_value

```

### 16.5.7 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

```

⟨SF base: types⟩+≡
  type :: sf_instance_t
    class(sf_int_t), allocatable :: int
    type(enumerator_t) :: eval
    real(default), dimension(:,:), allocatable :: r
    real(default), dimension(:,:), allocatable :: rb
    real(default), dimension(:), allocatable :: f
    logical, dimension(:), allocatable :: m
    real(default), dimension(:), allocatable :: x
    real(default), dimension(:), allocatable :: xb
  end type sf_instance_t

```

### 16.5.8 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and `n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

```

### 16.5.9 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the

random-number generator. The **r** array results from applying global mappings. The **x** array results from applying structure-function local mappings. The *x* values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The **f** factor is the Jacobian that results from applying all mappings.

Update 2017-08-22: carry and output all complements (**pb**, **rb**, **xb**). Previously, **xb** was not included in the record, and the output did not contain either. It does become more verbose, however.

The **mapping** entry may store a global mapping that is applied to a combination of *x* values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the **p** array to the **r** array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the `p` etc. arrays.

The brute-force assignment of the `sf` component would be straightforward, but we provide a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained `interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time calling the proper defined assignment. Furthermore, we allocate the parameter arrays for each structure function.

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the `channel` object are allocatable und thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

      end if
      chain%status = SF_INITIAL
    end if
  end subroutine sf_chain_instance_set_channel

```

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

```

Exchange the quantum-number masks between the interactions in the chain, so we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the `setup_constants` method, which prepares constant data that depend on the matrix element structure.

```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

```

<SF base: init evaluators: find outgoing particles>≡
subroutine find_outgoing_particles ()
  type(interaction_t), pointer :: int, int_next

end subroutine find_outgoing_particles

```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, we use up the MC input parameter array  $\mathbf{p}$  to compute the radiated and outgoing momenta.

In the multi-channel case,  $c\_sel$  is the channel which we use for computing the kinematics and the  $\mathbf{x}$  values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the  $\mathbf{r}$  array, and the Jacobian  $\mathbf{f}$ .

We first apply any global mapping to transform the input  $\mathbf{p}$  into the array  $\mathbf{r}$ . This is then given to the structure functions which compute the final array  $\mathbf{x}$  and Jacobian factors  $\mathbf{f}$ , which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the  $x$  parameters and reconstruct the momenta and the MC input parameters  $p$ . We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all  $x$  parameters, and then inverts mappings. See below `recover_kinematics`.

end subroutine sf_chain_instance_inverse_kinematics

```

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the  $x$  and  $p$  parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

end do
end if
chain%status = SF_DONE_KINEMATICS
end if
end subroutine sf_chain_instance_recover_kinematics

```

Return the initial beam momenta to their source, thus completing kinematics recovery. Obviously, this works as a side effect.

*(SF base: sf chain instance: TBP)*+≡

```

    procedure :: return_beam_momenta => sf_chain_instance_return_beam_momenta

```

*(SF base: procedures)*+≡

```

subroutine sf_chain_instance_return_beam_momenta (chain)
    class(sf_chain_instance_t), intent(in), target :: chain
    type(interaction_t), pointer :: int
    if (chain%status >= SF_DONE_KINEMATICS) then
        int => beam_get_int_ptr (chain%beam_t)
        call interaction_send_momenta (int)
    end if
end subroutine sf_chain_instance_return_beam_momenta

```

Evaluate all interactions in the chain and the product evaluators. We provide a **scale** argument that is given to all structure functions in the chain.

Hadronic NLO calculations involve rescaled fractions of the original beam momentum. In particular, we have to handle the following cases:

- normal evaluation (where `i_sub = 0`) for all terms except the real non-subtracted,
- rescaled momentum fraction for both beams in the case of the real non-subtracted term (`i_sub = 0`),
- and rescaled momentum fraction for one of both beams in the case of the subtraction and DGLAP component (`i_sub = 1,2`).

For the collinear final or initial state counter terms, we apply a rescaling to one beam, and keep the other beam as is. We redo it then vice versa having now two subtractions.

```

### 16.5.12 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

#### Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

```

<SF base: public test auxiliary>≡
    public :: sf_test_data_t
<SF base: test types>≡
    type, extends (sf_data_t) :: sf_test_data_t
        class(model_data_t), pointer :: model => null ()
        integer :: mode = 0
        type(flavor_t) :: flv_in
        type(flavor_t) :: flv_out
        type(flavor_t) :: flv_rad
        real(default) :: m = 0
        logical :: collinear = .true.

```

```

    real(default), dimension(:), allocatable :: qbounds
contains
  <SF base: sf test data: TBP>
end type sf_test_data_t

```

Output.

```

<SF base: sf test data: TBP>≡
  procedure :: write => sf_test_data_write

<SF base: test auxiliary>≡
  subroutine sf_test_data_write (data, unit, verbose)
    class(sf_test_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "SF test data:"

    call sf_int%freeze ()
    call sf_int%set_incoming ([1])
    call sf_int%set_radiated ([2])
    call sf_int%set_outgoing ([3])
  end select
  sf_int%status = SF_INITIAL
end subroutine sf_test_init

```

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

end subroutine sf_test_apply

```

### 16.5.13 Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two radiated and two outgoing particles.

#### Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```

<SF base: test types>+≡
type, extends (sf_data_t) :: sf_test_spectrum_data_t
  class(model_data_t), pointer :: model => null ()
  type(flavor_t) :: flv_in
  type(flavor_t) :: flv_out
  type(flavor_t) :: flv_rad
  logical :: with_radiation = .true.
  real(default) :: m = 0
contains
  <SF base: sf test spectrum data: TBP>
end type sf_test_spectrum_data_t

```

Output.

```

<SF base: sf test spectrum data: TBP>≡
  procedure :: write => sf_test_spectrum_data_write

<SF base: test auxiliary>+≡
subroutine sf_test_spectrum_data_write (data, unit, verbose)
  class(sf_test_spectrum_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "SF test spectrum data:"
  write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming  = "
  call data%flv_in%write (u); write (u, *)
  write (u, "(3x,A)", advance="no") "outgoing  = "
  call data%flv_out%write (u); write (u, *)
  write (u, "(3x,A)", advance="no") "radiated  = "
  call data%flv_rad%write (u); write (u, *)

```

```

        write (u, "(3x,A," // FMT_19 // ")") "mass      = ", data%m
    end subroutine sf_test_spectrum_data_write

```

Initialization.

```

<SF base: sf test spectrum data: TBP>+≡
    procedure :: init => sf_test_spectrum_data_init

<SF base: test auxiliary>+≡
    subroutine sf_test_spectrum_data_init (data, model, pdg_in, with_radiation)
        class(sf_test_spectrum_data_t), intent(out) :: data
        class(model_data_t), intent(in), target :: model
        type(pdg_array_t), intent(in) :: pdg_in
        logical, intent(in) :: with_radiation
        data%model => model
        data%with_radiation = with_radiation
        if (pdg_array_get (pdg_in, 1) /= 25) then
            call msg_fatal ("Test structure function: input flavor must be 's'")
        end if
        call data%flv_in%init (25, model)
        data%m = data%flv_in%get_mass ()
        call data%flv_out%init (25, model)
        if (with_radiation) then
            call data%flv_rad%init (25, model)
        end if
    end subroutine sf_test_spectrum_data_init

```

Return the number of parameters: 2, since we have only collinear splitting here.

```

<SF base: sf test spectrum data: TBP>+≡
    procedure :: get_n_par => sf_test_spectrum_data_get_n_par

<SF base: test auxiliary>+≡
    function sf_test_spectrum_data_get_n_par (data) result (n)

        integer :: n
        n = 2
    end function sf_test_spectrum_data_get_n_par

```

Return the outgoing particle PDG codes: 25

```

<SF base: sf test spectrum data: TBP>+≡
    procedure :: get_pdg_out => sf_test_spectrum_data_get_pdg_out

<SF base: test auxiliary>+≡
    subroutine sf_test_spectrum_data_get_pdg_out (data, pdg_out)
        class(sf_test_spectrum_data_t), intent(in) :: data
        type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
        pdg_out(1) = 25
        pdg_out(2) = 25
    end subroutine sf_test_spectrum_data_get_pdg_out

```

Allocate the matching interaction.

```

<SF base: sf test spectrum data: TBP>+≡
    procedure :: allocate_sf_int => &
        sf_test_spectrum_data_allocate_sf_int

```

```

⟨SF base: test auxiliary⟩+=
  subroutine sf_test_spectrum_data_allocate_sf_int (data, sf_int)
    class(sf_test_spectrum_data_t), intent(in) :: data
    class(sf_int_t), intent(inout), allocatable :: sf_int
    allocate (sf_test_spectrum_t :: sf_int)
  end subroutine sf_test_spectrum_data_allocate_sf_int

```

## Interaction

```

⟨SF base: test types⟩+=
  type, extends (sf_int_t) :: sf_test_spectrum_t
    type(sf_test_spectrum_data_t), pointer :: data => null ()
  contains
    ⟨SF base: sf test spectrum: TBP⟩
  end type sf_test_spectrum_t

## Structure function instance configuration

We create a structure-function chain instance which implements a configured structure-function chain. We link the momentum entries in the interactions and compute kinematics.

We do not actually connect the interactions and create evaluators. We skip this step and manually advance the status of the chain instead.

```

<SF base: execute tests>+≡
  call test (sf_base_9, "sf_base_9", &
    "structure function chain instance", &
    u, results)

<SF base: test declarations>+≡

### 16.6.1 Physics

The ISR structure function is in the most crude approximation (LLA without  $\alpha$  corrections, i.e.  $\epsilon^0$ )

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (16.29)$$

where  $m$  is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

In  $f_0(x)$ , there is an integrable singularity at  $x = 1$  which does not spoil the integration, but would lead to an unbounded  $f_{\max}$ . Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \quad (16.30)$$

such that

$$\int dx f_0(x) = \int dx' \quad (16.31)$$

For the detailed form of the QED ISR structure function cf. Chap. 10.

## 16.6.2 Implementation

In the concrete implementation, the zeroth order mapping (16.30) is implemented, and the Jacobian is equal to  $f_i(x)/f_0(x)$ . This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (16.32)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1-x^2}{2(1-x')} \quad (16.33)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 - \frac{1-x^2}{2(1-x')} \\ - \frac{(1+3x^2)\ln x + (1-x)(4(1+x)\ln(1-x) + 5+x)}{8(1-x')}\epsilon \end{aligned} \quad (16.34)$$

For  $x = 1$  (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (16.35)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (16.36)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (16.37)$$

The last line in (16.34) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (16.38)$$

(Mathematica result), independent of  $\epsilon$ . For  $x$  values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

## 16.6.3 The ISR data block

```

### 16.6.4 The ISR object

The `isr_t` data type is a  $1 \rightarrow 2$  interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```
<SF isr: public>+≡
  public :: isr_t
<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
    private
      type(isr_data_t), pointer :: data => null ()
      real(default) :: x = 0
      real(default) :: xb= 0
    contains
      <SF isr: isr: TBP>
    end type isr_t
```

Type string: has to be here, but there is no string variable on which ISR depends. Hence, a dummy routine.

```
<SF isr: isr: TBP>≡
  procedure :: type_string => isr_type_string

```

## 16.6.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number  $r$  to generate the momentum fraction  $x$  and the function value  $f$ . For numerical stability reasons, we also output  $xb$ , which is  $\bar{x} = 1 - x$ .

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian  $f$  and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian  $f$  includes the value of the (zeroth-order) structure function, and strongly peaked.

```

⟨SF isr: isr: TBP⟩+≡
    procedure :: complete_kinematics => isr_complete_kinematics

⟨SF isr: procedures⟩+≡
    subroutine isr_complete_kinematics (sf_int, x, xb, f, r, rb, map)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), dimension(:), intent(out) :: xb
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: r
        real(default), dimension(:), intent(in) :: rb
        logical, intent(in) :: map
        real(default) :: eps
        eps = sf_int%data%eps
        if (map) then
            call map_power_1 (sf_int%xb, f, rb(1), eps)

```

```

else
  sf_int%xb = rb(1)
  if (rb(1) > 0) then
    f = 1
  else
    f = 0
  end if
end if
sf_int%x = 1 - sf_int%xb
x(1) = sf_int%x
xb(1) = sf_int%xb
if (size (x) == 3) then
  x(2:3) = r(2:3)
  xb(2:3) = rb(2:3)
end if
call sf_int%split_momentum (x, xb)
select case (sf_int%status)
case (SF_FAILED_KINEMATICS)
  sf_int%x = 0
  sf_int%xb = 0
  f = 0
end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the  $x$  array from the momentum configuration. In the specific case of ISR, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

```

<SF isr: isr: TBP>+≡
  procedure :: recover_x => sf_isr_recover_x

<SF isr: procedures>+≡
  subroutine sf_isr_recover_x (sf_int, x, xb, x_free)
    class(isr_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
    sf_int%xb = xb(1)
  end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

For extracting  $x$ , we rely on the stored  $\bar{x}$  value, since the  $x$  value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

<SF isr: isr: TBP>+≡

### 16.6.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

### 16.7.1 Physics

The EPA structure function for a photon inside an (elementary) particle  $p$  with energy  $E$ , mass  $m$  and charge  $q_p$  (e.g., electron) is given by ( $\bar{x} \equiv 1 - x$ )

There are several variants of the EPA, which are steered by the `\$epa\_mode` switch. The formula (6.17b) from the report by Budnev et al. is given by

$$\begin{aligned}
 f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} & \left[ \left( \bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right. \\
 & \left. - \left( 1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left( 1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (16.39)
 \end{aligned}$$

If no explicit  $Q$  bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (16.40)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (16.41)$$

The second and third terms in (16.39) are negative definite (and subleading). Noting that  $\bar{x} + x^2/2$  is bounded between  $1/2$  and  $1$ , we derive that  $f(x)$  is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (16.42)$$

where we allow for explicit  $Q$  bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (16.43)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4 [x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (16.44)$$

such that  $x(0) = x_0$  and  $x(1) = x_1$  and

$$\frac{dx}{dx'} = \left( \frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (16.45)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (16.46)$$

such that (16.43) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (16.47)$$

where  $x'$  is calculated from  $x$  via (16.44).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x (L - \log x) - \log x_0 (L - \log x_0)}{\log x_1 (L - \log x_1) - \log x_0 (L - \log x_0)}. \quad (16.48)$$

Taking the Eq. (6.16e) from the Budnev et al. report, and integrating it over  $q^2$  yields the modified result

$$f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} \left[ \left( \bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} - x^2 \frac{m^2}{Q_{\min}^2} \left( 1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (16.49)$$

This is closer to many standard papers from LEP times, and to textbook formulae like e.g. in Peskin/Schroeder. For historical reasons, we keep Eq. (16.39) as the default in WHIZARD.

## 16.7.2 The EPA data block

The EPA parameters are:  $\alpha$ ,  $E_{\max}$ ,  $m$ ,  $Q_{\min}$ , and  $x_{\min}$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition  $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1} (L - \ln x_{0/1})$ , the c.m. energy squared and the incoming particle mass.

### 16.7.3 The EPA object

The `epa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

<SF epa: types>+≡
type, extends (sf_int_t) :: epa_t

    end subroutine epa_setup_constants

```

#### 16.7.4 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The  $x$  value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number  $r$  to generate the momentum fraction  $x$  and the function value  $f$ . For numerical stability reasons, we also output  $xb$ , which is  $\bar{x} = 1 - x$ .

```

<SF epa: epa: TBP>+≡
  procedure :: complete_kinematics => epa_complete_kinematics

<SF epa: procedures>+≡
  subroutine epa_complete_kinematics (sf_int, x, xb, f, r, rb, map)
    class(epa_t), intent(inout) :: sf_int

    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default) :: delta, sqrt_delta, lx
    if (map) then
      associate (data => sf_int%data)
        delta = data%log ** 2 - 4 * (r(1) * data%c1 + rb(1) * data%c0)
        if (delta > 0) then
          sqrt_delta = sqrt (delta)
          lx = (data%log - sqrt_delta) / 2
        else
          sf_int%status = SF_FAILED_KINEMATICS
          f = 0
          return
        end if
        x(1) = exp (lx)
        f = x(1) * data%dc / sqrt_delta
      end associate
    else
      x(1) = r(1)
      if (sf_int%data%x_min < x(1) .and. x(1) < sf_int%data%x_max) then
        f = 1
      else
        sf_int%status = SF_FAILED_KINEMATICS
        f = 0
        return
      end if
    end if
    xb(1) = 1 - x(1)
    if (size(x) == 3) then
      x(2:3) = r(2:3)
      xb(2:3) = rb(2:3)
    end if
    call sf_int%split_momentum (x, xb)
    select case (sf_int%status)
    case (SF_DONE_KINEMATICS)
      sf_int%x = x(1)

```

```

case (SF_FAILED_KINEMATICS)
  sf_int%x = 0
  sf_int%xb= 0
  f = 0
end select
end subroutine epa_complete_kinematics

```

Overriding the default method: we compute the  $\mathbf{x}$  array from the momentum configuration. In the specific case of EPA, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

Note: the extraction of  $\bar{x}$  is not numerically safe, but it cannot be as long as the base `recover_x` is not.

```

<SF epa: epa: TBP>+≡
  procedure :: recover_x => sf_epa_recover_x

<SF epa: procedures>+≡
  subroutine sf_epa_recover_x (sf_int, x, xb, x_free)
    class(epa_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
    sf_int%xb = xb(1)
  end subroutine sf_epa_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

<SF epa: epa: TBP>+≡

end subroutine epa_inverse_kinematics

```

### 16.7.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for  $x$ , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

Fix 2020-03-10: Divide by two if there is polarization. In the polarized case, the outgoing electron/positron retains the incoming polarization. The latter is summed over when convoluting with the beam, but there are still two states with different outgoing polarization but identical structure-function value. This leads to double-counting for the overall cross section.

```

### 16.8.1 Physics

The EWA structure function for a  $Z$  or  $W$  inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal ( $\pm$ ) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (16.50)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (16.51)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (16.52)$$

where  $p_{\perp,\max}$  is the cutoff in transversal momentum,  $M$  is the vector-boson mass,  $v$  and  $a$  are the vector and axial-vector couplings, and  $\bar{x} \equiv 1-x$ . Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (16.53)$$

The vector and axial couplings for a fermion branching into a  $W$  are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (16.54)$$

For  $Z$  emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (16.55)$$

where  $t_3 = \pm\frac{1}{2}$  is the fermion isospin, and  $q$  its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of  $v$  and  $a$  is irrelevant.

The EWA depends on the parameters  $g$ ,  $\sin^2\theta_w$ ,  $M_W$ , and  $M_Z$ . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a  $1/x$  singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial  $x$  bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (16.56)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (16.57)$$

As a user parameter, we have the cutoff  $p_{\perp,\max}$ . The divergence  $1/x$  also requires a  $x_0$  cutoff; and for completeness we introduce a corresponding  $x_1$ . Physically, the minimal sensible value of  $x$  is  $M^2/s$ , although the approximation loses its value already at higher  $x$  values.

## 16.8.2 The EWA data block

The EWA parameters are:  $p_{T,\max}$ ,  $c_V$ ,  $c_A$ , and  $m$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a  $W$  or a  $Z$  is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors  $g/2 = e/2/\sin\theta_W$ .

In principle, for EWA it would make sense to allow the user to also set the upper bound for  $x$ ,  $x_{\max}$ , but we fix it to one here.

### 16.8.3 The EWA object

The `ewa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision:  $W/Z$  bosons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated,  $W/Z$ ), where the  $W/Z$  initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the  $W/Z$  polarization. If we are having  $Z$  bosons, both up- and down-type fermions can participate. Otherwise, with a  $W^+$  an up-type fermion is transferred to a down-type fermion, and the other way round.

```

<SF ewa: types>+≡

#### 16.8.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, the exponential mapping for the  $1/x$  singularity discussed above is applied.

```

Overriding the default method: we compute the  $x$  array from the momentum

configuration. In the specific case of EWA, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

```

<SF ewa: ewa: TBP>+≡
  procedure :: recover_x => sf_ewa_recover_x

<SF ewa: procedures>+≡
  subroutine sf_ewa_recover_x (sf_int, x, xb, x_free)
    class(ewa_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
    sf_int%xb = xb(1)
  end subroutine sf_ewa_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

<SF ewa: ewa: TBP>+≡
  procedure :: inverse_kinematics => ewa_inverse_kinematics

### 16.8.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for  $x$ , one for  $Q^2$ , and two for the polar and azimuthal angles. Alternatively, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

```

<SF ewa: ewa: TBP>+=
  procedure :: apply => ewa_apply

## 16.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum  $f(x)$ , applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (16.58)$$

We want to compute the distribution of  $E = \sqrt{\hat{s}} = \sqrt{xs}$ , i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (16.59)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (16.60)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (16.61)$$

We implement this as a spectrum with a single parameter  $x$ . The parameters for the individual beams are computed as  $x_i = \sqrt{x}$ , so they are equal and the kinematics is always symmetric.

### 16.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and  $\sqrt{s}$  if it should be normalized to the total energy. In the latter case, the differential distribution  $d\sigma/d\sqrt{\hat{s}}$  coincides with the partonic cross section  $\hat{\sigma}$  as a function of  $\sqrt{\hat{s}}$ .

## 16.10 Gaussian beam spread

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `gaussian_t` objects act as proxies to this registry.

```

⟨sf_gaussian.f90⟩≡
  ⟨File header⟩

  module sf_gaussian

    ⟨Use kinds⟩
    ⟨Use strings⟩
    use io_units
    use format_defs, only: FMT_12

## 16.11 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `beam_events_t` objects act as proxies to this registry.

```
(sf_beam_events.f90)≡
  <File header>

  module sf_beam_events

    <Use kinds>
    <Use strings>
    use io_units
    use file_registries
    use diagnostics
    use lorentz
    use pdg_arrays
    use model_data
    use flavors
    use quantum_numbers
    use state_matrices
    use polarizations
    use sf_base

    <Standard module head>

    <SF beam events: public>

    <SF beam events: types>

    <SF beam events: variables>

    contains

    <SF beam events: procedures>

  end module sf_beam_events
```

### 16.11.1 The beam-data file registry

We manage data files via the `file_registries` module. To this end, we keep the registry as a private module variable here.

This is public only for the unit tests.

```

<SF beam events: public>≡
    public :: beam_file_registry

<SF beam events: variables>≡
    type(file_registry_t), save :: beam_file_registry

```

### 16.11.2 Data type

```

### 16.12.1 Physics

Beamstrahlung is applied before ISR. The **CIRCE1** implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the **CIRCE1** parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1-x)^\gamma \quad (16.62)$$

for  $x < 1 - \epsilon$  (resp.  $x > \epsilon$  in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at  $x = 1$  (resp.  $x = 0$ ). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the **kirke** version of the **CIRCE1** subroutines, and is used here.

The parameter `circe1\eps` sets the peak mapping of the CIRCE1 structure function. Its default value is  $10^{-5}$ . The other parameters are the parameterization version and revision number, the accelerator type, and the  $\sqrt{s}$  value used by CIRCE1. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1\epsilon` which is taken from the CIRCE1 internal data structure.

The  $\sqrt{s}$  value, if not explicitly set, is taken from the process data. Note that interpolating  $\sqrt{s}$  is not recommended; one should rather choose one of the distinct values known to CIRCE1.

### 16.12.2 The CIRCE1 data block

The CIRCE1 parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter  $\epsilon$ ,  $\sqrt{s}$  and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the  $x$  values are actually discarded and a random number generator is used instead.

  end function circe1_data_get_beam_file
```

### 16.12.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```
<SF circe1: types>+≡
  type, extends (circe1_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

<SF circe1: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate
```

### 16.12.4 The CIRCE1 object

This is a  $2 \rightarrow 4$  interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others

are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

In the case that no radiated particle is kept (which actually is the default), polarization is always transferred to the electrons, too. If there is a recoil photon in the event, the radiated particles are 3 and 4, respectively, and 5 and 6 are the outgoing ones (triggering the hard scattering process), while in the case of no radiation, the outgoing particles are 3 and 4, respectively. In the case of the electron being the radiated particle, helicity is not kept.

```

<SF circe1: public>+≡

### 16.13.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

### 16.13.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

```

### 16.13.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

(SF circe2: types)+≡
  type, extends (circe2_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

(SF circe2: procedures)+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

### 16.13.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a  $2 \rightarrow 2$  interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

      external InitForWhizard  
      call InitForWhizard (pdf_builtin, pdf, pdf_id)  
    end subroutine hoppet_init  
  
    subroutine hoppet_eval (x, q, f)  
      double precision, intent(in) :: x, q  
      double precision, intent(out) :: f(-6:6)  
      external EvalForWhizard  
      call EvalForWhizard (x, q, f)  
    end subroutine hoppet_eval  
  
  end module hoppet_interface
```

## 16.15 Builtin PDF sets

For convenience in order not to depend on the external package LHAPDF, we ship some PDFs with WHIZARD.

### 16.15.1 The module

```
<sf_pdf_builtin.f90>≡  
<File header>  
  
module sf_pdf_builtin  
  
  <Use kinds>  
    use kinds, only: double  
  <Use strings>  
    use io_units  
    use format_defs, only: FMT_17  
    use diagnostics  
    use os_interface  
    use physics_defs, only: PROTON, PHOTON, GLUON  
    use physics_defs, only: HADRON_REMNANT_SINGLET  
    use physics_defs, only: HADRON_REMNANT_TRIPLET  
    use physics_defs, only: HADRON_REMNANT_OCTET  
    use sm_qcd  
    use lorentz  
    use pdg_arrays  
    use model_data  
    use flavors  
    use colors  
    use quantum_numbers  
    use state_matrices  
    use polarizations  
    use sf_base  
    use pdf_builtin !NODEP!  
    use hoppet_interface  
  
  <Standard module head>  
  
  <SF pdf builtin: public>  
  
  <SF pdf builtin: types>  
  
  <SF pdf builtin: parameters>  
  
contains  
  
  <SF pdf builtin: procedures>  
  
end module sf_pdf_builtin
```

### 16.15.2 Codes for default PDF sets

```
<SF pdf builtin: parameters>≡
```

```

character(*), parameter :: PDF_BUILTIN_DEFAULT_PROTON = "CTEQ6L"
! character(*), parameter :: PDF_BUILTIN_DEFAULT_PION   = "NONE"
! character(*), parameter :: PDF_BUILTIN_DEFAULT_PHOTON = "MRST2004QEDp"

```

### 16.15.3 The PDF builtin data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

```

#### 16.15.4 The PDF object

The PDF  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

<SF pdf builtin: public>+≡
  public :: pdf_builtin_t

end subroutine pdf_builtin_init

```

### 16.15.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

*<SF pdf builtin: pdf builtin: TBP>+≡*

```
procedure :: complete_kinematics => pdf_builtin_complete_kinematics
```

*<SF pdf builtin: procedures>+≡*

```

subroutine pdf_builtin_complete_kinematics (sf_int, x, xb, f, r, rb, map)
  class(pdf_builtin_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), dimension(:), intent(out) :: xb

```

```

real(default), intent(out) :: f
real(default), dimension(:), intent(in) :: r
real(default), dimension(:), intent(in) :: rb
logical, intent(in) :: map
if (map) then
  call msg_fatal ("PDF builtin: map flag not supported")
else
  x(1) = r(1)
  xb(1) = rb(1)
  f = 1
end if
call sf_int%split_momentum (x, xb)
select case (sf_int%status)
case (SF_DONE_KINEMATICS)
  sf_int%x = x(1)
case (SF_FAILED_KINEMATICS)
  sf_int%x = 0
  f = 0
end select
end subroutine pdf_builtin_complete_kinematics

```

Overriding the default method: we compute the  $x$  value from the momentum configuration. In this specific case, we also set the internally stored  $x$  value, so it can be used in the following routine.

```

⟨SF pdf builtin: pdf builtin: TBP⟩+≡
  procedure :: recover_x => pdf_builtin_recover_x

⟨SF pdf builtin: procedures⟩+≡
  subroutine pdf_builtin_recover_x (sf_int, x, xb, x_free)
    class(pdf_builtin_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
  end subroutine pdf_builtin_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

⟨SF pdf builtin: pdf builtin: TBP⟩+≡
  procedure :: inverse_kinematics => pdf_builtin_inverse_kinematics

⟨SF pdf builtin: procedures⟩+≡
  subroutine pdf_builtin_inverse_kinematics (sf_int, x, xb, f, r, rb, map, set_momenta)
    class(pdf_builtin_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(in) :: x
    real(default), dimension(:), intent(in) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(out) :: r
    real(default), dimension(:), intent(out) :: rb
    logical, intent(in) :: map
    logical, intent(in), optional :: set_momenta

```

```

logical :: set_mom
set_mom = .false.; if (present (set_momenta)) set_mom = set_momenta
if (map) then
  call msg_fatal ("PDF builtin: map flag not supported")
else
  r(1) = x(1)
  rb(1)= xb(1)
  f = 1
end if
if (set_mom) then
  call sf_int%split_momentum (x, xb)
  select case (sf_int%status)
  case (SF_FAILED_KINEMATICS); f = 0
  end select
end if
end subroutine pdf_builtin_inverse_kinematics

```

### 16.15.6 Structure function

Once the scale is also known, we can actually call the PDF and set the values. Contrary to LHAPDF, the wrapper already takes care of adjusting to the  $x$  and  $Q$  bounds. Account for the Jacobian.

The parameter `negative_sf` is necessary to determine if we allow for negative PDF values. The class `rescale` gives rescaling prescription for NLO convolution of the structure function in combination with `i_sub`.

```

⟨SF pdf builtin: pdf builtin: TBP⟩+≡
  procedure :: apply => pdf_builtin_apply

⟨SF pdf builtin: procedures⟩+≡

    sf_int%status = SF_EVALUATED
end subroutine pdf_builtin_apply

```

### 16.15.7 Strong Coupling

Since the PDF codes provide a function for computing the running  $\alpha_s$  value, we make this available as an implementation of the abstract `alpha_qcd_t` type,

which is used for matrix element evaluation.

```

<SF pdf builtin: public>+≡
    public :: alpha_qcd_pdf_builtin_t

<SF pdf builtin: types>+≡
    type, extends (alpha_qcd_t) :: alpha_qcd_pdf_builtin_t
    type(string_t) :: pdfset_name
    integer :: pdfset_id = -1
    contains
    <SF pdf builtin: alpha qcd: TBP>
    end type alpha_qcd_pdf_builtin_t

```

Output.

```

<SF pdf builtin: alpha qcd: TBP>≡
    procedure :: write => alpha_qcd_pdf_builtin_write

<SF pdf builtin: procedures>+≡
    subroutine alpha_qcd_pdf_builtin_write (object, unit)
        class(alpha_qcd_pdf_builtin_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A)") "QCD parameters (pdf_builtin):"
        write (u, "(5x,A,A)") "PDF set = ", char (object%pdfset_name)
        write (u, "(5x,A,I0)") "PDF ID = ", object%pdfset_id
    end subroutine alpha_qcd_pdf_builtin_write

```

Calculation: the numeric ID selects the correct PDF set, which must be properly initialized.

```

<SF pdf builtin: alpha qcd: TBP>+≡
    procedure :: get => alpha_qcd_pdf_builtin_get

<SF pdf builtin: procedures>+≡
    function alpha_qcd_pdf_builtin_get (alpha_qcd, scale) result (alpha)
        class(alpha_qcd_pdf_builtin_t), intent(in) :: alpha_qcd
        real(default), intent(in) :: scale
        real(default) :: alpha
        alpha = pdf_alphas (alpha_qcd%pdfset_id, scale)
    end function alpha_qcd_pdf_builtin_get

```

Initialization. We need to access the global initialization status.

```

<SF pdf builtin: alpha qcd: TBP>+≡
    procedure :: init => alpha_qcd_pdf_builtin_init

<SF pdf builtin: procedures>+≡
    subroutine alpha_qcd_pdf_builtin_init (alpha_qcd, name, path)
        class(alpha_qcd_pdf_builtin_t), intent(out) :: alpha_qcd
        type(string_t), intent(in) :: name
        type(string_t), intent(in) :: path
        alpha_qcd%pdfset_name = name
        alpha_qcd%pdfset_id = pdf_get_id (name)
        if (alpha_qcd%pdfset_id < 0) &
            call msg_fatal ("QCD parameter initialization: PDF set " &
                // char (name) // " is unknown")
    end subroutine alpha_qcd_pdf_builtin_init

```

```

    call pdf_init (alpha_qcd%pdfset_id, path)
end subroutine alpha_qcd_pdf_builtin_init

```

### 16.15.8 Unit tests

Test module, followed by the corresponding implementation module.

```

<sf_pdf_builtin_ut.f90>≡
  <File header>

  module sf_pdf_builtin_ut
    use unit_tests
    use sf_pdf_builtin_uti

    <Standard module head>

    <SF pdf builtin: public test>

    contains

## 16.16 LHAPDF

Parton distribution functions (PDFs) are available via an interface to the LHAPDF standard library.

### 16.16.1 The module

```
<sf_lhapdf.f90>≡  
<File header>  
  
module sf_lhapdf  
  
  <Use kinds>  
  <Use strings>  
  use format_defs, only: FMT_17, FMT_19  
  use io_units  
  use system_dependencies, only: LHAPDF_PDFSETS_PATH  
  use system_dependencies, only: LHAPDF5_AVAILABLE  
  use system_dependencies, only: LHAPDF6_AVAILABLE  
  use diagnostics  
  use physics_defs, only: PROTON, PHOTON, PIPLUS, GLUON  
  use physics_defs, only: HADRON_REMNANT_SINGLET  
  use physics_defs, only: HADRON_REMNANT_TRIPLET  
  use physics_defs, only: HADRON_REMNANT_OCTET  
  use lorentz  
  use sm_qcd  
  use pdg_arrays  
  use model_data  
  use flavors  
  use colors  
  use quantum_numbers  
  use state_matrices  
  use polarizations  
  use sf_base  
  use lhapdf !NODEP!  
  use hoppet_interface  
  
  <Standard module head>  
  
  <SF lhapdf: public>  
  
  <SF lhapdf: types>  
  
  <SF lhapdf: parameters>  
  
  <SF lhapdf: variables>  
  
  <SF lhapdf: interfaces>  
  
contains  
  
  <SF lhapdf: procedures>  
  
end module sf_lhapdf
```

### 16.16.2 Codes for default PDF sets

The default PDF for protons set is chosen to be CTEQ6ll (LO fit with LO  $\alpha_s$ ).

```
<SF lhpdf: parameters>≡  
  character(*), parameter :: LHAPDF5_DEFAULT_PROTON = "cteq6ll.LHpdf"  
  character(*), parameter :: LHAPDF5_DEFAULT_PION   = "ABFKWPI.LHgrid"  
  character(*), parameter :: LHAPDF5_DEFAULT_PHOTON = "GSG960.LHgrid"  
  character(*), parameter :: LHAPDF6_DEFAULT_PROTON = "CT10"
```

### 16.16.3 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

```
<SF lhpdf: interfaces>≡  
  interface  
    subroutine InitPDFsetM (set, file)  
      integer, intent(in) :: set  
      character(*), intent(in) :: file  
    end subroutine InitPDFsetM  
  end interface
```

```
<SF lhpdf: interfaces>+≡  
  interface  
    subroutine InitPDFM (set, mem)  
      integer, intent(in) :: set, mem  
    end subroutine InitPDFM  
  end interface
```

```
<SF lhpdf: interfaces>+≡  
  interface  
    subroutine numberPDFM (set, n_members)  
      integer, intent(in) :: set  
      integer, intent(out) :: n_members  
    end subroutine numberPDFM  
  end interface
```

```
<SF lhpdf: interfaces>+≡  
  interface  
    subroutine evolvePDFM (set, x, q, ff)  
      integer, intent(in) :: set  
      double precision, intent(in) :: x, q  
      double precision, dimension(-6:6), intent(out) :: ff  
    end subroutine evolvePDFM  
  end interface
```

```
<SF lhpdf: interfaces>+≡  
  interface  
    subroutine evolvePDFphotonM (set, x, q, ff, fphot)  
      integer, intent(in) :: set  
      double precision, intent(in) :: x, q  
      double precision, dimension(-6:6), intent(out) :: ff  
      double precision, intent(out) :: fphot  
    end subroutine evolvePDFphotonM
```

```

end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine evolvePDFpM (set, x, q, s, scheme, ff)
    integer, intent(in) :: set
    double precision, intent(in) :: x, q, s
    integer, intent(in) :: scheme
    double precision, dimension(-6:6), intent(out) :: ff
  end subroutine evolvePDFpM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXminM (set, mem, xmin)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmin
  end subroutine GetXminM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetXmaxM (set, mem, xmax)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: xmax
  end subroutine GetXmaxM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2minM (set, mem, q2min)

    double precision, intent(out) :: q2min
  end subroutine GetQ2minM
end interface

<SF lhpdf: interfaces>+≡
interface
  subroutine GetQ2maxM (set, mem, q2max)
    integer, intent(in) :: set, mem
    double precision, intent(out) :: q2max
  end subroutine GetQ2maxM
end interface

<SF lhpdf: interfaces>+≡
interface
  function has_photon () result(flag)
    logical :: flag
  end function has_photon
end interface

```

#### 16.16.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global object. We implement it as a private module variable. To access it from elsewhere, the caller has to create and initialize an object of type `lhapdf_status_t`, which acts as a proxy.

```
<SF lhapdf: types>≡
  type :: lhapdf_global_status_t
    private
      logical, dimension(3) :: initialized = .false.
    end type lhapdf_global_status_t

<SF lhapdf: variables>≡
  type(lhapdf_global_status_t), save :: lhapdf_global_status

<SF lhapdf: procedures>≡
  function lhapdf_global_status_is_initialized (set) result (flag)
    logical :: flag
    integer, intent(in), optional :: set
    if (present (set)) then
      select case (set)
        case (1:3);   flag = lhapdf_global_status%initialized(set)
        case default; flag = .false.
      end select
    else
      flag = any (lhapdf_global_status%initialized)
    end if
  end function lhapdf_global_status_is_initialized

<SF lhapdf: procedures>+≡
  subroutine lhapdf_global_status_set_initialized (set)
    integer, intent(in) :: set
    lhapdf_global_status%initialized(set) = .true.
  end subroutine lhapdf_global_status_set_initialized
```

This is the only public procedure, it tells the system to forget about previous initialization, allowing for changing the chosen PDF set. Note that such a feature works only if the global program flow is serial, so no two distinct sets are accessed simultaneously. But this applies to LHAPDF anyway.

```
<SF lhapdf: public>≡
  public :: lhapdf_global_reset

<SF lhapdf: procedures>+≡
  subroutine lhapdf_global_reset ()
    lhapdf_global_status%initialized = .false.
  end subroutine lhapdf_global_reset
```

### 16.16.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an  $\alpha_s$  formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf.builtin` is that these things are outsourced to a separate module (inc. `lhpdf.status` etc.).

```

<SF lhpdf: public>+≡
  public :: lhpdf_initialize

<SF lhpdf: procedures>+≡
  subroutine lhpdf_initialize (set, prefix, file, member, pdf, b_match)
    integer, intent(in) :: set
    type(string_t), intent(inout) :: prefix
    type(string_t), intent(inout) :: file
    type(lhpdf_pdf_t), intent(inout), optional :: pdf
    integer, intent(inout) :: member
    logical, intent(in), optional :: b_match
    if (prefix == "") prefix = LHAPDF_PDFSETS_PATH
    if (LHAPDF5_AVAILABLE) then
      if (lhpdf_global_status_is_initialized (set)) return
      if (file == "") then
        select case (set)
          case (1); file = LHAPDF5_DEFAULT_PROTON
          case (2); file = LHAPDF5_DEFAULT_PION
          case (3); file = LHAPDF5_DEFAULT_PHOTON
        end select
      end if
      if (data_file_exists (prefix // "/" // file)) then
        call InitPDFsetM (set, char (prefix // "/" // file))
      else

### 16.16.6 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

<SF lhpdf: lhpdf: TBP>≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

<SF lhpdf: procedures>+≡
  subroutine lhpdf_complete_kinematics (sf_int, x, xb, f, r, rb, map)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    if (map) then
      call msg_fatal ("LHAPDF: map flag not supported")
    else
      x(1) = r(1)
      xb(1) = rb(1)
      f = 1
    end if
    call sf_int%split_momentum (x, xb)
    select case (sf_int%status)
    case (SF_DONE_KINEMATICS)
      sf_int%x = x(1)
    case (SF_FAILED_KINEMATICS)
      sf_int%x = 0
      f = 0
    end select
  end subroutine lhpdf_complete_kinematics

```

Overriding the default method: we compute the  $x$  value from the momentum configuration. In this specific case, we also set the internally stored  $x$  value, so it can be used in the following routine.

```

<SF lhpdf: lhpdf: TBP>+≡
  procedure :: recover_x => lhpdf_recover_x

<SF lhpdf: procedures>+≡
  subroutine lhpdf_recover_x (sf_int, x, xb, x_free)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
  end subroutine lhpdf_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

<SF lhpdf: lhpdf: TBP>+≡
  procedure :: inverse_kinematics => lhpdf_inverse_kinematics

### 16.16.7 The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

### 16.16.8 The LHAPDF object

The `lhpdf_t` data type is a  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the  $x$  momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

### 16.16.9 Structure function

We have to cast the LHAPDF arguments to/from double precision (possibly from/to extended/quadruple precision), if necessary. Some structure functions can yield negative results (sea quarks close to  $x = 1$ ). In an NLO computation, this is perfectly fine and we keep negative values. Unlike total cross sections, PDFs do not have to be positive definite. For LO however, negative PDFs would cause negative event weights so we set these values to zero instead.

### 16.16.10 Strong Coupling

Since the PDF codes provide a function for computing the running  $\alpha_s$  value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

```

<SF lhpdf: public>+≡
    public :: alpha_qcd_lhpdf_t

<SF lhpdf: types>+≡
    type, extends (alpha_qcd_t) :: alpha_qcd_lhpdf_t
        type(string_t) :: pdfset_dir
        type(string_t) :: pdfset_file
        integer :: pdfset_member = -1

```

```

    type(lhapdf_pdf_t) :: pdf
contains
  <SF lhpdf: alpha qcd: TBP>
end type alpha_qcd_lhapdf_t

```

Output. As in earlier versions we leave the LHAPDF path out.

```

<SF lhpdf: alpha qcd: TBP>≡
  procedure :: write => alpha_qcd_lhapdf_write

<SF lhpdf: procedures>+≡
  subroutine alpha_qcd_lhapdf_write (object, unit)
    class(alpha_qcd_lhapdf_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "QCD parameters (lhpdf):"
    write (u, "(5x,A,A)") "PDF set      = ", char (object%pdfset_file)
    write (u, "(5x,A,I0)") "PDF member = ", object%pdfset_member
  end subroutine alpha_qcd_lhapdf_write

```

Calculation: the numeric member ID selects the correct PDF set, which must be properly initialized.

```

<SF lhpdf: interfaces>+≡
  interface
    double precision function alphasPDF (Q)
      double precision, intent(in) :: Q
    end function alphasPDF
  end interface

<SF lhpdf: alpha qcd: TBP>+≡
  procedure :: get => alpha_qcd_lhapdf_get

<SF lhpdf: procedures>+≡
  function alpha_qcd_lhapdf_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_lhapdf_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    if (LHAPDF5_AVAILABLE) then
      alpha = alphasPDF (dble (scale))
    else if (LHAPDF6_AVAILABLE) then
      alpha = alpha_qcd%pdf%alphas_pdf (dble (scale))
    end if
  end function alpha_qcd_lhapdf_get

```

Initialization. We need to access the (quasi-global) initialization status.

```

<SF lhpdf: alpha qcd: TBP>+≡
  procedure :: init => alpha_qcd_lhapdf_init

<SF lhpdf: procedures>+≡
  subroutine alpha_qcd_lhapdf_init (alpha_qcd, file, member, path)
    class(alpha_qcd_lhapdf_t), intent(out) :: alpha_qcd
    type(string_t), intent(inout) :: file
    integer, intent(inout) :: member

```

```

type(string_t), intent(inout) :: path
alpha_qcd%pdfset_file = file
alpha_qcd%pdfset_member = member
if (alpha_qcd%pdfset_member < 0) &
    call msg_fatal ("QCD parameter initialization: PDF set " &
        // char (file) // " is unknown")

## 16.17 Easy PDF Access

For the shower, subtraction and matching, it is very useful to have direct access to  $f(x, Q)$  independently of the used library.

```

⟨pdf.f90⟩≡
  ⟨File header⟩

  module pdf

    ⟨Use kinds with double⟩
    use io_units
    use system_dependencies, only: LHAPDF5_AVAILABLE, LHAPDF6_AVAILABLE
    use diagnostics
    use beam_structures
    use lhapdf !NODEP!
    use pdf_builtin !NODEP!

    ⟨Standard module head⟩

    ⟨PDF: public⟩

    ⟨PDF: parameters⟩

    ⟨PDF: types⟩

    contains

    ⟨PDF: procedures⟩

  end module pdf

```

We support the following implementations:

```

⟨PDF: parameters⟩≡
  integer, parameter, public :: STRF_NONE = 0
  integer, parameter, public :: STRF_LHAPDF6 = 1
  integer, parameter, public :: STRF_LHAPDF5 = 2
  integer, parameter, public :: STRF_PDF_BUILTIN = 3

```

A container to bundle all necessary PDF data. Could be moved to a more central location.

$\langle PDF: public \rangle \equiv$

```
public :: pdf_data_t
```

$\langle PDF: types \rangle \equiv$

```
type :: pdf_data_t

    <Dispatch beams: public>

    <Dispatch beams: types>

    <Dispatch beams: variables>

contains

    <Dispatch beams: procedures>

end module dispatch_beams

```

This data type is a container for transferring structure-function specific data from the `dispatch_sf_data` to the `dispatch_sf_channels` subroutine.

```

<Dispatch beams: public>≡
    public :: sf_prop_t

<Dispatch beams: types>≡
    type :: sf_prop_t
        real(default), dimension(2) :: isr_eps = 1
    end type sf_prop_t

```

Allocate a structure-function configuration object according to the `sf_method` string.

The `sf_prop` object can be used to transfer structure-function specific data up and to the `dispatch_sf_channels` subroutine below, so they can be used for particular mappings.

The `var_list_global` object is used for the RNG generator seed. It is intent(inout) because the RNG generator seed may change during initialization.

The `pdg_in` array is the array of incoming flavors, corresponding to the upstream structure function or the beam array. This will be checked for the structure function in question and replaced by the outgoing flavors. The `pdg_prc` array is the array of incoming flavors (beam index, component index) for the hard process.

```

```

This is a hook that allows us to inject further handlers for structure-function objects, in particular a test structure function.

```

<Dispatch beams: public>+≡
public :: dispatch_sf_data_extra

```

```

⟨Dispatch beams: variables⟩≡
  procedure (dispatch_sf_data), pointer :: &
    dispatch_sf_data_extra => null ()

```

This is an auxiliary procedure, used by the beam-structure expansion: tell for a given structure function name, whether it corresponds to a pair spectrum ( $n = 2$ ), a single-particle structure function ( $n = 1$ ), or nothing ( $n = 0$ ). Though `energy_scan` can in principle also be a pair spectrum, it always has only one parameter.

```

⟨Dispatch beams: public⟩+≡
  public :: strfun_mode

```

```

⟨Dispatch beams: procedures⟩+≡
  function strfun_mode (name) result (n)
    type(string_t), intent(in) :: name
    integer :: n
    select case (char (name))
    case ("none")
      n = 0

      n = 1
    case ("pdf_builtin","pdf_builtin_photon", &
          "lhpdf","lhpdf_photon")
      n = 1
    case ("isr","epa","ewa")
      n = 1
    case ("circe1", "circe2")
      n = 2
    case ("gaussian")
      n = 2
    case ("beam_events")
      n = 2
    case ("energy_scan")
      n = 2
    case default
      n = -1
      call msg_bug ("Structure function '" // char (name) &
                    // "' not supported yet")
    end select
  end function strfun_mode

```

Dispatch a whole structure-function chain, given beam data and beam structure data.

This could be done generically, but we should look at the specific combination of structure functions in order to select appropriate mappings.

The `beam_structure` argument gets copied because we want to expand it to canonical form (one valid structure-function entry per record) before proceeding further.

The `pdg_prc` argument is the array of incoming flavors. The first index is the beam index, the second one the process component index. Each element is itself a PDG array, notrivial if there is a flavor sum for the incoming state of this component.

The dispatcher is divided in two parts. The first part configures the structure function data themselves. After this, we can configure the phase space for the elementary process.

```

<Dispatch beams: public>+≡
    public :: dispatch_sf_config

<Dispatch beams: procedures>+≡
    subroutine dispatch_sf_config (sf_config, sf_prop, beam_structure, &
        var_list, var_list_global, model, os_data, sqrts, pdg_prc)

            deallocate (sf_data)
        end do
    end subroutine dispatch_sf_config

```

### 16.18.1 QCD coupling

Allocate the `alpha` (running coupling) component of the `qcd` block with a concrete implementation, depending on the variable settings in the `global` record.

If a fixed  $\alpha_s$  is requested, we do not allocate the `qcd%alpha` object. In this case, the matrix element code will just take the model parameter as-is, which implies fixed  $\alpha_s$ . If the object is allocated, the  $\alpha_s$  value is computed and updated for each matrix-element call.

Also fetch the `alphas_nf` variable from the list and store it in the QCD record. This is not used in the  $\alpha_s$  calculation, but the QCD record thus becomes a messenger for this user parameter.

```
(Dispatch beams: public)+≡
    public :: dispatch_qcd

(Dispatch beams: procedures)+≡
    subroutine dispatch_qcd (qcd, var_list, os_data)

## Chapter 17

# Interface for Matrix Element Objects

These modules manage internal and, in particular, external matrix-element code.

**prc\_core** We define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes. This abstract type supplements the `prc_core_def_t` type and related types in another module. Together, they provide a complete set of matrix-element handlers that are implemented in the concrete types below.

These are the implementations:

**prc\_template\_me** Implements matrix-element code without actual content (trivial value), but full-fledged interface. This can be used for injecting user-defined matrix-element code.

**prc\_omega** Matrix elements calculated by `O'MEGA` are the default for WHIZARD. Here, we provide all necessary support.

**prc\_external** Matrix elements provided or using external (not `O'MEGA`) code or libraries. This is an abstract type, with concrete extensions below:

**prc\_external\_test** Concrete implementation of the external-code type, actually using some pre-defined test matrix elements.

**prc\_gosam** Interface for matrix elements computed using `GoSam`.

**prc\_openloops** Interface for matrix elements computed using `OpenLoops`.

**prc\_recola** Interface for matrix elements computed using `Recola`.

**prc\_threshold** Interface for matrix elements for the top-pair threshold, that use external libraries.

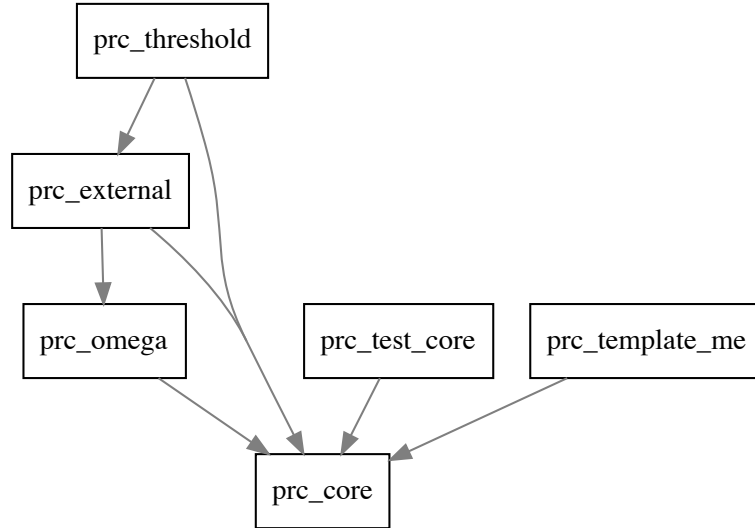

Figure 17.1: Module dependencies in `src/me_methods`.

## 17.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the O’MEGA matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

**prc\_core\_def\_t** process and matrix-element configuration

**prc\_writer\_t** (optional) writing external matrix-element code

**prc\_driver\_t** accessing the matrix element (internal or external)

**prc\_core\_t** evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the `processes` module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the `processes` module.

<Prc core: procedures>

end module prc_core

```

### 17.1.1 The process core

The process core is of abstract data type. Different types of matrix elements will be represented by different implementations.

```

<Prc core: public>≡
  public :: prc_core_t

<Prc core: types>≡
  type, abstract :: prc_core_t
    class(prc_core_def_t), pointer :: def => null ()
    logical :: data_known = .false.
    type(process_constants_t) :: data
    class(prc_core_driver_t), allocatable :: driver
    logical :: use_color_factors = .false.
    integer :: nc = 3
  contains
    <Prc core: process core: TBP>
  end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

```

```

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
      import
        class(prc_core_t), intent(in) :: object
        integer, intent(in), optional :: unit
    end subroutine prc_core_write
  end interface

```

Just type the name of the actual core method.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_write_name), deferred :: write_name

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_write_name (object, unit)
      import
        class(prc_core_t), intent(in) :: object
        integer, intent(in), optional :: unit
    end subroutine prc_core_write_name
  end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the object as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: procedures>≡
  subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

<Prc core: procedures>+≡
  function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object

```

```

    logical :: flag
    flag = object%data%n_flv /= 0
end function prc_core_has_matrix_element

```

Return true if this process-core type needs extra code that has to be compiled and/or linked, beyond the default O'MEGA framework. This depends only on the concrete type, and the default is no.

```

<Prc core: process core: TBP>+≡
    procedure, nopass :: needs_external_code => prc_core_needs_external_code

<Prc core: procedures>+≡
    function prc_core_needs_external_code () result (flag)
        logical :: flag
        flag = .false.
    end function prc_core_needs_external_code

```

The corresponding procedure to create and load extra libraries. The base procedure must not be called but has to be overridden, if extra code is required.

```

<Prc core: process core: TBP>+≡
    procedure :: prepare_external_code => &
        prc_core_prepare_external_code

<Prc core: procedures>+≡
    subroutine prc_core_prepare_external_code &
        (core, flv_states, var_list, os_data, libname, model, i_core, is_nlo)
        class(prc_core_t), intent(inout) :: core
        integer, intent(in), dimension(:,:), allocatable :: flv_states
        type(var_list_t), intent(in) :: var_list
        type(os_data_t), intent(in) :: os_data
        type(string_t), intent(in) :: libname
        type(model_data_t), intent(in), target :: model
        integer, intent(in) :: i_core
        logical, intent(in) :: is_nlo
        call core%write ()
        call msg_bug ("prc_core_prepare_external_code called &
            &but not overridden")
    end subroutine prc_core_prepare_external_code

```

Return true if this process-core type uses the BLHA interface. This depends only on the concrete type, and the default is no.

```

<Prc core: process core: TBP>+≡
    procedure, nopass :: uses_blha => prc_core_uses_blha

<Prc core: procedures>+≡
    function prc_core_uses_blha () result (flag)
        logical :: flag
        flag = .false.
    end function prc_core_uses_blha

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
    procedure(prc_core_is_allowed), deferred :: is_allowed

```

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
    end function prc_core_is_allowed
  end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: procedures>+≡
  subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that  $\alpha_s$  is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the process-specific workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: procedures>+≡
  function prc_core_get_alpha_s (object, core_state) result (alpha_qcd)
    class(prc_core_t), intent(in) :: object
    class(prc_core_state_t), intent(in), allocatable :: core_state
    real(default) :: alpha_qcd
    alpha_qcd = -1
  end function prc_core_get_alpha_s

```

We follow the same strategy for the electromagnetic coupling  $\alpha_{\text{em}}$ .

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_qed => prc_core_get_alpha_qed

<Prc core: procedures>+≡
  function prc_core_get_alpha_qed (object) result (alpha_qed)
    class(prc_core_t), intent(in) :: object
    real(default) :: alpha_qed
    alpha_qed = -1
  end function prc_core_get_alpha_qed

```

Setup an index mapping for flavor structures and helicities that give the same matrix element. The index mapping is according to the order of flavor structures known to the `prc_core` class. This procedure here acts as a fallback in case there is no overridden procedure in the `prc_core` extension.

```

<Prc core: process core: TBP>+≡
  procedure :: set_equivalent_flv_hel_indices => prc_core_set_equivalent_flv_hel_indices

<Prc core: procedures>+≡
  subroutine prc_core_set_equivalent_flv_hel_indices (object)
    class(prc_core_t), intent(inout) :: object
    integer :: i, n_flv, n_hel
    n_flv = object%data%n_flv
    n_hel = object%data%n_hel
    if (.not. allocated (object%data%eqv_flv_index)) &
      allocate (object%data%eqv_flv_index(n_flv))
    if (.not. allocated (object%data%eqv_hel_index)) &
      allocate (object%data%eqv_hel_index(n_hel))
    if (size (object%data%eqv_flv_index) /= n_flv) &
      call msg_bug ("BLHA Core: Size mismatch between eqv_flv_index and number of flavors.")
    if (size (object%data%eqv_hel_index) /= n_hel) &
      call msg_bug ("BLHA Core: Size mismatch between eqv_hel_index and number of helicities.")
    object%data%eqv_flv_index = [(i, i = 1, n_flv)]
    object%data%eqv_hel_index = [(i, i = 1, n_hel)]
  end subroutine prc_core_set_equivalent_flv_hel_indices

```

Get the index mappings for flavor and helicity mappings set up in `prc_core_get_equivalent_flv_index` or any overriding variation.

```

<Prc core: process core: TBP>+≡
  procedure :: get_equivalent_flv_index => prc_core_get_equivalent_flv_index
  procedure :: get_equivalent_hel_index => prc_core_get_equivalent_hel_index

<Prc core: procedures>+≡
  function prc_core_get_equivalent_flv_index (object) result (eqv_flv_index)
    class(prc_core_t), intent(in) :: object
    integer, dimension(:), allocatable :: eqv_flv_index
    eqv_flv_index = object%data%eqv_flv_index
  end function prc_core_get_equivalent_flv_index

  function prc_core_get_equivalent_hel_index (object) result (eqv_hel_index)
    class(prc_core_t), intent(in) :: object
    integer, dimension(:), allocatable :: eqv_hel_index
    eqv_hel_index = object%data%eqv_hel_index
  end function prc_core_get_equivalent_hel_index

```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: allocate_workspace => prc_core_ignore_workspace

```

```

<Prc core: procedures>+≡
  subroutine prc_core_ignore_workspace (object, core_state)

    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_compute_eff_kinematics
end interface

```

The process core must implement this function. Here, `j` is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `core_state` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

```

```

<Prc core: interfaces>+=
  abstract interface
    function prc_core_compute_amplitude &
      (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, &
       core_state) result (amp)
    import
    complex(default) :: amp
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    real(default), intent(in), allocatable :: alpha_qcd_forced
    class(prc_core_state_t), intent(inout), allocatable, optional :: &
      core_state
    end function prc_core_compute_amplitude
  end interface

```

### 17.1.2 Storage for intermediate results

The abstract `prc_core_state_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```

<Prc core: public>+=
  public :: prc_core_state_t
<Prc core: types>+=
  type, abstract :: prc_core_state_t
  contains
    procedure(workspace_write), deferred :: write
    procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
  end type prc_core_state_t

```

For debugging, we should at least have an output routine.

```

<Prc core: interfaces>+=
  abstract interface
    subroutine workspace_write (object, unit)
    import
    class(prc_core_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine workspace_write
  end interface

```

This is used during the NLO calculation, see there for more information.

```

<Prc core: interfaces>+=
  abstract interface
    subroutine workspace_reset_new_kinematics (object)
    import
    class(prc_core_state_t), intent(inout) :: object
    end subroutine workspace_reset_new_kinematics
  end interface

```

### 17.1.3 Helicity selection data

This is intended for use with 0'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than **threshold** (a value which multiplies **epsilon**, to be compared with the average of the current amplitude, default is  $10^{10}$ ) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero **cutoff** times.

```

<Prc core: public>+≡
    public :: helicity_selection_t

<Prc core: types>+≡
    type :: helicity_selection_t
        logical :: active = .false.
        real(default) :: threshold = 0
        integer :: cutoff = 0
    contains
        <Prc core: helicity selection: TBP>
    end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>≡
    procedure :: write => helicity_selection_write

<Prc core: procedures>+≡
    subroutine helicity_selection_write (object, unit)
        class(helicity_selection_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        if (object%active) then
            write (u, "(3x,A)") "Helicity selection data:"
            write (u, "(5x,A,ES17.10)") &
                "threshold =", object%threshold
            write (u, "(5x,A,I0)") &
                "cutoff    = ", object%cutoff
        end if
    end subroutine helicity_selection_write

```

## 17.2 Test process type

For the following tests, we define a simple implementation of the abstract **prc\_core\_t**, designed such as to complement the **prc\_test\_t** process definition type.

Note that it is not given that the actual process is defined as **prc\_test\_t** type. We enforce this by calling **prc\_test\_create\_library**. The driver component in

the process core will then become of type `prc_test_t`.

```

<prc_test_core.f90>≡
  <File header>

  module prc_test_core

    <Use kinds>
    use io_units
    use lorentz
    use interactions
    use prc_test
    use prc_core

    <Standard module head>

    <Prc test core: public>

    <Prc test core: types>

    contains

    <Prc test core: procedures>

    end module prc_test_core

    <Prc test core: public>≡
    public :: test_t

    <Prc test core: types>≡
    type, extends (prc_core_t) :: test_t
    contains
    <Prc test core: test type: TBP>
    end type test_t

    <Prc test core: test type: TBP>≡
    procedure :: write => test_write

    <Prc test core: procedures>≡
    subroutine test_write (object, unit)
      class(test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(3x,A)") "test type implementing prc_test"
    end subroutine test_write

    <Prc test core: test type: TBP>+≡
    procedure :: write_name => test_write_name

    <Prc test core: procedures>+≡
    subroutine test_write_name (object, unit)
      class(test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)

```

```

        write (u,"(1x,A)") "Core: prc_test"
    end subroutine test_write_name

```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

```

<Prc test core: test type: TBP>+≡
    procedure :: needs_mcset => test_needs_mcset
    procedure :: get_n_terms => test_get_n_terms
    procedure :: is_allowed => test_is_allowed

<Prc test core: procedures>+≡
    function test_needs_mcset (object) result (flag)
        class(test_t), intent(in) :: object
        logical :: flag
        flag = .true.
    end function test_needs_mcset

    function test_get_n_terms (object) result (n)
        class(test_t), intent(in) :: object
        integer :: n
        n = 1
    end function test_get_n_terms

    function test_is_allowed (object, i_term, f, h, c) result (flag)
        class(test_t), intent(in) :: object
        integer, intent(in) :: i_term, f, h, c
        logical :: flag
        flag = .true.
    end function test_is_allowed

```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

```

<Prc test core: test type: TBP>+≡
    procedure :: compute_hard_kinematics => test_compute_hard_kinematics

<Prc test core: procedures>+≡
    subroutine test_compute_hard_kinematics &
        (object, p_seed, i_term, int_hard, core_state)
        class(test_t), intent(in) :: object
        type(vector4_t), dimension(:), intent(in) :: p_seed
        integer, intent(in) :: i_term
        type(interaction_t), intent(inout) :: int_hard
        class(prc_core_state_t), intent(inout), allocatable :: core_state
        call int_hard%set_momenta (p_seed)
    end subroutine test_compute_hard_kinematics

```

This procedure is not called for test\_t, just a placeholder.

```

<Prc test core: test type: TBP>+≡
    procedure :: compute_eff_kinematics => test_compute_eff_kinematics

<Prc test core: procedures>+≡
    subroutine test_compute_eff_kinematics &
        (object, i_term, int_hard, int_eff, core_state)

```

```

class(test_t), intent(in) :: object
integer, intent(in) :: i_term
type(interaction_t), intent(in) :: int_hard
type(interaction_t), intent(inout) :: int_eff
class(prc_core_state_t), intent(inout), allocatable :: core_state
end subroutine test_compute_eff_kinematics

```

Transfer the incoming momenta of `p_seed` directly to the effective interaction, and vice versa for the outgoing momenta.

`int_hard` is left untouched since `int_eff` is an alias (via pointer) to it.

```

<Prc test core: test type: TBP>+≡
  procedure :: recover_kinematics => test_recover_kinematics

<Prc test core: procedures>+≡
  subroutine test_recover_kinematics &
    (object, p_seed, int_hard, int_eff, core_state)
    class(test_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    integer :: n_in
    n_in = int_eff%get_n_in ()
    call int_eff%set_momenta (p_seed(1:n_in), outgoing = .false.)
    p_seed(n_in+1:) = int_eff%get_momenta (outgoing = .true.)
  end subroutine test_recover_kinematics

```

Compute the amplitude. The driver ignores all quantum numbers and, in fact, returns a constant. Nevertheless, we properly transfer the momentum vectors.

```

<Prc test core: test type: TBP>+≡
  procedure :: compute_amplitude => test_compute_amplitude

<Prc test core: procedures>+≡
  function test_compute_amplitude &
    (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, core_state) &
    result (amp)
    class(test_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    real(default), intent(in), allocatable :: alpha_qcd_forced
    class(prc_core_state_t), intent(inout), allocatable, optional :: core_state
    complex(default) :: amp
    real(default), dimension(:,:), allocatable :: parray
    integer :: i, n_tot
    select type (driver => object%driver)
    type is (prc_test_t)
      if (driver%scattering) then
        n_tot = 4
      else
        n_tot = 3
      end if
      allocate (parray (0:3,n_tot))

```

```

        forall (i = 1:n_tot) parray(:,i) = vector4_get_components (p(i))
        amp = driver%get_amplitude (parray)
    end select
end function test_compute_amplitude

```

## 17.3 Template matrix elements

Here, we provide template matrix elements that are in structure very similar to O'MEGA matrix elements, but do not need its infrastructure. Per default, the matrix elements are flat, i.e. they have the constant value one. Analogous to the O'MEGA implementation, this section implements the interface to the templates (via the makefile) and the driver.

```

<prc_template_me.f90>≡
  <File header>

  module prc_template_me

    use, intrinsic :: iso_c_binding !NODEP!

    use kinds
    <Use strings>
    use io_units
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use lorentz
    use flavors
    use interactions
    use model_data

    use particle_specifiers, only: new_prt_spec
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use process_libraries
    use prc_core

    <Standard module head>

    <Template matrix elements: public>

    <Template matrix elements: types>

    <Template matrix elements: interfaces>

    contains

    <Template matrix elements: procedures>

  end module prc_template_me

```

### 17.3.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```
<Template matrix elements: public>≡
    public :: template_me_def_t

<Template matrix elements: types>≡
    type, extends (prc_core_def_t) :: template_me_def_t
    contains
    <Template matrix elements: template ME def: TBP>
    end type template_me_def_t

<Template matrix elements: template ME def: TBP>≡
    procedure, nopass :: type_string => template_me_def_type_string

<Template matrix elements: procedures>≡
    function template_me_def_type_string () result (string)
        type(string_t) :: string
        string = "template"
    end function template_me_def_type_string
```

Initialization: allocate the writer for the template matrix element. Also set any data for this process that the writer needs.

```
<Template matrix elements: template ME def: TBP>+≡
    procedure :: init => template_me_def_init

<Template matrix elements: procedures>+≡
    subroutine template_me_def_init &
        (object, model, prt_in, prt_out, unity)
        class(template_me_def_t), intent(out) :: object
        class(model_data_t), intent(in), target :: model
        type(string_t), dimension(:), intent(in) :: prt_in
        type(string_t), dimension(:), intent(in) :: prt_out
        logical, intent(in) :: unity
        allocate (template_me_writer_t :: object%writer)
        select type (writer => object%writer)
        type is (template_me_writer_t)
            call writer%init (model, prt_in, prt_out, unity)
        end select
    end subroutine template_me_def_init
```

Write/read process- and method-specific data.

```
<Template matrix elements: template ME def: TBP>+≡
    procedure :: write => template_me_def_write

<Template matrix elements: procedures>+≡
    subroutine template_me_def_write (object, unit)
        class(template_me_def_t), intent(in) :: object
        integer, intent(in) :: unit
        select type (writer => object%writer)
        type is (template_me_writer_t)
            call writer%write (unit)
        end select
```

```
end subroutine template_me_def_write
```

```
<Template matrix elements: template ME def: TBP>+≡
  procedure :: read => template_me_def_read
```

```
<Template matrix elements: procedures>+≡
  subroutine template_me_def_read (object, unit)
    class(template_me_def_t), intent(out) :: object
    integer, intent(in) :: unit
    call msg_bug &
      ("WHIZARD template process definition: input not supported (yet)")
  end subroutine template_me_def_read
```

Allocate the driver for template matrix elements.

```
<Template matrix elements: template ME def: TBP>+≡
  procedure :: allocate_driver => template_me_def_allocate_driver

<Template matrix elements: procedures>+≡
  subroutine template_me_def_allocate_driver (object, driver, basename)
    class(template_me_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (template_me_driver_t :: driver)
  end subroutine template_me_def_allocate_driver
```

We need code:

```
<Template matrix elements: template ME def: TBP>+≡
  procedure, nopass :: needs_code => template_me_def_needs_code

<Template matrix elements: procedures>+≡
  function template_me_def_needs_code () result (flag)
    logical :: flag
    flag = .true.
  end function template_me_def_needs_code
```

These are the features that a template matrix element provides.

```
<Template matrix elements: template ME def: TBP>+≡
  procedure, nopass :: get_features => template_me_def_get_features

<Template matrix elements: procedures>+≡
  subroutine template_me_def_get_features (features)
    type(string_t), dimension(:), allocatable, intent(out) :: features
    allocate (features (5))
    features = [ &
      var_str ("init"), &
      var_str ("update_alpha_s"), &
      var_str ("is_allowed"), &
      var_str ("new_event"), &
      var_str ("get_amplitude")]
  end subroutine template_me_def_get_features
```

The interface of the specific features.

*<Template matrix elements: interfaces>≡*

```

abstract interface
  subroutine init_t (par, scheme) bind(C)
  import
    real(c_default_float), dimension(*), intent(in) :: par
    integer(c_int), intent(in) :: scheme
  end subroutine init_t
end interface

abstract interface
  subroutine update_alpha_s_t (alpha_s) bind(C)
  import
    real(c_default_float), intent(in) :: alpha_s
  end subroutine update_alpha_s_t
end interface

abstract interface
  subroutine is_allowed_t (flv, hel, col, flag) bind(C)
  import
    integer(c_int), intent(in) :: flv, hel, col
    logical(c_bool), intent(out) :: flag
  end subroutine is_allowed_t
end interface

abstract interface
  subroutine new_event_t (p) bind(C)
  import
    real(c_default_float), dimension(0:3,*), intent(in) :: p
  end subroutine new_event_t
end interface

abstract interface
  subroutine get_amplitude_t (flv, hel, col, amp) bind(C)
  import
    integer(c_int), intent(in) :: flv, hel, col
    complex(c_default_complex), intent(out) :: amp
  end subroutine get_amplitude_t
end interface

```

Connect the template matrix element features with the process driver.

*<Template matrix elements: template ME def: TBP>+≡*

```

procedure :: connect => template_me_def_connect

```

*<Template matrix elements: procedures>+≡*

```

subroutine template_me_def_connect (def, lib_driver, i, proc_driver)
  class(template_me_def_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  integer(c_int) :: pid, fid
  type(c_funptr) :: fptr
  select type (proc_driver)
  type is (template_me_driver_t)

```

```

        pid = i
        fid = 1
        call lib_driver%get_fptr (pid, fid, fptr)
        call c_f_procpointer (fptr, proc_driver%init)
        fid = 2
        call lib_driver%get_fptr (pid, fid, fptr)
        call c_f_procpointer (fptr, proc_driver%update_alpha_s)
        fid = 3
        call lib_driver%get_fptr (pid, fid, fptr)
        call c_f_procpointer (fptr, proc_driver%is_allowed)
        fid = 4
        call lib_driver%get_fptr (pid, fid, fptr)
        call c_f_procpointer (fptr, proc_driver%new_event)
        fid = 5
        call lib_driver%get_fptr (pid, fid, fptr)
        call c_f_procpointer (fptr, proc_driver%get_amplitude)
    end select
end subroutine template_me_def_connect

```

### 17.3.2 The Template Matrix element writer

Unlike O'MEGA, the template matrix element is directly written by the main WHIZARD program, so there will be no entry in the makefile for calling an external program. The template matrix element writer is responsible for writing interfaces and wrappers.

```

<Template matrix elements: types>+≡
    type, extends (prc_writer_f_module_t) :: template_me_writer_t
    class(model_data_t), pointer :: model => null ()
    type(string_t) :: model_name
    logical :: unity
    type(string_t), dimension(:), allocatable :: prt_in
    type(string_t), dimension(:), allocatable :: prt_out
    integer :: n_in
    integer :: n_out
    integer :: n_tot
    contains
    <Template matrix elements: template ME writer: TBP>
end type template_me_writer_t

```

The reported type is the same as for the `template_me_def.t` type.

```

<Template matrix elements: template ME writer: TBP>≡
    procedure, nopass :: type_name => template_me_writer_type_name
<Template matrix elements: procedures>+≡
    function template_me_writer_type_name () result (string)
        type(string_t) :: string
        string = "template"
    end function template_me_writer_type_name

```

Taking into account the prefix for template ME module names.

```

<Template matrix elements: template ME writer: TBP>+≡
    procedure, nopass :: get_module_name => template_me_writer_get_module_name

```

```

<Template matrix elements: procedures>+≡
function template_me_writer_get_module_name (id) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: id
  name = "tpr_" // id
end function template_me_writer_get_module_name

```

Output. This is called by `template_me_def.write`.

```

<Template matrix elements: template ME writer: TBP>+≡
procedure :: write => template_me_writer_write

<Template matrix elements: procedures>+≡
subroutine template_me_writer_write (object, unit)
  class(template_me_writer_t), intent(in) :: object
  integer, intent(in) :: unit
  integer :: i, j
  write (unit, "(5x,A,I0)") "# incoming part. = ", object%n_in
  write (unit, "(7x,A)", advance="no") &
    "    Initial state: "
  do i = 1, object%n_in - 1
    write (unit, "(1x,A)", advance="no") char (object%prt_in(i))
  end do
  write (unit, "(1x,A)") char (object%prt_in(object%n_in))
  write (unit, "(5x,A,I0)") "# outgoing part. = ", object%n_out
  write (unit, "(7x,A)", advance="no") &
    "    Final state:  "
  do j = 1, object%n_out - 1
    write (unit, "(1x,A)", advance="no") char (object%prt_out(j))
  end do
  write (unit, "(1x,A)") char (object%prt_out(object%n_out))
  write (unit, "(5x,A,I0)") "# part. (total) = ", object%n_tot
end subroutine template_me_writer_write

```

Initialize with process data.

```

<Template matrix elements: template ME writer: TBP>+≡
procedure :: init => template_me_writer_init

<Template matrix elements: procedures>+≡
subroutine template_me_writer_init (writer, model, &
  prt_in, prt_out, unity)
  class(template_me_writer_t), intent(out) :: writer
  class(model_data_t), intent(in), target :: model
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  logical, intent(in) :: unity
  writer%model => model
  writer%model_name = model%get_name ()
  writer%n_in = size (prt_in)
  writer%n_out = size (prt_out)
  writer%n_tot = size (prt_in) + size (prt_out)
  allocate (writer%prt_in (size (prt_in)), source = prt_in)
  allocate (writer%prt_out (size (prt_out)), source = prt_out)
  writer%unity = unity
end subroutine template_me_writer_init

```

The makefile is the driver file for the test matrix elements.

```

<Template matrix elements: template ME writer: TBP>+≡
    procedure :: write_makefile_code => template_me_write_makefile_code

<Template matrix elements: procedures>+≡
    subroutine template_me_write_makefile_code &

### 17.3.3 Driver

```

<Template matrix elements: public>+≡
  public :: template_me_driver_t
<Template matrix elements: types>+≡
  type, extends (prc_core_driver_t) :: template_me_driver_t
    procedure(init_t), nopass, pointer :: &
      init => null ()
    procedure(update_alpha_s_t), nopass, pointer :: &
      update_alpha_s => null ()
    procedure(is_allowed_t), nopass, pointer :: &
      is_allowed => null ()
    procedure(new_event_t), nopass, pointer :: &
      new_event => null ()
    procedure(get_amplitude_t), nopass, pointer :: &
      get_amplitude => null ()
  contains
    <Template matrix elements: template ME driver: TBP>
  end type template_me_driver_t

```

The reported type is the same as for the `template_me_def_t` type.

```

<Template matrix elements: template ME driver: TBP>≡
  procedure, nopass :: type_name => template_me_driver_type_name
<Template matrix elements: procedures>+≡
  function template_me_driver_type_name () result (string)
    type(string_t) :: string
    string = "template"
  end function template_me_driver_type_name

```

### 17.3.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an template matrix element.

```

<Template matrix elements: public>+≡
  public :: template_me_make_process_component
<Template matrix elements: procedures>+≡
  subroutine template_me_make_process_component (entry, component_index, &
    model, model_name, prt_in, prt_out, unity)
    class(process_def_entry_t), intent(inout) :: entry
    integer, intent(in) :: component_index
    type(string_t), intent(in) :: model_name
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: unity
    class(prc_core_def_t), allocatable :: def

```

```

allocate (template_me_def_t :: def)
select type (def)
type is (template_me_def_t)
    call def%init (model, prt_in, prt_out, unity)
end select
call entry%import_component (component_index, &
    n_out = size (prt_out), &
    prt_in  = new_prt_spec (prt_in), &
    prt_out = new_prt_spec (prt_out), &
    method = var_str ("template"), &
    variant = def)
end subroutine template_me_make_process_component

```

### 17.3.5 The prc\_template\_me\_t wrapper

This is an instance of the generic prc\_core\_t object. It contains a pointer to the process definition (template\_me\_def\_t), a data component (process\_constants\_t), and the matrix-element driver (template\_me\_driver\_t).

```

<Template matrix elements: public>+≡
public :: prc_template_me_t

<Template matrix elements: types>+≡
type, extends (prc_core_t) :: prc_template_me_t
    real(default), dimension(:), allocatable :: par
    integer :: scheme = 0
contains
    <Template matrix elements: prc template ME: TBP>
end type prc_template_me_t

```

The workspace associated to a prc\_template\_me\_t object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Template matrix elements: types>+≡
type, extends (prc_core_state_t) :: template_me_state_t
    logical :: new_kinematics = .true.
    real(default) :: alpha_qcd = -1
contains
    procedure :: write => template_me_state_write
    procedure :: reset_new_kinematics => template_me_state_reset_new_kinematics
end type template_me_state_t

<Template matrix elements: procedures>+≡
subroutine template_me_state_write (object, unit)
    class(template_me_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)

```

```

        write (u, "(3x,A,L1)") "Template ME state: new kinematics = ", &
            object%new_kinematics
    end subroutine template_me_state_write

```

```

<Template matrix elements: procedures>+≡
    subroutine template_me_state_reset_new_kinematics (object)
        class(template_me_state_t), intent(inout) :: object
    end subroutine template_me_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Template matrix elements: prc template ME: TBP>≡
    procedure :: allocate_workspace => prc_template_me_allocate_workspace

<Template matrix elements: procedures>+≡
    subroutine prc_template_me_allocate_workspace (object, core_state)
        class(prc_template_me_t), intent(in) :: object
        class(prc_core_state_t), intent(inout), allocatable :: core_state
        allocate (template_me_state_t :: core_state)
    end subroutine prc_template_me_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters.

```

<Template matrix elements: prc template ME: TBP>+≡
    procedure :: write => prc_template_me_write

<Template matrix elements: procedures>+≡
    subroutine prc_template_me_write (object, unit)
        class(prc_template_me_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "(3x,A)", advance="no") "Template process core:"
        if (object%data_known) then
            write (u, "(1x,A)") char (object%data%id)
        else
            write (u, "(1x,A)") "[undefined]"
        end if
        if (allocated (object%par)) then
            write (u, "(3x,A)") "Parameter array:"
            do i = 1, size (object%par)
                write (u, "(5x,I0,1x,ES17.10)") i, object%par(i)
            end do
        end if
    end subroutine prc_template_me_write

```

```

<Template matrix elements: prc template ME: TBP>+≡
    procedure :: write_name => prc_template_me_write_name

```

```

<Template matrix elements: procedures>+=
subroutine prc_template_me_write_name (object, unit)
  class(prc_template_me_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u,"(1x,A)") "Core: template"
end subroutine prc_template_me_write_name

```

Temporarily store the parameter array inside the `prc_template_me` object, so we can use it later during the actual initialization.

```

<Template matrix elements: prc template ME: TBP>+=
procedure :: set_parameters => prc_template_me_set_parameters

<Template matrix elements: procedures>+=
subroutine prc_template_me_set_parameters (prc_template_me, model)
  class(prc_template_me_t), intent(inout) :: prc_template_me
  class(model_data_t), intent(in), target, optional :: model
  if (present (model)) then
    if (.not. allocated (prc_template_me%par)) &
      allocate (prc_template_me%par (model%get_n_real ()))
    call model%real_parameters_to_array (prc_template_me%par)
    prc_template_me%scheme = model%get_scheme_num ()
  end if
end subroutine prc_template_me_set_parameters

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

```

<Template matrix elements: prc template ME: TBP>+=
procedure :: init => prc_template_me_init

<Template matrix elements: procedures>+=
subroutine prc_template_me_init (object, def, lib, id, i_component)
  class(prc_template_me_t), intent(inout) :: object
  class(prc_core_def_t), intent(in), target :: def
  type(process_library_t), intent(in), target :: lib
  type(string_t), intent(in) :: id
  integer, intent(in) :: i_component
  call object%base_init (def, lib, id, i_component)
  call object%activate_parameters ()
end subroutine prc_template_me_init

```

Activate the stored parameters by transferring them to the external matrix element.

```

<Template matrix elements: prc template ME: TBP>+=
procedure :: activate_parameters => prc_template_me_activate_parameters

```

```

<Template matrix elements: procedures>+≡
subroutine prc_template_me_activate_parameters (object)
class (prc_template_me_t), intent(inout) :: object

end subroutine prc_template_me_compute_eff_kinematics
```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index  $j$  is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

*<Template matrix elements: prc template ME: TBP>+≡*

```

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

    <Template matrix elements: execute tests>≡
        call test (prc_template_me_1, "prc_template_me_1", &

## 17.4 O'MEGA Interface

The standard method for process computation with WHIZARD is the O'MEGA matrix element generator.

This section implements the interface to the code generator (via the makefile) and the driver for the features provided by the **O’MEGA** matrix element.

There are actually two different methods steered by this interface, the traditional one which delivers compiled Fortran code, while the **O’MEGA** virtual machine (OVM) produces bytecode with look-up tables.

```

<prc_omega.f90>≡
  <File header>

  module prc_omega

    use, intrinsic :: iso_c_binding !NODEP!

    use kinds

  end module prc_omega

```

### 17.4.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

<Omega interface: public>≡
  public :: omega_def_t

```

```

<Omega interface: types>≡
  type, extends (prc_core_def_t) :: omega_def_t
    logical :: ufo = .false.
    logical :: ovm = .false.
  contains
    <Omega interface: omega def: TBP>
  end type omega_def_t

<Omega interface: omega def: TBP>≡
  procedure, nopass :: type_string => omega_def_type_string

<Omega interface: procedures>≡
  function omega_def_type_string () result (string)
    type(string_t) :: string
    string = "omega"
  end function omega_def_type_string

```

Initialization: allocate the writer for the O'MEGA matrix element. The writer type depends on the settings of the ufo and ovm flags. Also set any data for this process that the writer needs.

```

<Omega interface: omega def: TBP>+≡
  procedure :: init => omega_def_init

<Omega interface: procedures>+≡
  subroutine omega_def_init (object, &
    model_name, prt_in, prt_out, &
    ovm, ufo, ufo_path, &
    restrictions, cms_scheme, &
    openmp_support, report_progress, write_phs_output, extra_options, diags, diags_color)
    class(omega_def_t), intent(out) :: object
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: ovm
    logical, intent(in) :: ufo
    type(string_t), intent(in), optional :: ufo_path
    type(string_t), intent(in), optional :: restrictions

```

```

<Omega interface: procedures>+≡
  function omega_driver_type_name () result (string)
    type(string_t) :: string
    string = "omega"
  end function omega_driver_type_name

```

#### 17.4.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an O'MEGA matrix element.

```

<Omega interface: public>+≡
  public :: omega_make_process_component

<Omega interface: procedures>+≡
  subroutine omega_make_process_component (entry, component_index, &
    model_name, prt_in, prt_out, &
    ufo, ufo_path, restrictions, cms_scheme, &
    openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color)
    class(process_def_entry_t), intent(inout) :: entry
    integer, intent(in) :: component_index
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in), optional :: ufo
    type(string_t), intent(in), optional :: ufo_path
    type(string_t), intent(in), optional :: restrictions
    logical, intent(in), optional :: cms_scheme
    logical, intent(in), optional :: openmp_support
    logical, intent(in), optional :: report_progress
    logical, intent(in), optional :: write_omega_output
    type(string_t), intent(in), optional :: extra_options
    logical, intent(in), optional :: diags, diags_color
    logical :: ufo_model
    class(prc_core_def_t), allocatable :: def
    ufo_model = .false.; if (present (ufo)) ufo_model = ufo
    allocate (omega_def_t :: def)
    select type (def)
    class is (omega_def_t)
      call def%init (model_name, prt_in, prt_out, &
        .false., ufo_model, ufo_path, &
        restrictions, cms_scheme, &
        openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color)
    end select
    call entry%import_component (component_index, &
      n_out = size (prt_out), &
      prt_in = new_prt_spec (prt_in), &
      prt_out = new_prt_spec (prt_out), &
      method = var_str ("omega"), &
      variant = def)
  end subroutine omega_make_process_component

```

### 17.4.5 The prc\_omega\_t wrapper

This is an instance of the generic prc\_core\_t object. It contains a pointer to the process definition (omega\_def\_t), a data component (process\_constants\_t), and the matrix-element driver (omega\_driver\_t).

```

<Omega interface: public>+≡
    public :: prc_omega_t

<Omega interface: types>+≡
    type, extends (prc_core_t) :: prc_omega_t
        real(default), dimension(:), allocatable :: par
        integer :: scheme = 0
        type(helicity_selection_t) :: helicity_selection
        type(qcd_t) :: qcd
        type(qed_t) :: qed
    contains
        <Omega interface: prc omega: TBP>
    end type prc_omega_t

```

The workspace associated to a prc\_omega\_t object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Omega interface: public>+≡
    public :: omega_state_t

<Omega interface: types>+≡
    type, extends (prc_core_state_t) :: omega_state_t
        logical :: new_kinematics = .true.
        real(default) :: alpha_qcd = -1
    contains
        <Omega interface: omega state: TBP>
    end type omega_state_t

<Omega interface: omega state: TBP>≡
    procedure :: write => omega_state_write

<Omega interface: procedures>+≡
    subroutine omega_state_write (object, unit)
        class(omega_state_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(3x,A,L1)") "0'Mega state: new kinematics = ", &
            object%new_kinematics
    end subroutine omega_state_write

<Omega interface: omega state: TBP>+≡
    procedure :: reset_new_kinematics => omega_state_reset_new_kinematics

```

```

<Omega interface: procedures>+≡
  subroutine omega_state_reset_new_kinematics (object)
    class(omega_state_t), intent(inout) :: object
    object%new_kinematics = .true.
  end subroutine omega_state_reset_new_kinematics

```

Allocate the workspace with the above specific type.

```

<Omega interface: prc omega: TBP>≡
  procedure :: allocate_workspace => prc_omega_allocate_workspace

<Omega interface: procedures>+≡
  subroutine prc_omega_allocate_workspace (object, core_state)
    class(prc_omega_t), intent(in) :: object
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    allocate (omega_state_t :: core_state)
  end subroutine prc_omega_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters and the helicity selection data. (The latter are printed only if active.)

```

<Omega interface: prc omega: TBP>+≡
  procedure :: write => prc_omega_write

<Omega interface: procedures>+≡
  subroutine prc_omega_write (object, unit)
    class(prc_omega_t), intent(in) :: object

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

If requested, we initialize the helicity selection counter.

```

<Omega interface: prc omega: TBP>+=

```

```

    procedure :: init => prc_omega_init

    end if
end if
end select
end subroutine prc_omega_reset_helicity_selection

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index  $j$  is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

The core objects computes the appropriate  $\alpha_s$  value via the `qcd` subobject, taking into account the provided `fac_scale` value. However, if the extra parameter `alpha_qcd_forced` is allocated, it overrides this setting.

The `is_allowed` query is not redundant, since the status may change during the run if helicities are switched off.

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

```

<Omega interface: execute tests>≡

### Check prc\_omega\_t wrapper and options

The process is  $e^-e^+ \rightarrow e^-e^+$  for vanishing masses and  $e = 0.3$ . We build the library using the high-level procedure `omega.make_process_component` and

the “black box” `prc_omega_t` object. Two variants with different settings for restrictions and OpenMP.

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

```

<Omega interface: execute tests>+≡

## QCD coupling

The process is  $u\bar{u} \rightarrow d\bar{d}$  for vanishing masses. We compute the amplitude for a fixed configuration once, then reset  $\alpha_s$ , then compute again.

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```
<Omega interface: execute tests>+≡

### UFO model file support

Again, the process is  $e^-e^+ \rightarrow e^-e^+$  for vanishing masses and  $e = 0.3$ . We build the library using the high-level procedure `omega_make_process_component` and the “black box” `prc_omega_t` object. OMega must be able to digest the specified UFO file and provide use with a fresh model file that can be read after producing the process code.

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

```

## 17.5 External matrix elements (squared)

This defines an abstract framework that can handle matrix elements which are computed outside of WHIZARD. Such matrix elements typically (i) require extra code or libraries to be configured linked at execution time, and (ii) provide only plain or correlated squared matrix elements instead of amplitudes.

In particular, matrix-element libraries that conform to the BLHA standard belong to this class. They have their own (also abstract) extension of the abstract `prc_external_t` type introduced here. `prc_external_t`-type.

### 17.5.2 Abstract interface to external matrix elements

This process class allows us to factor out common necessities of processes that involve external code or libraries.

#### Workspace

This is the workspace that is available for external matrix elements.

```

<Prc external: public>≡
  public :: prc_external_state_t

```

```

<Prc external: types>+≡
  type, abstract, extends (prc_core_state_t) :: prc_external_state_t
    logical :: new_kinematics = .true.
    real(default) :: alpha_qcd = -1
  contains
    <Prc external: external state: TBP>
  end type prc_external_state_t

<Prc external: external state: TBP>≡
  procedure :: reset_new_kinematics => prc_external_state_reset_new_kinematics

<Prc external: procedures>+≡
  subroutine prc_external_state_reset_new_kinematics (object)
    class(prc_external_state_t), intent(inout) :: object
    object%new_kinematics = .true.
  end subroutine prc_external_state_reset_new_kinematics

<Prc external: external state: TBP>+≡
  procedure :: get_alpha_qcd => prc_external_state_get_alpha_qcd

<Prc external: procedures>+≡
  function prc_external_state_get_alpha_qcd (object) result (alpha_qcd)
    real(default) :: alpha_qcd
    class(prc_external_state_t), intent(in) :: object
    alpha_qcd = object%alpha_qcd
  end function prc_external_state_get_alpha_qcd

```

## Driver

We have to add two O'Mega-routines to the external matrix-element driver to ensure proper process setup. The problem is that during the setup of the real component, the particle and flavor data are taken from the Born component to set up the subtraction terms. However, the Born component expects this data to be obtained from the Omega code, accessed by the driver.

```

<Prc external: public>+≡
  public :: prc_external_driver_t

<Prc external: types>+≡
  type, abstract, extends (prc_core_driver_t) :: prc_external_driver_t
    procedure(omega_update_alpha_s), nopass, pointer :: &
      update_alpha_s => null ()
    procedure(omega_is_allowed), nopass, pointer :: &
      is_allowed => null ()
  end type prc_external_driver_t

```

## Core

```

<Prc external: public>+≡
  public :: prc_external_t

```

```

<Prc external: types>+≡
  type, abstract, extends (prc_core_t) :: prc_external_t

### 17.5.3 external test

#### Writer

```
<Prc external: public>+≡
  public :: prc_external_test_writer_t

<Prc external: types>+≡
  type, extends (prc_external_writer_t) :: prc_external_test_writer_t
  contains
  <Prc external: external test writer: TBP>
  end type prc_external_test_writer_t

<Prc external: external test writer: TBP>≡
  procedure, nopass :: type_name => prc_external_test_writer_type_name

<Prc external: procedures>+≡
  function prc_external_test_writer_type_name () result (string)
    type(string_t) :: string
    string = "External matrix element dummy"
  end function prc_external_test_writer_type_name
```

#### Workspace

This looks pretty useless. Why don't we make `prc_external_state_t` nonabstract and remove this?

```
<Prc external: public>+≡
  public :: prc_external_test_state_t

<Prc external: types>+≡
  type, extends (prc_external_state_t) :: prc_external_test_state_t
  contains
  <Prc external: external test state: TBP>
  end type prc_external_test_state_t

<Prc external: external test state: TBP>≡
  procedure :: write => prc_external_test_state_write

<Prc external: procedures>+≡
  subroutine prc_external_test_state_write (object, unit)
    class(prc_external_test_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine prc_external_test_state_write
```

#### Driver

```
<Prc external: public>+≡
  public :: prc_external_test_driver_t

<Prc external: types>+≡
  type, extends (prc_external_driver_t) :: prc_external_test_driver_t
  contains
  <Prc external: external test driver: TBP>
  end type prc_external_test_driver_t
```

```

<Prc external: external test driver: TBP>≡

## Chapter 18

# Generic Event Handling

Event records allow the MC to communicate with the outside world. The event record should exhibit the observable contents of a physical event. We should be able to read and write events. The actual implementation of the event need not be defined yet, for that purpose.

We have the following basic modules:

**event\_base** Abstract base type for event records. The base type contains a reference to a **particle\_set\_t** object as the event core, and it holds some data that we should always expect, such as the squared matrix element and event weight.

**eio\_data** Transparent container for the metadata of an event sample.

**eio\_base** Abstract base type for event-record input and output. The implementations of this base type represent specific event I/O formats.

These are the implementation modules:

**eio\_checkpoints** Auxiliary output format. The only purpose is to provide screen diagnostics during event output.

**eio\_callback** Auxiliary output format. The only purpose is to execute a callback procedure, so we have a hook for external access during event output.

**eio\_weights** Print some event summary data, no details. The main use is for testing purposes.

Figure 18.1: Module dependencies in `src/events`.

**eio\_dump** Dump the contents of WHIZARD's `particle_set` internal record, using the `write` method of that record as-is. The main use is for testing purposes.

**hep\_common** Implements traditional HEP common blocks that are (still) used by some of the event I/O formats below.

**hepmc\_interface** Access particle objects of the HepMC package. Functional only if this package is linked. The interface is working both for HepMC2 and HepMC3.

**lcio\_interface** Access objects of the LCIO package. Functional only if this package is linked.

**hep\_events** Interface between the event record and the common blocks.

**eio\_ascii** Collection of event output formats that write ASCII files.

**eio\_lhef** LHEF for input and output.

**eio\_stdhep** Support for the StdHEP format (binary, machine-independent).

**eio\_hepmc** Support for the HepMC format (C++).

**eio\_lcio** Support for the LCIO format (C++).

## 18.1 Generic Event Handling

We introduce events first in form of an abstract type, together with some utilities. Abstract events can be used by other modules, in particular event I/O, without introducing an explicit dependency on the event implementation.

```

<event_base.f90>≡
  <File header>

  module event_base

    <Use kinds>
    use kinds, only: i64
    <Use strings>
    use io_units
    use string_utils, only: lower_case
    use diagnostics
    use model_data
    use particles

    <Standard module head>

    <Event base: public>

    <Event base: parameters>

    <Event base: types>

    <Event base: interfaces>

```

```

contains

<Event base: procedures>

end module event_base

```

### 18.1.1 generic event type

```

<Event base: public>≡
    public :: generic_event_t

<Event base: types>≡
    type, abstract :: generic_event_t
        !private
        logical :: particle_set_is_valid = .false.
        type(particle_set_t), pointer :: particle_set => null ()
        logical :: sqme_ref_known = .false.
        real(default) :: sqme_ref = 0
        logical :: sqme_prc_known = .false.
        real(default) :: sqme_prc = 0
        logical :: weight_ref_known = .false.
        real(default) :: weight_ref = 0
        logical :: weight_prc_known = .false.
        real(default) :: weight_prc = 0
        logical :: excess_prc_known = .false.
        real(default) :: excess_prc = 0
        logical :: n_dropped_known = .false.
        integer :: n_dropped = 0
        integer :: n_alt = 0
        logical :: sqme_alt_known = .false.
        real(default), dimension(:), allocatable :: sqme_alt
        logical :: weight_alt_known = .false.
        real(default), dimension(:), allocatable :: weight_alt
    contains
    <Event base: generic event: TBP>
end type generic_event_t

```

### 18.1.2 Initialization

This determines the number of alternate weights and sqme values.

```

<Event base: generic event: TBP>≡
    procedure :: base_init => generic_event_init

<Event base: procedures>≡
    subroutine generic_event_init (event, n_alt)
        class(generic_event_t), intent(out) :: event
        integer, intent(in) :: n_alt
        event%n_alt = n_alt
        allocate (event%sqme_alt (n_alt))
        allocate (event%weight_alt (n_alt))
    end subroutine generic_event_init

```

### 18.1.3 Access particle set

The particle set is the core of the event. We allow access to it via a pointer, and we maintain the information whether the particle set is valid, i.e., has been filled with meaningful data.

```
<Event base: generic event: TBP>+≡
  procedure :: has_valid_particle_set => generic_event_has_valid_particle_set
  procedure :: accept_particle_set => generic_event_accept_particle_set
  procedure :: discard_particle_set => generic_event_discard_particle_set

<Event base: procedures>+≡
  function generic_event_has_valid_particle_set (event) result (flag)
    class(generic_event_t), intent(in) :: event
    logical :: flag
    flag = event%particle_set_is_valid
  end function generic_event_has_valid_particle_set

  subroutine generic_event_accept_particle_set (event)
    class(generic_event_t), intent(inout) :: event
    event%particle_set_is_valid = .true.
  end subroutine generic_event_accept_particle_set

  subroutine generic_event_discard_particle_set (event)
    class(generic_event_t), intent(inout) :: event
    event%particle_set_is_valid = .false.
  end subroutine generic_event_discard_particle_set
```

These procedures deal with the particle set directly. Return the pointer:

```
<Event base: generic event: TBP>+≡
  procedure :: get_particle_set_ptr => generic_event_get_particle_set_ptr

<Event base: procedures>+≡
  function generic_event_get_particle_set_ptr (event) result (ptr)
    class(generic_event_t), intent(in) :: event
    type(particle_set_t), pointer :: ptr
    ptr => event%particle_set
  end function generic_event_get_particle_set_ptr
```

Let it point to some existing particle set:

```
<Event base: generic event: TBP>+≡
  procedure :: link_particle_set => generic_event_link_particle_set

<Event base: procedures>+≡
  subroutine generic_event_link_particle_set (event, particle_set)
    class(generic_event_t), intent(inout) :: event
    type(particle_set_t), intent(in), target :: particle_set
    event%particle_set => particle_set
    call event%accept_particle_set ()
  end subroutine generic_event_link_particle_set
```

### 18.1.4 Access sqme and weight

There are several incarnations: the current value, a reference value, alternate values.

*(Event base: generic event: TBP)+≡*

```
procedure :: sqme_prc_is_known => generic_event_sqme_prc_is_known
procedure :: sqme_ref_is_known => generic_event_sqme_ref_is_known
procedure :: sqme_alt_is_known => generic_event_sqme_alt_is_known
procedure :: weight_prc_is_known => generic_event_weight_prc_is_known
procedure :: weight_ref_is_known => generic_event_weight_ref_is_known
procedure :: weight_alt_is_known => generic_event_weight_alt_is_known
procedure :: excess_prc_is_known => generic_event_excess_prc_is_known
```

*(Event base: procedures)+≡*

```
function generic_event_sqme_prc_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%sqme_prc_known
end function generic_event_sqme_prc_is_known

### 18.1.5 Pure Virtual Methods

These procedures can only be implemented in the concrete implementation.

Output (verbose, depending on parameters).

*(Event base: generic event: TBP)*+≡  
 procedure (generic\_event\_write), deferred :: write

*(Event base: interfaces)*≡  
 abstract interface  
 subroutine generic\_event\_write (object, unit, &  
 show\_process, show\_transforms, &  
 show\_decay, verbose, testflag)  
 import  
 class(generic\_event\_t), intent(in) :: object  
 integer, intent(in), optional :: unit  
 logical, intent(in), optional :: show\_process  
 logical, intent(in), optional :: show\_transforms  
 logical, intent(in), optional :: show\_decay  
 logical, intent(in), optional :: verbose  
 logical, intent(in), optional :: testflag  
 end subroutine generic\_event\_write  
end interface

Generate an event, based on a selector index *i\_mci*, and optionally on an extra set of random numbers *r*. For the main bunch of random numbers that the generator needs, the event object should contain its own generator.

*(Event base: generic event: TBP)*+≡  
 procedure (generic\_event\_generate), deferred :: generate

*(Event base: interfaces)*+≡  
 abstract interface  
 subroutine generic\_event\_generate (event, i\_mci, r, i\_nlo)  
 import  
 class(generic\_event\_t), intent(inout) :: event  
 integer, intent(in) :: i\_mci  
 real(default), dimension(:), intent(in), optional :: r  
 integer, intent(in), optional :: i\_nlo  
 end subroutine generic\_event\_generate

```
end interface
```

Alternative : inject a particle set that is supposed to represent the hard process.  
How this determines the event, is dependent on the event structure, therefore  
this is a deferred method.

```
<Event base: generic event: TBP>+≡
  procedure (generic_event_set_hard_particle_set), deferred :: &
    set_hard_particle_set

<Event base: interfaces>+≡
  abstract interface
    subroutine generic_event_set_hard_particle_set (event, particle_set)
      import
      class(generic_event_t), intent(inout) :: event
      type(particle_set_t), intent(in) :: particle_set
    end subroutine generic_event_set_hard_particle_set
  end interface
```

Event index handlers.

```
<Event base: generic event: TBP>+≡

    end interface

```

### 18.1.6 Utilities

Applying this, current event contents are marked as incomplete but are not deleted. In particular, the initialization is kept.

```

<Event base: generic event: TBP>+≡
    procedure :: reset_contents => generic_event_reset_contents
    procedure :: base_reset_contents => generic_event_reset_contents

<Event base: procedures>+≡
    subroutine generic_event_reset_contents (event)
        class(generic_event_t), intent(inout) :: event
        call event%discard_particle_set ()
        event%sqme_ref_known = .false.
        event%sqme_prc_known = .false.
        event%sqme_alt_known = .false.
        event%weight_ref_known = .false.
        event%weight_prc_known = .false.
        event%weight_alt_known = .false.
        event%excess_prc_known = .false.
    end subroutine generic_event_reset_contents

```

Pacify particle set.

```

<Event base: generic event: TBP>+≡
    procedure :: pacify_particle_set => generic_event_pacify_particle_set

<Event base: procedures>+≡
    subroutine generic_event_pacify_particle_set (event)
        class(generic_event_t), intent(inout) :: event
        if (event%has_valid_particle_set ()) call pacify (event%particle_set)
    end subroutine generic_event_pacify_particle_set

```

### 18.1.7 Event normalization

The parameters for event normalization. For unweighted events, `NORM_UNIT` is intended as default, while for weighted events, it is `NORM_SIGMA`.

Note: the unit test for this is in `eio_data_2` below.

```
<Event base: parameters>≡
  integer, parameter, public :: NORM_UNDEFINED = 0
  integer, parameter, public :: NORM_UNIT = 1
  integer, parameter, public :: NORM_N_EVT = 2
  integer, parameter, public :: NORM_SIGMA = 3
  integer, parameter, public :: NORM_S_N = 4
```

These functions translate between the user representation and the internal one.

```
<Event base: public>+≡
  public :: event_normalization_mode
  public :: event_normalization_string

<Event base: procedures>+≡
  function event_normalization_mode (string, unweighted) result (mode)
    integer :: mode
    type(string_t), intent(in) :: string
    logical, intent(in) :: unweighted
    select case (lower_case (char (string)))
    case ("auto")
      if (unweighted) then
        mode = NORM_UNIT
      else
        mode = NORM_SIGMA
      end if
    case ("1")
      mode = NORM_UNIT
    case ("1/n")
      mode = NORM_N_EVT
    case ("sigma")
      mode = NORM_SIGMA
    case ("sigma/n")
      mode = NORM_S_N
    case default
      call msg_fatal ("Event normalization: unknown value '" &
        // char (string) // "'")
    end select
  end function event_normalization_mode

  function event_normalization_string (norm_mode) result (string)
    integer, intent(in) :: norm_mode
    type(string_t) :: string
    select case (norm_mode)
    case (NORM_UNDEFINED); string = "[undefined]"
    case (NORM_UNIT);      string = "'1'"
    case (NORM_N_EVT);     string = "'1/n'"
    case (NORM_SIGMA);     string = "'sigma'"
    case (NORM_S_N);       string = "'sigma/n'"
    case default;          string = "???"
    end select
```

```
end function event_normalization_string
```

We place this here as a generic helper, so we can update event weights whenever we need, not just in connection with an event sample data object.

```
<Event base: public>+≡
  public :: event_normalization_update

<Event base: procedures>+≡
  subroutine event_normalization_update (weight, sigma, n, mode_new, mode_old)
    real(default), intent(inout) :: weight
    real(default), intent(in) :: sigma
    integer, intent(in) :: n
    integer, intent(in) :: mode_new, mode_old
    if (mode_new /= mode_old) then
      if (sigma > 0 .and. n > 0) then
        weight = weight / factor (mode_old) * factor (mode_new)
      else
        call msg_fatal ("Event normalization update: null sample")
      end if
    end if
  contains
    function factor (mode)
      real(default) :: factor
      integer, intent(in) :: mode
      select case (mode)
        case (NORM_UNIT);   factor = 1._default
        case (NORM_N_EVT);  factor = 1._default / n
        case (NORM_SIGMA);  factor = sigma
        case (NORM_S_N);    factor = sigma / n
        case default
          call msg_fatal ("Event normalization update: undefined mode")
        end select
      end function factor
    end subroutine event_normalization_update
```

### 18.1.8 Callback container

This derived type contains a callback procedure that can be executed during event I/O. The callback procedure is given the event object (with class `generic_event`) and an event index.

This is a simple wrapper. The object is abstract, so the the actual procedure is introduced by overriding the deferred one. We use the PASS attribute, so we may supplement runtime data in the callback object if desired.

```
<Event base: public>+≡
  public :: event_callback_t

<Event base: types>+≡
  type, abstract :: event_callback_t
    private
  contains
    procedure(event_callback_write), deferred :: write
    procedure(event_callback_proc), deferred :: proc
```

```
end type event_callback_t
```

Identify the callback procedure in output

*<Event base: interfaces>+≡*

```
abstract interface
  subroutine event_callback_write (event_callback, unit)
    import
    class(event_callback_t), intent(in) :: event_callback
    integer, intent(in), optional :: unit
  end subroutine event_callback_write
end interface
```

This is the procedure interface.

*<Event base: interfaces>+≡*

```
abstract interface
  subroutine event_callback_proc (event_callback, i, event)
    import
    class(event_callback_t), intent(in) :: event_callback
    integer(i64), intent(in) :: i
    class(generic_event_t), intent(in) :: event
  end subroutine event_callback_proc
end interface
```

A dummy implementation for testing and fallback.

*<Event base: public>+≡*

```
public :: event_callback_nop_t
```

*<Event base: types>+≡*

```
type, extends (event_callback_t) :: event_callback_nop_t
private
contains
  procedure :: write => event_callback_nop_write
  procedure :: proc => event_callback_nop
end type event_callback_nop_t
```

*<Event base: procedures>+≡*

```
subroutine event_callback_nop_write (event_callback, unit)
  class(event_callback_nop_t), intent(in) :: event_callback
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "NOP"
end subroutine event_callback_nop_write

subroutine event_callback_nop (event_callback, i, event)
  class(event_callback_nop_t), intent(in) :: event_callback
  integer(i64), intent(in) :: i
  class(generic_event_t), intent(in) :: event
end subroutine event_callback_nop
```

## 18.2 Event Handle

This module defines an abstract base type that allows us to communicate any type of event record within the program. The concrete extensions are expected to consist of pointers, such as the C pointers for HepMC or LCIO events, so the communication object is a very light-weight one.

```
<event_handles.f90>≡  
  <File header>
```

```
  module event_handles
```

```
    <Standard module head>
```

```
    <Event handle: public>
```

```
    <Event handle: types>
```

```
  end module event_handles
```

There is only one abstract type.

```
<Event handle: public>≡
```

```
  public :: event_handle_t
```

```
<Event handle: types>≡
```

```
  type, abstract :: event_handle_t
```

```
  end type event_handle_t
```

## 18.3 Event Sample Data

We define a simple and transparent container for (meta)data that are associated with an event sample.

```
<eio_data.f90>≡  
  <File header>
```

```
  module eio_data
```

```
    <Use kinds>
```

```
    <Use strings>
```

```
      use io_units
```

```
      use numeric_utils
```

```
      use diagnostics
```

```
      use event_base
```

```
    <Standard module head>
```

```
    <EIO data: public>
```

```
    <EIO data: types>
```

```
  contains
```

```

    <EIO data: procedures>

```

```

end module eio_data

```

### 18.3.1 Event Sample Data

These are data that apply to an event sample as a whole. They are given in an easily portable form (no fancy structure) and are used for initializing event formats.

There are two MD5 sums here. `md5sum_proc` depends only on the definition of the contributing processes. A sample with matching checksum can be rescanned with modified model parameters, beam structure etc, to recalculate observables. `md5sum_config` includes all relevant data. Rescanning a sample with matching checksum will produce identical observables. (A third checksum might be added which depends on the event sample itself. This is not needed, so far.)

If alternate weights are part of the event sample (`n_alt` nonzero), there is a configuration MD5 sum for each of them.

```

<EIO data: public>≡

```

```

    public :: event_sample_data_t

```

```

<EIO data: types>≡

```

```

    type :: event_sample_data_t
        character(32) :: md5sum_prc = ""
        character(32) :: md5sum_cfg = ""
        logical :: unweighted = .true.
        logical :: negative_weights = .false.
        integer :: norm_mode = NORM_UNDEFINED
        integer :: n_beam = 0
        integer, dimension(2) :: pdg_beam = 0
        real(default), dimension(2) :: energy_beam = 0
        integer :: n_proc = 0
        integer :: n_evt = 0
        integer :: nlo_multiplier = 1
        integer :: split_n_evt = 0
        integer :: split_n_kbytes = 0
        integer :: split_index = 0
        real(default) :: total_cross_section = 0
        integer, dimension(:), allocatable :: proc_num_id
        integer :: n_alt = 0
        character(32), dimension(:), allocatable :: md5sum_alt
        real(default), dimension(:), allocatable :: cross_section
        real(default), dimension(:), allocatable :: error
    contains
        <EIO data: event sample data: TBP>
    end type event_sample_data_t

```

Initialize: allocate for the number of processes

```

<EIO data: event sample data: TBP>≡

```

```

    procedure :: init => event_sample_data_init

```

```

<EIO data: procedures>≡

end subroutine eio_data_2

```

## 18.4 Abstract I/O Handler

This module defines an abstract object for event I/O and the associated methods.

There are **output** and **input** methods which write or read a single event from/to the I/O stream, respectively. The I/O stream itself may be a file, a common block, or an externally linked structure, depending on the concrete implementation.

A **write** method prints the current content of the implementation-dependent event record in human-readable form.

The `init_in/init_out` and `final` prepare and finalize the I/O stream, respectively. There is also a `switch_inout` method which turns an input stream into an output stream where events can be appended.

Optionally, output files can be split in chunks of well-defined size. The `split_out` method takes care of this.

```

⟨eio_base.f90⟩≡
  ⟨File header⟩

  module eio_base

    use kinds, only: i64
  ⟨Use strings⟩
    use io_units
    use diagnostics
    use model_data
    use event_base
    use event_handles, only: event_handle_t
    use eio_data

  ⟨Standard module head⟩

  ⟨EIO base: public⟩

  ⟨EIO base: types⟩

  ⟨EIO base: interfaces⟩

  contains

  ⟨EIO base: procedures⟩

  end module eio_base

```

### 18.4.1 Type

We can assume that most implementations will need the file extension as a fixed string and, if they support file splitting, the current file index.

The fallback model is useful for implementations that are able to read unknown files which may contain hadrons etc., not in the current hard-interaction model.

```

⟨EIO base: public⟩≡
  public :: eio_t

⟨EIO base: types⟩≡
  type, abstract :: eio_t
    type(string_t) :: sample
    type(string_t) :: extension
    type(string_t) :: filename
    logical :: has_file = .false.
    logical :: split = .false.
    integer :: split_n_evt = 0
    integer :: split_n_kbytes = 0
    integer :: split_index = 0

```

```

integer :: split_count = 0
class(model_data_t), pointer :: fallback_model => null ()
contains
  <EIO base: eio: TBP>
end type eio_t

```

Write to screen. If possible, this should display the contents of the current event, i.e., the last one that was written or read.

```

<EIO base: eio: TBP>≡
  procedure (eio_write), deferred :: write
<EIO base: interfaces>≡
  abstract interface
    subroutine eio_write (object, unit)
      import
      class(eio_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine eio_write
  end interface

```

Finalize. This should write/read footer data and close input/output channels.

```

<EIO base: eio: TBP>+≡
  procedure (eio_final), deferred :: final
<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_final (object)
      import
      class(eio_t), intent(inout) :: object
    end subroutine eio_final
  end interface

```

Determine splitting parameters from the event sample data.

```

<EIO base: eio: TBP>+≡
  procedure :: set_splitting => eio_set_splitting
<EIO base: procedures>≡
  subroutine eio_set_splitting (eio, data)
    class(eio_t), intent(inout) :: eio
    type(event_sample_data_t), intent(in) :: data
    eio%split = data%split_n_evt > 0 .or. data%split_n_kbytes > 0
    if (eio%split) then
      eio%split_n_evt = data%split_n_evt
      eio%split_n_kbytes = data%split_n_kbytes
      eio%split_index = data%split_index
      eio%split_count = 0
    end if
  end subroutine eio_set_splitting

```

Update the byte count and check if it has increased. We use integer division to determine the number of `n_kbytes` blocks that are in the event file.

```

<EIO base: eio: TBP>+≡
  procedure :: update_split_count => eio_update_split_count

```

```

(EIO base: procedures)+≡
subroutine eio_update_split_count (eio, increased)
  class(eio_t), intent(inout) :: eio
  logical, intent(out) :: increased
  integer :: split_count_old
  if (eio%split_n_kbytes > 0) then
    split_count_old = eio%split_count
    eio%split_count = eio%file_size_kbytes () / eio%split_n_kbytes
    increased = eio%split_count > split_count_old
  end if
end subroutine eio_update_split_count

```

Generate a filename, taking a possible split index into account.

```

(EIO base: eio: TBP)+≡
  procedure :: set_filename => eio_set_filename

(EIO base: procedures)+≡
subroutine eio_set_filename (eio)
  class(eio_t), intent(inout) :: eio
  character(32) :: buffer
  if (eio%split) then
    write (buffer, "(I0,'.')") eio%split_index
    eio%filename = eio%sample // "." // trim (buffer) // eio%extension
    eio%has_file = .true.
  else
    eio%filename = eio%sample // "." // eio%extension
    eio%has_file = .true.
  end if
end subroutine eio_set_filename

```

Set the fallback model.

```

(EIO base: eio: TBP)+≡
  procedure :: set_fallback_model => eio_set_fallback_model

(EIO base: procedures)+≡
subroutine eio_set_fallback_model (eio, model)
  class(eio_t), intent(inout) :: eio
  class(model_data_t), intent(in), target :: model
  eio%fallback_model => model
end subroutine eio_set_fallback_model

```

Initialize for output. We provide process names. This should open an event file if appropriate and write header data. Some methods may require event sample data.

```

(EIO base: eio: TBP)+≡
  procedure (eio_init_out), deferred :: init_out

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_init_out (eio, sample, data, success, extension)
      import
      class(eio_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
    end subroutine eio_init_out
  end interface

```

```

        type(event_sample_data_t), intent(in), optional :: data
        logical, intent(out), optional :: success
        type(string_t), intent(in), optional :: extension
    end subroutine eio_init_out
end interface

```

Initialize for input. We provide process names. This should open an event file if appropriate and read header data. The `md5sum` can be used to check the integrity of the configuration, it provides a checksum to compare with. In case the extension has changed the extension is also given as an argument.

The `data` argument is `intent(inout)`: we may read part of it and keep other parts and/or check them against the data in the file.

```

<EIO base: eio: TBP>+≡
    procedure (eio_init_in), deferred :: init_in

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_init_in (eio, sample, data, success, extension)
            import
            class(eio_t), intent(inout) :: eio
            type(string_t), intent(in) :: sample
            type(event_sample_data_t), intent(inout), optional :: data
            logical, intent(out), optional :: success
            type(string_t), intent(in), optional :: extension
        end subroutine eio_init_in
    end interface

```

Re-initialize for output. This should change the status of any event file from input to output and position it for appending new events.

```

<EIO base: eio: TBP>+≡
    procedure (eio_switch_inout), deferred :: switch_inout

<EIO base: interfaces>+≡
    abstract interface
        subroutine eio_switch_inout (eio, success)
            import
            class(eio_t), intent(inout) :: eio
            logical, intent(out), optional :: success
        end subroutine eio_switch_inout
    end interface

```

This is similar: split the output, i.e., close the current file and open a new one. The default implementation does nothing. For the feature to work, an implementation must override this.

```

<EIO base: eio: TBP>+≡
    procedure :: split_out => eio_split_out

<EIO base: procedures>+≡
    subroutine eio_split_out (eio)
        class(eio_t), intent(inout) :: eio
    end subroutine eio_split_out

```

Determine the file size in kilobytes. More exactly, determine the size in units of 1024 storage units, as returned by the `INQUIRE` statement.

The implementation returns zero if there is no file. The `has_file` flag is set by the `set_filename` method, so we can be confident that the `inquire` call is meaningful. If this algorithm doesn't apply for a particular format, we still can override the procedure.

```

(EIO base: eio: TBP)+≡
  procedure :: file_size_kbytes => eio_file_size_kbytes

(EIO base: procedures)+≡
  function eio_file_size_kbytes (eio) result (kbytes)
    class(eio_t), intent(in) :: eio
    integer :: kbytes
    integer(i64) :: bytes
    if (eio%has_file) then
      inquire (file = char (eio%filename), size = bytes)
      if (bytes > 0) then
        kbytes = bytes / 1024
      else
        kbytes = 0
      end if
    else
      kbytes = 0
    end if
  end function eio_file_size_kbytes

```

Output an event. All data can be taken from the `event` record. The index `i_prc` identifies the process among the processes that are contained in the current sample. The `reading` flag, if present, indicates that the event was read from file, not generated.

The `passed` flag tells us that this event has passed the selection criteria. Depending on the event format, we may choose to skip events that have not passed.

```

(EIO base: eio: TBP)+≡
  procedure (eio_output), deferred :: output

(EIO base: interfaces)+≡
  abstract interface
    subroutine eio_output &
      (eio, event, i_prc, reading, passed, pacify, event_handle)
    import
    class(eio_t), intent(inout) :: eio
    class(generic_event_t), intent(in), target :: event
    integer, intent(in) :: i_prc
    logical, intent(in), optional :: reading, passed, pacify
    class(event_handle_t), intent(inout), optional :: event_handle
  end subroutine eio_output
end interface

```

Input an event. This should fill all event data that cannot be inferred from the associated process.

The input is broken down into two parts. First we read the `i_prc` index. So we know which process to expect in the subsequent event. If we have reached end of file, we also will know. Then, we read the event itself.

The parameter `iostat` is supposed to be set as the Fortran standard requires, negative for EOF and positive for error.

```

<EIO base: eio: TBP>+≡
  procedure (eio_input_i_prc), deferred :: input_i_prc
  procedure (eio_input_event), deferred :: input_event

<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_input_i_prc (eio, i_prc, iostat)
      import
      class(eio_t), intent(inout) :: eio
      integer, intent(out) :: i_prc
      integer, intent(out) :: iostat
    end subroutine eio_input_i_prc
  end interface

  abstract interface
    subroutine eio_input_event (eio, event, iostat, event_handle)
      import
      class(eio_t), intent(inout) :: eio
      class(generic_event_t), intent(inout), target :: event
      integer, intent(out) :: iostat
      class(event_handle_t), intent(inout), optional :: event_handle
    end subroutine eio_input_event
  end interface

<EIO base: eio: TBP>+≡
  procedure (eio_skip), deferred :: skip

<EIO base: interfaces>+≡
  abstract interface
    subroutine eio_skip (eio, iostat)
      import
      class(eio_t), intent(inout) :: eio
      integer, intent(out) :: iostat
    end subroutine eio_skip
  end interface

```

### 18.4.2 Unit tests

Test module, followed by the corresponding implementation module.

```

<eio_base.ut.f90>≡
  <File header>

  module eio_base_ut
    use unit_tests
    use eio_base_ut_i

    <Standard module head>

```

```

    <EIO base: public test>

    <EIO base: public test auxiliary>

    contains

    <EIO base: test driver>

    end module eio_base_ut

    <eio_base.uti.f90>≡
    <File header>

    module eio_base_uti

    <Use kinds>
    <Use strings>
        use io_units
        use lorentz
        use model_data
        use particles
        use event_base
        use event_handles, only: event_handle_t
        use eio_data

        use eio_base

    <Standard module head>

    <EIO base: public test auxiliary>

    <EIO base: test declarations>

    <EIO base: test types>

    <EIO base: test variables>

    contains

    <EIO base: tests>

    <EIO base: test auxiliary>

    end module eio_base_uti
API: driver for the unit tests below.
    <EIO base: public test>≡
        public :: eio_base_test
    <EIO base: test driver>≡
        subroutine eio_base_test (u, results)
            integer, intent(in) :: u
            type(test_results_t), intent(inout) :: results
        <EIO base: execute tests>
        end subroutine eio_base_test

```

The caller has to provide procedures that prepare and cleanup the test environment. They depend on modules that are not available here.

```

<EIO base: test types>≡
  abstract interface
    subroutine eio_prepare_event (event, unweighted, n_alt, sample_norm)
      import
      class(generic_event_t), intent(inout), pointer :: event
      logical, intent(in), optional :: unweighted
      integer, intent(in), optional :: n_alt
      type(string_t), intent(in), optional :: sample_norm
    end subroutine eio_prepare_event
  end interface

  abstract interface
    subroutine eio_cleanup_event (event)
      import
      class(generic_event_t), intent(inout), pointer :: event
    end subroutine eio_cleanup_event
  end interface

```

We store pointers to the test-environment handlers as module variables. This allows us to call them from the test routines themselves, which don't allow for extra arguments.

```

<EIO base: public test auxiliary>≡
  public :: eio_prepare_test, eio_cleanup_test

<EIO base: test types>+≡
  procedure(eio_prepare_event), pointer :: eio_prepare_test => null ()
  procedure(eio_cleanup_event), pointer :: eio_cleanup_test => null ()

```

Similarly, for the fallback (hadron) model that some eio tests require:

```

<EIO base: test types>+≡
  abstract interface
    subroutine eio_prepare_model (model)
      import
      class(model_data_t), intent(inout), pointer :: model
    end subroutine eio_prepare_model
  end interface

  abstract interface
    subroutine eio_cleanup_model (model)
      import
      class(model_data_t), intent(inout), target :: model
    end subroutine eio_cleanup_model
  end interface

<EIO base: public test auxiliary>+≡
  public :: eio_prepare_fallback_model, eio_cleanup_fallback_model

<EIO base: test variables>≡
  procedure(eio_prepare_model), pointer :: eio_prepare_fallback_model => null ()

```

```
procedure(eio_cleanup_model), pointer :: eio_cleanup_fallback_model => null ()
```

## Test type for event I/O

The contents simulate the contents of an external file. We have the `sample` string as the file name and the array of momenta `event_p` as the list of events. The second index is the event index. The `event_i` component is the pointer to the current event, `event_n` is the total number of stored events.

```
<EIO base: test types>+≡
  type, extends (eio_t) :: eio_test_t
    integer :: event_n = 0
    integer :: event_i = 0
    integer :: i_prc = 0
    type(vector4_t), dimension(:,,:), allocatable :: event_p
  contains
    <EIO base: eio test: TBP>
  end type eio_test_t
```

Write to screen. Pretend that this is an actual event format.

```
<EIO base: eio test: TBP>≡
  procedure :: write => eio_test_write

<EIO base: test auxiliary>≡
  subroutine eio_test_write (object, unit)
    class(eio_test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Test event stream"
    if (object%event_i /= 0) then
      write (u, "(1x,A,I0,A)") "Event #", object%event_i, ":"
      do i = 1, size (object%event_p, 1)
        call vector4_write (object%event_p(i, object%event_i), u)
      end do
    end if
  end subroutine eio_test_write
```

Finalizer. For the test case, we just reset the event count, but keep the stored “events”. For the real implementations, the events would be stored on an external medium, so we would delete the object contents.

```
<EIO base: eio test: TBP>+≡
  procedure :: final => eio_test_final

<EIO base: test auxiliary>+≡
  subroutine eio_test_final (object)
    class(eio_test_t), intent(inout) :: object
    object%event_i = 0
  end subroutine eio_test_final
```

Initialization: We store the process IDs and the energy from the beam-data object. We also allocate the momenta (i.e., the simulated event record) for a fixed maximum size of 10 events, 2 momenta each. There is only a single process.

```

(EIO base: eio test: TBP)+≡
  procedure :: init_out => eio_test_init_out

(EIO base: test auxiliary)+≡
  subroutine eio_test_init_out (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(in), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    eio%sample = sample
    eio%event_n = 0
    eio%event_i = 0
    allocate (eio%event_p (2, 10))
    if (present (success)) success = .true.
  end subroutine eio_test_init_out

```

Initialization for input. Nothing to do for the test type.

```

(EIO base: eio test: TBP)+≡
  procedure :: init_in => eio_test_init_in

(EIO base: test auxiliary)+≡
  subroutine eio_test_init_in (eio, sample, data, success, extension)
    class(eio_test_t), intent(inout) :: eio
    type(string_t), intent(in) :: sample
    type(event_sample_data_t), intent(inout), optional :: data
    logical, intent(out), optional :: success
    type(string_t), intent(in), optional :: extension
    if (present (success)) success = .true.
  end subroutine eio_test_init_in

```

Switch from output to input. Again, nothing to do for the test type.

```

(EIO base: eio test: TBP)+≡
  procedure :: switch_inout => eio_test_switch_inout

(EIO base: test auxiliary)+≡
  subroutine eio_test_switch_inout (eio, success)
    class(eio_test_t), intent(inout) :: eio
    logical, intent(out), optional :: success
    if (present (success)) success = .true.
  end subroutine eio_test_switch_inout

```

Output. Increment the event counter and store the momenta of the current event.

```

(EIO base: eio test: TBP)+≡
  procedure :: output => eio_test_output

```

```

(EIO base: test auxiliary)+≡
subroutine eio_test_output &
  (eio, event, i_prc, reading, passed, pacify, event_handle)
  class(eio_test_t), intent(inout) :: eio
  class(generic_event_t), intent(in), target :: event
  logical, intent(in), optional :: reading, passed, pacify
  class(event_handle_t), intent(inout), optional :: event_handle
  integer, intent(in) :: i_prc
  type(particle_set_t), pointer :: pset
  type(particle_t) :: prt
  eio%event_n = eio%event_n + 1
  eio%event_i = eio%event_n
  eio%i_prc = i_prc
  pset => event%get_particle_set_ptr ()
  prt = pset%get_particle (3)
  eio%event_p(1, eio%event_i) = prt%get_momentum ()
  prt = pset%get_particle (4)
  eio%event_p(2, eio%event_i) = prt%get_momentum ()
end subroutine eio_test_output

```

Input. Increment the event counter and retrieve the momenta of the current event. For the test case, we do not actually modify the current event.

```

(EIO base: eio test: TBP)+≡
procedure :: input_i_prc => eio_test_input_i_prc
procedure :: input_event => eio_test_input_event

(EIO base: test auxiliary)+≡
subroutine eio_test_input_i_prc (eio, i_prc, iostat)
  class(eio_test_t), intent(inout) :: eio
  integer, intent(out) :: i_prc
  integer, intent(out) :: iostat
  i_prc = eio%i_prc
  iostat = 0
end subroutine eio_test_input_i_prc

subroutine eio_test_input_event (eio, event, iostat, event_handle)
  class(eio_test_t), intent(inout) :: eio
  class(generic_event_t), intent(inout), target :: event
  integer, intent(out) :: iostat
  class(event_handle_t), intent(inout), optional :: event_handle
  eio%event_i = eio%event_i + 1
  iostat = 0
end subroutine eio_test_input_event

(EIO base: eio test: TBP)+≡
procedure :: skip => eio_test_skip

(EIO base: test auxiliary)+≡
subroutine eio_test_skip (eio, iostat)
  class(eio_test_t), intent(inout) :: eio
  integer, intent(out) :: iostat
  iostat = 0
end subroutine eio_test_skip

```

## Test I/O methods

## 18.5 Direct Event Access

As a convenient application of the base type, we construct an event handler that allows us of setting and retrieving events just in the same way as an file I/O format, but directly dealing with particle data and momenta. This is an input and output format, but we do not care about counting events.

`<eio_direct.f90>`≡  
*<File header>*

```

module eio_direct

## 18.8 Event Weight Output

This is an output-only format. For each event, we print the indices that identify process, process part (MCI group), and term. As numerical information we print the squared matrix element (trace) and the event weight.

```

<eio_weights.f90>≡
    <File header>

    module eio_weights

        <Use kinds>
        <Use strings>
        use io_units

        if (present (success)) success = .false.
    end subroutine eio_weights_switch_inout

```

Output an event. Write first the event indices, then weight and two values of the squared matrix element: `sqme_ref` is the value stored in the event record, and `sqme_prc` is the one stored in the process instance. (They can differ: when recalculating, the former is read from file and the latter is the result of the new calculation.)

For the alternative entries, the `sqme` value is always obtained by a new calculation, and thus qualifies as `sqme_prc`.

Don't write the file if the `passed` flag is set and false.

```

<EIO weights: eio weights: TBP>+≡
    procedure :: output => eio_weights_output

## 18.11 HEP Common Blocks

Long ago, to transfer data between programs one had to set up a common block and link both programs as libraries to the main executable. The HEP community standardizes several of those common blocks.

The modern way of data exchange uses data files with standard formats. However, the LHEF standard data format derives from a common block (actually, two).

WHIZARD used to support those common blocks, and LHEF was implemented via writing/reading blocks. We still keep this convention, but intend to eliminate common blocks (or any other static storage) from the workflow in the future. This will gain flexibility towards concurrent running of program images.

We encapsulate everything here in a module. The module holds the variables which are part of the common block. To access the common block variables, we just have to **use** this module. (They are nevertheless in the common block, since external software may access it in this way.)

Note: This code is taken essentially unchanged from WHIZARD 2.1 and does not (yet) provide unit tests.

```

<HEP common: variables>

<HEP common: common blocks>

contains

<HEP common: procedures>

end module hep_common

```

### 18.11.1 Event characteristics

The maximal number of particles in an event record.

*<HEP common: parameters>*≡  
integer, parameter, public :: MAXNUP = 500

The number of particles in this event.

*<HEP common: variables>*≡  
integer, public :: NUP

The process ID for this event.

*<HEP common: variables>*+≡  
integer, public :: IDPRUP

The weight of this event ( $\pm 1$  for unweighted events).

*<HEP common: variables>*+≡  
double precision, public :: XWGTUP

The factorization scale that is used for PDF calculation ( $-1$  if undefined).

*<HEP common: variables>*+≡  
double precision, public :: SCALUP

The QED and QCD couplings  $\alpha$  used for this event ( $-1$  if undefined).

```
<HEP common: variables>+≡  
  double precision, public :: AQEDUP  
  double precision, public :: AQCDUP
```

### 18.11.2 Particle characteristics

The PDG code:

```
<HEP common: variables>+≡  
  integer, dimension(MAXNUP), public :: IDUP
```

The status code. Incoming:  $-1$ , outgoing:  $+1$ . Intermediate t-channel propagator:  $-2$  (currently not used by WHIZARD). Intermediate resonance whose mass should be preserved:  $2$ . Intermediate resonance for documentation:  $3$  (currently not used). Beam particles:  $-9$ .

```
<HEP common: variables>+≡  
  integer, dimension(MAXNUP), public :: ISTUP
```

Index of first and last mother.

```
<HEP common: variables>+≡  
  integer, dimension(2,MAXNUP), public :: MOTHUP
```

Color line index of the color and anticolor entry for the particle. The standard recommends using large numbers; we start from MAXNUP+1.

```
<HEP common: variables>+≡  
  integer, dimension(2,MAXNUP), public :: ICOLUP
```

Momentum, energy, and invariant mass:  $(p_x, p_y, p_z, E, M)$ . For space-like particles,  $M$  is the negative square root of the absolute value of the invariant mass.

```
<HEP common: variables>+≡  
  double precision, dimension(5,MAXNUP), public :: PUP
```

Invariant lifetime (distance) from production to decay in mm.

```
<HEP common: variables>+≡  
  double precision, dimension(MAXNUP), public :: VTIMUP
```

Cosine of the angle between the spin-vector and a particle and the 3-momentum of its mother, given in the lab frame. If undefined/unpolarized:  $9$ .

```
<HEP common: variables>+≡  
  double precision, dimension(MAXNUP), public :: SPINUP
```

### 18.11.3 The HEPRUP common block

This common block is filled once per run.

#### Run characteristics

The maximal number of different processes.

```
<HEP common: parameters>+≡  
  integer, parameter, public :: MAXPUP = 100
```

The beam PDG codes.

```
<HEP common: variables>+≡  
  integer, dimension(2), public :: IDBMUP
```

The beam energies in GeV.

```
<HEP common: variables>+≡  
    double precision, dimension(2), public :: EBMUP
```

The PDF group and set for the two beams. (Undefined: use -1; LHAPDF: use group = 0).

```
<HEP common: variables>+≡  
    integer, dimension(2), public :: PDFGUP  
    integer, dimension(2), public :: PDFSUP
```

The (re)weighting model. 1: events are weighted, the shower generator (SHG) selects processes according to the maximum weight (in pb) and unweights events. 2: events are weighted, the SHG selects processes according to their cross section (in pb) and unweights events. 3: events are unweighted and simply run through the SHG. 4: events are weighted, and the SHG keeps the weight. Negative numbers: negative weights are allowed (and are reweighted to  $\pm 1$  by the SHG, if allowed).

WHIZARD only supports modes 3 and 4, as the SHG is not given control over process selection. This is consistent with writing events to file, for offline showering.

```
<HEP common: variables>+≡  
    integer, public :: IDWTUP
```

The number of different processes.

```
<HEP common: variables>+≡  
    integer, public :: NPRUP
```

## Process characteristics

Cross section and error in pb. (Cross section is needed only for IDWTUP = 2, so here both values are given for informational purposes only.)

```
<HEP common: variables>+≡  
    double precision, dimension(MAXPUP), public :: XSECUP  
    double precision, dimension(MAXPUP), public :: XERRUP
```

Maximum weight, i.e., the maximum value that XWGTUP can take. Also unused for the supported weighting models. It is  $\pm 1$  for unweighted events.

```
<HEP common: variables>+≡  
    double precision, dimension(MAXPUP), public :: XMAXUP
```

Internal ID of the selected process, matches IDPRUP below.

```
<HEP common: variables>+≡  
    integer, dimension(MAXPUP), public :: LPRUP
```

## The common block

```
<HEP common: common blocks>≡  
    common /HEPRUP/ &  
        IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP, &  
        XSECUP, XERRUP, XMAXUP, LPRUP  
    save /HEPRUP/
```

Fill the run characteristics of the common block. The initialization sets the beam properties, number of processes, and weighting model.

```

<HEP common: public>≡
    public :: heprup_init
<HEP common: procedures>≡
    subroutine heprup_init &
        (beam_pdg, beam_energy, n_processes, unweighted, negative_weights)
        integer, dimension(2), intent(in) :: beam_pdg
        real(default), dimension(2), intent(in) :: beam_energy
        integer, intent(in) :: n_processes
        logical, intent(in) :: unweighted
        logical, intent(in) :: negative_weights
        IDBMUP = beam_pdg
        EBMUP = beam_energy
        PDFGUP = -1
        PDFSUP = -1
        if (unweighted) then
            IDWTUP = 3
        else
            IDWTUP = 4
        end if
        if (negative_weights) IDWTUP = - IDWTUP
        NPRUP = n_processes
    end subroutine heprup_init

```

The HEPRUP (event) common block is needed for the interface to the shower. Filling of it is triggered by some output file formats. If these are not present, the common block is filled with some dummy information. Be generous with the number of processes in HEPRUP so that PYTHIA only rarely needs to be reinitialized in case events with higher process ids are generated.

```

<HEP common: public>+≡
    public :: assure_heprup
<HEP common: procedures>+≡
    subroutine assure_heprup (pset)
        type(particle_set_t), intent(in) :: pset
        integer :: i, num_id
        integer, parameter :: min_processes = 10
        num_id = 1
        if (LPRUP (num_id) /= 0) return
        call heprup_init ( &

```

#### 18.11.4 Run parameter output (verbose)

This is a verbose output of the HEPRUP block.

```

<HEP common: public>+≡
    public :: heprup_write_verbose

```

```

<HEP common: procedures>+≡
subroutine heprup_write_verbose (unit)
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(A)") "HEPRUP Common Block"
  write (u, "(3x,A6,' = ',I9,3x,1x,I9,3x,8x,A)") "IDBMUP", IDBMUP, &
    "PDG code of beams"
  write (u, "(3x,A6,' = ',G12.5,1x,G12.5,8x,A)") "EBMUP ", EBMUP, &
    "Energy of beams in GeV"
  write (u, "(3x,A6,' = ',I9,3x,1x,I9,3x,8x,A)") "PDFGUP", PDFGUP, &
    "PDF author group [-1 = undefined]"
  write (u, "(3x,A6,' = ',I9,3x,1x,I9,3x,8x,A)") "PDFSUP", PDFSUP, &
    "PDF set ID [-1 = undefined]"
  write (u, "(3x,A6,' = ',I9,3x,1x,9x,3x,8x,A)") "IDWTUP", IDWTUP, &
    "LHA code for event weight mode"
  write (u, "(3x,A6,' = ',I9,3x,1x,9x,3x,8x,A)") "NPRUP ", NPRUP, &
    "Number of user subprocesses"
  do i = 1, NPRUP
    write (u, "(1x,A,I0)") "Subprocess #", i
    write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XSECUP", XSECUP(i), &
      "Cross section in pb"
    write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XERRUP", XERRUP(i), &
      "Cross section error in pb"
    write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)") "XMAXUP", XMAXUP(i), &
      "Maximum event weight (cf. IDWTUP)"
    write (u, "(3x,A6,' = ',I9,3x,1x,12x,8x,A)") "LPRUP ", LPRUP(i), &
      "Subprocess ID"
  end do
end subroutine heprup_write_verbose

```

### 18.11.5 Run parameter output (other formats)

This routine writes the initialization block according to the LHEF standard. It uses the current contents of the HEPRUP block.

```

<HEP common: public>+≡
  public :: heprup_write_lhef

<HEP common: procedures>+≡
subroutine heprup_write_lhef (unit)
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
    IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
  do i = 1, NPRUP
    write (u, "(3(1x,ES17.10),1x,I0)") &
      XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
  end do
end subroutine heprup_write_lhef

```

This routine is a complete dummy at the moment. It uses the current contents of the HEPRUP block. At the end, it should depend on certain input flags for the different ASCII event formats.

```

<HEP common: public>+≡
  public :: heprup_write_ascii

<HEP common: procedures>+≡
  subroutine heprup_write_ascii (unit)
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
      IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
    do i = 1, NPRUP
      write (u, "(3(1x,ES17.10),1x,I0)") &
        XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
    end do
  end subroutine heprup_write_ascii

```

### Run parameter input (LHEF)

In a LHEF file, the parameters are written in correct order on separate lines, but we should not count on the precise format. List-directed input should just work.

```

<HEP common: public>+≡
  public :: heprup_read_lhef

<HEP common: procedures>+≡
  subroutine heprup_read_lhef (u)
    integer, intent(in) :: u
    integer :: i
    read (u, *) &
      IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
    do i = 1, NPRUP
      read (u, *) &
        XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
    end do
  end subroutine heprup_read_lhef

```

### 18.11.6 The HEPEUP common block

```

<HEP common: common blocks>+≡
  common /HEPEUP/ &
    NUP, IDPRUP, XWGTUP, SCALUP, AQEDUP, AQCDUP, &
    IDUP, ISTUP, MOTHUP, ICOLUP, PUP, VTIMUP, SPINUP
  save /HEPEUP/

```

## Initialization

Fill the event characteristics of the common block. The initialization sets only the number of particles and initializes the rest with default values. The other routine sets the optional parameters.

```
<HEP common: public>+≡
  public :: hepeup_init
  public :: hepeup_set_event_parameters

<HEP common: procedures>+≡
  subroutine hepeup_init (n_tot)
    integer, intent(in) :: n_tot
    NUP = n_tot
    IDPRUP = 0
    XWGTUP = 1
    SCALUP = -1
    AQEDUP = -1
    AQCDUP = -1
  end subroutine hepeup_init

  subroutine hepeup_set_event_parameters &
    (proc_id, weight, scale, alpha_qed, alpha_qcd)
    integer, intent(in), optional :: proc_id
    real(default), intent(in), optional :: weight, scale, alpha_qed, alpha_qcd
    if (present (proc_id)) IDPRUP = proc_id
    if (present (weight)) XWGTUP = weight
    if (present (scale)) SCALUP = scale
    if (present (alpha_qed)) AQEDUP = alpha_qed
    if (present (alpha_qcd)) AQCDUP = alpha_qcd
  end subroutine hepeup_set_event_parameters
```

Extract event information. The caller determines the parameters.

```
<HEP common: public>+≡
  public :: hepeup_get_event_parameters

<HEP common: procedures>+≡
  subroutine hepeup_get_event_parameters &
    (proc_id, weight, scale, alpha_qed, alpha_qcd)
    integer, intent(out), optional :: proc_id
    real(default), intent(out), optional :: weight, scale, alpha_qed, alpha_qcd
    if (present (proc_id)) proc_id = IDPRUP
    if (present (weight)) weight = XWGTUP
    if (present (scale)) scale = SCALUP
    if (present (alpha_qed)) alpha_qed = AQEDUP
    if (present (alpha_qcd)) alpha_qcd = AQCDUP
  end subroutine hepeup_get_event_parameters
```

## Particle data

Below we need the particle status codes which are actually defined in the subevents module.

Set the entry for a specific particle. All parameters are set with the exception of lifetime and spin, where default values are stored.

```

<HEP common: public>+≡
    public :: hepeup_set_particle

<HEP common: procedures>+≡
    subroutine hepeup_set_particle (i, pdg, status, parent, col, p, m2)
        integer, intent(in) :: i
        integer, intent(in) :: pdg, status
        integer, dimension(:), intent(in) :: parent
        type(vector4_t), intent(in) :: p
        integer, dimension(2), intent(in) :: col
        real(default), intent(in) :: m2
        if (i > MAXNUP) then
            call msg_error (arr=[ &
                var_str ("Too many particles in HEPEUP common block. " // &
                    "If this happened "), &
                var_str ("during event output, your events will be " // &
                    "invalid; please consider "), &
                var_str ("switching to a modern event format like HEPMC. " // &
                    "If you are not "), &
                var_str ("using an old, HEPEUP based format and " // &
                    "nevertheless get this error,"), &
                var_str ("please notify the WHIZARD developers,") ])
            return
        end if
        IDUP(i) = pdg
        select case (status)
            case (PRT_BEAM);          ISTUP(i) = -9
            case (PRT_INCOMING);      ISTUP(i) = -1
            case (PRT_BEAM_REMNANT);  ISTUP(i) = 3
            case (PRT_OUTGOING);      ISTUP(i) = 1
            case (PRT_RESONANT);      ISTUP(i) = 2
            case (PRT_VIRTUAL);       ISTUP(i) = 3
            case default;             ISTUP(i) = 0
        end select
        select case (size (parent))
            case (0);      MOTHUP(:,i) = 0
            case (1);      MOTHUP(1,i) = parent(1); MOTHUP(2,i) = 0
            case default;  MOTHUP(:,i) = [ parent(1), parent(size (parent)) ]
        end select
        if (col(1) > 0) then
            ICOLUP(1,i) = 500 + col(1)
        else
            ICOLUP(1,i) = 0
        end if
        if (col(2) > 0) then
            ICOLUP(2,i) = 500 + col(2)
        else
            ICOLUP(2,i) = 0
        end if
        PUP(1:3,i) = refmt_tiny (vector3_get_components (space_part (p)))
        PUP(4,i) = refmt_tiny (energy (p))
        PUP(5,i) = refmt_tiny (sign (sqrt (abs (m2))), m2))
    end subroutine

```

```

      VTIMUP(i) = 0
      SPINUP(i) = 9
end subroutine hepeup_set_particle

```

Set the lifetime, actually  $c\tau$  measured in mm, where  $\tau$  is the invariant lifetime.

```

<HEP common: public>+≡
  public :: hepeup_set_particle_lifetime

<HEP common: procedures>+≡
  subroutine hepeup_set_particle_lifetime (i, lifetime)
    integer, intent(in) :: i
    real(default), intent(in) :: lifetime
    VTIMUP(i) = lifetime
  end subroutine hepeup_set_particle_lifetime

```

Set the particle spin entry. We need the cosine of the angle of the spin axis with respect to the three-momentum of the parent particle.

If the particle has a full polarization density matrix given, we need the particle momentum and polarization as well as the mother-particle momentum. The polarization is transformed into a spin vector (which is sensible only for spin-1/2 or massless particles), which then is transformed into the lab frame (by a rotation of the 3-axis to the particle momentum axis). Finally, we compute the scalar product of this vector with the mother-particle three-momentum.

This puts severe restrictions on the applicability of this definition, and Lorentz invariance is lost. Unfortunately, the Les Houches Accord requires this computation.

```

<HEP common: public>+≡
  public :: hepeup_set_particle_spin

<HEP common: interfaces>≡
  interface hepeup_set_particle_spin
    module procedure hepeup_set_particle_spin_pol
  end interface

<HEP common: procedures>+≡
  subroutine hepeup_set_particle_spin_pol (i, p, pol, p_mother)
    integer, intent(in) :: i
    type(vector4_t), intent(in) :: p
    type(polarization_t), intent(in) :: pol
    type(vector4_t), intent(in) :: p_mother
    type(vector3_t) :: s3, p3
    type(vector4_t) :: s4
    s3 = vector3_moving (pol%get_axis ())
    p3 = space_part (p)
    s4 = rotation_to_2nd (3, p3) * vector4_moving (0._default, s3)
    SPINUP(i) = enclosed_angle_ct (s4, p_mother)
  end subroutine hepeup_set_particle_spin_pol

```

Extract particle data. The caller decides which ones to retrieve.

Status codes: beam remnants share the status code with virtual particles. However, for the purpose of WHIZARD we should identify them. We use the PDG code for this.

```

<HEP common: public>+≡

```

```

public :: hepeup_get_particle
<HEP common: procedures>+≡
subroutine hepeup_get_particle (i, pdg, status, parent, col, p, m2)
  integer, intent(in) :: i
  integer, intent(out), optional :: pdg, status
  integer, dimension(:), intent(out), optional :: parent
  type(vector4_t), intent(out), optional :: p
  integer, dimension(2), intent(out), optional :: col
  real(default), dimension(5,MAXNUP) :: pup_def
  real(default), intent(out), optional :: m2
  if (present (pdg)) pdg = IDUP(i)
  if (present (status)) then
    select case (ISTUP(i))
    case (-9); status = PRT_BEAM
    case (-1); status = PRT_INCOMING
    case (1); status = PRT_OUTGOING
    case (2); status = PRT_RESONANT
    case (3);
      select case (abs (IDUP(i)))

            HADRON_REMNANT_TRIPLET, HADRON_REMNANT_OCTET)
        status = PRT_BEAM_REMNANT
      case default
        status = PRT_VIRTUAL
      end select
    case default
      status = PRT_UNDEFINED
    end select
  end if
  if (present (parent)) then
    select case (size (parent))
    case (0)
    case (1); parent(1) = MOTHUP(1,i)
    case (2); parent = MOTHUP(:,i)
    end select
  end if
  if (present (col)) then
    col = ICOLUP(:,i)
  end if
  if (present (p)) then
    pup_def = PUP
    p = vector4_moving (pup_def(4,i), vector3_moving (pup_def(1:3,i)))
  end if
  if (present (m2)) then
    m2 = sign (PUP(5,i) ** 2, PUP(5,i))
  end if
end subroutine hepeup_get_particle

```

### 18.11.7 The HEPEVT and HEPEV4 common block

For the LEP Monte Carlos, a standard common block has been proposed in AKV89. We strongly recommend its use. (The description is an abbreviated

transcription of AKV89, Vol. 3, pp. 327-330).

NMXHEP is the maximum number of entries:

```
<HEP common: variables>+≡  
integer, parameter :: NMXHEP = 4000
```

NEVHEP is normally the event number, but may take special values as follows:

0 the program does not keep track of event numbers. -1 a special initialization record. -2 a special final record.

```
<HEP common: variables>+≡  
integer :: NEVHEP
```

NHEP holds the number of entries for this event.

```
<HEP common: variables>+≡  
integer, public :: NHEP
```

The entry ISTHEP(N) gives the status code for the Nth entry, with the following semantics: 0 a null entry. 1 an existing entry, which has not decayed or fragmented. 2 a decayed or fragmented entry, which is retained for event history information. 3 documentation line. 4- 10 reserved for future standards. 11-200 at the disposal of each model builder. 201- at the disposal of users.

```
<HEP common: variables>+≡  
integer, dimension(NMXHEP), public :: ISTHEP
```

The Particle Data Group has proposed standard particle codes, which are to be stored in IDHEP(N).

```
<HEP common: variables>+≡  
integer, dimension(NMXHEP), public :: IDHEP
```

JMOHEP(1,N) points to the mother of the Nth entry, if any. It is set to zero for initial entries. JMOHEP(2,N) points to the second mother, if any.

```
<HEP common: variables>+≡  
integer, dimension(2, NMXHEP), public :: JMOHEP
```

JDAHEP(1,N) and JDAHEP(2,N) point to the first and last daughter of the Nth entry, if any. These are zero for entries which have not yet decayed. The other daughters are stored in between these two.

```
<HEP common: variables>+≡  
integer, dimension(2, NMXHEP), public :: JDAHEP
```

In PHEP we store the momentum of the particle, more specifically this means that PHEP(1,N), PHEP(2,N), and PHEP(3,N) contain the momentum in the  $x$ ,  $y$ , and  $z$  direction (as defined by the machine people), measured in GeV/c. PHEP(4,N) contains the energy in GeV and PHEP(5,N) the mass in GeV/ $c^2$ . The latter may be negative for spacelike partons.

```
<HEP common: variables>+≡  
double precision, dimension(5, NMXHEP), public :: PHEP
```

Finally VHEP is the place to store the position of the production vertex. VHEP(1,N), VHEP(2,N), and VHEP(3,N) contain the  $x$ ,  $y$ , and  $z$  coordinate (as defined by the machine people), measured in mm. VHEP(4,N) contains the production time in mm/c.

```
<HEP common: variables>+≡
    double precision, dimension(4, NMXHEP) :: VHEP
```

As an amendment to the proposed standard common block HEPEVT, we also have a polarisation common block HEPSPN, as described in AKV89. SHEP(1,N), SHEP(2,N), and SHEP(3,N) give the  $x$ ,  $y$ , and  $z$  component of the spinvector  $s$  of a fermion in the fermions restframe.

Furthermore, we add the polarization of the corresponding outgoing particles:

```
<HEP common: variables>+≡
    integer, dimension(NMXHEP) :: hepevt_pol
```

By this variable the identity of the current process is given, defined via the LPRUP codes.

```
<HEP common: variables>+≡
    integer, public :: idruplh
```

This is the event weight, i.e. the cross section divided by the total number of generated events for the output of the parton shower programs.

```
<HEP common: variables>+≡
    double precision, public :: eventweightlh
```

There are the values for the electromagnetic and the strong coupling constants,  $\alpha_{em}$  and  $\alpha_s$ .

```
<HEP common: variables>+≡
    double precision, public :: alphasqedlh, alphasqcdlh
```

This is the squared scale  $Q$  of the event.

```
<HEP common: variables>+≡
    double precision, dimension(10), public :: scalelh
```

Finally, these variables contain the spin information and the color/anticolor flow of the particles.

```
<HEP common: variables>+≡
    double precision, dimension (3,NMXHEP), public :: spinlh
    integer, dimension (2,NMXHEP), public :: icolorflowlh
```

By convention, SHEP(4,N) is always 1. All this is taken from StdHep 4.06 manual and written using Fortran90 conventions.

```
<HEP common: common blocks>+≡
    common /HEPEVT/ &
        NEVHEP, NHEP, ISTHEP, IDHEP, &
        JMOHEP, JDAHEP, PHEP, VHEP
    save /HEPEVT/
```

Here we store HEPEVT parameters of the WHIZARD 1 realization which are not part of the HEPEVT common block.

```
<HEP common: variables>+≡
  integer :: hepevt_n_out, hepevt_n_remnants
```

```
<HEP common: variables>+≡
  double precision :: hepevt_weight, hepevt_function_value
  double precision :: hepevt_function_ratio
```

The HEPEV4 common block is an extension of the HEPEVT common block to allow for partonic colored events, including especially the color flow etc.

```
<HEP common: common blocks>+≡
  common /HEPEV4/ &
    eventweightlh, alphaqedlh, alphaqcdlh, scalelh, &
    spinlh, icolorflowlh, idruplh
  save /HEPEV4/
```

Filling HEPEVT: If the event count is not provided, set `NEVHEP` to zero. If the event count is `-1` or `-2`, the record corresponds to initialization and finalization, and the event is irrelevant.

Note that the event count may be larger than  $2^{31}$  (2 GEvents). In that case, cut off the upper bits since `NEVHEP` is probably limited to default integer.

For the HEPEV4 common block, it is unclear why the `scalelh` variable is 10-dimensional. We choose to only set the first value of the array.

    end do
end subroutine hepeup_write_lha

```

This routine writes event output according to the HEPEVT standard. It uses the current contents of the HEPEVT block and some additional parameters according to the standard in WHIZARD 1. For the long ASCII format, the value of the sample function (i.e. the product of squared matrix element, structure functions and phase space factor is printed out). The option of reweighting matrix elements with respect to some reference cross section is not implemented in WHIZARD 2 for this event format, therefore the second entry in the long ASCII format (the function ratio) is always one. The ATHENA format is an implementation of the HEPEVT format that is readable by the ATLAS ATHENA software framework. It is very similar to the WHIZARD 1 HEPEVT format, except that it contains an event counter, a particle counter inside the event, and has the HEPEVT ISTHEP status before the PDG code. The MOKKA format is a special ASCII format that contains the information to be parsed to the MOKKA LC fast simulation software.

```

### 18.11.11 Data Transfer: particle sets

The WHIZARD format for handling particle data in events is `particle_set_t`. We have to interface this to the common blocks.

We first create a new particle set that contains only the particles that are supported by the LHEF format. These are: beam, incoming, resonant, outgoing. We drop particles with unknown, virtual or beam-remnant status.

From this set we fill the common block. Event information such as process ID and weight is not transferred here; this has to be done by the caller. The spin information is set only if the particle has a unique mother, and if its polarization is fully defined.

We use this routine also to hand over information to Pythia which lets Tauola access SPINUP. Tauola expects in SPINUP the helicity and not the LHA convention. We switch to this mode with `tauola_convention`.

```

<HEP common: public>+≡
    public :: hepeup_from_particle_set

```

Input. The particle set should be allocated properly, but we replace the particle contents.

If there are no beam particles in the event, we try to reconstruct beam particles and beam remnants. We assume for simplicity that the beam particles, if any, are the first two particles. If they are absent, the first two particles should be the incoming partons.

## 18.12 HepMC events

This section provides the interface to the HepMC C++ library for handling Monte-Carlo events.

Each C++ class of HepMC that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of HepMC that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

(hepmc\_interface.f90)≡

    <HepMC interface: procedures>

    end module hepmc_interface

```

### 18.12.1 Interface check

This function can be called in order to verify that we are using the actual HepMC library, and not the dummy version.

```

<HepMC interface: interfaces>≡
    interface
        logical(c_bool) function hepmc_available () bind(C)
        import
        end function hepmc_available
    end interface

<HepMC interface: public>≡
    public :: hepmc_is_available

<HepMC interface: procedures>≡
    function hepmc_is_available () result (flag)
        logical :: flag
        flag = hepmc_available ()
    end function hepmc_is_available

```

### 18.12.2 FourVector

The C version of four-vectors is often transferred by value, and the associated procedures are all inlined. The wrapper needs to transfer by reference, so we create FourVector objects on the heap which have to be deleted explicitly. The input is a `vector4_t` or `vector3_t` object from the `lorentz` module.

```

<HepMC interface: public>+≡
    public :: hepmc_four_vector_t

```

```

<HepMC interface: types>≡
  type :: hepmc_four_vector_t
  private
  type(c_ptr) :: obj
end type hepmc_four_vector_t

```

In the C constructor, the zero-component (fourth argument) is optional; if missing, it is set to zero. The Fortran version has initializer form and takes either a three-vector or a four-vector. A further version extracts the four-vector from a HepMC particle object.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_four_vector_xyz (x, y, z) bind(C)
    import
      real(c_double), value :: x, y, z

    end subroutine hepmc_four_vector_to_vector4

```

### 18.12.3 Polarization

Polarization objects are temporarily used for assigning particle polarization. We add a flag `polarized`. If this is false, the polarization is not set and should not be transferred to `hepmc_particle` objects.

```

<HepMC interface: public>+≡
    public :: hepmc_polarization_t
<HepMC interface: types>+≡
    type :: hepmc_polarization_t
    private
    logical :: polarized = .false.
    type(c_ptr) :: obj
end type hepmc_polarization_t

```

Constructor. The C wrapper takes polar and azimuthal angle as arguments. The Fortran version allows for either a complete polarization density matrix, or for a definite (diagonal) helicity.

*HepMC does not allow to specify the degree of polarization, therefore we have to map it to either 0 or 1. We choose 0 for polarization less than 0.5 and 1 for polarization greater than 0.5. Even this simplification works only for spin-1/2 and for massless particles; massive vector bosons cannot be treated this way. In particular, zero helicity is always translated as unpolarized.*

*For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle  $\pi/2$ . This works under the condition that helicity is projected onto one of the basis states.*

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function new_polarization (theta, phi) bind(C)
            import
            real(c_double), value :: theta, phi

#### 18.12.4 GenParticle

Particle objects have the obvious meaning.

```

<HepMC interface: public>+≡
    public :: hepmc_particle_t

<HepMC interface: types>+≡
    type :: hepmc_particle_t
    private
        type(c_ptr) :: obj
    end type hepmc_particle_t

```

Constructor. The C version takes a FourVector object, which in the Fortran wrapper is created on the fly from a `vector4` Lorentz vector.

No destructor is needed as long as all particles are entered into vertex containers.

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function new_gen_particle (prt_obj, pdg_id, status) bind(C)
            import
            type(c_ptr), value :: prt_obj
            integer(c_int), value :: pdg_id, status
        end function new_gen_particle
    end interface

### 18.12.5 GenVertex

Vertices are made of particles (incoming and outgoing).

```

<HepMC interface: public>+≡
  public :: hepmc_vertex_t

<HepMC interface: types>+≡
  type :: hepmc_vertex_t
  private
  type(c_ptr) :: obj
end type hepmc_vertex_t

```

Constructor. Two versions, one plain, one with the position in space and time (measured in mm) as argument. The Fortran version has initializer form, and the vertex position is an optional argument.

A destructor is unnecessary as long as all vertices are entered into an event container.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_gen_vertex () bind(C)
      import
    end function new_gen_vertex
  end interface
  interface
    type(c_ptr) function new_gen_vertex_pos (prt_obj) bind(C)
      import
    end function new_gen_vertex_pos
  end interface

```

```

        type(c_ptr), value :: prt_obj
    end function new_gen_vertex_pos
end interface

<HepMC interface: public>+≡
    public :: hepmc_vertex_init

### 18.12.6 Vertex-particle-in iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer to the vertex in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
    public :: hePMC_vertex_particle_in_iterator_t

<HepMC interface: types>+≡
    type :: hePMC_vertex_particle_in_iterator_t
    private
        type(c_ptr) :: obj
        type(c_ptr) :: v_obj
    end type hePMC_vertex_particle_in_iterator_t

```

Constructor. The iterator is initialized at the first particle in the vertex.

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function &
            new_vertex_particles_in_const_iterator (v_obj) bind(C)
        import
            type(c_ptr), value :: v_obj
        end function new_vertex_particles_in_const_iterator
    end interface

<HepMC interface: public>+≡
    public :: hePMC_vertex_particle_in_iterator_init

<HepMC interface: procedures>+≡
    subroutine hePMC_vertex_particle_in_iterator_init (it, v)
        type(hePMC_vertex_particle_in_iterator_t), intent(out) :: it
        type(hePMC_vertex_t), intent(in) :: v
        it%obj = new_vertex_particles_in_const_iterator (v%obj)
        it%v_obj = v%obj
    end subroutine hePMC_vertex_particle_in_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```

<HepMC interface: interfaces>+≡
    interface
        subroutine vertex_particles_in_const_iterator_delete (it_obj) bind(C)
        import

end function hepmc_vertex_get_nth_particle_out

```

### 18.12.7 Vertex-particle-out iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer to the vertex in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
    public :: hepmc_vertex_particle_out_iterator_t

<HepMC interface: types>+≡
    type :: hepmc_vertex_particle_out_iterator_t
    private
    type(c_ptr) :: obj
    type(c_ptr) :: v_obj
end type hepmc_vertex_particle_out_iterator_t

```

Constructor. The iterator is initialized at the first particle in the vertex.

```

<HepMC interface: interfaces>+≡
    interface
        type(c_ptr) function &
            new_vertex_particles_out_const_iterator (v_obj) bind(C)
        import
        type(c_ptr), value :: v_obj
        end function new_vertex_particles_out_const_iterator
    end interface

<HepMC interface: public>+≡
    public :: hepmc_vertex_particle_out_iterator_init

<HepMC interface: procedures>+≡
    subroutine hepmc_vertex_particle_out_iterator_init (it, v)
        type(hepmc_vertex_particle_out_iterator_t), intent(out) :: it
        type(hepmc_vertex_t), intent(in) :: v
        it%obj = new_vertex_particles_out_const_iterator (v%obj)
        it%v_obj = v%obj
    end subroutine hepmc_vertex_particle_out_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```
<HepMC interface: interfaces>+≡  
  interface  
    subroutine vertex_particles_out_const_iterator_delete (it_obj) bind(C)  
      import  
      type(c_ptr), value :: it_obj  
    end subroutine vertex_particles_out_const_iterator_delete  
  end interface

    prt%obj = vertex_particles_out_const_iterator_get (it%obj)
  end function hepvc_vertex_particle_out_iterator_get

```

### 18.12.8 GenEvent

The main object of HepMC is a GenEvent. The object is filled by GenVertex objects, which in turn contain GenParticle objects.

This is an extension of the abstract `event_handle_t`, so we can use the according communicator features.

```

<HepMC interface: public>+≡
  public :: hepvc_event_t

```

```

<HepMC interface: types>+≡
  type, extends (event_handle_t) :: hepmc_event_t
  private
  type(c_ptr) :: obj = c_null_ptr
end type hepmc_event_t

```

Constructor. Arguments are process ID (integer) and event ID (integer).  
The Fortran version has initializer form.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_gen_event (proc_id, event_id) bind(C)
    import
    integer(c_int), value :: proc_id, event_id
    end function new_gen_event
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_init

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_init (evt, proc_id, event_id)
    type(hepmc_event_t), intent(out) :: evt
    integer, intent(in), optional :: proc_id, event_id
    integer(c_int) :: pid, eid
    pid = 0; if (present (proc_id)) pid = proc_id
    eid = 0; if (present (event_id)) eid = event_id
    evt%obj = new_gen_event (pid, eid)
  end subroutine hepmc_event_init

```

Destructor.

```

<HepMC interface: interfaces>+≡
  interface
    subroutine gen_event_delete (evt_obj) bind(C)
    import
    type(c_ptr), value :: evt_obj
    end subroutine gen_event_delete
  end interface

```

Finalize: use the HepMC destructor. Also nullify the pointer explicitly, to be on the safe side.

```

<HepMC interface: public>+≡
  public :: hepmc_event_final

<HepMC interface: procedures>+≡
  subroutine hepmc_event_final (evt)
    type(hepmc_event_t), intent(inout) :: evt
    if (c_associated (evt%obj)) then
      call gen_event_delete (evt%obj)
      evt%obj = c_null_ptr
    end if
  end subroutine hepmc_event_final

```

Nullify: do not call the destructor, just nullify the C pointer. There should be another pointer associated with the object.

```

<HepMC interface: public>+≡
    public :: hepmc_event_nullify

<HepMC interface: procedures>+≡
    subroutine hepmc_event_nullify (evt)
        type(hepmc_event_t), intent(inout) :: evt
        evt%obj = c_null_ptr
    end subroutine hepmc_event_nullify

```

Return the actual object as a C pointer. For use in the native C++ interface only.

```

<HepMC interface: public>+≡
    public :: hepmc_event_get_c_ptr

<HepMC interface: procedures>+≡
    function hepmc_event_get_c_ptr (evt) result (p)
        type(hepmc_event_t), intent(in) :: evt
        type(c_ptr) :: p
        p = evt%obj
    end function hepmc_event_get_c_ptr

```

Screen output. Printing to file is possible in principle (using a C++ output channel), by allowing an argument. Printing to an open Fortran unit is obviously not possible.

```

<HepMC interface: interfaces>+≡
    interface
        subroutine gen_event_print (evt_obj) bind(C)
            import
            type(c_ptr), value :: evt_obj

real(c_double), value :: xs, xs_err
end subroutine gen_event_set_cross_section
end interface

```

### 18.12.9 Event-particle iterator

This iterator iterates over all particles in an event. We store a pointer to the event in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
public :: hepmc_event_particle_iterator_t

<HepMC interface: types>+≡
type :: hepmc_event_particle_iterator_t
private
type(c_ptr) :: obj
type(c_ptr) :: evt_obj
end type hepmc_event_particle_iterator_t

```

Constructor. The iterator is initialized at the first particle in the event.

```

<HepMC interface: interfaces>+≡
interface
type(c_ptr) function new_event_particle_const_iterator (evt_obj) bind(C)
import
type(c_ptr), value :: evt_obj

```

```

        end function new_event_particle_const_iterator
    end interface

    <HepMC interface: public>+≡
        public :: hepmc_event_particle_iterator_init

    <HepMC interface: procedures>+≡
        subroutine hepmc_event_particle_iterator_init (it, evt)
            type(hepmc_event_particle_iterator_t), intent(out) :: it
            type(hepmc_event_t), intent(in) :: evt
            it%obj = new_event_particle_const_iterator (evt%obj)
            it%evt_obj = evt%obj
        end subroutine hepmc_event_particle_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```

    <HepMC interface: interfaces>+≡
        interface
            subroutine event_particle_const_iterator_delete (it_obj) bind(C)
                import
                type(c_ptr), value :: it_obj
            end subroutine event_particle_const_iterator_delete
        end interface

    <HepMC interface: public>+≡
        public :: hepmc_event_particle_iterator_final

    <HepMC interface: procedures>+≡
        subroutine hepmc_event_particle_iterator_final (it)
            type(hepmc_event_particle_iterator_t), intent(inout) :: it
            call event_particle_const_iterator_delete (it%obj)
        end subroutine hepmc_event_particle_iterator_final

```

Increment

```

    <HepMC interface: interfaces>+≡
        interface
            subroutine event_particle_const_iterator_advance (it_obj) bind(C)
                import
                type(c_ptr), value :: it_obj
            end subroutine event_particle_const_iterator_advance
        end interface

    <HepMC interface: public>+≡
        public :: hepmc_event_particle_iterator_advance

    <HepMC interface: procedures>+≡
        subroutine hepmc_event_particle_iterator_advance (it)
            type(hepmc_event_particle_iterator_t), intent(inout) :: it
            call event_particle_const_iterator_advance (it%obj)
        end subroutine hepmc_event_particle_iterator_advance

```

Reset to the beginning

```

    <HepMC interface: interfaces>+≡
        interface
            subroutine event_particle_const_iterator_reset (it_obj, evt_obj) bind(C)
                import

```

```

        type(c_ptr), value :: it_obj, evt_obj
    end subroutine event_particle_const_iterator_reset
end interface

<HepMC interface: public>+≡
    public :: hepmc_event_particle_iterator_reset

### 18.12.10 I/O streams

There is a specific I/O stream type for handling the output of GenEvent objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```

<HepMC interface: public>+≡
public :: hepmc_iostream_t

```

```

<HepMC interface: types>+≡
  type :: hepmc_iostream_t
  private
  type(c_ptr) :: obj
end type hepmc_iostream_t

```

Constructor for an output stream associated to a file.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_io_gen_event_out (hepmc3_mode, filename) bind(C)
    import
    integer(c_int), intent(in) :: hepmc3_mode
    character(c_char), dimension(*), intent(in) :: filename
    end function new_io_gen_event_out
  end interface

<HepMC interface: public>+≡
  public :: hepmc_iostream_open_out

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_open_out (iostream, filename, hepmc3_mode)
    type(hepmc_iostream_t), intent(out) :: iostream
    type(string_t), intent(in) :: filename
    integer, intent(in) :: hepmc3_mode
    integer(c_int) :: mode
    mode = hepmc3_mode
    iostream%obj = &
      new_io_gen_event_out (mode, char (filename) // c_null_char)
  end subroutine hepmc_iostream_open_out

```

Constructor for an input stream associated to a file.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_io_gen_event_in (hepmc3_mode, filename) bind(C)

```

*<HepMC interface: tests>*

end module hepmc\_interface\_util

API: driver for the unit tests below.

*<HepMC interface: public test>*≡

public :: hepmc\_interface\_test

*<HepMC interface: test driver>*≡

subroutine hepmc\_interface\_test (u, results)

integer, intent(in) :: u

type(test\_results\_t), intent(inout) :: results

*<HepMC interface: execute tests>*

end subroutine hepmc\_interface\_test

This test example is an abridged version from the build-from-scratch example in the HepMC distribution. We create two vertices for  $p \rightarrow q$  PDF splitting, then a vertex for a  $qq \rightarrow W^- g$  hard-interaction process, and finally a vertex for  $W^- \rightarrow qq$  decay. The setup is for LHC kinematics.

Extending the original example, we set color flow for the incoming quarks and polarization for the outgoing photon. For the latter, we have to define a particle-data object for the photon, so a flavor object can be correctly initialized.

## 18.13 LCIO events

This section provides the interface to the LCIO C++ library for handling Monte-Carlo events.

Each C++ class of LCIO that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of LCIO that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

```

<lcio_interface.f90>≡
  <File header>

```

```

module lcio_interface

  use, intrinsic :: iso_c_binding !NODEP!

  <Use kinds>
  <Use strings>
  use constants, only: PI

```

```

    use physics_defs, only: ns_per_mm
    use diagnostics
    use lorentz
    use flavors
    use colors
    use helicities
    use polarizations
    use event_handles, only: event_handle_t

    <Standard module head>

    <LCIO interface: public>

    <LCIO interface: types>

    <LCIO interface: interfaces>

    contains

    <LCIO interface: procedures>

end module lcio_interface

```

### 18.13.1 Interface check

This function can be called in order to verify that we are using the actual LCIO library, and not the dummy version.

```

<LCIO interface: interfaces>≡
    interface
        logical(c_bool) function lcio_available () bind(C)
            import
        end function lcio_available
    end interface

<LCIO interface: public>≡
    public :: lcio_is_available

<LCIO interface: procedures>≡
    function lcio_is_available () result (flag)
        logical :: flag
        flag = lcio_available ()
    end function lcio_is_available

```

### 18.13.2 LCIO Run Header

This is a type for the run header of the LCIO file.

```

<LCIO interface: public>+≡
    public :: lcio_run_header_t

<LCIO interface: types>≡
    type :: lcio_run_header_t
    private
    type(c_ptr) :: obj

```

```
end type lcio_run_header_t
```

The Fortran version has initializer form.

*<LCIO interface: interfaces>+≡*

```
interface
  type(c_ptr) function new_lcio_run_header (proc_id) bind(C)
  import
  integer(c_int), value :: proc_id
  end function new_lcio_run_header
end interface
```

*<LCIO interface: interfaces>+≡*

```
interface
  subroutine run_header_set_simstring &
    (runhdr_obj, simstring) bind(C)
  import
  type(c_ptr), value :: runhdr_obj
  character(c_char), dimension(*), intent(in) :: simstring
  end subroutine run_header_set_simstring
end interface
```

*<LCIO interface: public>+≡*

```
public :: lcio_run_header_init
```

*<LCIO interface: procedures>+≡*

```
subroutine lcio_run_header_init (runhdr, proc_id, run_id)
  type(lcio_run_header_t), intent(out) :: runhdr
  integer, intent(in), optional :: proc_id, run_id
  integer(c_int) :: rid
  rid = 0; if (present (run_id)) rid = run_id
  runhdr%obj = new_lcio_run_header (rid)
  call run_header_set_simstring (runhdr%obj, &
    "WHIZARD version:" // "{Version}")
end subroutine lcio_run_header_init
```

*<LCIO interface: interfaces>+≡*

```
interface
  subroutine write_run_header (lcwrt_obj, runhdr_obj) bind(C)
  import
  type(c_ptr), value :: lcwrt_obj
  type(c_ptr), value :: runhdr_obj
  end subroutine write_run_header
end interface
```

*<LCIO interface: public>+≡*

```
public :: lcio_run_header_write
```

*<LCIO interface: procedures>+≡*

```
subroutine lcio_run_header_write (wrt, hdr)
  type(lcio_writer_t), intent(inout) :: wrt
  type(lcio_run_header_t), intent(inout) :: hdr
  call write_run_header (wrt%obj, hdr%obj)
end subroutine lcio_run_header_write
```

### 18.13.3 LCIO Event and LC Collection

The main object of LCIO is a LCEventImpl. The object is filled by MCParticle objects, which are set as LCCollection.

```
<LCIO interface: public>+≡
  public :: lccollection_t

<LCIO interface: types>+≡
  type :: lccollection_t
  private
    type(c_ptr) :: obj = c_null_ptr
  end type lccollection_t
```

Initializer.

```
<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function new_lccollection () bind(C)
    import
  end function new_lccollection
  end interface

<LCIO interface: public>+≡
  public :: lcio_event_t

<LCIO interface: types>+≡
  type, extends (event_handle_t) :: lcio_event_t
  private
    type(c_ptr) :: obj = c_null_ptr
    type(lccollection_t) :: lccoll
  end type lcio_event_t
```

Constructor. Arguments are process ID (integer) and event ID (integer).

The Fortran version has initializer form.

```
<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function new_lcio_event (proc_id, event_id, run_id) bind(C)
    import
    integer(c_int), value :: proc_id, event_id, run_id
  end function new_lcio_event
  end interface

<LCIO interface: public>+≡
  public :: lcio_event_init

<LCIO interface: procedures>+≡
  subroutine lcio_event_init (evt, proc_id, event_id, run_id)
    type(lcio_event_t), intent(out) :: evt
    integer, intent(in), optional :: proc_id, event_id, run_id
    integer(c_int) :: pid, eid, rid
    pid = 0; if (present (proc_id)) pid = proc_id
    eid = 0; if (present (event_id)) eid = event_id
    rid = 0; if (present (run_id)) rid = run_id
    evt%obj = new_lcio_event (pid, eid, rid)
    evt%lccoll%obj = new_lccollection ()
  end subroutine lcio_event_init
```

Destructor.

```
<LCIO interface: interfaces>+≡  
  interface  
    subroutine lcio_event_delete (evt_obj) bind(C)  
      import  
        type(c_ptr), value :: evt_obj  
    end subroutine lcio_event_delete  
  end interface
```

Show event on screen.

```
<LCIO interface: interfaces>+≡  
  interface  
    subroutine dump_lcio_event (evt_obj) bind(C)  
      import  
        type(c_ptr), value :: evt_obj  
    end subroutine dump_lcio_event  
  end interface
```

```
<LCIO interface: public>+≡  
  public :: show_lcio_event
```

```
<LCIO interface: procedures>+≡  
  subroutine show_lcio_event (evt)  
    type(lcio_event_t), intent(in) :: evt  
    if (c_associated (evt%obj)) then  
      call dump_lcio_event (evt%obj)  
    else  
      call msg_error ("LCIO event is not allocated.")  
    end if  
  end subroutine show_lcio_event
```

Put a single event to file.

```
<LCIO interface: interfaces>+≡  
  interface  
    subroutine lcio_event_to_file (evt_obj, filename) bind(C)  
      import  
        type(c_ptr), value :: evt_obj  
        character(c_char), dimension(*), intent(in) :: filename  
    end subroutine lcio_event_to_file  
  end interface  
  
<LCIO interface: public>+≡  
  public :: write_lcio_event  
  
<LCIO interface: procedures>+≡  
  subroutine write_lcio_event (evt, filename)  
    type(lcio_event_t), intent(in) :: evt  
    type(string_t), intent(in) :: filename  
    call lcio_event_to_file (evt%obj, char (filename) // c_null_char)  
  end subroutine write_lcio_event
```

Finalize: use the LCIO destructor. Also nullify the pointer explicitly, to be on the safe side.

```
<LCIO interface: public>+≡  
  public :: lcio_event_final
```

```

<LCIO interface: procedures>+≡
  subroutine lcio_event_final (evt, delete)
    type(lcio_event_t), intent(inout) :: evt
    logical, intent(in) :: delete
    if (c_associated (evt%obj)) then
      if (delete) call lcio_event_delete (evt%obj)
      evt%obj = c_null_ptr
      evt%lccoll%obj = c_null_ptr
    end if
  end subroutine lcio_event_final

```

Nullify: do not call the destructor, just nullify the C pointer. There should be another pointer associated with the object.

```

<LCIO interface: public>+≡
  public :: lcio_event_nullify

<LCIO interface: procedures>+≡
  subroutine lcio_event_nullify (evt)
    type(lcio_event_t), intent(inout) :: evt
    evt%obj = c_null_ptr
    evt%lccoll%obj = c_null_ptr
  end subroutine lcio_event_nullify

```

Return the actual object as a C pointer. For use in the native C++ interface only.

```

<LCIO interface: public>+≡
  public :: lcio_event_get_c_ptr

<LCIO interface: procedures>+≡
  function lcio_event_get_c_ptr (evt) result (p)
    type(lcio_event_t), intent(in) :: evt
    type(c_ptr) :: p
    p = evt%obj
  end function lcio_event_get_c_ptr

```

```

<LCIO interface: interfaces>+≡
  interface
    subroutine lcio_set_weight (evt_obj, weight) bind(C)
      import
      type(c_ptr), value :: evt_obj
      real(c_double), value :: weight

```

### 18.13.5 Polarization

For polarization there is a three-component float entry foreseen in the LCIO format. Completely generic density matrices can in principle be attached to events as float vectors added to LCCollection of the LCEvent. This is not yet implemented currently. Here, we restrict ourselves to the same implementation as in HepMC format: we use two entries as the polarization angles, while the first entry gives the degree of polarization (something not specified in the HepMC format). *For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle  $\pi/2$ . This works under the condition that helicity is projected onto one of the basis states.*

### 18.13.6 LCIO Writer type

There is a specific LCIO Writer type for handling the output of LCEventImpl objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```
<LCIO interface: public>+≡
    public :: lcio_writer_t

<LCIO interface: types>+≡
    type :: lcio_writer_t
    private
        type(c_ptr) :: obj
    end type lcio_writer_t
```

Constructor for an output associated to a file.

```
<LCIO interface: interfaces>+≡
    interface
        type(c_ptr) function open_lcio_writer_new (filename, complevel) bind(C)
        import
            character(c_char), dimension(*), intent(in) :: filename
            integer(c_int), intent(in) :: complevel
        end function open_lcio_writer_new
    end interface

<LCIO interface: public>+≡
    public :: lcio_writer_open_out

<LCIO interface: procedures>+≡
    subroutine lcio_writer_open_out (lcio_writer, filename)
        type(lcio_writer_t), intent(out) :: lcio_writer
        type(string_t), intent(in) :: filename
        lcio_writer%obj = open_lcio_writer_new (char (filename) // &
            c_null_char, 9_c_int)
    end subroutine lcio_writer_open_out
```

Destructor:

```
<LCIO interface: interfaces>+≡
    interface
        subroutine lcio_writer_delete (io_obj) bind(C)
        import
            type(c_ptr), value :: io_obj
        end subroutine lcio_writer_delete
    end interface

<LCIO interface: public>+≡
    public :: lcio_writer_close

<LCIO interface: procedures>+≡
    subroutine lcio_writer_close (lcio_writer)
        type(lcio_writer_t), intent(inout) :: lcio_writer
        call lcio_writer_delete (lcio_writer%obj)
    end subroutine lcio_writer_close
```

Write a single event to the LCIO writer.

```

<LCIO interface: interfaces>+≡
  interface
    subroutine lcio_write_event (io_obj, evt_obj) bind(C)
      import
      type(c_ptr), value :: io_obj, evt_obj
    end subroutine lcio_write_event
  end interface
<LCIO interface: public>+≡
  public :: lcio_event_write
<LCIO interface: procedures>+≡

    type(lcio_event_t), intent(in) :: evt
    call lcio_write_event (wrt%obj, evt%obj)
  end subroutine lcio_event_write

```

### 18.13.7 LCIO Reader type

There is a specific LCIO Reader type for handling the input of LCEventImpl objects (i.e., Monte Carlo event samples) from file. Opening the file is done by the constructor, closing by the destructor.

```

<LCIO interface: public>+≡
  public :: lcio_reader_t
<LCIO interface: types>+≡
  type :: lcio_reader_t
  private
  type(c_ptr) :: obj
  end type lcio_reader_t

```

Constructor for an output associated to a file.

```

<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function open_lcio_reader (filename) bind(C)
      import
      character(c_char), dimension(*), intent(in) :: filename
    end function open_lcio_reader
  end interface
<LCIO interface: public>+≡
  public :: lcio_open_file
<LCIO interface: procedures>+≡
  subroutine lcio_open_file (lcio_reader, filename)
    type(lcio_reader_t), intent(out) :: lcio_reader
    type(string_t), intent(in) :: filename
    lcio_reader%obj = open_lcio_reader (char (filename) // c_null_char)
  end subroutine lcio_open_file

```

Destructor:

```
<LCIO interface: interfaces>+≡
interface
  subroutine lcio_reader_delete (io_obj) bind(C)
    import
    type(c_ptr), value :: io_obj
  end subroutine lcio_reader_delete
end interface

<LCIO interface: public>+≡
public :: lcio_reader_close

<LCIO interface: procedures>+≡
subroutine lcio_reader_close (lcioreader)
  type(lcio_reader_t), intent(inout) :: lcioreader
  call lcio_reader_delete (lcioreader%obj)
end subroutine lcio_reader_close
```

Read a single event from the event file. Return true if successful.

```
<LCIO interface: interfaces>+≡
interface
  type(c_ptr) function read_lcio_event (io_obj) bind(C)
    import
    type(c_ptr), value :: io_obj
  end function read_lcio_event
end interface

<LCIO interface: public>+≡
public :: lcio_read_event

<LCIO interface: procedures>+≡

## 18.14 HEP Common and Events

This is a separate module that manages data exchange between the common blocks and `event_t` objects. We separate this from the previous module in order to avoid a circular module dependency. It also contains the functions necessary for communication between `hepmc_event_t` and `event_t` or `lcio_event_t` and `event_t` as well as `particle_set_t` and `particle_t` objects.

`<hep_events.f90>`≡

```

### 18.14.1 Data Transfer: events

Fill the HEPEUP block, given a WHIZARD event object.

```

<HEP events: public>≡
  public :: hepeup_from_event

<HEP events: procedures>≡
  subroutine hepeup_from_event &
    (event, keep_beams, keep_remnants, process_index)
    class(generic_event_t), intent(in), target :: event
    logical, intent(in), optional :: keep_beams
    logical, intent(in), optional :: keep_remnants
    integer, intent(in), optional :: process_index
    type(particle_set_t), pointer :: particle_set
    real(default) :: scale, alpha_qcd
    if (event%has_valid_particle_set ()) then
      particle_set => event%get_particle_set_ptr ()
      call hepeup_from_particle_set (particle_set, keep_beams, keep_remnants)
      if (present (process_index)) then
        call hepeup_set_event_parameters (proc_id = process_index)

```

```

end if
scale = event%get_fac_scale ()
if (.not. vanishes (scale)) then
    call hepeup_set_event_parameters (scale = scale)
end if
alpha_qcd = event%get_alpha_s ()
if (.not. vanishes (alpha_qcd)) then
    call hepeup_set_event_parameters (alpha_qcd = alpha_qcd)
end if
if (event%weight_prc_is_known ()) then
    call hepeup_set_event_parameters (weight = event%get_weight_prc ())
end if
else
    call msg_bug ("HEPEUP: event incomplete")
end if
end subroutine hepeup_from_event

```

Reverse.

Note: The current implementation sets the particle set of the hard process and is therefore not useful if the event on file is dressed. This should be reconsidered.

Note: setting of scale or alpha is not yet supported by the `event_t` object. Ticket #628.

```

<HEP events: public>+≡
    public :: hepeup_to_event

## HepMC format

The master output function fills a HepMC GenEvent object that is already initialized, but has no vertices in it.

We first set up the vertex lists and enter the vertices into the HepMC event. Then, we assign first all incoming particles and then all outgoing particles to their associated vertices. Particles which have neither parent nor children entries (this should not happen) are dropped.

Finally, we insert the beam particles. If there are none, use the incoming particles instead. Transform a particle into a `hepmc_particle` object, including color and polarization. The HepMC status is equivalent to the HEPEVT status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see <http://herwig.hepforge.org/trac/wiki/FaQs>.

```

Initialize a particle from a HepMC particle object. The model is necessary for making a fully qualified flavor component. We have the additional flag `polarized` which tells whether the polarization information should be interpreted or ignored, and the lookup array of barcodes. Note that the lookup array is searched linearly, a possible bottleneck for large particle arrays. If necessary, the barcode array could be replaced by a hash table.

If a particle set is initialized from a HepMC event record, we have to specify the treatment of polarization (unpolarized or density matrix) which is common to all particles. Correlated polarization information is not available.

There is some complication in reconstructing incoming particles and beam remnants. First of all, they all will be tagged as virtual. We then define an incoming particle as

```

## LCIO event format

The master output function fills a LCIO event object that is already initialized, but has no particles in it.

In contrast to HepMC in LCIO there are no vertices (except for tracker and other detector specifications). So we assign first all incoming particles and then all outgoing particles to LCIO particle types. Particles which have neither

parent nor children entries (this should not happen) are dropped. Finally, we insert the beam particles. If there are none, use the incoming particles instead.

Transform a particle into a `lcio_particle` object, including color and polarization. The LCIO status is equivalent to the HepMC status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see <http://herwig.hepforge.org/trac/wiki/FaQs>.

A beam-remnant particle (e.g., ISR photon) that has no children is tagged as outgoing, otherwise unphysical.

Input an event. Upon input of `i_prc`, we can just read in the whole HEPEUP common block. These data are known to come first. The `i_prc` value can be deduced from the IDPRUP value by a table lookup.

Reading the common block bypasses the `cstream` which accesses the input unit. This is consistent with the LHEF specification. After the common-block data have been swallowed, we can resume reading from stream.

We don't catch actual I/O errors. However, we return a negative value in `iostat` if we reached the terminating `</LesHouchesEvents>` tag.

```

Since we have already read the event information from file, this input routine can transfer the common-block contents to the event record. Also, we read any further information in the event record.

Since LHEF doesn't give this information, we must assume that the MCI group, term, and channel can all be safely set to 1. This works if there is only one MCI group and term. The channel doesn't matter for the matrix element.

The event index is incremented, as if the event was generated. The LHEF format does not support event indices.

    end subroutine err_version
  end subroutine eio_lhef_read_header

```

### 18.15.5 Version-Specific Code: 1.0

In version 1.0, the init tag contains just HEPUP data. While a `cstream` is connected to the input unit, we bypass it temporarily for the purpose of reading the HEPUP contents. This is consistent with the LHEF standard.

This routine does not read the closing tag of the init block.

```

<EIO LHEF: eio_lhef: TBP>+≡
  procedure :: read_init_10 => eio_lhef_read_init_10

```

```

<EIO LHEF: procedures>+≡
subroutine eio_lhef_read_init_10 (eio, data)
  class(eio_lhef_t), intent(in) :: eio
  type(event_sample_data_t), intent(out) :: data
  integer :: n_proc, i
  call heprup_read_lhef (eio%unit)
  call heprup_get_run_parameters (n_processes = n_proc)
  call data%init (n_proc)
  data%n_beam = 2
  call heprup_get_run_parameters ( &
    unweighted = data%unweighted, &
    negative_weights = data%negative_weights, &
    beam_pdg = data%pdg_beam, &
    beam_energy = data%energy_beam)
  if (data%unweighted) then
    data%norm_mode = NORM_UNIT
  else
    data%norm_mode = NORM_SIGMA
  end if
  do i = 1, n_proc
    call heprup_get_process_parameters (i, &
      process_id = data%proc_num_id(i), &
      cross_section = data%cross_section(i), &
      error = data%error(i))
  end do
end subroutine eio_lhef_read_init_10

```

### 18.15.6 Version-Specific Code: 2.0

This is the init information for the 2.0 format, after the HEPRUP data. We have the following tags:

- **generator** Generator name and version.
- **xsecinfo** Cross section and weights data. We have the total cross section and number of events (assuming that the event file is intact), but information on minimum and maximum weights is not available before the file is complete. We just write the mandatory tags. (Note that the default values of the other tags describe a uniform unit weight, but we can determine most values only after the sample is complete.)
- **cutsinfo** This optional tag is too specific to represent the possibilities of WHIZARD, so we skip it.
- **procinfo** This optional tag is useful for giving details of NLO calculations. Skipped.
- **mergetype** Optional, also not applicable.

```

<EIO LHEF: eio_lhef: TBP>+≡
procedure :: write_init_20 => eio_lhef_write_init_20

```

```

<EIO LHEF: procedures>+≡
subroutine eio_lhef_write_init_20 (eio, data)
  class(eio_lhef_t), intent(in) :: eio
  type(event_sample_data_t), intent(in) :: data
  integer :: u
  u = eio%unit
  call eio%tag_generator%write (u)
  write (u, "(A)", advance="no") "WHIZARD"
  call eio%tag_generator%close (u); write (u, *)
  call eio%tag_xsecinfo%write (u); write (u, *)
end subroutine eio_lhef_write_init_20

```

When reading the init block, we first call the 1.0 routine that fills HEPRUP. Then we consider the possible tags. Only the `generator` and `xsecinfo` tags are of interest. We skip everything else except for the closing tag.

```

### 18.15.7 Version-Specific Code: 3.0

This is the init information for the 3.0 format, after the HEPUP data. We have the following tags:

- **generator** Generator name and version.
- **xsecinfo** Cross section and weights data. We have the total cross section and number of events (assuming that the event file is intact), but information on minimum and maximum weights is not available before the file is complete. We just write the mandatory tags. (Note that the default values of the other tags describe a uniform unit weight, but we can determine most values only after the sample is complete.)
- **cutsinfo** This optional tag is too specific to represent the possibilities of WHIZARD, so we skip it.
- **procinfo** This optional tag is useful for giving details of NLO calculations. Skipped.
- **weightinfo** Determine the meaning of optional weights, whose values are given in the event record.

```

<EIO LHEF: eio_lhef: TBP>+≡
  procedure :: write_init_30 => eio_lhef_write_init_30

<EIO LHEF: procedures>+≡
  subroutine eio_lhef_write_init_30 (eio, data)
    class(eio_lhef_t), intent(in) :: eio
    type(event_sample_data_t), intent(in) :: data
    integer :: u, i
    u = given_output_unit (eio%unit)
    call eio%tag_generator%write (u)
    write (u, "(A)", advance="no") "WHIZARD"
    call eio%tag_generator%close (u); write (u, *)
    call eio%tag_xsecinfo%write (u); write (u, *)
    if (eio%write_sqme_ref) then
      call eio%tag_sqme_ref%write (u); write (u, *)
    end if
    if (eio%write_sqme_prc) then
      call eio%tag_sqme_prc%write (u); write (u, *)
    end if
    if (eio%write_sqme_alt) then
      do i = 1, eio%n_alt
        call eio%tag_sqme_alt(i)%write (u); write (u, *)
      end do
    end if
    do i = 1, eio%n_alt
      call eio%tag_wgts_alt(i)%write (u); write (u, *)
    end do
  end subroutine eio_lhef_write_init_30

```

When reading the init block, we first call the 1.0 routine that fills HEPRUP. Then we consider the possible tags. Only the **generator** and **xsecinfo** tags are of interest. We skip everything else except for the closing tag.

```

    end subroutine err_init
end subroutine eio_lhef_read_init_30

```

This is additional event-specific information for the 3.0 format, after the HEP-EUP data. We can specify weights, starting from the master weight and adding alternative weights. The weight tags are already allocated, so we just have to transfer the weight values to strings, assemble them and write them to file. All weights are collected in a single tag.

Note: If efficiency turns out to be an issue, we may revert to traditional character buffer writing. However, we need to know the maximum length.

```

<EIO LHEF: eio_lhef: TBP>+≡
    procedure :: write_event_30 => eio_lhef_write_event_30

<EIO LHEF: procedures>+≡
    subroutine eio_lhef_write_event_30 (eio, event)
        class(eio_lhef_t), intent(in) :: eio
        class(generic_event_t), intent(in) :: event
        type(string_t) :: s
    end subroutine

```

```

integer :: u, i
u = eio%unit
s = ""
if (eio%write_sqme_ref) then
  s = s // str (event%get_sqme_ref ()) // " "
end if
if (eio%write_sqme_prc) then
  s = s // str (event%get_sqme_prc ()) // " "
end if
if (eio%n_alt > 0) then
  if (eio%write_sqme_alt) then
    s = s // str (event%get_sqme_alt(1)) // " "
    do i = 2, eio%n_alt
      s = s // str (event%get_sqme_alt(i)) // " "
    end do
  end if
  s = s // str (event%get_weight_alt(1)) // " "
  do i = 2, eio%n_alt
    s = s // str (event%get_weight_alt(i)) // " "
  end do
end if
if (len_trim (s) > 0) then
  call eio%tag_weights%write (trim (s), u); write (u, *)
end if
end subroutine eio_lhef_write_event_30

```

Read extra event data. If there is a `weights` tag and if there was a `weightinfo` entry labeled `sqme_prc`, we extract the corresponding entry from the weights string and store this as the event's squared matrix-element value. Other tags, including tags written by the above writer, are skipped.

## 18.16 STDHEP File Formats

Here, we implement the two existing STDHEP file formats, one based on the HEPRUP/HEPEUP common blocks, the other based on the HEPEVT common block. The second one is actually the standard STDHEP format.

```

⟨eio_stdhep.f90⟩≡
  ⟨File header⟩

module eio_stdhep

  use kinds, only: i32, i64
  ⟨Use strings⟩
  use io_units
  use string_utils
  use diagnostics
  use event_base
  use event_handles, only: event_handle_t
  use hep_common
  use hep_events
  use eio_data
  use eio_base

  ⟨Standard module head⟩

  ⟨EIO stdhep: public⟩

```

```

    <EIO stdhep: types>

    <EIO stdhep: variables>

    contains

    <EIO stdhep: procedures>

    end module eio_stdhep

```

### 18.16.1 Type

```

<EIO stdhep: public>≡
    public :: eio_stdhep_t

<EIO stdhep: types>≡
    type, abstract, extends (eio_t) :: eio_stdhep_t
        logical :: writing = .false.
        logical :: reading = .false.
        integer :: unit = 0
        logical :: keep_beams = .false.
        logical :: keep_remnants = .true.
        logical :: ensure_order = .false.
        logical :: recover_beams = .false.
        logical :: use_alphas_from_file = .false.
        logical :: use_scale_from_file = .false.
        integer, dimension(:), allocatable :: proc_num_id
        integer(i64) :: n_events_expected = 0
    contains
        <EIO stdhep: eio stdhep: TBP>
    end type eio_stdhep_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepevt_t

<EIO stdhep: types>+≡
    type, extends (eio_stdhep_t) :: eio_stdhep_hepevt_t
    end type eio_stdhep_hepevt_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepeup_t

<EIO stdhep: types>+≡
    type, extends (eio_stdhep_t) :: eio_stdhep_hepeup_t
    end type eio_stdhep_hepeup_t

<EIO stdhep: public>+≡
    public :: eio_stdhep_hepev4_t

<EIO stdhep: types>+≡
    type, extends (eio_stdhep_t) :: eio_stdhep_hepev4_t
    end type eio_stdhep_hepev4_t

```

### 18.16.2 Specific Methods

Set parameters that are specifically used with STDHEP file formats.

*(EIO stdhep: eio stdhep: TBP)*≡

```
procedure :: set_parameters => eio_stdhep_set_parameters
```

*(EIO stdhep: procedures)*≡

```
subroutine eio_stdhep_set_parameters (eio, &
    keep_beams, keep_remnants, ensure_order, recover_beams, &
    use_alphas_from_file, use_scale_from_file, extension)
class(eio_stdhep_t), intent(inout) :: eio
logical, intent(in), optional :: keep_beams
logical, intent(in), optional :: keep_remnants
logical, intent(in), optional :: ensure_order
logical, intent(in), optional :: recover_beams
logical, intent(in), optional :: use_alphas_from_file
logical, intent(in), optional :: use_scale_from_file
type(string_t), intent(in), optional :: extension
if (present (keep_beams)) eio%keep_beams = keep_beams
if (present (keep_remnants)) eio%keep_remnants = keep_remnants

## 18.17 HepMC Output

The HepMC event record is standardized. It is an ASCII format. We try our best at using it for both input and output.

```

<eio_hepmc.f90>≡
  <File header>

  module eio_hepmc

    <Use kinds>
    <Use strings>
    use io_units
    use string_utils
    use diagnostics
    use particles
    use model_data
    use event_base
    use event_handles, only: event_handle_t
    use hep_events
    use eio_data
    use eio_base
    use hepmc_interface

    <Standard module head>

    <EIO HepMC: public>

```

*<EIO HepMC: types>*

contains

*<EIO HepMC: procedures>*

end module eio\_hepmc

### 18.17.1 Type

A type `hepmc_event` is introduced as container to store HepMC event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported. Beams will always be written. Tools like `Rivet` can use the cross section information of a HepMC file for scaling plots. As there is no header in HepMC and this is written for every event, we make it optional with `output_cross_section`.

*<EIO HepMC: public>*≡

public :: eio\_hepmc\_t

*<EIO HepMC: types>*≡

```
type, extends (eio_t) :: eio_hepmc_t
  logical :: writing = .false.
  logical :: reading = .false.
  type(event_sample_data_t) :: data
  ! logical :: keep_beams = .false.
  logical :: recover_beams = .false.
  logical :: use_alphas_from_file = .false.
  logical :: use_scale_from_file = .false.
  logical :: output_cross_section = .false.
  integer :: hepmc3_mode = HEPMC3_MODE_HEPMC3
  type(hepmc_iostream_t) :: iostream
  type(hepmc_event_t) :: hepmc_event
  integer, dimension(:), allocatable :: proc_num_id
contains
  <EIO HepMC: eio hepmc: TBP>
end type eio_hepmc_t
```

### 18.17.2 Specific Methods

Set parameters that are specifically used with HepMC.

*<EIO HepMC: eio hepmc: TBP>*≡

procedure :: set\_parameters => eio\_hepmc\_set\_parameters

*<EIO HepMC: procedures>*≡

```
subroutine eio_hepmc_set_parameters &
  (eio, &
    recover_beams, use_alphas_from_file, use_scale_from_file, &
    extension, output_cross_section, hepmc3_mode)
class(eio_hepmc_t), intent(inout) :: eio
logical, intent(in), optional :: recover_beams
```

```

## 18.18 LCIO Output

The LCIO event record is standardized for the use with Linear  $e^+e^-$  colliders. It is a binary event format. We try our best at using it for both input and output.

```

⟨eio_lcio.f90⟩≡
  ⟨File header⟩

module eio_lcio

  ⟨Use kinds⟩
  ⟨Use strings⟩
  use io_units
  use string_utils
  use diagnostics
  use particles
  use event_base
  use event_handles, only: event_handle_t
  use hep_events
  use eio_data
  use eio_base
  use lcio_interface

  ⟨Standard module head⟩

```

```

    <EIO LCIO: public>

    <EIO LCIO: types>

contains

    <EIO LCIO: procedures>

end module eio_lcio

```

### 18.18.1 Type

A type `lcio_event` is introduced as container to store LCIO event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported.

```

<EIO LCIO: public>≡
    public :: eio_lcio_t

<EIO LCIO: types>≡
    type, extends (eio_t) :: eio_lcio_t
        logical :: writing = .false.
        logical :: reading = .false.
        type(event_sample_data_t) :: data
        logical :: recover_beams = .false.
        logical :: use_alphas_from_file = .false.
        logical :: use_scale_from_file = .false.
        logical :: proc_as_run_id = .true.
        integer :: n_alt = 0
        integer :: lcio_run_id = 0
        type(lcio_writer_t) :: lcio_writer
        type(lcio_reader_t) :: lcio_reader
        type(lcio_run_header_t) :: lcio_run_hdr
        type(lcio_event_t) :: lcio_event
        integer, dimension(:), allocatable :: proc_num_id
    contains
        <EIO LCIO: eio lcio: TBP>
    end type eio_lcio_t

```

### 18.18.2 Specific Methods

Set parameters that are specifically used with LCIO.

```

<EIO LCIO: eio lcio: TBP>≡
    procedure :: set_parameters => eio_lcio_set_parameters

<EIO LCIO: procedures>≡
    subroutine eio_lcio_set_parameters &
        (eio, recover_beams, use_alphas_from_file, use_scale_from_file, &
         extension, proc_as_run_id, lcio_run_id)
    class(eio_lcio_t), intent(inout) :: eio
    logical, intent(in), optional :: recover_beams
    logical, intent(in), optional :: use_alphas_from_file

```

```

logical, intent(in), optional :: use_scale_from_file
logical, intent(in), optional :: proc_as_run_id
integer, intent(in), optional :: lcio_run_id
type(string_t), intent(in), optional :: extension
if (present (recover_beams)) eio%recover_beams = recover_beams

## Chapter 19

# Phase Space

The abstract representation of a type that parameterizes phase space, with methods for construction and evaluation.

**phs\_base** Abstract phase-space representation.

A simple implementation:

**phs\_none** This implements a non-functional dummy module for the phase space. A process which uses this module cannot be integrated. The purpose of this module is to provide a placeholder for processes which do not require phase-space evaluation. They may still allow for evaluating matrix elements.

**phs\_single** Parameterize the phase space of a single particle, i.e., the solid angle. This is useful only for very restricted problems, but it avoids the complexity of a generic approach in those trivial cases.

The standard implementation is called *wood* phase space. It consists of several auxiliary modules and the actual implementation module.

**mappings** Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

**phs\_trees** Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

**phs\_forests** The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

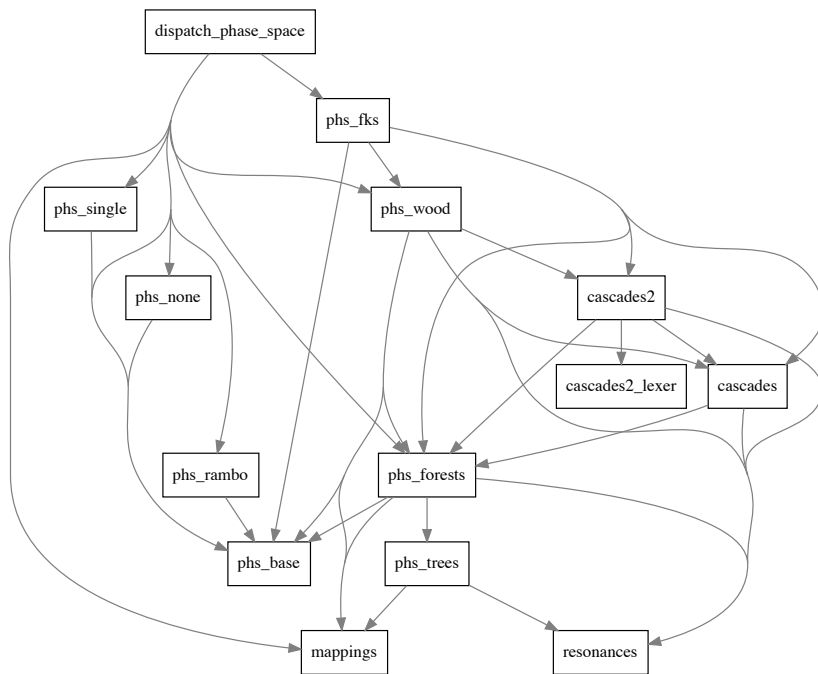

Figure 19.1: Module dependencies in `src/phase_space`.

**cascades** This module is a pseudo Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

**phs\_wood** Make the functionality available in form of an implementation of the abstract phase-space type.

**phs\_fks** Phase-space parameterization with modifications for the FKS scheme.

## 19.1 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

```
<phs_base.f90>≡  
  <File header>  
  
  module phs_base  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use constants, only: TWOPI, TWOPI4  
    use string_utils, only: split_string  
    use format_defs, only: FMT_19  
    use numeric_utils  
    use diagnostics  
    use md5  
    use physics_defs  
    use lorentz  
    use model_data  
    use flavors  
    use process_constants  
  
    <Standard module head>  
  
    <PHS base: public>  
  
    <PHS base: types>  
  
    <PHS base: interfaces>  
  
    contains  
  
    <PHS base: procedures>  
  
  end module phs_base
```

### 19.1.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

#### Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

```
<PHS base: public>≡  
  public :: channel_prop_t  
  
<PHS base: types>≡  
  type, abstract :: channel_prop_t
```

```

contains
  procedure (channel_prop_to_string), deferred :: to_string
  generic :: operator (==) => is_equal
  procedure (channel_eq), deferred :: is_equal
end type channel_prop_t

```

```

<PHS base: interfaces>≡
abstract interface
  function channel_prop_to_string (object) result (string)
    import
    class(channel_prop_t), intent(in) :: object
    type(string_t) :: string
  end function channel_prop_to_string
end interface

```

```

<PHS base: interfaces>+≡
abstract interface
  function channel_eq (prop1, prop2) result (flag)
    import
    class(channel_prop_t), intent(in) :: prop1, prop2
    logical :: flag
  end function channel_eq
end interface

```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

```

<PHS base: public>+≡
public :: resonance_t

<PHS base: types>+≡
type, extends (channel_prop_t) :: resonance_t
  real(default) :: mass = 0
  real(default) :: width = 0
contains
  procedure :: to_string => resonance_to_string
  procedure :: is_equal => resonance_is_equal
end type resonance_t

```

Print mass and width.

```

<PHS base: procedures>≡
function resonance_to_string (object) result (string)
  class(resonance_t), intent(in) :: object
  type(string_t) :: string
  character(32) :: buffer
  string = "resonant: m ="
  write (buffer, "(" // FMT_19 // ")") object%mass
  string = string // trim (buffer) // " GeV, w ="
  write (buffer, "(" // FMT_19 // ")") object%width
  string = string // trim (buffer) // " GeV"
end function resonance_to_string

```

Equality.

```
<PHS base: procedures>+≡  
function resonance_is_equal (prop1, prop2) result (flag)  
  class(resonance_t), intent(in) :: prop1  
  class(channel_prop_t), intent(in) :: prop2  
  logical :: flag  
  select type (prop2)  
  type is (resonance_t)  
    flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width  
  class default  
    flag = .false.  
  end select  
end function resonance_is_equal
```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

```
<PHS base: public>+≡  
  public :: on_shell_t  
  
<PHS base: types>+≡  
  type, extends (channel_prop_t) :: on_shell_t  
    real(default) :: mass = 0  
  contains  
    procedure :: to_string => on_shell_to_string  
    procedure :: is_equal => on_shell_is_equal  
end type on_shell_t
```

Print mass and width.

```
<PHS base: procedures>+≡  
function on_shell_to_string (object) result (string)  
  class(on_shell_t), intent(in) :: object  
  type(string_t) :: string  
  character(32) :: buffer  
  string = "on shell: m ="  
  write (buffer, "(" // FMT_19 // ")") object%mass  
  string = string // trim (buffer) // " GeV"  
end function on_shell_to_string
```

Equality.

```
<PHS base: procedures>+≡  
function on_shell_is_equal (prop1, prop2) result (flag)  
  class(on_shell_t), intent(in) :: prop1  
  class(channel_prop_t), intent(in) :: prop2  
  logical :: flag  
  select type (prop2)  
  type is (on_shell_t)  
    flag = prop1%mass == prop2%mass  
  class default  
    flag = .false.  
  end select  
end function on_shell_is_equal
```

## Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

```

<PHS base: types>+≡
  type :: phs_equivalence_t
    integer :: c = 0
    integer, dimension(:), allocatable :: perm
    integer, dimension(:), allocatable :: mode
    contains
    <PHS base: phs equivalence: TBP>
  end type phs_equivalence_t

```

The mapping modes are

```

<PHS base: types>+≡
  integer, parameter, public :: &
    EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3

```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the integrand can be assumed to be symmetric w.r.t. a reflection  $x \rightarrow 1 - x$  of the corresponding integration variable.

These are the associated tags, for output:

```

<PHS base: types>+≡
  character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]

```

Write an equivalence.

```

<PHS base: phs equivalence: TBP>≡
  procedure :: write => phs_equivalence_write

<PHS base: procedures>+≡
  subroutine phs_equivalence_write (object, unit)
    class(phs_equivalence_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(5x,'=',1x,I0,1x)", advance = "no") object%c
    if (allocated (object%perm)) then
      write (u, "(A)", advance = "no") "("
      do j = 1, size (object%perm)
        if (j > 1) write (u, "(1x)", advance = "no")
        write (u, "(I0,A1)", advance = "no") &
          object%perm(j), TAG(object%mode(j))
      end do
      write (u, "(A)" ) ")"
    else
      write (u, "(A)")
    end if
  end subroutine phs_equivalence_write

```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

```

(PHS base: phs equivalence: TBP)+≡
  procedure :: init => phs_equivalence_init

(PHS base: procedures)+≡
  subroutine phs_equivalence_init (eq, n_dim)
    class(phs_equivalence_t), intent(out) :: eq
    integer, intent(in) :: n_dim
    allocate (eq%perm (n_dim), source = 0)
    allocate (eq%mode (n_dim), source = EQ_IDENTITY)
  end subroutine phs_equivalence_init

```

## Channel objects

The channel entry holds (optionally) specific properties.

`sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

```

(PHS base: public)+≡
  public :: phs_channel_t

(PHS base: types)+≡
  type :: phs_channel_t
    class(channel_prop_t), allocatable :: prop
    integer :: sf_channel = 1
    type(phs_equivalence_t), dimension(:), allocatable :: eq
  contains
    (PHS base: phs channel: TBP)
  end type phs_channel_t

```

Output.

```

(PHS base: phs channel: TBP)≡
  procedure :: write => phs_channel_write

(PHS base: procedures)+≡
  subroutine phs_channel_write (object, unit)
    class(phs_channel_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(1x,I0)", advance="no") object%sf_channel
    if (allocated (object%prop)) then
      write (u, "(1x,A)") char (object%prop%to_string ())
    else
      write (u, *)
    end if
    if (allocated (object%eq)) then
      do j = 1, size (object%eq)
        call object%eq(j)%write (u)
      end do
    end if
  end subroutine

```

```
end subroutine phs_channel_write
```

Identify the channel with an s-channel resonance.

```
<PHS base: phs channel: TBP>+≡
  procedure :: set_resonant => channel_set_resonant

<PHS base: procedures>+≡
  subroutine channel_set_resonant (channel, mass, width)
    class(phs_channel_t), intent(inout) :: channel
    real(default), intent(in) :: mass, width
    allocate (resonance_t :: channel%prop)
    select type (prop => channel%prop)
    type is (resonance_t)
      prop%mass = mass
      prop%width = width
    end select
  end subroutine channel_set_resonant
```

Identify the channel with an on-shell particle.

```
<PHS base: phs channel: TBP>+≡
  procedure :: set_on_shell => channel_set_on_shell

<PHS base: procedures>+≡
  subroutine channel_set_on_shell (channel, mass)
    class(phs_channel_t), intent(inout) :: channel
    real(default), intent(in) :: mass
    allocate (on_shell_t :: channel%prop)
    select type (prop => channel%prop)
    type is (on_shell_t)
      prop%mass = mass
    end select
  end subroutine channel_set_on_shell
```

### 19.1.2 Property collection

We can set up a list of all distinct channel properties for a given set of channels.

```
<PHS base: public>+≡
  public :: phs_channel_collection_t

<PHS base: types>+≡
  type :: prop_entry_t
    integer :: i = 0
    class(channel_prop_t), allocatable :: prop
    type(prop_entry_t), pointer :: next => null ()
  end type prop_entry_t

  type :: phs_channel_collection_t
    integer :: n = 0
    type(prop_entry_t), pointer :: first => null ()
    contains
    <PHS base: phs channel collection: TBP>
  end type phs_channel_collection_t
```

Finalizer for the list.

```

(PHS base: phs_channel_collection: TBP)≡
  procedure :: final => phs_channel_collection_final

(PHS base: procedures)+≡
  subroutine phs_channel_collection_final (object)
    class(phs_channel_collection_t), intent(inout) :: object
    type(prop_entry_t), pointer :: entry
    do while (associated (object%first))
      entry => object%first
      object%first => entry%next
      deallocate (entry)
    end do
  end subroutine phs_channel_collection_final

```

Output.

```

(PHS base: phs_channel_collection: TBP)+≡
  procedure :: write => phs_channel_collection_write

(PHS base: procedures)+≡
  subroutine phs_channel_collection_write (object, unit)
    class(phs_channel_collection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    type(prop_entry_t), pointer :: entry
    integer :: u
    u = given_output_unit (unit)
    entry => object%first

### 19.1.3 Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It does not depend on the QCD setup.)

```

    end if
  end subroutine phs_base_select_channel

```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the  $z$  axis is the direction of the first beam, the second beam is along the negative  $z$  axis. The transformation from the c.m. to the lab frame is a rotation from the  $z$  axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

```

  class(phs_t), intent(in) :: phs
  real(default) :: f
  f = phs%flux * phs%volume
end function phs_get_overall_factor

```

Compute flux factor. We do this during initialization (when the incoming momenta  $\mathbf{p}$  are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \quad (19.1)$$

2. For a  $2 \rightarrow n$  scattering process with  $n > 1$ , the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \quad (19.2)$$

where for massless incoming particles,  $\sqrt{\lambda} = s$ .

3. For a  $2 \rightarrow 1$  on-shell production process, the factor includes an extra  $1/(2\pi)^3$  factor and a  $1/m^2$  factor from the phase-space delta function  $\delta(x_1x_2 - m^2/s)$ , which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \quad (19.3)$$

The delta function is handled by the structure-function parameterization.

```

<PHS base: phs: TBP>+=
  procedure :: compute_flux => phs_compute_flux
  procedure :: compute_base_flux => phs_compute_flux

<PHS base: procedures>+=

      real(default), dimension(:), intent(in) :: r_in
    end subroutine phs_evaluate_selected_channel
  end interface

```

Compute the inverse mappings to completely fill the **r** and **f** arrays, for the non-selected channels.

```

<PHS base: phs: TBP>+≡
  procedure (phs_evaluate_other_channels), deferred :: &
    evaluate_other_channels

<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_evaluate_other_channels (phs, c_in)
      import
      class(phs_t), intent(inout) :: phs
      integer, intent(in) :: c_in
    end subroutine phs_evaluate_other_channels
  end interface

```

Inverse evaluation. If all momenta are known, we compute the inverse mappings to fill the **r** and **f** arrays.

```

<PHS base: phs: TBP>+≡
  procedure (phs_inverse), deferred :: inverse

<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_inverse (phs)
      import
      class(phs_t), intent(inout) :: phs
    end subroutine phs_inverse
  end interface

```

```

<PHS base: phs: TBP>+≡
  procedure :: get_sqrts => phs_get_sqrts

<PHS base: procedures>+≡
  function phs_get_sqrts (phs) result (sqrts)
    real(default) :: sqrts
    class(phs_t), intent(in) :: phs
    sqrts = phs%config%sqrts
  end function phs_get_sqrts

```

## Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters  $x_1$  and  $x_2$ :

$$\cos \theta = 1 - 2x_1, \quad \phi = 2\pi x_2 \quad (19.4)$$

We generate a rotation (Lorentz transformation) which rotates the positive  $z$  axis into this point on the unit sphere. This rotation is applied to the  $\mathbf{p}$  momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

```
<PHS base: public>+=  
  public :: compute_kinematics_solid_angle  
  
<PHS base: procedures>+=  
  subroutine compute_kinematics_solid_angle (p, q, x)  
    type(vector4_t), dimension(2), intent(in) :: p  
    type(vector4_t), dimension(2), intent(out) :: q  
    real(default), dimension(2), intent(in) :: x  
    real(default) :: ct, st, phi  
    type(lorentz_transformation_t) :: rot  
    integer :: i  
    ct = 1 - 2*x(1)  
    st = sqrt (1 - ct**2)  
    phi = twopi * x(2)  
    rot = rotation (phi, 3) * rotation (ct, st, 2)  
    do i = 1, 2  
      q(i) = rot * p(i)  
    end do  
  end subroutine compute_kinematics_solid_angle
```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from  $q(1)$  alone.  $\mathbf{p}$  is unused.

```
<PHS base: public>+=  
  public :: inverse_kinematics_solid_angle  
  
<PHS base: procedures>+=  
  subroutine inverse_kinematics_solid_angle (p, q, x)  
    type(vector4_t), dimension(:), intent(in) :: p  
    type(vector4_t), dimension(2), intent(in) :: q  
    real(default), dimension(2), intent(out) :: x  
    real(default) :: ct, phi  
    ct = polar_angle_ct (q(1))  
    phi = azimuthal_angle (q(1))  
    x(1) = (1 - ct) / 2  
    x(2) = phi / twopi  
  end subroutine inverse_kinematics_solid_angle
```

### 19.1.6 Auxiliary stuff

The `pacify` subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. This is useful for numerical checks.

```
<PHS base: public>+≡
    public :: pacify

<PHS base: interfaces>+≡
    interface pacify
        module procedure pacify_phs
    end interface pacify

<PHS base: procedures>+≡
    subroutine pacify_phs (phs)
        class(phs_t), intent(inout) :: phs
        if (phs%p_defined) then
            call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
            call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
        end if
        if (phs%q_defined) then
            call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
        end if
    end subroutine pacify_phs
```

### 19.1.7 Unit tests

<phs_base_util.f90>≡
<File header>

    module phs_base_util

<Use kinds>
```

```

    <Use strings>
    use diagnostics
    use io_units
    use format_defs, only: FMT_19
    use physics_defs, only: BORN
    use lorentz
    use flavors
    use model_data
    use process_constants

    use phs_base

    <Standard module head>

    <PHS base: public test auxiliary>

    <PHS base: test declarations>

    <PHS base: test types>

contains

    <PHS base: tests>

    <PHS base: test auxiliary>

end module phs_base_util

API: driver for the unit tests below.
<PHS base: public test>≡
    public :: phs_base_test
<PHS base: test driver>≡
    subroutine phs_base_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <PHS base: execute tests>
    end subroutine phs_base_test

```

## Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

```

<PHS base: public test auxiliary>≡
    public :: init_test_process_data
<PHS base: test auxiliary>≡
    subroutine init_test_process_data (id, data)
        type(process_constants_t), intent(out) :: data
        type(string_t), intent(in), optional :: id
        if (present (id)) then
            data%id = id
        else

```

```

        data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 2
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state = 25
end subroutine init_test_process_data

```

This is the variant for a decay process.

```

<PHS base: public test auxiliary>+≡
    public :: init_test_decay_data

<PHS base: test auxiliary>+≡
    subroutine init_test_decay_data (id, data)
        type(process_constants_t), intent(out) :: data
        type(string_t), intent(in), optional :: id
        if (present (id)) then
            data%id = id
        else
            data%id = "testproc"
        end if
        data%model_name = "Test"
        data%n_in = 1
        data%n_out = 2
        data%n_flv = 1
        allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
        data%flv_state(:,1) = [25, 6, -6]
    end subroutine init_test_decay_data

```

## Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

```

<PHS base: public test auxiliary>+≡
    public :: phs_test_config_t

<PHS base: test types>≡
    type, extends (phs_config_t) :: phs_test_config_t
        logical :: create_equivalences = .false.
    contains
        procedure :: final => phs_test_config_final
        procedure :: write => phs_test_config_write
        procedure :: configure => phs_test_config_configure
        procedure :: startup_message => phs_test_config_startup_message
        procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t

```

The finalizer is empty.

```

<PHS base: test auxiliary>+≡
    subroutine phs_test_config_final (object)
        class(phs_test_config_t), intent(inout) :: object
    end subroutine

```

```
end subroutine phs_test_config_final
```

The `lab_is_cm` parameter is not tested here; we defer this to the `phs.single` implementation.

*(PHS base: test auxiliary)*+≡

```
subroutine phs_test_config_write (object, unit, include_id)
  class(phs_test_config_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: include_id
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "Partonic phase-space configuration:"
  call object%base_write (unit)
end subroutine phs_test_config_write

    eq%c = 1; eq%perm = [1, 2]; eq%mode = [EQ_IDENTITY, EQ_SYMMETRIC]
  end associate
  associate (eq => channel%eq(2))
    eq%c = 2; eq%perm = [2, 1]; eq%mode = [EQ_INVARIANT, EQ_IDENTITY]
  end associate
end associate
end subroutine setup_test_equivalences

```

Ditto, for channel properties.

```

<PHS base: test auxiliary>+≡
subroutine setup_test_channel_props (phs_config)
  class(phs_test_config_t), intent(inout) :: phs_config
  associate (channel => phs_config%channel(2))
    call channel%set_resonant (140._default, 3.1415_default)
  end associate
end subroutine setup_test_channel_props

```

Startup message

```

<PHS base: test auxiliary>+≡
subroutine phs_test_config_startup_message (phs_config, unit)
  class(phs_test_config_t), intent(in) :: phs_config
  integer, intent(in), optional :: unit
  call phs_config%base_startup_message (unit)
  write (msg_buffer, "(A)") "Phase space: Test"
  call msg_message (unit = unit)
end subroutine phs_test_config_startup_message

```

The instance type that matches `phs_test_config_t` is `phs_test_t`.

```

<PHS base: test auxiliary>+≡
subroutine phs_test_config_allocate_instance (phs)
  class(phs_t), intent(inout), pointer :: phs
  allocate (phs_test_t :: phs)
end subroutine phs_test_config_allocate_instance

```

## Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates  $\cos\theta$  and  $\phi$  uniformly, in the other channel we map the  $r_1$  parameter which belongs to  $\cos\theta$ .

We should store the mass parameter that we need.

```

<PHS base: public test auxiliary>+≡

```

```

    public :: phs_test_t
<PHS base: test types>+≡
    type, extends (phs_t) :: phs_test_t
        real(default) :: m = 0
        real(default), dimension(:), allocatable :: x
    contains
        <PHS base: phs test: TBP>
    end type phs_test_t

```

Output. The specific data are displayed only if `verbose` is set.

```

<PHS base: phs test: TBP>≡
    procedure :: write => phs_test_write

<PHS base: test auxiliary>+≡
    subroutine phs_test_write (object, unit, verbose)
        class(phs_test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        logical :: verb
        u = given_output_unit (unit)
        verb = .false.; if (present (verbose)) verb = verbose
        if (verb) then
            write (u, "(1x,A)") "Partonic phase space: data"
            write (u, "(3x,A," // FMT_19 // ")") "m = ", object%m
        end if
        call object%base_write (u)
    end subroutine phs_test_write

```

The finalizer is empty.

```

<PHS base: phs test: TBP>+≡
    procedure :: final => phs_test_final

<PHS base: test auxiliary>+≡
    subroutine phs_test_final (object)
        class(phs_test_t), intent(inout) :: object
    end subroutine phs_test_final

```

Initialization: set the mass value.

```

<PHS base: phs test: TBP>+≡
    procedure :: init => phs_test_init

<PHS base: test auxiliary>+≡
    subroutine phs_test_init (phs, phs_config)
        class(phs_test_t), intent(out) :: phs
        class(phs_config_t), intent(in), target :: phs_config
        call phs%base_init (phs_config)
        phs%m = phs%config%flv(1,1)%get_mass ()
        allocate (phs%x (phs_config%n_par), source = 0._default)
    end subroutine phs_test_init

```

Evaluation. In channel 1, we uniformly generate  $\cos\theta$  and  $\phi$ , with Jacobian normalized to one. In channel 2, we prepend a mapping  $r_1 \rightarrow r_1^{(1/3)}$  with Jacobian  $f = 3r_1^2$ .

The component `x` is allocated in the first subroutine, used and deallocated in the second one.

```

    use phs_base, only: phs_config_t, phs_t  
  
    <Standard module head>  
  
    <PHS none: public>  
  
    <PHS none: types>  
  
    contains  
  
    <PHS none: procedures>  
  
  end module phs_none
```

### 19.2.1 Configuration

Nothing to configure, but we provide the type and methods.

```
<PHS none: public>≡  
  public :: phs_none_config_t  
  
<PHS none: types>≡  
  type, extends (phs_config_t) :: phs_none_config_t  
  contains  
  <PHS none: phs none config: TBP>  
  end type phs_none_config_t
```

The finalizer is empty.

```
<PHS none: phs none config: TBP>≡  
  procedure :: final => phs_none_config_final  
  
<PHS none: procedures>≡  
  subroutine phs_none_config_final (object)  
    class(phs_none_config_t), intent(inout) :: object  
  end subroutine phs_none_config_final
```

Output. No contents, just an informative line.

```
<PHS none: phs none config: TBP>+≡  
  procedure :: write => phs_none_config_write
```

```

<PHS none: procedures>+≡
  subroutine phs_none_config_write (object, unit, include_id)
    class(phs_none_config_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: include_id
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Partonic phase-space configuration: non-functional dummy"
  end subroutine phs_none_config_write

```

Configuration: we have to implement this method, but it obviously does nothing.

```

<PHS none: phs none config: TBP>+≡
  procedure :: configure => phs_none_config_configure

<PHS none: procedures>+≡
  subroutine phs_none_config_configure (phs_config, sqrts, &
    sqrts_fixed, lab_is_cm, azimuthal_dependence, rebuild, ignore_mismatch, &
    nlo_type, subdir)
    class(phs_none_config_t), intent(inout) :: phs_config
    real(default), intent(in) :: sqrts
    logical, intent(in), optional :: sqrts_fixed
    logical, intent(in), optional :: lab_is_cm
    logical, intent(in), optional :: azimuthal_dependence
    logical, intent(in), optional :: rebuild
    logical, intent(in), optional :: ignore_mismatch
    integer, intent(in), optional :: nlo_type
    type(string_t), intent(in), optional :: subdir
  end subroutine phs_none_config_configure

```

Startup message, after configuration is complete.

```

<PHS none: phs none config: TBP>+≡
  procedure :: startup_message => phs_none_config_startup_message

<PHS none: procedures>+≡
  subroutine phs_none_config_startup_message (phs_config, unit)
    class(phs_none_config_t), intent(in) :: phs_config
    integer, intent(in), optional :: unit
    call msg_message ("Phase space: none")
  end subroutine phs_none_config_startup_message

```

Allocate an instance: the actual phase-space object.

```

<PHS none: phs none config: TBP>+≡
  procedure, nopass :: allocate_instance => phs_none_config_allocate_instance

<PHS none: procedures>+≡
  subroutine phs_none_config_allocate_instance (phs)
    class(phs_t), intent(inout), pointer :: phs
    allocate (phs_none_t :: phs)
  end subroutine phs_none_config_allocate_instance

```

## 19.2.2 Kinematics implementation

This is considered as empty, but we have to implement the minimal set of methods.

```
<PHS none: public>+≡
    public :: phs_none_t
<PHS none: types>+≡
    type, extends (phs_t) :: phs_none_t
    contains
    <PHS none: phs none: TBP>
    end type phs_none_t
```

Output.

```
<PHS none: phs none: TBP>≡
    procedure :: write => phs_none_write
<PHS none: procedures>+≡
    subroutine phs_none_write (object, unit, verbose)
        class(phs_none_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        u = given_output_unit (unit)
        write (u, "(A)") "Partonic phase space: none"
    end subroutine phs_none_write
```

The finalizer is empty.

```
<PHS none: phs none: TBP>+≡
    procedure :: final => phs_none_final
<PHS none: procedures>+≡
    subroutine phs_none_final (object)
        class(phs_none_t), intent(inout) :: object
    end subroutine phs_none_final
```

Initialization, trivial.

```
<PHS none: phs none: TBP>+≡
    procedure :: init => phs_none_init
<PHS none: procedures>+≡
    subroutine phs_none_init (phs, phs_config)
        class(phs_none_t), intent(out) :: phs
        class(phs_config_t), intent(in), target :: phs_config
        call phs%base_init (phs_config)
    end subroutine phs_none_init
```

Evaluation. This must not be called at all.

```
<PHS none: phs none: TBP>+≡
    procedure :: evaluate_selected_channel => phs_none_evaluate_selected_channel
    procedure :: evaluate_other_channels => phs_none_evaluate_other_channels
```

```

<PHS none: procedures>+≡
  subroutine phs_none_evaluate_selected_channel (phs, c_in, r_in)
    class(phs_none_t), intent(inout) :: phs
    integer, intent(in) :: c_in
    real(default), intent(in), dimension(:) :: r_in
    call msg_fatal ("Phase space: attempt to evaluate with the 'phs_none' method")
  end subroutine phs_none_evaluate_selected_channel

  subroutine phs_none_evaluate_other_channels (phs, c_in)
    class(phs_none_t), intent(inout) :: phs
    integer, intent(in) :: c_in
  end subroutine phs_none_evaluate_other_channels

```

Inverse evaluation, likewise.

```

<PHS none: phs none: TBP>+≡
  procedure :: inverse => phs_none_inverse

<PHS none: procedures>+≡
  subroutine phs_none_inverse (phs)
    class(phs_none_t), intent(inout) :: phs
    call msg_fatal ("Phase space: attempt to evaluate inverse with the 'phs_none' method")
  end subroutine phs_none_inverse

```

### 19.2.3 Unit tests

Test module, followed by the corresponding implementation module.

```

<phs_none_ut.f90>≡
  <File header>

  module phs_none_ut
    use unit_tests
    use phs_none_ut_i

    <Standard module head>

    <PHS none: public test>

    <Use kinds>
    <Use strings>
    use flavors
    use lorentz
    use model_data

```

```

    use process_constants
    use phs_base

    use phs_none

    use phs_base_ut, only: init_test_process_data, init_test_decay_data

    <Standard module head>

    <PHS none: test declarations>

contains

    <PHS none: tests>

end module phs_none_ut
API: driver for the unit tests below.
<PHS none: public test>≡
    public :: phs_none_test
<PHS none: test driver>≡
    subroutine phs_none_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <PHS none: execute tests>
    end subroutine phs_none_test

```

## Phase-space configuration data

Construct and display a test phase-space configuration object. Also check the azimuthal dependence flag.

```

<PHS none: execute tests>≡
    call test (phs_none_1, "phs_none_1", &
        "phase-space configuration dummy", &
        u, results)
<PHS none: test declarations>≡
    public :: phs_none_1
<PHS none: tests>≡
    subroutine phs_none_1 (u)
        integer, intent(in) :: u
        type(model_data_t), target :: model
        type(process_constants_t) :: process_data
        class(phs_config_t), allocatable :: phs_data
        real(default) :: sqrts

        write (u, "(A)")  "* Test output: phs_none_1"
        write (u, "(A)")  "* Purpose: display &
            &phase-space configuration data"
        write (u, "(A)")

        allocate (phs_none_config_t :: phs_data)

```

```

call phs_data%init (process_data, model)

sqrts = 1000._default
call phs_data%configure (sqrts, azimuthal_dependence=.false.)

call phs_data%write (u)

call phs_data%final ()
call model%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: phs_none_1"

end subroutine phs_none_1

```

## 19.3 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for  $1 \rightarrow 2$  decays or for  $2 \rightarrow 2$  scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic  $2 \rightarrow 2$  situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

```
<phs_single.f90>≡  
  <File header>  
  
  module phs_single  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use constants  
    use numeric_utils  
    use diagnostics  
    use os_interface  
    use lorentz  
    use physics_defs  
    use model_data  
    use flavors  
    use process_constants  
    use phs_base  
  
    <Standard module head>  
  
    <PHS single: public>  
  
    <PHS single: types>  
  
    contains  
  
    <PHS single: procedures>  
  
  end module phs_single
```

### 19.3.1 Configuration

```
<PHS single: public>≡  
  public :: phs_single_config_t  
  
<PHS single: types>≡  
  type, extends (phs_config_t) :: phs_single_config_t  
  contains  
  <PHS single: phs single config: TBP>
```

```
end type phs_single_config_t
```

The finalizer is empty.

```
<PHS single: phs single config: TBP>≡
  procedure :: final => phs_single_config_final

<PHS single: procedures>≡
  subroutine phs_single_config_final (object)
    class(phs_single_config_t), intent(inout) :: object
  end subroutine phs_single_config_final
```

Output.

```
<PHS single: phs single config: TBP>+≡
  procedure :: write => phs_single_config_write

<PHS single: procedures>+≡
  subroutine phs_single_config_write (object, unit, include_id)
    class(phs_single_config_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: include_id
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Partonic phase-space configuration (single-particle):"
    call object%base_write (unit)
  end subroutine phs_single_config_write
```

Configuration: there is only one channel and two parameters. The second parameter is the azimuthal angle, which may be a flat dimension.

```
<PHS single: phs single config: TBP>+≡
  procedure :: configure => phs_single_config_configure

<PHS single: procedures>+≡
  subroutine phs_single_config_configure (phs_config, sqrts, &
    sqrts_fixed, lab_is_cm, azimuthal_dependence, rebuild, ignore_mismatch, &
    nlo_type, subdir)

    if (.not. present (nlo_type)) &
      phs_config%nlo_type = BORN
    if (phs_config%n_out == 2) then
      phs_config%n_channel = 1
      phs_config%n_par = 2
      phs_config%sqrts = sqrts
      if (present (sqrts_fixed)) phs_config%sqrts_fixed = sqrts_fixed
      if (present (lab_is_cm)) phs_config%lab_is_cm = lab_is_cm
      if (present (azimuthal_dependence)) then
```

```

        phs_config%azimuthal_dependence = azimuthal_dependence
        if (.not. azimuthal_dependence) then
            allocate (phs_config%dim_flat (1))
            phs_config%dim_flat(1) = 2
        end if
    end if
    if (allocated (phs_config%channel)) deallocate (phs_config%channel)
    allocate (phs_config%channel (1))
    call phs_config%compute_md5sum ()
else
    call msg_fatal ("Single-particle phase space requires n_out = 2")
end if
end subroutine phs_single_config_configure

```

Startup message, after configuration is complete.

```

<PHS single: phs single config: TBP>+≡
    procedure :: startup_message => phs_single_config_startup_message

<PHS single: procedures>+≡
    subroutine phs_single_config_startup_message (phs_config, unit)
        class(phs_single_config_t), intent(in) :: phs_config
        integer, intent(in), optional :: unit
        call phs_config%base_startup_message (unit)
        write (msg_buffer, "(A,2(1x,I0,1x,A))") &
            "Phase space: single-particle"
        call msg_message (unit = unit)
    end subroutine phs_single_config_startup_message

```

Allocate an instance: the actual phase-space object.

```

<PHS single: phs single config: TBP>+≡
    procedure, nopass :: allocate_instance => phs_single_config_allocate_instance

<PHS single: procedures>+≡
    subroutine phs_single_config_allocate_instance (phs)
        class(phs_t), intent(inout), pointer :: phs
        allocate (phs_single_t :: phs)
    end subroutine phs_single_config_allocate_instance

```

### 19.3.2 Kinematics implementation

We generate  $\cos\theta$  and  $\phi$  uniformly, covering the solid angle.

Note: The incoming momenta must be in the c.m. system.

```

<PHS single: public>+≡
    public :: phs_single_t

<PHS single: types>+≡
    type, extends (phs_t) :: phs_single_t
        contains
        <PHS single: phs single: TBP>
    end type phs_single_t

```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

```

<PHS single: phs single: TBP>≡
  procedure :: write => phs_single_write

<PHS single: procedures>+≡
  subroutine phs_single_write (object, unit, verbose)
    class(phs_single_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    call object%base_write (u)
  end subroutine phs_single_write

```

The finalizer is empty.

```

<PHS single: phs single: TBP>+≡
  procedure :: final => phs_single_final

<PHS single: procedures>+≡
  subroutine phs_single_final (object)
    class(phs_single_t), intent(inout) :: object
  end subroutine phs_single_final

```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \quad (19.5)$$

For a decay with nonvanishing masses ( $m_3, m_4$ ), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (19.6)$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (19.7)$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying  $\hat{s}$ .

```

<PHS single: phs single: TBP>+≡
  procedure :: init => phs_single_init

<PHS single: procedures>+≡
  subroutine phs_single_init (phs, phs_config)
    class(phs_single_t), intent(out) :: phs
    class(phs_config_t), intent(in), target :: phs_config
    call phs%base_init (phs_config)
    phs%volume = 1 / (4 * twopi5)
    call phs%compute_factor ()
  end subroutine phs_single_init

```

Compute the correction factor for nonzero masses. We do this during initialization (when the incoming momenta  $\mathbf{p}$  are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

```

<PHS single: phs single: TBP>+≡
  procedure :: compute_factor => phs_single_compute_factor

<PHS single: procedures>+≡
  subroutine phs_single_compute_factor (phs)
    class(phs_single_t), intent(inout) :: phs
    real(default) :: s_hat
    select case (phs%config%n_in)
    case (1)
      if (.not. phs%p_defined) then
        if (sum (phs%m_out) < phs%m_in(1)) then
          s_hat = phs%m_in(1) ** 2
          phs%f(1) = 1 / s_hat &
            * sqrt (lambda (s_hat, phs%m_out(1)**2, phs%m_out(2)**2))
        else
          print *, "m_in = ", phs%m_in
          print *, "m_out = ", phs%m_out
          call msg_fatal ("Decay is kinematically forbidden")
        end if
      end if
    case (2)
      if (phs%config%sqrts_fixed) then
        if (phs%p_defined) return
        s_hat = phs%config%sqrts ** 2
      else
        if (.not. phs%p_defined) return
        s_hat = sum (phs%p) ** 2
      end if
      if (sum (phs%m_in)**2 < s_hat .and. sum (phs%m_out)**2 < s_hat) then
        phs%f(1) = 1 / s_hat * &
          ( lambda (s_hat, phs%m_in (1)**2, phs%m_in (2)**2) &
            * lambda (s_hat, phs%m_out(1)**2, phs%m_out(2)**2) ) &
          ** 0.25_default
      else
        phs%f(1) = 0
      end if
    end select
  end subroutine phs_single_compute_factor

```

Evaluation. We uniformly generate  $\cos\theta$  and  $\phi$ , with Jacobian normalized to one.

There is only a single channel, so the second subroutine does nothing.

Note: the current implementation works for elastic scattering only.

```

<PHS single: phs single: TBP>+≡

## 19.4 Flat RAMBO phase space

This module implements the flat RAMBO phase space for massless and massive particles using the minimal d.o.f  $3n - 4$  in a straightforward parameterization with a single channel. We generate  $n$  mass systems  $M_i$  with  $M_0 = \sqrt{s}$  and  $M_n = 0$ . We let each mass system decay  $1 \rightarrow 2$  in a four-momentum conserving way. The four-momenta of the two particles are generated back-to-back where we map the d.o.f. to energy, azimuthal and polar angle. The particle momenta are then boosted to CMS by an appropriate boost using the kinematics of the parent mass system.

## 19.5 Resonance Handler

For various purposes (e.g., shower histories), we should extract the set of resonances and resonant channels from a phase-space tree set. A few methods do kinematics calculations specifically for those resonance data.

```
<resonances.f90>≡  
  <File header>  
  
  module resonances  
  
    <Use kinds>  
    <Use strings>  
    <Use debug>  
    use string_utils, only: str  
    use format_utils, only: write_indent  
    use io_units  
    use diagnostics  
    use lorentz  
    use constants, only: one  
    use model_data, only: model_data_t  
    use flavors, only: flavor_t  
  
    <Standard module head>  
  
    <Resonances: public>  
  
    <Resonances: parameters>  
  
    <Resonances: types>  
  
    contains  
  
    <Resonances: procedures>  
  
  end module resonances
```

### 19.5.1 Decay products (contributors)

This stores the indices of the particles that contribute to a resonance, i.e., the decay products.

```
<Resonances: public>≡  
  public :: resonance_contributors_t  
  
<Resonances: types>≡  
  type :: resonance_contributors_t  
    integer, dimension(:), allocatable :: c  
    contains  
    <Resonances: resonance contributors: TBP>  
  end type resonance_contributors_t
```

Equality (comparison)

```
<Resonances: resonance contributors: TBP>≡  
  procedure, private :: resonance_contributors_equal
```

```

generic :: operator(==) => resonance_contributors_equal
<Resonances: procedures>≡
  elemental function resonance_contributors_equal (c1, c2) result (equal)
    logical :: equal
    class(resonance_contributors_t), intent(in) :: c1, c2
    equal = allocated (c1%c) .and. allocated (c2%c)
    if (equal) equal = size (c1%c) == size (c2%c)
    if (equal) equal = all (c1%c == c2%c)
  end function resonance_contributors_equal

```

#### Assignment

```

<Resonances: resonance_contributors: TBP>+≡
  procedure, private :: resonance_contributors_assign
  generic :: assignment(=) => resonance_contributors_assign

<Resonances: procedures>+≡
  pure subroutine resonance_contributors_assign (contributors_out, contributors_in)

### 19.5.2 Resonance info object

This data structure augments the set of resonance contributors by a flavor object, such that we can perform calculations that take into account the particle properties, including mass and width.

Avoiding nameclash with similar but different `resonance_t` of `phs_base`:

```

<Resonances: public>+≡
  public :: resonance_info_t

<Resonances: types>+≡
  type :: resonance_info_t
    type(flavor_t) :: flavor
    type(resonance_contributors_t) :: contributors
  contains
    <Resonances: resonance_info: TBP>
  end type resonance_info_t

<Resonances: resonance_info: TBP>≡
  procedure :: copy => resonance_info_copy

<Resonances: procedures>+≡
  subroutine resonance_info_copy (resonance_in, resonance_out)
    class(resonance_info_t), intent(in) :: resonance_in
    type(resonance_info_t), intent(out) :: resonance_out
    resonance_out%flavor = resonance_in%flavor
    if (allocated (resonance_in%contributors%c)) then

```

```

        associate (c => resonance_in%contributors%c)
        allocate (resonance_out%contributors%c (size (c)))
        resonance_out%contributors%c = c
    end associate
end if
end subroutine resonance_info_copy

```

*<Resonances: resonance info: TBP>+≡*

```

    procedure :: write => resonance_info_write

```

*<Resonances: procedures>+≡*

```

subroutine resonance_info_write (resonance, unit, verbose)
    class(resonance_info_t), intent(in) :: resonance
    integer, optional, intent(in) :: unit
    logical, optional, intent(in) :: verbose
