flag = .true.
end function disjoint
end subroutine subevt_join

```

The combine operation makes a subevent whose entries are the result of adding (the momenta of) each pair of particles in the input lists. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

```

end do CHECK_DOUBLES
if (ok) n = n + 1
end if
end do
end do
subevt%n_active = n - 1
end subroutine subevt_combine

```

The collect operation makes a single-entry subevent which results from combining (the momenta of) all particles in the input list. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

(Thus, if the input particles are already composite, there is some chance that the result depends on the order of the input list and is not as expected. This situation should be avoided.)

```

<Subevents: public>+≡
public :: subevt_collect

<Subevents: sub interfaces>+≡
module subroutine subevt_collect (subevt, pl1, mask1)

      subevt%n_active = 1
      subevt%prt(1) = pl1%prt(i)
    else
      call prt_combine (prt, subevt%prt(1), pl1%prt(i), ok)
      if (ok) subevt%prt(1) = prt
    end if
  end if
end do
end subroutine subevt_collect

```

The cluster operation is similar to `collect`, but applies a jet algorithm. The result is a subevent consisting of jets and, possibly, unclustered extra particles. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

The algorithm: first determine the (pseudo)particles that participate in the clustering. They should not overlap, and the mask entry must be set. We then cluster the particles, using the given jet definition. The result particles are retrieved from the cluster sequence. We still have to determine the source indices for each jet: for each input particle, we get the jet index. Accumulating the source entries for all particles that are part of a given jet, we derive the jet source entries. Finally, we delete the C structures that have been constructed by FastJet and its interface.

Do recombination. The incoming subevent `pl` is left unchanged if it either does not contain photons at all, or consists just of a single photon and nothing else or the photon does have a larger  $R > R_0$  distance to the nearest other particle or does not fulfill the `mask1` condition. Otherwise, the subevent is one entry shorter and contains a single recombined particle whose original flavor is kept depending on the setting `keep_flv`. When this subroutine is called, it is explicitly assumed that there is only one photon. For the moment, we take here the first photon from the subevent to possibly recombine and leave this open for generalization.

### 13.4.3 Eliminate numerical noise

This is useful for testing purposes: set entries to zero that are smaller in absolute values than a given tolerance parameter.

Note: instead of setting the tolerance in terms of EPSILON (kind-dependent), we fix it to  $10^{-16}$ , which is the typical value for double precision. The reason is that there are situations where intermediate representations (external libraries, files) are limited to double precision, even if the main program uses higher precision.

## 13.5 Analysis tools

This module defines structures useful for data analysis. These include observables, histograms, and plots.

Observables are quantities that are calculated and summed up event by event. At the end, one can compute the average and error.

Histograms have their bins in addition to the observable properties. Histograms are usually written out in tables and displayed graphically.

In plots, each record creates its own entry in a table. This can be used for scatter plots if called event by event, or for plotting dependencies on parameters if called once per integration run.

Graphs are container for histograms and plots, which carry their own graphics options.

The type layout is still somewhat obfuscated. This would become much simpler if type extension could be used.

### 13.5.1 Output formats

These formats share a common field width (alignment).

```

<Analysis: parameters>≡
character(*), parameter, public :: HISTOGRAM_HEAD_FORMAT = "1x,A15,3x"
character(*), parameter, public :: HISTOGRAM_INTG_FORMAT = "3x,I9,3x"
character(*), parameter, public :: HISTOGRAM_DATA_FORMAT = "ES19.12"

```

### 13.5.2 Graph options

These parameters are used for displaying data. They apply to a whole graph, which may contain more than one plot element.

The GAMELAN code chunks are part of both `graph_options` and `drawing_options`. The `drawing_options` copy is used in histograms and plots, also as graph elements. The `graph_options` copy is used for `graph` objects as a whole. Both copies are usually identical.

obs%count = obs%count + 1
if (present (success)) success = .true.
end subroutine observable_record_value_weighted
```

Here are the statistics formulas:

1. Unweighted case: Given a sample of  $n$  values  $x_i$ , the average is

$$\langle x \rangle = \frac{\sum x_i}{n} \quad (13.4)$$

and the error estimate

$$\Delta x = \sqrt{\frac{1}{n-1} \langle \sum (x_i - \langle x \rangle)^2 \rangle} \quad (13.5)$$

$$= \sqrt{\frac{1}{n-1} \left( \frac{\sum x_i^2}{n} - \frac{(\sum x_i)^2}{n^2} \right)} \quad (13.6)$$

2. Weighted case: Instead of weight 1, each event comes with weight  $w_i$ .

$$\langle x \rangle = \frac{\sum x_i w_i}{\sum w_i} \quad (13.7)$$

and

$$\Delta x = \sqrt{\frac{1}{n-1} \left( \frac{\sum x_i^2 w_i}{\sum w_i} - \frac{(\sum x_i w_i)^2}{(\sum w_i)^2} \right)} \quad (13.8)$$

For  $w_i = 1$ , this specializes to the previous formula.

```

### 13.5.8 Graphs

A graph is a container for several graph elements. Each graph element is either a plot or a histogram. There is an appropriate base type below (the `analysis_object_t`), but to avoid recursion, we define a separate base type here. Note that there is no actual recursion: a graph is an analysis object, but a graph cannot contain graphs.

(If we could use type extension, the implementation would be much more transparent.)

#### Graph elements

Graph elements cannot be filled by the `record` command directly. The contents are always copied from elementary histograms or plots.

```

<Analysis: types>+≡
type :: graph_element_t
private
integer :: type = AN_UNDEFINED
type(histogram_t), pointer :: h => null ()
type(plot_t), pointer :: p => null ()
end type graph_element_t

```

```

<Analysis: procedures>+≡
subroutine graph_element_final (el)
type(graph_element_t), intent(inout) :: el
select case (el%type)
case (AN_HISTOGRAM)
deallocate (el%h)
case (AN_PLOT)
call plot_final (el%p)
deallocate (el%p)
end select
el%type = AN_UNDEFINED
end subroutine graph_element_final

```

Return the number of entries in the graph element:

```

<Analysis: procedures>+≡
function graph_element_get_n_entries (el) result (n)
integer :: n
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); n = histogram_get_n_entries (el%h)

```

```

case (AN_PLOT);          n = plot_get_n_entries (el%p)
case default;           n = 0
end select
end function graph_element_get_n_entries

```

Return a pointer to the graph / drawing options.

*<Analysis: procedures>+≡*

```

function graph_element_get_graph_options_ptr (el) result (ptr)
type(graph_options_t), pointer :: ptr
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); ptr => histogram_get_graph_options_ptr (el%h)
case (AN_PLOT);      ptr => plot_get_graph_options_ptr (el%p)
case default;        ptr => null ()
end select
end function graph_element_get_graph_options_ptr

function graph_element_get_drawing_options_ptr (el) result (ptr)
type(drawing_options_t), pointer :: ptr
type(graph_element_t), intent(in) :: el
select case (el%type)
case (AN_HISTOGRAM); ptr => histogram_get_drawing_options_ptr (el%h)
case (AN_PLOT);      ptr => plot_get_drawing_options_ptr (el%p)
case default;        ptr => null ()
end select
end function graph_element_get_drawing_options_ptr

```

Output, simple wrapper for the plot/histogram writer.

*<Analysis: procedures>+≡*

```

subroutine graph_element_write (el, unit)
type(graph_element_t), intent(in) :: el
integer, intent(in), optional :: unit
type(graph_options_t), pointer :: gro
type(string_t) :: id
integer :: u
u = given_output_unit (unit); if (u < 0) return
gro => graph_element_get_graph_options_ptr (el)
id = graph_options_get_id (gro)
write (u, "(A,A)" ) '#', repeat("-", 78)

write (u, "(1x,A)" ) char (id)
call plot_write (el%p, unit)
end select
end subroutine graph_element_write

```

*<Analysis: procedures>+≡*

```

subroutine graph_element_write_gml_reader (el, filename, unit)

```

```

type(graph_element_t), intent(in) :: el
type(string_t), intent(in) :: filename
integer, intent(in), optional :: unit
select case (el%type)
case (AN_HISTOGRAM); call histogram_write_gml_reader (el%h, filename, unit)
case (AN_PLOT);      call plot_write_gml_reader (el%p, filename, unit)
end select
end subroutine graph_element_write_gml_reader

```

## The graph type

The actual graph type contains its own `graph_options`, which override the individual settings. The `drawing_options` are set in the graph elements. This distinction motivates the separation of the two types.

*(Analysis: types)* +=

```

type :: graph_t
private
type(graph_element_t), dimension(:), allocatable :: el
type(graph_options_t) :: graph_options
end type graph_t

```

## Initializer/finalizer

The graph is created with a definite number of elements. The elements are filled one by one, optionally with modified drawing options.

*(Analysis: procedures)* +=

```

subroutine graph_init (g, id, n_elements, graph_options)
type(graph_t), intent(out) :: g
type(string_t), intent(in) :: id
integer, intent(in) :: n_elements
type(graph_options_t), intent(in), optional :: graph_options
allocate (g%el (n_elements))
if (present (graph_options)) then
g%graph_options = graph_options
else
call g%graph_options%init ()
end if
call g%graph_options%set (id = id)
end subroutine graph_init

```

*(Analysis: procedures)* +=

```

subroutine graph_insert_histogram (g, i, h, drawing_options)
type(graph_t), intent(inout), target :: g
integer, intent(in) :: i
type(histogram_t), intent(in) :: h
type(drawing_options_t), intent(in), optional :: drawing_options
type(graph_options_t), pointer :: gro
type(drawing_options_t), pointer :: dro
type(string_t) :: id
g%el(i)%type = AN_HISTOGRAM

```

type(graph_t), intent(in) :: graph
n = size (graph%el)
end function graph_get_n_elements

```

Retrieve a pointer to the drawing options of an element, so they can be modified. (The `target` attribute is not actually needed because the components are pointers.)

*<Analysis: procedures>+≡*

```

function graph_get_drawing_options_ptr (g, i) result (ptr)
type(drawing_options_t), pointer :: ptr
type(graph_t), intent(in), target :: g
integer, intent(in) :: i
ptr => graph_element_get_drawing_options_ptr (g%el(i))
end function graph_get_drawing_options_ptr

```

## Output

The default output format just writes histogram and plot data.

*<Analysis: procedures>+≡*

```

subroutine graph_write (graph, unit)
type(graph_t), intent(in) :: graph
integer, intent(in), optional :: unit
integer :: i
do i = 1, size (graph%el)
call graph_element_write (graph%el(i), unit)
end do
end subroutine graph_write

```

The GAMELAN driver is not a simple wrapper, but it writes the plot/histogram contents embedded the complete graph. First, data are read in, global background commands next, then individual elements, then global foreground commands.

*<Analysis: procedures>+≡*

```

subroutine graph_write_gml_driver (g, filename, unit)
type(graph_t), intent(in) :: g
type(string_t), intent(in) :: filename
type(string_t) :: calc_cmd, bg_cmd, draw_cmd, err_cmd, symb_cmd, fg_cmd
integer, intent(in), optional :: unit
type(drawing_options_t), pointer :: dro
integer :: u, i
u = given_output_unit (unit); if (u < 0) return
call graph_options_write_tex_header (g%graph_options, unit)

call graph_options_get_header (graph%graph_options, header, comment)
call ifile_append (header, &
c // "number of graph elements: " &
// int2char (graph_get_n_elements (graph)))
end subroutine graph_get_header

```

### 13.5.9 Analysis objects

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings.

(This should rather be coded by type extension.)

```

<Analysis: parameters>+≡
integer, parameter :: AN_UNDEFINED = 0
integer, parameter :: AN_OBSERVABLE = 1
integer, parameter :: AN_HISTOGRAM = 2
integer, parameter :: AN_PLOT = 3
integer, parameter :: AN_GRAPH = 4

<Analysis: public>+≡
public :: AN_UNDEFINED, AN_HISTOGRAM, AN_OBSERVABLE, AN_PLOT, AN_GRAPH

<Analysis: types>+≡
type :: analysis_object_t
private

```

```

type(string_t) :: id
integer :: type = AN_UNDEFINED
type(observable_t), pointer :: obs => null ()
type(histogram_t), pointer :: h => null ()
type(plot_t), pointer :: p => null ()
type(graph_t), pointer :: g => null ()
type(analysis_object_t), pointer :: next => null ()
end type analysis_object_t

```

### Initializer/finalizer

Allocate with the correct type but do not fill initial values.

```

<Analysis: procedures>+≡
subroutine analysis_object_init (obj, id, type)
type(analysis_object_t), intent(out) :: obj
type(string_t), intent(in) :: id
integer, intent(in) :: type
obj%id = id
obj%type = type
select case (obj%type)
case (AN_OBSERVABLE); allocate (obj%obs)
case (AN_HISTOGRAM); allocate (obj%h)
case (AN_PLOT); allocate (obj%p)
case (AN_GRAPH); allocate (obj%g)
end select
end subroutine analysis_object_init

```

```

<Analysis: procedures>+≡
subroutine analysis_object_final (obj)
type(analysis_object_t), intent(inout) :: obj
select case (obj%type)
case (AN_OBSERVABLE)
deallocate (obj%obs)
case (AN_HISTOGRAM)
deallocate (obj%h)
case (AN_PLOT)
call plot_final (obj%p)
deallocate (obj%p)
case (AN_GRAPH)
call graph_final (obj%g)
deallocate (obj%g)
end select
obj%type = AN_UNDEFINED
end subroutine analysis_object_final

```

Clear the analysis object, i.e., reset it to its initial state. Not applicable to graphs, which are always combinations of other existing objects.

```

<Analysis: procedures>+≡
subroutine analysis_object_clear (obj)
type(analysis_object_t), intent(inout) :: obj
select case (obj%type)

```

```

case (AN_OBSERVABLE)
call observable_clear (obj%obs)
case (AN_HISTOGRAM)
call histogram_clear (obj%h)
case (AN_PLOT)
call plot_clear (obj%p)
end select
end subroutine analysis_object_clear

```

## Fill with data

Record data. The effect depends on the type of analysis object.

*<Analysis: procedures>+≡*

```

subroutine analysis_object_record_data (obj, &
x, y, yerr, xerr, weight, excess, success)
type(analysis_object_t), intent(inout) :: obj
real(default), intent(in) :: x
real(default), intent(in), optional :: y, yerr, xerr, weight, excess
logical, intent(out), optional :: success
select case (obj%type)
case (AN_OBSERVABLE)
if (present (weight)) then
call observable_record_value_weighted (obj%obs, x, weight, success)
else
call observable_record_value_unweighted (obj%obs, x, success)
end if
case (AN_HISTOGRAM)
if (present (weight)) then
call histogram_record_value_weighted (obj%h, x, weight, success)
else
call histogram_record_value_unweighted (obj%h, x, excess, success)
end if
case (AN_PLOT)
if (present (y)) then
call plot_record_value (obj%p, x, y, yerr, xerr, success)
else
if (present (success)) success = .false.
end if
case default
if (present (success)) success = .false.
end select
end subroutine analysis_object_record_data

```

Explicitly set the pointer to the next object in the list.

*<Analysis: procedures>+≡*

```

subroutine analysis_object_set_next_ptr (obj, next)
type(analysis_object_t), intent(inout) :: obj
type(analysis_object_t), pointer :: next
obj%next => next
end subroutine analysis_object_set_next_ptr

```

## Access contents

Return a pointer to the next object in the list.

```
<Analysis: procedures>+≡
function analysis_object_get_next_ptr (obj) result (next)
  type(analysis_object_t), pointer :: next
  type(analysis_object_t), intent(in) :: obj
  next => obj%next
end function analysis_object_get_next_ptr
```

Return data as appropriate for the object type.

```
<Analysis: procedures>+≡
function analysis_object_get_n_elements (obj) result (n)
  integer :: n
  type(analysis_object_t), intent(in) :: obj
  select case (obj%type)
    case (AN_HISTOGRAM)
      n = 1
    case (AN_PLOT)
      n = 1
    case (AN_GRAPH)
      n = graph_get_n_elements (obj%g)
    case default
      n = 0
  end select
end function analysis_object_get_n_elements

function analysis_object_get_n_entries (obj, within_bounds) result (n)
  integer :: n
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
  select case (obj%type)
    case (AN_OBSERVABLE)
      n = observable_get_n_entries (obj%obs)
    case (AN_HISTOGRAM)
      wb = .false.; if (present (within_bounds)) wb = within_bounds
      if (wb) then
        n = histogram_get_n_entries_within_bounds (obj%h)
      else
        n = histogram_get_n_entries (obj%h)
      end if
    case (AN_PLOT)
      n = plot_get_n_entries (obj%p)
    case default
      n = 0
  end select
end function analysis_object_get_n_entries

function analysis_object_get_average (obj, within_bounds) result (avg)
  real(default) :: avg
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
```

```

select case (obj%type)
case (AN_OBSERVABLE)
avg = observable_get_average (obj%obs)
case (AN_HISTOGRAM)
wb = .false.; if (present (within_bounds)) wb = within_bounds
if (wb) then
avg = histogram_get_average_within_bounds (obj%h)
else
avg = histogram_get_average (obj%h)
end if
case default
avg = 0
end select
end function analysis_object_get_average

function analysis_object_get_error (obj, within_bounds) result (err)
real(default) :: err
type(analysis_object_t), intent(in) :: obj
logical, intent(in), optional :: within_bounds
logical :: wb
select case (obj%type)
case (AN_OBSERVABLE)
err = observable_get_error (obj%obs)
case (AN_HISTOGRAM)
wb = .false.; if (present (within_bounds)) wb = within_bounds
if (wb) then
err = histogram_get_error_within_bounds (obj%h)
else
err = histogram_get_error (obj%h)
end if
case default
err = 0
end select
end function analysis_object_get_error

```

Return pointers to the actual contents:

```

<Analysis: procedures>+≡
function analysis_object_get_observable_ptr (obj) result (obs)
type(observable_t), pointer :: obs
type(analysis_object_t), intent(in) :: obj
select case (obj%type)
case (AN_OBSERVABLE); obs => obj%obs
case default; obs => null ()
end select
end function analysis_object_get_observable_ptr

function analysis_object_get_histogram_ptr (obj) result (h)
type(histogram_t), pointer :: h
type(analysis_object_t), intent(in) :: obj
select case (obj%type)
case (AN_HISTOGRAM); h => obj%h
case default; h => null ()
end select
end function analysis_object_get_histogram_ptr

```

```

function analysis_object_get_plot_ptr (obj) result (plot)
type(plot_t), pointer :: plot
type(analysis_object_t), intent(in) :: obj
select case (obj%type)
case (AN_PLOT); plot => obj%p
case default; plot => null ()
end select
end function analysis_object_get_plot_ptr

function analysis_object_get_graph_ptr (obj) result (g)
type(graph_t), pointer :: g
type(analysis_object_t), intent(in) :: obj
select case (obj%type)
case (AN_GRAPH); g => obj%g
case default; g => null ()
end select
end function analysis_object_get_graph_ptr

```

Return true if the object has a graphical representation:

```

<Analysis: procedures>+≡
function analysis_object_has_plot (obj) result (flag)
logical :: flag
type(analysis_object_t), intent(in) :: obj
select case (obj%type)
case (AN_HISTOGRAM); flag = .true.
case (AN_PLOT); flag = .true.
case (AN_GRAPH); flag = .true.
case default; flag = .false.
end select
end function analysis_object_has_plot

```

## Output

```

<Analysis: procedures>+≡
subroutine analysis_object_write (obj, unit, verbose)
type(analysis_object_t), intent(in) :: obj
integer, intent(in), optional :: unit
logical, intent(in), optional :: verbose
logical :: verb
integer :: u
u = given_output_unit (unit); if (u < 0) return
verb = .false.; if (present (verbose)) verb = verbose

call histogram_get_header (obj%h, header, comment)
case (AN_PLOT)
call plot_get_header (obj%p, header, comment)
end select
end subroutine analysis_object_get_header

```

### 13.5.10 Analysis object iterator

Analysis objects are containers which have iterable data structures: histograms/bins and plots/points. If they are to be treated on a common basis, it is useful to have an iterator which hides the implementation details.

The iterator is used only for elementary analysis objects that contain plot data: histograms or plots. It is invalid for meta-objects (graphs) and non-graphical objects (observables).

```

<Analysis: types>+≡
type :: analysis_iterator_t
private
integer :: type = AN_UNDEFINED
type(analysis_object_t), pointer :: object => null ()
integer :: index = 1
type(point_t), pointer :: point => null ()
end type

```

The initializer places the iterator at the beginning of the analysis object.

```

<Analysis: procedures>+≡
subroutine analysis_iterator_init (iterator, object)
type(analysis_iterator_t), intent(out) :: iterator
type(analysis_object_t), intent(in), target :: object
iterator%object => object
if (associated (iterator%object)) then
iterator%type = iterator%object%type
select case (iterator%type)
case (AN_PLOT)
iterator%point => iterator%object%p%first
end select
end if
end subroutine analysis_iterator_init

```

The iterator is valid as long as it points to an existing entry. An iterator for a data object without array data (observable) is always invalid.

```

<Analysis: procedures>+≡
function analysis_iterator_is_valid (iterator) result (valid)
logical :: valid
type(analysis_iterator_t), intent(in) :: iterator
if (associated (iterator%object)) then
select case (iterator%type)
case (AN_HISTOGRAM)
valid = iterator%index <= histogram_get_n_bins (iterator%object%h)

```

```

case (AN_PLOT)
valid = associated (iterator%point)
case default
valid = .false.
end select
else
valid = .false.
end if
end function analysis_iterator_is_valid

```

Advance the iterator.

```

<Analysis: procedures>+≡
subroutine analysis_iterator_advance (iterator)
type(analysis_iterator_t), intent(inout) :: iterator
if (associated (iterator%object)) then
select case (iterator%type)
case (AN_PLOT)
iterator%point => iterator%point%next
end select
iterator%index = iterator%index + 1
end if
end subroutine analysis_iterator_advance

```

Retrieve the object type:

```

<Analysis: procedures>+≡
function analysis_iterator_get_type (iterator) result (type)
integer :: type
type(analysis_iterator_t), intent(in) :: iterator
type = iterator%type
end function analysis_iterator_get_type

```

Use the iterator to retrieve data. We implement a common routine which takes the data descriptors as optional arguments. Data which do not occur in the selected type trigger to an error condition.

The iterator must point to a valid entry.

```

<Analysis: procedures>+≡
subroutine analysis_iterator_get_data (iterator, &
x, y, yerr, xerr, width, excess, index, n_total)
type(analysis_iterator_t), intent(in) :: iterator
real(default), intent(out), optional :: x, y, yerr, xerr, width, excess
integer, intent(out), optional :: index, n_total
select case (iterator%type)
case (AN_HISTOGRAM)
if (present (x)) &
x = bin_get_midpoint (iterator%object%h%bin(iterator%index))
if (present (y)) &
y = bin_get_sum (iterator%object%h%bin(iterator%index))
if (present (yerr)) &
yerr = bin_get_error (iterator%object%h%bin(iterator%index))
if (present (xerr)) &
call invalid ("histogram", "xerr")
if (present (width)) &

```

```

width = bin_get_width (iterator%object%h%bin(iterator%index))
if (present (excess)) &
excess = bin_get_excess (iterator%object%h%bin(iterator%index))
if (present (index)) &
index = iterator%index
if (present (n_total)) &
n_total = histogram_get_n_bins (iterator%object%h)
case (AN_PLOT)
if (present (x)) &
x = point_get_x (iterator%point)
if (present (y)) &
y = point_get_y (iterator%point)
if (present (yerr)) &
yerr = point_get_yerr (iterator%point)
if (present (xerr)) &
xerr = point_get_xerr (iterator%point)
if (present (width)) &
call invalid ("plot", "width")
if (present (excess)) &
call invalid ("plot", "excess")
if (present (index)) &
index = iterator%index
if (present (n_total)) &
n_total = plot_get_n_entries (iterator%object%p)
case default
call msg_bug ("analysis_iterator_get_data: called " &
// "for unsupported analysis object type")
end select
contains
subroutine invalid (typestr, objstr)
character(*), intent(in) :: typestr, objstr
call msg_bug ("analysis_iterator_get_data: attempt to get '" &
// objstr // "' for type '" // typestr // "'")
end subroutine invalid
end subroutine analysis_iterator_get_data

```

### 13.5.11 Analysis store

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings and types.

```

<Analysis: variables>≡
  type(analysis_store_t), save :: analysis_store

<Analysis: types>+≡
  type :: analysis_store_t
  private
  type(analysis_object_t), pointer :: first => null ()
  type(analysis_object_t), pointer :: last => null ()
  end type analysis_store_t

```

Delete the analysis store

```
<Analysis: public>+≡
  public :: analysis_final

<Analysis: sub interfaces>+≡
  module subroutine analysis_final ()
  end subroutine analysis_final

<Analysis: procedures>+≡
  module subroutine analysis_final ()
  type(analysis_object_t), pointer :: current
  do while (associated (analysis_store%first))
  current => analysis_store%first
  analysis_store%first => current%next
  call analysis_object_final (current)
  end do
  analysis_store%last => null ()
  end subroutine analysis_final
```

Append a new analysis object

```
<Analysis: procedures>+≡
  subroutine analysis_store_append_object (id, type)
  type(string_t), intent(in) :: id
  integer, intent(in) :: type
  type(analysis_object_t), pointer :: obj
  allocate (obj)
  call analysis_object_init (obj, id, type)
  if (associated (analysis_store%last)) then
  analysis_store%last%next => obj
  else
  analysis_store%first => obj
  end if
  analysis_store%last => obj
  end subroutine analysis_store_append_object
```

Return a pointer to the analysis object with given ID.

```
<Analysis: procedures>+≡
  function analysis_store_get_object_ptr (id) result (obj)
  type(string_t), intent(in) :: id
  type(analysis_object_t), pointer :: obj
  obj => analysis_store%first
  do while (associated (obj))
  if (obj%id == id) return
  obj => obj%next
  end do
  end function analysis_store_get_object_ptr
```

Initialize an analysis object: either reset it if present, or append a new entry.

```
<Analysis: procedures>+≡
  subroutine analysis_store_init_object (id, type, obj)
  type(string_t), intent(in) :: id
  integer, intent(in) :: type
  type(analysis_object_t), pointer :: obj, next
```

```

obj => analysis_store_get_object_ptr (id)
if (associated (obj)) then
next => analysis_object_get_next_ptr (obj)
call analysis_object_final (obj)
call analysis_object_init (obj, id, type)
call analysis_object_set_next_ptr (obj, next)
else
call analysis_store_append_object (id, type)
obj => analysis_store%last
end if
end subroutine analysis_store_init_object

```

Get the type of a analysis object

```

<Analysis: public>+≡
public :: analysis_store_get_object_type

<Analysis: sub interfaces>+≡
module function analysis_store_get_object_type (id) result (type)
type(string_t), intent(in) :: id
integer :: type
end function analysis_store_get_object_type

<Analysis: procedures>+≡
module function analysis_store_get_object_type (id) result (type)
type(string_t), intent(in) :: id
integer :: type
type(analysis_object_t), pointer :: object
object => analysis_store_get_object_ptr (id)
if (associated (object)) then
type = object%type
else
type = AN_UNDEFINED
end if
end function analysis_store_get_object_type

```

Return the number of objects in the store.

```

<Analysis: procedures>+≡
function analysis_store_get_n_objects () result (n)
integer :: n
type(analysis_object_t), pointer :: current
n = 0
current => analysis_store%first
do while (associated (current))
n = n + 1
current => current%next
end do
end function analysis_store_get_n_objects

```

Allocate an array and fill it with all existing IDs.

```

<Analysis: public>+≡
public :: analysis_store_get_ids

```

```

<Analysis: sub interfaces>+≡
  module subroutine analysis_store_get_ids (id)
    type(string_t), dimension(:), allocatable, intent(out) :: id
  end subroutine analysis_store_get_ids

<Analysis: procedures>+≡
  module subroutine analysis_store_get_ids (id)
    type(string_t), dimension(:), allocatable, intent(out) :: id
    type(analysis_object_t), pointer :: current
    integer :: i
    allocate (id (analysis_store_get_n_objects()))
    i = 0
    current => analysis_store%first
    do while (associated (current))
      i = i + 1
      id(i) = current%id
      current => current%next
    end do
  end subroutine analysis_store_get_ids

```

### 13.5.12 L<sup>A</sup>T<sub>E</sub>X driver file

Write a driver file for all objects in the store.

```

<Analysis: procedures>+≡
  subroutine analysis_store_write_driver_all (filename_data, unit)
    type(string_t), intent(in) :: filename_data
    integer, intent(in), optional :: unit
    type(analysis_object_t), pointer :: obj
    call analysis_store_write_driver_header (unit)
    obj => analysis_store%first
    do while (associated (obj))
      call analysis_object_write_driver (obj, filename_data, unit)
      obj => obj%next
    end do

## Chapter 14

# Matrix Element Handling

In this chapter, we support internal and external matrix elements: initialization, automatic generation where necessary, and numerical evaluation. We provide the interface for code generation and linking. Matrix-element code is organized in processes and process libraries.

**process\_constants** A record of static process properties, for easy transfer between various WHIZARD modules.

**prclib\_interfaces** This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

**prc\_core\_def** This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

**process\_libraries** This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

**prclib\_stacks** Collect process libraries.

**test\_me** This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.

Figure 14.1: Module dependencies in `src/matrix_elements`.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

## 14.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

```
<process_constants.f90>≡
  <File header>

  module process_constants

    <Use kinds>
    <Use strings>
    use pdg_arrays

    <Standard module head>

    <Process constants: public>

    <Process constants: types>

    interface
      <Process constants: sub interfaces>
    end interface

  end module process_constants

<process_constants_sub.f90>≡
  <File header>

  submodule (process_constants) process_constants_s

    use io_units, only: given_output_unit, free_unit
    use format_utils, only: write_integer_array
    use md5, only: md5sum

    implicit none

    contains

    <Process constants: procedures>

  end submodule process_constants_s
```

The data type is just a block of public objects, only elementary types, no type-bound procedures.

```
<Process constants: public>≡

## 14.2 Process library interface

The module `prclib_interfaces` handles external matrix-element code.

### 14.2.1 Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.
2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.
3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.
4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and C-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that

is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, O’MEGA matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

### 14.2.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.
2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.
3. The `generate_driver_code` writes the common driver as source code to file.
4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.
5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

### 14.2.3 The module

```

<prclib_interfaces.f90>≡
  <File header>

  module prclib_interfaces

    use, intrinsic :: iso_c_binding !NODEP!

    use kinds
    <Use strings>
    use os_interface

    <Standard module head>

    <Prclib interfaces: public>

    <Prclib interfaces: types>

```

```

    <Prclib interfaces: interfaces>

    interface
    <Prclib interfaces: sub interfaces>
    end interface

    contains

    <Prclib interfaces: main procedures>

    end module prclib_interfaces

<prclib_interfaces_sub.f90>≡
    <File header>

    submodule (prclib_interfaces) prclib_interfaces_s

    use io_units
    use system_defs, only: TAB
    use string_utils, only: lower_case
    use diagnostics

    implicit none

    contains

    <Prclib interfaces: procedures>

    end submodule prclib_interfaces_s

```

#### 14.2.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of `bind(C)` procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

##### Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such

```

as O'MEGA.

<Prclib interfaces: public>≡
  public :: prc_writer_t

<Prclib interfaces: types>≡
  type, abstract :: prc_writer_t
  character(32) :: md5sum = ""
  contains
  <Prclib interfaces: prc writer: TBP>
  end type prc_writer_t

```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

```

<Prclib interfaces: prc writer: TBP>≡
  procedure(get_const_string), nopass, deferred :: type_name

<Prclib interfaces: interfaces>≡
  abstract interface
  function get_const_string () result (string)
  import
  type(string_t) :: string
  end function get_const_string
  end interface

```

Return the name of a procedure that implements a given feature, as it is provided by the external matrix-element code. For a reasonable default, we take the feature name unchanged. Due to a bug of bind(C) features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure, nopass :: get_procname => prc_writer_get_procname

<Prclib interfaces: main procedures>≡
  function prc_writer_get_procname (feature) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: feature
  name = feature
  end function prc_writer_get_procname

```

Return the name of a procedure that implements a given feature with the bind(C) property, so it can be accessed via a C procedure pointer and handled by dlopen. We need this for all special features of a matrix element, since the interface has to return a C function pointer for it. For a default implementation, we prefix the external procedure name by the process ID. Due to a bug of bind(C) features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: get_c_procname => prc_writer_get_c_procname

<Prclib interfaces: main procedures>+≡
  function prc_writer_get_c_procname (writer, id, feature) result (name)
  class(prc_writer_t), intent(in) :: writer
  type(string_t), intent(in) :: id, feature

```

```

type(string_t) :: name
name = id // "_" // feature
end function prc_writer_get_c_procname

```

Common signature of code-writing procedures. The procedure may use the process ID, and the feature name. (Not necessarily all of them.)

*(Prclib interfaces: interfaces)+≡*

```

abstract interface
subroutine write_code_file (writer, id)
import
class(prc_writer_t), intent(in) :: writer
type(string_t), intent(in) :: id
end subroutine write_code_file
end interface

abstract interface
subroutine write_code (writer, unit, id)
import
class(prc_writer_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
end subroutine write_code
end interface

abstract interface
subroutine write_code_os &
(writer, unit, id, os_data, verbose, testflag)
import
class(prc_writer_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
type(os_data_t), intent(in) :: os_data
logical, intent(in) :: verbose
logical, intent(in), optional :: testflag
end subroutine write_code_os
end interface

abstract interface
subroutine write_feature_code (writer, unit, id, feature)
import
class(prc_writer_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id, feature
end subroutine write_feature_code
end interface

```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

*(Prclib interfaces: prc writer: TBP)+≡*

```

procedure(write_feature_code), deferred :: write_interface

```

There must also be a procedure which writes Makefile code which is specific for

the current process, but not the feature.

```
<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code_os), deferred :: write_makefile_code
```

This procedure writes code process-specific source-code file (which need not be Fortran). It is called before `make source` is called. It may be a no-op, if the source code is generated by Make instead.

```
<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code_file), deferred :: write_source_code
```

This procedure is executed, once for each process, before (after) `make compile` is called, respectively.

```
<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code_file), deferred :: before_compile
  procedure(write_code_file), deferred :: after_compile
```

### Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require `bind(C)` wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```
<Prclib interfaces: public>+≡
  public :: prc_writer_f_module_t

<Prclib interfaces: types>+≡
  type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
  contains
  <Prclib interfaces: prc writer f module: TBP>
  end type prc_writer_f_module_t
```

Return the name of the Fortran module. As a default implementation, we take the process ID unchanged. Due to a bug of `bind(C)` features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```
<Prclib interfaces: prc writer f module: TBP>≡
  procedure, nopass :: get_module_name => prc_writer_get_module_name

<Prclib interfaces: main procedures>+≡
  function prc_writer_get_module_name (id) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: id
  name = id
  end function prc_writer_get_module_name
```

Write a `use` directive that associates the driver reference with the procedure in the matrix element code. By default, we use the C name for this.

```
<Prclib interfaces: prc writer f module: TBP>+≡
  procedure :: write_use_line => prc_writer_write_use_line
```

```

<Prclib interfaces: sub interfaces>≡
  module subroutine prc_writer_write_use_line (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t) :: id, feature
  end subroutine prc_writer_write_use_line

<Prclib interfaces: procedures>≡
  module subroutine prc_writer_write_use_line (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t) :: id, feature
  write (unit, "(2x,9A)") "use ", char (writer%get_module_name (id)), &
  ", only: ", char (writer%get_c_procname (id, feature)), &
  " => ", char (writer%get_procname (feature))
  end subroutine prc_writer_write_use_line

```

Write a wrapper routine for a feature. This also associates a C name the module procedure. The details depend on the writer variant.

```

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure(prc_write_wrapper), deferred :: write_wrapper

<Prclib interfaces: interfaces>+≡
  abstract interface
  subroutine prc_write_wrapper (writer, unit, id, feature)
  import
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  end subroutine prc_write_wrapper
  end interface

```

This is used for testing only: initialize the writer with a specific MD5 sum string.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: init_test => prc_writer_init_test

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_init_test (writer)
  class(prc_writer_t), intent(out) :: writer
  end subroutine prc_writer_init_test

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_init_test (writer)
  class(prc_writer_t), intent(out) :: writer
  writer%md5sum = "1234567890abcdef1234567890abcdef"
  end subroutine prc_writer_init_test

```

## Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library with bind(C) compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

<Prclib interfaces: public>+≡

```

```

    public :: prc_writer_c_lib_t
<Prclib interfaces: types>+≡
    type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
    contains
    <Prclib interfaces: prc writer c lib: TBP>
    end type prc_writer_c_lib_t

```

### 14.2.5 Process records in the library driver

A process record holds the process (component) ID, the physics `model_name`, and the array of `features` that are implemented by the corresponding matrix element code.

The `writer` component holds procedures. The procedures write source code for the current record, either for the driver or for the Makefile.

```

<Prclib interfaces: types>+≡
    type :: prclib_driver_record_t
    type(string_t) :: id
    type(string_t) :: model_name
    type(string_t), dimension(:), allocatable :: feature
    class(prc_writer_t), pointer :: writer => null ()
    contains
    <Prclib interfaces: prclib driver record: TBP>
    end type prclib_driver_record_t

```

Output routine. We indent the output, so it smoothly integrates into the output routine for the whole driver.

Note: the pointer `writer` is introduced as a workaround for a NAG compiler bug.

```

<Prclib interfaces: prclib driver record: TBP>≡
    procedure :: write => prclib_driver_record_write

<Prclib interfaces: sub interfaces>+≡
    module subroutine prclib_driver_record_write (object, unit)
    class(prclib_driver_record_t), intent(in) :: object
    integer, intent(in) :: unit
    end subroutine prclib_driver_record_write

<Prclib interfaces: procedures>+≡
    module subroutine prclib_driver_record_write (object, unit)
    class(prclib_driver_record_t), intent(in) :: object
    integer, intent(in) :: unit
    integer :: j
    class(prc_writer_t), pointer :: writer
    write (unit, "(3x,A,2x,['',A,']')") &
    char (object%id), char (object%model_name)
    if (allocated (object%feature)) then
    writer => object%writer
    write (unit, "(5x,A,A)", advance="no") &
    char (writer%type_name ()), ":"
    do j = 1, size (object%feature)
    write (unit, "(1x,A)", advance="no") &
    char (object%feature(j))

```

```

end do
write (unit, *)
end if
end subroutine prclib_driver_record_write

```

Get the C procedure name for a feature. Due to a bug of bind(C) features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: get_c_procname => prclib_driver_record_get_c_procname

<Prclib interfaces: main procedures>+≡
  function prclib_driver_record_get_c_procname (record, feature) result (name)
  type(string_t) :: name
  class(prclib_driver_record_t), intent(in) :: record
  type(string_t), intent(in) :: feature
  name = record%writer%get_c_procname (record%id, feature)
end function prclib_driver_record_get_c_procname

```

Write a USE directive for a given feature. Applies only if the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_use_line => prclib_driver_record_write_use_line

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_use_line (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
end subroutine prclib_driver_record_write_use_line

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_use_line (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
  select type (writer => record%writer)
  class is (prc_writer_f_module_t)
  call writer%write_use_line (unit, record%id, feature)
end select
end subroutine prclib_driver_record_write_use_line

```

The alternative: write an interface block for a given feature, unless the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_interface => prclib_driver_record_write_interface

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_interface (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
end subroutine prclib_driver_record_write_interface

```

```

<Prclib interfaces: procedures>+≡
module subroutine prclib_driver_record_write_interface (record, unit, feature)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
type(string_t), intent(in) :: feature
select type (writer => record%writer)
class is (prc_writer_f_module_t)
class default
call writer%write_interface (unit, record%id, feature)
end select
end subroutine prclib_driver_record_write_interface

```

Write all special feature interfaces for the current record. Do this for all process variants.

```

<Prclib interfaces: prclib driver record: TBP>+≡
procedure :: write_interfaces => prclib_driver_record_write_interfaces

<Prclib interfaces: sub interfaces>+≡
module subroutine prclib_driver_record_write_interfaces (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
end subroutine prclib_driver_record_write_interfaces

<Prclib interfaces: procedures>+≡
module subroutine prclib_driver_record_write_interfaces (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
integer :: i
do i = 1, size (record%feature)
call record%writer%write_interface (unit, record%id, record%feature(i))
end do
end subroutine prclib_driver_record_write_interfaces

```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
procedure :: write_wrappers => prclib_driver_record_write_wrappers

<Prclib interfaces: sub interfaces>+≡
module subroutine prclib_driver_record_write_wrappers (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
end subroutine prclib_driver_record_write_wrappers

<Prclib interfaces: procedures>+≡
module subroutine prclib_driver_record_write_wrappers (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
integer :: i
select type (writer => record%writer)
class is (prc_writer_f_module_t)
do i = 1, size (record%feature)
call writer%write_wrapper (unit, record%id, record%feature(i))
end do
end select
end subroutine prclib_driver_record_write_wrappers

```

Write the Makefile code for this record.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_makefile_code => prclib_driver_record_write_makefile_code

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_makefile_code &
    (record, unit, os_data, verbose, testflag)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    type(os_data_t), intent(in) :: os_data
    logical, intent(in) :: verbose
    logical, intent(in), optional :: testflag
    end subroutine prclib_driver_record_write_makefile_code

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_makefile_code &
    (record, unit, os_data, verbose, testflag)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    type(os_data_t), intent(in) :: os_data
    logical, intent(in) :: verbose
    logical, intent(in), optional :: testflag
    call record%writer%write_makefile_code &
      (unit, record%id, os_data, verbose, testflag)
    end subroutine prclib_driver_record_write_makefile_code

```

Write source-code files for this record. This can be used as an alternative to handling source code via Makefile. In fact, this procedure is executed before `make source` is called. Usually, does nothing.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_source_code => prclib_driver_record_write_source_code

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_source_code (record)
    class(prclib_driver_record_t), intent(in) :: record
    end subroutine prclib_driver_record_write_source_code

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_source_code (record)
    class(prclib_driver_record_t), intent(in) :: record
    call record%writer%write_source_code (record%id)
    end subroutine prclib_driver_record_write_source_code

```

Execute commands for this record that depend on the sources, so they cannot be included in the previous procedure. This procedure is executed before (after) `make compile` is called, respectively. Usually, does nothing.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: before_compile => prclib_driver_record_before_compile
  procedure :: after_compile => prclib_driver_record_after_compile

end subroutine prclib_driver_record_after_compile

```

### 14.2.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The `basename` identifies the library, both by file names and by Fortran variable names.

The `loaded` flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a `dlaccess` object.

`n_processes` is the number of external process code components that are referenced by this library. The code is addressed by index (`i_lib` in the process library entry above). This number should be equal to the number returned by `get_n_prc`.

For each external process, there is a separate `record` which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The `get_fptr` procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the `unload_hook` and `reload_hook` pointers allow for the insertion of additional code when a library is loaded.

```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name. Due to a bug of `bind(C)` features with submodules in `gfortran 7/8/9` (and maybe together with `MPI`) this needs to be in the module, not the submodule.

```

<Prclib interfaces: public>+≡
  public :: dispatch_prclib_driver

<Prclib interfaces: main procedures>+≡
  subroutine dispatch_prclib_driver &

## 14.2.8 Write driver file

This procedure writes the process library driver source code to the specified output unit. The individual routines for writing source-code procedures are given below.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: generate_driver_code => prclib_driver_generate_code

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_generate_code (driver, unit)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
  end subroutine prclib_driver_generate_code

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_generate_code (driver, unit)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t) :: prefix
    integer :: i

    prefix = driver%basename // "_"

    write (unit, "(A)") "! WHIZARD matrix-element code interface"
    write (unit, "(A)") "!"
    write (unit, "(A)") "! Automatically generated file, do not edit"
    call driver%write_module (unit, prefix)
    call driver%write_lib_md5sum_fun (unit, prefix)
    call driver%write_get_n_processes_fun (unit, prefix)
    call driver%write_get_process_id_fun (unit, prefix)
    call driver%write_get_model_name_fun (unit, prefix)
    call driver%write_get_md5sum_fun (unit, prefix)
    call driver%write_string_to_array_fun (unit, prefix)
    call driver%write_get_openmp_status_fun (unit, prefix)
    call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
    call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
    call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))

```

```

call driver%write_set_col_state_sub (unit, prefix)
call driver%write_set_color_factors_sub (unit, prefix)
call driver%write_get_fptr_sub (unit, prefix)
do i = 1, driver%n_processes
call driver%record(i)%write_wrappers (unit)
end do
end subroutine prclib_driver_generate_code

```

The driver module is used and required *only* if we intend to link the library statically. Then, it provides the (static) driver type as a concrete implementation of the abstract library driver. This type contains the internal dispatcher for assigning the library procedures to their appropriate procedure pointers. In the dynamical case, the assignment is done via the base-type dispatcher which invokes the DL mechanism.

However, compiling this together with the rest in any case should not do any harm.

```

### 14.2.9 Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main program) and the process-library driver. The procedures are all BIND(C), so they can safely be exposed by the library and handled by the `dlopen` mechanism, which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself and a procedure that writes the corresponding procedure as source code to the process library driver.

### Process count

Return the number of processes contained in the library.

```
<Prclib interfaces: public>+≡
  public :: prc_get_n_processes

<Prclib interfaces: interfaces>+≡
  abstract interface
    function prc_get_n_processes () result (n) bind(C)
  import
    integer(c_int) :: n
  end function prc_get_n_processes
  end interface
```

Here is the code.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_n_processes_fun

<Prclib interfaces: sub interfaces>+≡
  module subroutine write_get_n_processes_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    end subroutine write_get_n_processes_fun

<Prclib interfaces: procedures>+≡
  module subroutine write_get_n_processes_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the number of processes in this library"
    write (unit, "(A)") "function " // char (prefix) &
    // "get_n_processes () result (n) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " implicit none"
    write (unit, "(A)") " integer(c_int) :: n"
    write (unit, "(A,IO)") " n = ", driver%n_processes
    write (unit, "(A)") "end function " // char (prefix) &
    // "get_n_processes"
    end subroutine write_get_n_processes_fun
```

### Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

```
<Prclib interfaces: public>+≡
  public :: prc_get_stringptr
```

```

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_get_stringptr (i, cptr, len) bind(C)
    import
    integer(c_int), intent(in) :: i
    type(c_ptr), intent(out) :: cptr
    integer(c_int), intent(out) :: len
    end subroutine prc_get_stringptr
  end interface

```

To hide this complication, we introduce a subroutine that converts the returned C pointer to a `string_t` object. As a side effect, we deallocate the original after conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran character array pointer, length 1 and size `len`. Using argument association and an internal subroutine, we convert this to a character array with length `len` and size 1. Using ordinary assignment, we finally convert this to `string_t`.

The function takes the pointer-returning function as an argument. The index `i` identifies the process in the library.

```

<Prclib interfaces: procedures>+≡
  subroutine get_string_via_cptr (string, i, get_stringptr)
    type(string_t), intent(out) :: string
    integer, intent(in) :: i
    procedure(prc_get_stringptr) :: get_stringptr
    type(c_ptr) :: cptr
    integer(c_int) :: pid, len
    character(kind=c_char), dimension(:), pointer :: c_array
    pid = i
    call get_stringptr (pid, cptr, len)
    if (c_associated (cptr)) then
      call c_f_pointer (cptr, c_array, shape = [len])
      call set_string (c_array)
      call get_stringptr (0_c_int, cptr, len)
    else
      string = ""
    end if
    contains
    subroutine set_string (buffer)
      character(len, kind=c_char), dimension(1), intent(in) :: buffer
      string = buffer(1)
    end subroutine set_string
  end subroutine get_string_via_cptr

```

Since the module procedures return Fortran strings, we have to convert them. This is the necessary auxiliary routine. The routine is not `BIND(C)`, it is not accessed from outside.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure, nopass :: write_string_to_array_fun

<Prclib interfaces: sub interfaces>+≡
  module subroutine write_string_to_array_fun (unit, prefix)
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    end subroutine write_string_to_array_fun

```

```

<Prclib interfaces: procedures>+≡
module subroutine write_string_to_array_fun (unit, prefix)
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
write (unit, "(A)") ""
write (unit, "(A)") "! Auxiliary: convert character string &
&to array pointer"
write (unit, "(A)") "subroutine " // char (prefix) &
// "string_to_array (string, a)"
write (unit, "(A)") " use iso_c_binding"
write (unit, "(A)") " implicit none"
write (unit, "(A)") " character(*), intent(in) :: string"
write (unit, "(A)") " character(kind=c_char), dimension(:), &
&allocatable, intent(out) :: a"
write (unit, "(A)") " integer :: i"
write (unit, "(A)") " allocate (a (len (string)))"
write (unit, "(A)") " do i = 1, size (a)"
write (unit, "(A)") " a(i) = string(i:i)"
write (unit, "(A)") " end do"
write (unit, "(A)") "end subroutine " // char (prefix) &
// "string_to_array"
end subroutine write_string_to_array_fun

```

The above routine is called by other functions. It is not in a module, so they need its interface explicitly.

```

<Prclib interfaces: procedures>+≡
subroutine write_string_to_array_interface (unit, prefix)
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
write (unit, "(2x,A)") "interface"
write (unit, "(2x,A)") " subroutine " // char (prefix) &
// "string_to_array (string, a)"
write (unit, "(2x,A)") " use iso_c_binding"
write (unit, "(2x,A)") " implicit none"
write (unit, "(2x,A)") " character(*), intent(in) :: string"
write (unit, "(2x,A)") " character(kind=c_char), dimension(:), &
&allocatable, intent(out) :: a"
write (unit, "(2x,A)") " end subroutine " // char (prefix) &
// "string_to_array"
write (unit, "(2x,A)") "end interface"
end subroutine write_string_to_array_interface

```

Here are the info functions which return strings, implementing the interface `prc_get_stringptr`.

Return the process ID for each process.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_get_process_id_fun

<Prclib interfaces: sub interfaces>+≡
module subroutine write_get_process_id_fun (driver, unit, prefix)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix

```

```

end subroutine write_get_process_id_fun

write (unit, "(A)") " end subroutine copy"
write (unit, "(A)") "end subroutine " // char (prefix) &
// "get_md5sum_ptr"
end subroutine write_get_md5sum_fun

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_md5sum_call => prclib_driver_record_write_md5sum_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_md5sum_call (record, unit)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  end subroutine prclib_driver_record_write_md5sum_call

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_md5sum_call (record, unit)
  class(prclib_driver_record_t), intent(in) :: record

```

```

integer, intent(in) :: unit
call record%writer%write_md5sum_call (unit, record%id)
end subroutine prclib_driver_record_write_md5sum_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡

```

```

  procedure(write_code), deferred :: write_md5sum_call

```

In the Fortran module case, we take a detour. The string returned by the Fortran function is copied into a fixed-size array. The copy routine is an internal subroutine of `get_md5sum_ptr`. We return the C address of the target array.

```

<Prclib interfaces: prc writer f module: TBP>+≡

```

```

  procedure :: write_md5sum_call => prc_writer_f_module_write_md5sum_call

```

```

<Prclib interfaces: sub interfaces>+≡

```

```

module subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
class(prc_writer_f_module_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
end subroutine prc_writer_f_module_write_md5sum_call

```

```

<Prclib interfaces: procedures>+≡

```

```

module subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
class(prc_writer_f_module_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
!!! Workaround for Intel oneAPI 2022/23 regression
! write (unit, "(5x,9A)") "call copy (" , &
!      char (writer%get_c_procname (id, var_str ("md5sum"))), " ())"
write (unit, "(5x,9A)") "call copy ((" , &
char (writer%get_c_procname (id, var_str ("md5sum"))), " ())"
write (unit, "(5x,9A)") "cptr = c_loc (md5sum)"
end subroutine prc_writer_f_module_write_md5sum_call

```

In the C library case, the library function returns a C pointer, which we can just copy.

```

<Prclib interfaces: prc writer c lib: TBP>≡

```

```

  procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call

```

```

<Prclib interfaces: sub interfaces>+≡

```

```

module subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
class(prc_writer_c_lib_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
end subroutine prc_writer_c_lib_write_md5sum_call

```

```

<Prclib interfaces: procedures>+≡

```

```

module subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
class(prc_writer_c_lib_t), intent(in) :: writer
integer, intent(in) :: unit
type(string_t), intent(in) :: id
write (unit, "(5x,9A)") &
"cptr = ", &
char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
end subroutine prc_writer_c_lib_write_md5sum_call

```

## Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into `string_t` objects.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: get_process_id => prclib_driver_get_process_id
  procedure :: get_model_name => prclib_driver_get_model_name
  procedure :: get_md5sum => prclib_driver_get_md5sum

<Prclib interfaces: sub interfaces>+≡
  module function prclib_driver_get_process_id (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
  end function prclib_driver_get_process_id
  module function prclib_driver_get_model_name (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
  end function prclib_driver_get_model_name
  module function prclib_driver_get_md5sum (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
  end function prclib_driver_get_md5sum

<Prclib interfaces: procedures>+≡
  module function prclib_driver_get_process_id (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    call get_string_via_cptr (string, i, driver%get_process_id_ptr)
  end function prclib_driver_get_process_id

  module function prclib_driver_get_model_name (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    call get_string_via_cptr (string, i, driver%get_model_name_ptr)
  end function prclib_driver_get_model_name

  module function prclib_driver_get_md5sum (driver, i) result (string)
    type(string_t) :: string
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    call get_string_via_cptr (string, i, driver%get_md5sum_ptr)
  end function prclib_driver_get_md5sum
```

## Informational logical functions

When returning a logical value, we use the C boolean type, which may differ from Fortran.

```
<Prclib interfaces: public>+≡
```

```

    public :: prc_get_log
<Prclib interfaces: interfaces>+≡
    abstract interface
    function prc_get_log (pid) result (l) bind(C)
    import
    integer(c_int), intent(in) :: pid
    logical(c_bool) :: l
    end function prc_get_log
    end interface

```

Return a logical flag which tells whether OpenMP is supported for a specific process code.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: write_get_openmp_status_fun

<Prclib interfaces: sub interfaces>+≡
    module subroutine write_get_openmp_status_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    end subroutine write_get_openmp_status_fun

<Prclib interfaces: procedures>+≡
    module subroutine write_get_openmp_status_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the OpenMP support status"
    write (unit, "(A)") "function " // char (prefix) &
    // "get_openmp_status (i) result (openmp_status) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    call driver%write_interfaces (unit, var_str ("openmp_supported"))
    write (unit, "(A)") " integer(c_int), intent(in) :: i"
    write (unit, "(A)") " logical(c_bool) :: openmp_status"
    write (unit, "(A)") " select case (i)"
    do i = 1, driver%n_processes
    write (unit, "(A,I0,9A)") " case (" , i, "); ", &
    "openmp_status = ", &
    char (driver%record(i)%get_c_procname &
    (var_str ("openmp_supported"))), " ()"
    end do
    write (unit, "(A)") " end select"
    write (unit, "(A)") "end function " // char (prefix) &
    // "get_openmp_status"
    end subroutine write_get_openmp_status_fun

```

## Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

```

<Prclib interfaces: public>+≡
    public :: prc_get_int

```

```

<Prclib interfaces: interfaces>+≡
abstract interface
function prc_get_int (pid) result (n) bind(C)
import
integer(c_int), intent(in) :: pid
integer(c_int) :: n
end function prc_get_int
end interface

```

This function returns any data of type integer, for each process.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_get_int_fun

```

```

<Prclib interfaces: sub interfaces>+≡
module subroutine write_get_int_fun (driver, unit, prefix, feature)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
type(string_t), intent(in) :: feature
end subroutine write_get_int_fun

```

```

<Prclib interfaces: procedures>+≡
module subroutine write_get_int_fun (driver, unit, prefix, feature)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
type(string_t), intent(in) :: feature
integer :: i
write (unit, "(A)") ""
write (unit, "(9A)") "! Return the value of ", char (feature)
write (unit, "(9A)") "function ", char (prefix), &
"get_", char (feature), " (pid)", &
" result (" , char (feature), ") bind(C)"
write (unit, "(9A)") " use iso_c_binding"
call driver%write_interfaces (unit, feature)
write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
write (unit, "(9A)") " integer(c_int) :: ", char (feature)
write (unit, "(9A)") " select case (pid)"
do i = 1, driver%n_processes
write (unit, "(2x,A,I0,9A)") "case (" , i, "); ", &
char (feature), " = ", &
char (driver%record(i)%get_c_procname (feature)), &
" ()"
end do
write (unit, "(9A)") " end select"
write (unit, "(9A)") "end function ", char (prefix), &
"get_", char (feature)
end subroutine write_get_int_fun

```

Write a **case** line that assigns the value of the external function to the current return value.

```

<Prclib interfaces: procedures>+≡
subroutine write_case_int_fun (record, unit, i, feature)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit

```

```

integer, intent(in) :: i
type(string_t), intent(in) :: feature
write (unit, "(5x,A,I0,9A)") "case (" , i, " ); " , &
char (feature), " = " , char (record%get_c_procname (feature))
end subroutine write_case_int_fun

```

## Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

```

<Prclib interfaces: public>+≡
  public :: prc_set_int_tab1
<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), dimension(*), intent(out) :: tab
    integer(c_int), dimension(2), intent(in) :: shape
  end subroutine prc_set_int_tab1
end interface

```

This subroutine returns a table of integers.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_set_int_sub
<Prclib interfaces: sub interfaces>+≡
  module subroutine write_set_int_sub (driver, unit, prefix, feature)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    type(string_t), intent(in) :: feature
  end subroutine write_set_int_sub
<Prclib interfaces: procedures>+≡
  module subroutine write_set_int_sub (driver, unit, prefix, feature)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    type(string_t), intent(in) :: feature
    integer :: i
    write (unit, "(A)") ""
    write (unit, "(9A)") "! Set table: " , char (feature)
    write (unit, "(9A)") "subroutine " , char (prefix), &
    "set_" , char (feature), "_ptr (pid, " , char (feature), &
    " , shape) bind(C)"
    write (unit, "(9A)") " use iso_c_binding"
    call driver%write_interfaces (unit, feature)
    write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(9A)") " integer(c_int), dimension(*), intent(out) :: " , &
    char (feature)
    write (unit, "(9A)") " integer(c_int), dimension(2), intent(in) :: shape"
    write (unit, "(9A)") " integer, dimension(:,:), allocatable :: " , &
    char (feature), "_tmp"
    write (unit, "(9A)") " integer :: i, j"

```

```

write (unit, "(9A)") " select case (pid)"
do i = 1, driver%n_processes
write (unit, "(2x,A,I0,A)") "case (" , i, ")"
call driver%record(i)%write_int_sub_call (unit, feature)
end do
write (unit, "(9A)") " end select"
write (unit, "(9A)") "end subroutine ", char (prefix), &
"set_", char (feature), "_ptr"
end subroutine write_set_int_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib_driver_record: TBP>+≡
  procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
  end subroutine prclib_driver_record_write_int_sub_call

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  type(string_t), intent(in) :: feature
  call record%writer%write_int_sub_call (unit, record%id, feature)
  end subroutine prclib_driver_record_write_int_sub_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc_writer: TBP>+≡
  procedure(write_feature_code), deferred :: write_int_sub_call

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and c_int differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.

<Prclib interfaces: prc_writer_f_module: TBP>+≡
  procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  end subroutine prc_writer_f_module_write_int_sub_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  write (unit, "(5x,9A)") "allocate (" , char (feature), "_tmp ", &
"(shape(1), shape(2)))"
  write (unit, "(5x,9A)") "call ", &
char (writer%get_c_procname (id, feature)), &

```

```

" (", char (feature), "_tmp)"
write (unit, "(5x,9A)") "forall (i=1:shape(1), j=1:shape(2)) "
write (unit, "(8x,9A)") char (feature), "(i + shape(1)*(j-1)) = ", &
char (feature), "_tmp", "(i,j)"
write (unit, "(5x,9A)") "end forall"
end subroutine prc_writer_f_module_write_int_sub_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  end subroutine prc_writer_c_lib_write_int_sub_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id, feature
  write (unit, "(5x,9A)") "call ", &
  char (writer%get_c_procname (id, feature)), " (", char (feature), ")"
  end subroutine prc_writer_c_lib_write_int_sub_call

```

## Color state table

The color-state specification needs a table of integers (one array per color flow) and a corresponding array of color-ghost flags.

```

<Prclib interfaces: public>+≡
  public :: prc_set_col_state

<Prclib interfaces: interfaces>+≡
  abstract interface
  subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
  import
  integer(c_int), intent(in) :: pid
  integer(c_int), dimension(*), intent(out) :: col_state
  logical(c_bool), dimension(*), intent(out) :: ghost_flag
  integer(c_int), dimension(3), intent(in) :: shape
  end subroutine prc_set_col_state
  end interface

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_set_col_state_sub

<Prclib interfaces: sub interfaces>+≡
  module subroutine write_set_col_state_sub (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  end subroutine write_set_col_state_sub

```

```

<Prclib interfaces: procedures>+≡
module subroutine write_set_col_state_sub (driver, unit, prefix)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
integer :: i
type(string_t) :: feature
feature = "col_state"
write (unit, "(A)") ""
write (unit, "(9A)") "! Set tables: col_state, ghost_flag"
write (unit, "(9A)") "subroutine ", char (prefix), &
"set_col_state_ptr (pid, col_state, ghost_flag, shape) bind(C)"
write (unit, "(9A)") " use iso_c_binding"
call driver%write_interfaces (unit, feature)
write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
write (unit, "(9A)") &
" integer(c_int), dimension(*), intent(out) :: col_state"
write (unit, "(9A)") &
" logical(c_bool), dimension(*), intent(out) :: ghost_flag"
write (unit, "(9A)") &
" integer(c_int), dimension(3), intent(in) :: shape"
write (unit, "(9A)") &
" integer, dimension(:, :, :), allocatable :: col_state_tmp"
write (unit, "(9A)") &
" logical, dimension(:, :, :), allocatable :: ghost_flag_tmp"
write (unit, "(9A)") " integer :: i, j, k"
write (unit, "(A)") " select case (pid)"
do i = 1, driver%n_processes
write (unit, "(A,I0,A)") " case (", i, ")"
call driver%record(i)%write_col_state_call (unit)
end do
write (unit, "(A)") " end select"
write (unit, "(9A)") "end subroutine ", char (prefix), &
"set_col_state_ptr"
end subroutine write_set_col_state_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
procedure :: write_col_state_call => prclib_driver_record_write_col_state_call

<Prclib interfaces: sub interfaces>+≡
module subroutine prclib_driver_record_write_col_state_call (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
end subroutine prclib_driver_record_write_col_state_call

<Prclib interfaces: procedures>+≡
module subroutine prclib_driver_record_write_col_state_call (record, unit)
class(prclib_driver_record_t), intent(in) :: record
integer, intent(in) :: unit
call record%writer%write_col_state_call (unit, record%id)
end subroutine prclib_driver_record_write_col_state_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code), deferred :: write_col_state_call

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and c_int differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.
<Prclib interfaces: prc writer f module: TBP>+≡
  procedure :: write_col_state_call => prc_writer_f_module_write_col_state_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  end subroutine prc_writer_f_module_write_col_state_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(9A)") " allocate (col_state_tmp ", &
    "(shape(1), shape(2), shape(3)))"
  write (unit, "(5x,9A)") "allocate (ghost_flag_tmp ", &
    "(shape(2), shape(3)))"
  write (unit, "(5x,9A)") "call ", &
    char (writer%get_c_procname (id, var_str ("col_state"))), &
    " (col_state_tmp, ghost_flag_tmp)"
  write (unit, "(5x,9A)") "forall (i = 1:shape(2), j = 1:shape(3))"
  write (unit, "(8x,9A)") "forall (k = 1:shape(1))"
  write (unit, "(11x,9A)") &
    "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
    "= col_state_tmp(k,i,j)"
  write (unit, "(8x,9A)") "end forall"
  write (unit, "(8x,9A)") &
    "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
  write (unit, "(5x,9A)") "end forall"
  end subroutine prc_writer_f_module_write_col_state_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  end subroutine prc_writer_c_lib_write_col_state_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id

```

```

write (unit, "(5x,9A)") "call ", &
char (writer%get_c_procname (id, var_str ("col_state"))), &
" (col_state, ghost_flag)"
end subroutine prc_writer_c_lib_write_col_state_call

```

## Color factors

For the color-factor information, we return two integer arrays and a complex array.

```

<Prclib interfaces: public>+≡
public :: prc_set_color_factors

<Prclib interfaces: interfaces>+≡
abstract interface
subroutine prc_set_color_factors &
(pid, cf_index1, cf_index2, color_factors, shape) bind(C)
import
integer(c_int), intent(in) :: pid
integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
complex(c_default_complex), dimension(*), intent(out) :: color_factors
integer(c_int), dimension(1), intent(in) :: shape
end subroutine prc_set_color_factors
end interface

```

This subroutine returns the color-flavor factor table.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_set_color_factors_sub

<Prclib interfaces: sub interfaces>+≡
module subroutine write_set_color_factors_sub (driver, unit, prefix)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
end subroutine write_set_color_factors_sub

<Prclib interfaces: procedures>+≡
module subroutine write_set_color_factors_sub (driver, unit, prefix)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
integer :: i
type(string_t) :: feature
feature = "color_factors"
write (unit, "(A)") ""
write (unit, "(A)") "! Set tables: color factors"
write (unit, "(9A)") "subroutine ", char (prefix), &
"set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
"shape) bind(C)"
write (unit, "(A)") " use iso_c_binding"
write (unit, "(A)") " use kinds"
write (unit, "(A)") " use omega_color"
call driver%write_interfaces (unit, feature)
write (unit, "(A)") " integer(c_int), intent(in) :: pid"

```

```

write (unit, "(A)") " integer(c_int), dimension(1), intent(in) :: shape"
write (unit, "(A)") " integer(c_int), dimension(*), intent(out) :: &
&cf_index1, cf_index2"
write (unit, "(A)") " complex(c_default_complex), dimension(*), &
&intent(out) :: color_factors"
write (unit, "(A)") " type(omega_color_factor), dimension(:), &
&allocatable :: cf"
write (unit, "(A)") " select case (pid)"
do i = 1, driver%n_processes
write (unit, "(2x,A,I0,A)") "case (", i, ")"
call driver%record(i)%write_color_factors_call (unit)
end do
write (unit, "(A)") " end select"
write (unit, "(A)") "end subroutine " // char (prefix) &
// "set_color_factors_ptr"
end subroutine write_set_color_factors_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_record_write_color_factors_call (record, unit)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  end subroutine prclib_driver_record_write_color_factors_call

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_record_write_color_factors_call (record, unit)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit
  call record%writer%write_color_factors_call (unit, record%id)
  end subroutine prclib_driver_record_write_color_factors_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure(write_code), deferred :: write_color_factors_call

In the Fortran module case, the matrix-element procedure fills an array of
omega_color_factor elements. We distribute this array among two integer
arrays and one complex-valued array, for which we have the C pointers.

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  end subroutine prc_writer_f_module_write_color_factors_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit

```

```

type(string_t), intent(in) :: id
write (unit, "(5x,A)") "allocate (cf (shape(1)))"
write (unit, "(5x,9A)") "call ", &
char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
write (unit, "(5x,9A)") "cf_index1(1:shape(1)) = cf%i1"
write (unit, "(5x,9A)") "cf_index2(1:shape(1)) = cf%i2"
write (unit, "(5x,9A)") "color_factors(1:shape(1)) = cf%factor"
end subroutine prc_writer_f_module_write_color_factors_call

```

In the C library case, we just transfer the C pointers to the library function. There are three arrays.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_color_factors_call => &
    prc_writer_c_lib_write_color_factors_call

<Prclib interfaces: sub interfaces>+≡
  module subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    end subroutine prc_writer_c_lib_write_color_factors_call

<Prclib interfaces: procedures>+≡
  module subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    write (unit, "(5x,9A)") "call ", &
    char (writer%get_c_procname (id, var_str ("color_factors"))), &
    " (cf_index1, cf_index2, color_factors)"
    end subroutine prc_writer_c_lib_write_color_factors_call

```

#### 14.2.10 Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or bind(C) Fortran library, we need explicit interfaces for the library functions. They are not identical to the Fortran module versions. They transfer pointers directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as base type for all C-library writers. It writes specific interfaces depending on the feature.

We bind this as the method `write_standard_interface` instead of `write_interface`, because we have to override the latter. Otherwise we could not call the method because the writer type is abstract.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_standard_interface => prc_writer_c_lib_write_interface

<Prclib interfaces: sub interfaces>+≡

### 14.2.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return tables, actually C pointers to tables. Here, we write convenience routines that unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use intermediate storage for correctly transforming C to Fortran data types.

*<Prclib interfaces: prclib driver: TBP>+≡*

```

procedure :: set_flv_state => prclib_driver_set_flv_state
procedure :: set_hel_state => prclib_driver_set_hel_state

```

*<Prclib interfaces: sub interfaces>+≡*

```

module subroutine prclib_driver_set_flv_state (driver, i, flv_state)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
integer, dimension(:,:), allocatable, intent(out) :: flv_state
end subroutine prclib_driver_set_flv_state
module subroutine prclib_driver_set_hel_state (driver, i, hel_state)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
integer, dimension(:,:), allocatable, intent(out) :: hel_state
end subroutine prclib_driver_set_hel_state

```

*<Prclib interfaces: procedures>+≡*

```

module subroutine prclib_driver_set_flv_state (driver, i, flv_state)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
integer, dimension(:,:), allocatable, intent(out) :: flv_state
integer :: n_tot, n_flv
integer(c_int) :: pid
integer(c_int), dimension(:,:), allocatable :: c_flv_state
pid = i
n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
n_flv = driver%get_n_flv (pid)
allocate (flv_state (n_tot, n_flv))
allocate (c_flv_state (n_tot, n_flv))
call driver%set_flv_state_ptr &
(pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
flv_state = c_flv_state
end subroutine prclib_driver_set_flv_state

```

```

module subroutine prclib_driver_set_hel_state (driver, i, hel_state)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
integer, dimension(:,:), allocatable, intent(out) :: hel_state
integer :: n_tot, n_hel
integer(c_int) :: pid
integer(c_int), dimension(:,:), allocatable, target :: c_hel_state
pid = i
n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
n_hel = driver%get_n_hel (pid)

    cf_index(1,:) = c_cf_index1
    cf_index(2,:) = c_cf_index2
  end subroutine prclib_driver_set_color_factors

```

### 14.2.12 Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

```
<Prclib interfaces: public>+≡
  public :: prc_get_fptr

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_get_fptr (pid, fid, fptr) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), intent(in) :: fid
    type(c_funptr), intent(out) :: fptr
  end subroutine prc_get_fptr
end interface
```

This procedure writes the source code for the procedure pointer returning subroutine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered `select case` construct.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_fptr_sub

<Prclib interfaces: sub interfaces>+≡
  module subroutine write_get_fptr_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
  end subroutine write_get_fptr_sub

<Prclib interfaces: procedures>+≡
  module subroutine write_get_fptr_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i, j
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return C pointer to a procedure:"
    write (unit, "(A)") "! pid = process index; fid = function index"
    write (unit, "(4A)") "subroutine ", char (prefix), "get_fptr ", &
      "(pid, fid, fptr) bind(C)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " use kinds"
    write (unit, "(A)") " implicit none"
    write (unit, "(A)") " integer(c_int), intent(in) :: pid"
    write (unit, "(A)") " integer(c_int), intent(in) :: fid"
    write (unit, "(A)") " type(c_funptr), intent(out) :: fptr"
    do i = 1, driver%n_processes
      call driver%record(i)%write_interfaces (unit)
```

```

end do
write (unit, "(A)") " select case (pid)"
do i = 1, driver%n_processes
write (unit, "(2x,A,I0,A)") "case (" , i, ")"
write (unit, "(5x,A)") "select case (fid)"
associate (record => driver%record(i))
do j = 1, size (record%feature)
write (unit, "(5x,A,I0,9A)") "case (" , j, "); " , &
"fptr = c_funloc (" , &
char (record%get_c_procname (record%feature(j))), &
")"
end do
end associate
write (unit, "(5x,A)") "end select"
end do
write (unit, "(A)") " end select"
write (unit, "(3A)") "end subroutine " , char (prefix), "get_fptr"
end subroutine write_get_fptr_sub

```

The procedures for which we want to return a pointer (the 'features' of the matrix element code) are actually Fortran module procedures. If we want to have a C signature, we must write wrapper functions for all of them. The procedures, their signatures, and the appropriate writer routines are specific for the process type.

To keep this generic, we do not provide the writer routines here, but just the interface for a writer routine. The actual routines are stored in the process record.

The `prefix` indicates the library, the `id` indicates the process, and `procname` is the bare name of the procedure to be written.

```

<Prclib interfaces: public>+≡
public :: write_driver_code

<Prclib interfaces: interfaces>+≡
abstract interface
subroutine write_driver_code (unit, prefix, id, procname)
import
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
type(string_t), intent(in) :: id
type(string_t), intent(in) :: procname
end subroutine write_driver_code
end interface

```

### 14.2.13 Hooks

Interface for additional library unload / reload hooks (currently unused!)

```

<Prclib interfaces: public>+≡
public :: prclib_unload_hook
public :: prclib_reload_hook

```

```

<Prclib interfaces: interfaces>+≡
  abstract interface
  subroutine prclib_unload_hook (libname)
  import
  type(string_t), intent(in) :: libname
  end subroutine prclib_unload_hook

  subroutine prclib_reload_hook (libname)
  import
  type(string_t), intent(in) :: libname
  end subroutine prclib_reload_hook
end interface

```

#### 14.2.14 Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple `make` calls. Note that the Makefile targets depend on each other, so calling `link` executes also the `source` and `compile` steps, when necessary.

Optionally, we can use a subdirectory. We construct a prefix for the subdirectory, and generate a shell `cd` call that moves us into the workspace.

The `prefix` version is intended to be prepended to a filename, and can be empty. The `path` version is intended to be prepended with a following slash, so the default is `..`.

```

<Prclib interfaces: public>+≡
  public :: workspace_prefix
  public :: workspace_path

<Prclib interfaces: sub interfaces>+≡
  module function workspace_prefix (workspace) result (prefix)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: prefix
  end function workspace_prefix
  module function workspace_path (workspace) result (path)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: path
  end function workspace_path
  module function workspace_cmd (workspace) result (cmd)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: cmd
  end function workspace_cmd

<Prclib interfaces: procedures>+≡
  module function workspace_prefix (workspace) result (prefix)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: prefix
  if (present (workspace)) then
  if (workspace /= "") then
  prefix = workspace // "/"
  else
  prefix = ""
  end if
  else
  prefix = ""
  end if

```

```

end function workspace_prefix

module function workspace_path (workspace) result (path)
type(string_t), intent(in), optional :: workspace
type(string_t) :: path
if (present (workspace)) then
if (workspace /= "") then
path = workspace
else
path = "."
end if
else
path = "."
end if
end function workspace_path

module function workspace_cmd (workspace) result (cmd)
type(string_t), intent(in), optional :: workspace
type(string_t) :: cmd
if (present (workspace)) then
if (workspace /= "") then
cmd = "cd " // workspace // " && "
else
cmd = ""
end if
else
cmd = ""
end if
end function workspace_cmd

```

The first routine writes source-code files for the individual processes. First it calls the writer routines directly for each process, then it calls `make source`. The make command may either post-process the files, or it may do the complete work, e.g., calling an external program that generates the files.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_source => prclib_driver_make_source

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_make_source (driver, os_data, workspace)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  type(string_t), intent(in), optional :: workspace
  end subroutine prclib_driver_make_source

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_make_source (driver, os_data, workspace)
  class(prclib_driver_t), intent(in) :: driver
  type(os_data_t), intent(in) :: os_data
  type(string_t), intent(in), optional :: workspace
  integer :: i
  do i = 1, driver%n_processes
  call driver%record(i)%write_source_code ()
  end do
  call os_system_call ( &

```

```

workspace_cmd (workspace) &
// "make source " // os_data%makeflags &
// " -f " // driver%basename // ".makefile")
end subroutine prclib_driver_make_source

```

Compile matrix element source code and the driver source code. As above, we first iterate through all processes and call `before_compile`. This is usually empty, but can execute code that depends on `make_source` already completed. Similarly, `after_compile` scans all processes again.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_compile => prclib_driver_make_compile

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_make_compile (driver, os_data, workspace)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    type(string_t), intent(in), optional :: workspace
    end subroutine prclib_driver_make_compile

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_make_compile (driver, os_data, workspace)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    type(string_t), intent(in), optional :: workspace
    integer :: i
    do i = 1, driver%n_processes
      call driver%record(i)%before_compile ()
    end do
    call os_system_call ( &
      workspace_cmd (workspace) &
      // "make compile " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
    do i = 1, driver%n_processes
      call driver%record(i)%after_compile ()
    end do
    end subroutine prclib_driver_make_compile

```

Combine all matrix-element code together with the driver in a process library on disk.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_link => prclib_driver_make_link

<Prclib interfaces: sub interfaces>+≡
  module subroutine prclib_driver_make_link (driver, os_data, workspace)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    type(string_t), intent(in), optional :: workspace
    end subroutine prclib_driver_make_link

<Prclib interfaces: procedures>+≡
  module subroutine prclib_driver_make_link (driver, os_data, workspace)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    type(string_t), intent(in), optional :: workspace
    integer :: i

```

```

call os_system_call ( &
workspace_cmd (workspace) &
// "make link " // os_data%makeflags &
// " -f " // driver%basename // ".makefile")
end subroutine prclib_driver_make_link

```

## 14.2.15 Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile targets. Apart from removing everything, removing specific files may be useful for partial rebuilds. (Note that removing the makefile itself can only be done once, for obvious reasons.)

If there is no makefile, do nothing.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: clean_library => prclib_driver_clean_library
  procedure :: clean_objects => prclib_driver_clean_objects
  procedure :: clean_source => prclib_driver_clean_source
  procedure :: clean_driver => prclib_driver_clean_driver
  procedure :: clean_makefile => prclib_driver_clean_makefile
  procedure :: clean => prclib_driver_clean
  procedure :: distclean => prclib_driver_distclean

<Prclib interfaces: sub interfaces>+≡

write (u, "(A)") "* Test output end: prclib_interfaces_6"
end subroutine prclib_interfaces_6

```

This version of test-code writer writes interfaces for all standard features plus one specific feature. The interfaces are all bind(C), so no wrapper is needed.

The driver part is identical to the Fortran case, so we simply extend the previous `test_writer_5` type. We only have to override the Makefile writer.

```

<Prclib interfaces: test types>+≡
type, extends (test_writer_5_t) :: test_writer_6_t
contains
procedure, nopass :: type_name => test_writer_6_type_name
procedure :: write_makefile_code => test_writer_6_mk
procedure :: write_source_code => test_writer_6_src
end type test_writer_6_t

```

```

<Prclib interfaces: test auxiliary>+≡

```

### 14.3 Abstract process core configuration

In this module, we define abstract data types that handle the method-specific part of defining a process (including all of its options) and accessing an external matrix element.

There are no unit tests, these are deferred to the `process_libraries` module below.

```

<prc_core_def.f90>≡
<File header>

```

```

module prc_core_def

  <Use strings>
  use process_constants
  use prclib_interfaces

  <Standard module head>

  <Prc core def: public>

  <Prc core def: types>

  <Prc core def: interfaces>

  interface
    <Prc core def: sub interfaces>
  end interface

end module prc_core_def

<prc_core_def_sub.f90>≡
  <File header>

  submodule (prc_core_def) prc_core_def_s

    use io_units
    use diagnostics

    implicit none

    contains

    <Prc core def: procedures>

  end submodule prc_core_def_s

```

### 14.3.1 Process core definition type

For storing configuration data that depend on the specific process variant, we introduce a polymorphic type. At this point, we just declare an abstract base type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we would have to call a finalizer from the `process_component_def_t` wrapper. Translate a `prc_core_def_t` to above named integers

```

<Prc core def: public>≡
  public :: prc_core_def_t

<Prc core def: types>≡
  type, abstract :: prc_core_def_t
  class(prc_writer_t), allocatable :: writer
  contains
  <Prc core def: process core def: TBP>

```

```
end type prc_core_def_t
```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

```
<Prc core def: process core def: TBP>≡
  procedure (prc_core_def_get_string), nopass, deferred :: type_string

<Prc core def: interfaces>≡
  abstract interface
    function prc_core_def_get_string () result (string)
  import
    type(string_t) :: string
  end function prc_core_def_get_string
end interface
```

The write method should display the content completely.

```
<Prc core def: process core def: TBP>+≡
  procedure (prc_core_def_write), deferred :: write

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_write (object, unit)
  import
    class(prc_core_def_t), intent(in) :: object
    integer, intent(in) :: unit
  end subroutine prc_core_def_write
end interface
```

The read method should fill the content completely.

```
<Prc core def: process core def: TBP>+≡
  procedure (prc_core_def_read), deferred :: read

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_read (object, unit)
  import
    class(prc_core_def_t), intent(out) :: object
    integer, intent(in) :: unit
  end subroutine prc_core_def_read
end interface
```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

```
<Prc core def: process core def: TBP>+≡
  procedure :: set_md5sum => prc_core_def_set_md5sum

<Prc core def: sub interfaces>≡
  module subroutine prc_core_def_set_md5sum (core_def, md5sum)
    class(prc_core_def_t), intent(inout) :: core_def
    character(32) :: md5sum
  end subroutine prc_core_def_set_md5sum
```

```

<Prc core def: procedures>≡
  module subroutine prc_core_def_set_md5sum (core_def, md5sum)
    class(prc_core_def_t), intent(inout) :: core_def
    character(32) :: md5sum
    if (allocated (core_def%writer)) core_def%writer%md5sum = md5sum
  end subroutine prc_core_def_set_md5sum

```

Allocate an appropriate driver object which corresponds to the chosen process core definition.

For internal matrix element (i.e., those which do not need external code), the driver should have access to all matrix element information from the beginning. In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix element code.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_allocate_driver), deferred :: allocate_driver

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_allocate_driver (object, driver, basename)
    import
    class(prc_core_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
  end subroutine prc_core_def_allocate_driver
  end interface

```

This flag tells whether the particular variant needs external code. We implement a default function which returns false. The flag depends only on the type, therefore we implement it as `nopass`.

```

<Prc core def: process core def: TBP>+≡
  procedure, nopass :: needs_code => prc_core_def_needs_code

<Prc core def: sub interfaces>+≡
  module function prc_core_def_needs_code () result (flag)
    logical :: flag
  end function prc_core_def_needs_code

<Prc core def: procedures>+≡
  module function prc_core_def_needs_code () result (flag)
    logical :: flag
    flag = .false.
  end function prc_core_def_needs_code

```

This subroutine allocates an array which holds the name of all features that this process core implements. This feature applies to matrix element code that is not coded as a Fortran module but communicates via independent library functions, which follow the C calling conventions. The addresses of those functions are returned as C function pointers, which can be converted into Fortran procedure pointers. The conversion is done in code specific for the process variant; here we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code. The driver interfaces only those C functions which are supported for the given process core.

If the process core does not require external code, this array is meaningless.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_get_features), nopass, deferred &
  :: get_features
<Prc core def: interfaces>+≡
  abstract interface
  subroutine prc_core_def_get_features (features)
  import
  type(string_t), dimension(:), allocatable, intent(out) :: features
  end subroutine prc_core_def_get_features
  end interface

```

Assign pointers to the process-specific procedures to the driver, if the process is external.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_connect), deferred :: connect
<Prc core def: interfaces>+≡
  abstract interface
  subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
  import
  class(prc_core_def_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  end subroutine prc_core_def_connect
  end interface

```

### 14.3.2 Process core template

We must be able to automatically allocate a process core definition object with the appropriate type, given only the type name.

To this end, we introduce a `prc_template_t` type which is simply a wrapper for an empty `prc_core_def_t` object. Choosing one of the templates from an array, we can allocate the target object.

```

<Prc core def: public>+≡
  public :: prc_template_t
<Prc core def: types>+≡
  type :: prc_template_t
  class(prc_core_def_t), allocatable :: core_def
  end type prc_template_t

```

The allocation routine. We use the `source` option of the `allocate` statement. The `mold` option would probably more appropriate, but is a F2008 feature.

```

<Prc core def: public>+≡
  public :: allocate_core_def

```

```

<Prc core def: sub interfaces>+≡
  module subroutine allocate_core_def (template, name, core_def)
    type(prc_template_t), dimension(:), intent(in) :: template
    type(string_t), intent(in) :: name
    class(prc_core_def_t), allocatable :: core_def
  end subroutine allocate_core_def

<Prc core def: procedures>+≡
  module subroutine allocate_core_def (template, name, core_def)
    type(prc_template_t), dimension(:), intent(in) :: template
    type(string_t), intent(in) :: name
    class(prc_core_def_t), allocatable :: core_def
    integer :: i
    do i = 1, size (template)
      if (template(i)%core_def%type_string () == name) then
        allocate (core_def, source = template(i)%core_def)
        return
      end if
    end do
  end subroutine allocate_core_def

```

### 14.3.3 Process driver

For each process component, we implement a driver object which holds the calls to the matrix element and various auxiliary routines as procedure pointers. Any actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding `prc_core_def` object), the procedure pointers may refer to external or internal code, and there may be additional procedures for certain types. The base type defined here is abstract.

```

<Prc core def: public>+≡
  public :: prc_core_driver_t

<Prc core def: types>+≡
  type, abstract :: prc_core_driver_t
  contains
  <Prc core def: process driver: TBP>
  end type prc_core_driver_t

```

This returns the process type. No reference to contents.

```

<Prc core def: process driver: TBP>≡
  procedure(prc_core_driver_type_name), nopass, deferred :: type_name

<Prc core def: interfaces>+≡
  abstract interface
    function prc_core_driver_type_name () result (type)
  import
    type(string_t) :: type
  end function prc_core_driver_type_name
  end interface

```

### 14.3.4 Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method, namely a subroutine that fills the record of constant process data. For an external process, this task is performed by the external library driver instead.

```
<Prc core def: public>+≡
  public :: process_driver_internal_t

<Prc core def: types>+≡
  type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
  contains
  <Prc core def: process driver internal: TBP>
  end type process_driver_internal_t

<Prc core def: process driver internal: TBP>≡
  procedure(process_driver_fill_constants), deferred :: fill_constants

<Prc core def: interfaces>+≡
  abstract interface
    subroutine process_driver_fill_constants (driver, data)
    import
    class(process_driver_internal_t), intent(in) :: driver
    type(process_constants_t), intent(out) :: data
  end subroutine process_driver_fill_constants
  end interface
```

## 14.4 Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

```
<process_libraries.f90>≡
  <File header>

  module process_libraries

    use, intrinsic :: iso_c_binding !NODEP!
```

```

    <Use strings>
    use physics_defs
    use os_interface
    use model_data
    use particle_specifiers
    use process_constants
    use prclib_interfaces
    use prc_core_def

    <Standard module head>

    <Process libraries: public>

    <Process libraries: parameters>

    <Process libraries: types>

    interface
    <Process libraries: sub interfaces>
    end interface

    character(*), intent(inout) :: buffer
    type(string_t) :: string, prefix
    string = buffer
    call split (string, prefix, "=")
    buffer = string
  end subroutine strip_equation_lhs

```

#### 14.4.2 Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

##### Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

Compute the MD5 sum of a process component. We reset the stored MD5 sum to the empty string (so a previous value is not included in the calculation), then write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

## Process definition

The process component definitions are collected in a common process definition object.

The `id` is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number `n_in` is 1 or 2 for a decay or scattering process, respectively. This must be identical to `n_in` for all components.

The initial and extra component definitions (see above) are allocated as the `initial` and `extra` arrays, respectively. The latter are determined from the former.

The `md5sum` is used to verify the integrity of the configuration.

```

```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

```

```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

We assume that the particle arrays match the `n_in` and `n_out` values in size. The model is referred to by name; it is identified as an existing model later. The index `i` must refer to an existing element of the component array.

Data specific for the process core of a component are imported as the `core_def` argument. We should allocate an object of class `prc_core_def_t` with the appropriate specific type, fill it, and transfer it to the process compo-

nent definition here. The allocation is moved, so the original allocated object is returned empty.

```

## Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

```
<Process libraries: public>+≡
  public :: process_def_entry_t

<Process libraries: types>+≡
  type, extends (process_def_t) :: process_def_entry_t
  private
  type(process_def_entry_t), pointer :: next => null ()
  end type process_def_entry_t
```

This is the type for the list itself.

```
<Process libraries: public>+≡
  public :: process_def_list_t

<Process libraries: types>+≡
  type :: process_def_list_t
  private
  type(process_def_entry_t), pointer :: first => null ()
  type(process_def_entry_t), pointer :: last => null ()
  contains
  <Process libraries: process def list: TBP>
  end type process_def_list_t
```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

```
<Process libraries: process def list: TBP>≡
  procedure :: final => process_def_list_final

<Process libraries: sub interfaces>+≡
  module subroutine process_def_list_final (list)
    class(process_def_list_t), intent(inout) :: list
  end subroutine process_def_list_final

<Process libraries: procedures>+≡
  module subroutine process_def_list_final (list)
    class(process_def_list_t), intent(inout) :: list
    type(process_def_entry_t), pointer :: current
    nullify (list%last)
    do while (associated (list%first))
      current => list%first
      list%first => current%next
      deallocate (current)
    end do
  end subroutine process_def_list_final
```

Write the complete list.

```
<Process libraries: process def list: TBP>+≡
  procedure :: write => process_def_list_write
```

```

<Process libraries: sub interfaces>+≡
  module subroutine process_def_list_write (object, unit, libpath)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
  end subroutine process_def_list_write

<Process libraries: procedures>+≡
  module subroutine process_def_list_write (object, unit, libpath)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
    type(process_def_entry_t), pointer :: entry
    integer :: i, u
    u = given_output_unit (unit)
    if (associated (object%first)) then
      i = 1
      entry => object%first
      do while (associated (entry))
        write (u, "(1x,A,I0,A)") "Process #", i, ":"
        call entry%write (u)
        i = i + 1
        entry => entry%next
      if (associated (entry)) write (u, *)
      end do
    else
      write (u, "(1x,A)") "Process definition list: [empty]"
    end if
  end subroutine process_def_list_write

```

Short account.

```

<Process libraries: process def list: TBP>+≡
  procedure :: show => process_def_list_show

<Process libraries: sub interfaces>+≡
  module subroutine process_def_list_show (object, unit)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine process_def_list_show

<Process libraries: procedures>+≡
  module subroutine process_def_list_show (object, unit)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    type(process_def_entry_t), pointer :: entry
    integer :: u
    u = given_output_unit (unit)
    if (associated (object%first)) then
      write (u, "(2x,A)") "Processes:"
      entry => object%first
      do while (associated (entry))
        call entry%show (u)
        entry => entry%next
      end do
    else

```

```

write (u, "(2x,A)") "Processes: [empty]"
end if
end subroutine process_def_list_show

```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

```

<Process libraries: process def list: TBP>+≡
  procedure :: read => process_def_list_read

<Process libraries: sub interfaces>+≡
  module subroutine process_def_list_read (object, unit, core_def_templates)
    class(process_def_list_t), intent(out) :: object
    integer, intent(in) :: unit
    type(prc_template_t), dimension(:), intent(in) :: core_def_templates
  end subroutine process_def_list_read

<Process libraries: procedures>+≡
  module subroutine process_def_list_read (object, unit, core_def_templates)
    class(process_def_list_t), intent(out) :: object
    integer, intent(in) :: unit
    type(prc_template_t), dimension(:), intent(in) :: core_def_templates
    type(process_def_entry_t), pointer :: entry
    character(80) :: buffer, ref
    integer :: i
    read (unit, "(A)") buffer
    write (ref, "(1x,A)") "Process definition list: [empty]"
    if (buffer == ref) return ! OK: empty library
    backspace (unit)
    READ_ENTRIES: do i = 1, huge(0)-1
      if (i > 1) read (unit, *, end=1)
      read (unit, "(A)") buffer

      write (ref, "(1x,A,I0,A)") "Process #", i, ":"
      if (buffer /= ref) return ! Wrong process header: done.
      allocate (entry)
      call entry%read (unit, core_def_templates)
      call object%append (entry)
    end do READ_ENTRIES
    1 continue ! EOF: done
  end subroutine process_def_list_read

```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

```

<Process libraries: process def list: TBP>+≡
  procedure :: append => process_def_list_append

<Process libraries: sub interfaces>+≡
  module subroutine process_def_list_append (list, entry)
    class(process_def_list_t), intent(inout) :: list
    type(process_def_entry_t), intent(inout), pointer :: entry
  end subroutine process_def_list_append

```

```

<Process libraries: procedures>+≡
module subroutine process_def_list_append (list, entry)

```

### 14.4.3 Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

#### Process library entry

For each process component that is part of the library, there is a separate library entry (`process_library_entry_t`). The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The **status** indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status **STAT\_LOADED** is accessible for computing matrix elements.

The **def** pointer identifies the corresponding process definition. The process component within that definition is identified by the **i\_component** index.

The **i\_external** index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The **driver** component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

```

(Process libraries: types)+≡
  type :: process_library_entry_t
  private
  integer :: status = STAT_UNKNOWN
  type(process_def_t), pointer :: def => null ()
  integer :: i_component = 0
  integer :: i_external = 0
  class(prc_core_driver_t), allocatable :: driver
  contains
  (Process libraries: process library entry: TBP)
end type process_library_entry_t

```

Here are the available status codes. An entry starts with **UNKNOWN** status. Once the association with a valid process definition is established, the status becomes **CONFIGURED**. If matrix element source code is to be generated by the system or provided from elsewhere, **CODE\_GENERATED** indicates that this is done. The **COMPILED** status is next, it also applies to processes which are accessed as pre-compiled binaries. Finally, the library is linked and process pointers are set; this is marked as **LOADED**.

For a process library, the initial status is **OPEN**, since process definitions may be added. After configuration, the process content is fixed and the status becomes **CONFIGURED**. The further states are as above, always referring to the lowest status among the process entries.

```

(Process libraries: parameters)≡
  integer, parameter, public :: STAT_UNKNOWN = 0
  integer, parameter, public :: STAT_OPEN = 1
  integer, parameter, public :: STAT_CONFIGURED = 2
  integer, parameter, public :: STAT_SOURCE = 3
  integer, parameter, public :: STAT_COMPILED = 4
  integer, parameter, public :: STAT_LINKED = 5
  integer, parameter, public :: STAT_ACTIVE = 6

  integer, parameter, public :: ASSOCIATED_BORN = 1
  integer, parameter, public :: ASSOCIATED_REAL = 2
  integer, parameter, public :: ASSOCIATED_VIRT = 3
  integer, parameter, public :: ASSOCIATED_SUB = 4
  integer, parameter, public :: ASSOCIATED_PDF = 5
  integer, parameter, public :: ASSOCIATED_REAL_SING = 6
  integer, parameter, public :: ASSOCIATED_REAL_FIN = 7
  integer, parameter, public :: N_ASSOCIATED_COMPONENTS = 7

```

These are the associated code letters, for output:

```

<Process libraries: parameters>+≡
character, dimension(0:6), parameter :: STATUS_LETTER = &
["?", "o", "f", "s", "c", "l", "a"]

```

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

```

<Process libraries: process library entry: TBP>≡
procedure :: to_string => process_library_entry_to_string

<Process libraries: sub interfaces>+≡
module function process_library_entry_to_string (object) result (string)
type(string_t) :: string
class(process_library_entry_t), intent(in) :: object

integer, intent(in) :: i
call entry%def%initial(entry%i_component)%connect &
(lib_driver, i, entry%driver)
end subroutine process_library_entry_connect

```

## The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The **entry** array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The **driver** object is needed only if **external** is true. This object handles all interactions with external matrix-element code.

The **md5sum** summarizes the complete **process\_def\_list\_t** base object. It can be used to check if the library configuration has changed.

```

<Process libraries: public>+≡
  public :: process_library_t

<Process libraries: types>+≡
  type, extends (process_def_list_t) :: process_library_t
  private
  type(string_t) :: basename
  integer :: n_entries = 0
  logical :: external = .false.
  integer :: status = STAT_UNKNOWN
  logical :: static = .false.
  logical :: driver_exists = .false.
  logical :: makefile_exists = .false.
  integer :: update_counter = 0
  type(process_library_entry_t), dimension(:), allocatable :: entry
  class(prclib_driver_t), allocatable :: driver
  character(32) :: md5sum = ""
  contains
  <Process libraries: process library: TBP>
  end type process_library_t

```

For the output, we write first the metadata and the DL access record, then the library entries in short form, and finally the process definition list which is the base object.

Don't write the MD5 sum since this is used to generate it.

```

<Process libraries: process library: TBP>≡
  procedure :: write => process_library_write

<Process libraries: sub interfaces>+≡
  module subroutine process_library_write (object, unit, libpath)

  case (STAT_ACTIVE);    write (u, "(A)") "active"
  end select
  call object%process_def_list_t%show (u)
  end subroutine process_library_show

```

The initializer defines just the basename. We may now add process definitions to the library.

```

<Process libraries: process library: TBP>+≡
  procedure :: init => process_library_init

<Process libraries: sub interfaces>+≡
  module subroutine process_library_init (lib, basename)
    class(process_library_t), intent(out) :: lib
    type(string_t), intent(in) :: basename
  end subroutine process_library_init

<Process libraries: procedures>+≡
  module subroutine process_library_init (lib, basename)
    class(process_library_t), intent(out) :: lib
    type(string_t), intent(in) :: basename
    lib%basename = basename
    lib%status = STAT_OPEN
    call msg_message ("Process library '" // char (basename) &
// "' : initialized")
  end subroutine process_library_init

```

This alternative initializer declares the library as static. We should now add process definitions to the library, but all external process code exists already. We need the driver object, and we should check the defined processes against the stored ones.

```

<Process libraries: process library: TBP>+≡
  procedure :: init_static => process_library_init_static

<Process libraries: sub interfaces>+≡
  module subroutine process_library_init_static (lib, basename)
    class(process_library_t), intent(out) :: lib
    type(string_t), intent(in) :: basename
  end subroutine process_library_init_static

<Process libraries: procedures>+≡
  module subroutine process_library_init_static (lib, basename)
    class(process_library_t), intent(out) :: lib
    type(string_t), intent(in) :: basename
    lib%basename = basename
    lib%status = STAT_OPEN
    lib%static = .true.
    call msg_message ("Static process library '" // char (basename) &
// "' : initialized")
  end subroutine process_library_init_static

```

The `configure` procedure scans the allocated entries in the process definition list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of process components and the number of components which need external code. This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry for each external matrix element.

NOTE: Currently we handle only initial process components; extra components are ignored.

```

<Process libraries: process library: TBP>+≡
  procedure :: configure => process_library_configure

  end if
  end subroutine process_library_write_driver

```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to

identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

```

(Process libraries: process library: TBP)+≡
  procedure :: update_status => process_library_update_status

(Process libraries: sub interfaces)+≡
  module subroutine process_library_update_status (lib, os_data, workspace)

if (lib%md5sum == md5sum_file) then
lib%status = STAT_SOURCE
end if
end if
end select
end if
end subroutine process_library_update_status

```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status `STAT_CONFIGURED`, which then advance to `STAT_SOURCE`. If, for a particular process, the status is already advanced, we do not remove previous files, so `make` will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh `make`.

Finally, if any source code has been generated, we need a driver file.

```

<Process libraries: process library: TBP>+≡
procedure :: make_source => process_library_make_source
<Process libraries: sub interfaces>+≡
module subroutine process_library_make_source &

```

```

#### 14.4.4 Use the library

Return the base name of the library

```

<Process libraries: process library: TBP>+≡
  procedure :: get_name => process_library_get_name

<Process libraries: sub interfaces>+≡
  module function process_library_get_name (lib) result (name)
    class(process_library_t), intent(in) :: lib
    type(string_t) :: name
  end function process_library_get_name

<Process libraries: procedures>+≡
  module function process_library_get_name (lib) result (name)
    class(process_library_t), intent(in) :: lib
    type(string_t) :: name
    name = lib%basename
  end function process_library_get_name

```

Once activated, we view the process library object as an interface for accessing the matrix elements.

```

<Process libraries: process library: TBP>+≡
  procedure :: is_active => process_library_is_active

<Process libraries: sub interfaces>+≡
  module function process_library_is_active (lib) result (flag)
    logical :: flag
    class(process_library_t), intent(in) :: lib
  end function process_library_is_active

<Process libraries: procedures>+≡
  module function process_library_is_active (lib) result (flag)
    logical :: flag
    class(process_library_t), intent(in) :: lib
    flag = lib%status == STAT_ACTIVE
  end function process_library_is_active

```

Return the current status code of the library. If an index is provided, return the status of that entry.

```

<Process libraries: process library: TBP>+≡
  procedure :: get_status => process_library_get_status

<Process libraries: sub interfaces>+≡
  module function process_library_get_status (lib, i) result (status)
    class(process_library_t), intent(in) :: lib
    integer, intent(in), optional :: i
    integer :: status
  end function process_library_get_status

```

```

<Process libraries: procedures>+≡
module function process_library_get_status (lib, i) result (status)

#### 14.4.5 Collect model-specific libraries

This returns appropriate linker flags for the model parameter libraries that are used by the generated matrix element. At the end, the main libwhizard is appended (again), because functions from that may be required.

Extra models in the local user space need to be treated individually.

```

call process_def_list%write (u)

write (u, "(A)")
write (u, "(A)")  "* Test output end: process_libraries_1"
end subroutine process_libraries_1

```

### Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

```

<Process libraries: test types>≡
  type, extends (prc_core_def_t) :: prcdef_2_t
  integer :: data = 0
  logical :: file = .false.
  contains
  <Process libraries: prcdef 2: TBP>
  end type prcdef_2_t

```

The process variant is named 'test'.

```

<Process libraries: prcdef 2: TBP>≡
  procedure, nopass :: type_string => prcdef_2_type_string

<Process libraries: test auxiliary>≡
  function prcdef_2_type_string () result (string)
  type(string_t) :: string
  string = "test"
  end function prcdef_2_type_string

```

Write the contents (the integer value).

```

<Process libraries: prcdef 2: TBP>+≡
  procedure :: write => prcdef_2_write

<Process libraries: test auxiliary>+≡
  subroutine prcdef_2_write (object, unit)
  class(prcdef_2_t), intent(in) :: object
  integer, intent(in) :: unit
  write (unit, "(3x,A,I0)") "Test data          = ", object%data
  end subroutine prcdef_2_write

```

Recover the integer value.

```

<Process libraries: prcdef 2: TBP>+≡
  procedure :: read => prcdef_2_read

```

```

<Process libraries: test auxiliary>+≡
subroutine prcdef_2_read (object, unit)
class(prcdef_2_t), intent(out) :: object
integer, intent(in) :: unit
character(80) :: buffer
read (unit, "(A)") buffer
call strip_equation_lhs (buffer)
read (buffer, *) object%data
end subroutine prcdef_2_read

```

No external procedures.

```

<Process libraries: prcdef 2: TBP>+≡
procedure, nopass :: get_features => prcdef_2_get_features

<Process libraries: test auxiliary>+≡
subroutine prcdef_2_get_features (features)
type(string_t), dimension(:), allocatable, intent(out) :: features
allocate (features (0))
end subroutine prcdef_2_get_features

```

No code generated.

```

<Process libraries: prcdef 2: TBP>+≡
procedure :: generate_code => prcdef_2_generate_code

<Process libraries: test auxiliary>+≡
subroutine prcdef_2_generate_code (object, &
basename, model_name, prt_in, prt_out)
class(prcdef_2_t), intent(in) :: object

type(string_t), intent(in) :: model_name
type(string_t), dimension(:), intent(in) :: prt_in
type(string_t), dimension(:), intent(in) :: prt_out
end subroutine prcdef_2_generate_code

```

Allocate the driver with the appropriate type.

```

<Process libraries: prcdef 2: TBP>+≡
procedure :: allocate_driver => prcdef_2_allocate_driver

<Process libraries: test auxiliary>+≡
subroutine prcdef_2_allocate_driver (object, driver, basename)
class(prcdef_2_t), intent(in) :: object
class(prc_core_driver_t), intent(out), allocatable :: driver
type(string_t), intent(in) :: basename
allocate (prctest_2_t :: driver)
end subroutine prcdef_2_allocate_driver

```

Nothing to connect.

```

<Process libraries: prcdef 2: TBP>+≡
procedure :: connect => prcdef_2_connect

```

```

<Process libraries: test auxiliary>+≡
  subroutine prcdef_2_connect (def, lib_driver, i, proc_driver)
  class(prcdef_2_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  end subroutine prcdef_2_connect

```

The associated driver type.

```

<Process libraries: test types>+≡
  type, extends (process_driver_internal_t) :: prctest_2_t
  contains
  <Process libraries: prctest 2: TBP>
  end type prctest_2_t

```

Return the type name.

```

<Process libraries: prctest 2: TBP>≡
  procedure, nopass :: type_name => prctest_2_type_name

<Process libraries: test auxiliary>+≡
  function prctest_2_type_name () result (type)
  type(string_t) :: type
  type = "test"
  end function prctest_2_type_name

```

This should fill constant process data. We do not check those here, however, therefore nothing done.

```

<Process libraries: prctest 2: TBP>+≡
  procedure :: fill_constants => prctest_2_fill_constants

<Process libraries: test auxiliary>+≡
  subroutine prctest_2_fill_constants (driver, data)
  class(prctest_2_t), intent(in) :: driver
  type(process_constants_t), intent(out) :: data
  end subroutine prctest_2_fill_constants

```

Here is the actual test.

For reading, we need a list of templates, i.e., an array containing allocated objects for all available process variants. This is the purpose of `process_core_templates`. Here, we have only a single template for the 'test' variant.

```

<Process libraries: execute tests>+≡
  call test (process_libraries_2, "process_libraries_2", &
    "process definition list", &
    u, results)

## Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

```

<Process libraries: test types>+≡
  type, extends (prc_core_def_t) :: prcdef_5_t
  contains
  <Process libraries: prcdef 5: TBP>
  end type prcdef_5_t

```

The process variant is named `test_file`.

```

<Process libraries: prcdef 5: TBP>≡
  procedure, nopass :: type_string => prcdef_5_type_string

<Process libraries: test auxiliary>+≡
  function prcdef_5_type_string () result (string)
  type(string_t) :: string
  string = "test_file"
  end function prcdef_5_type_string

```

We reuse the writer `test_writer_4` from the previous module.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: init => prcdef_5_init

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_init (object)
  class(prcdef_5_t), intent(out) :: object
  allocate (test_writer_4_t :: object%writer)
  end subroutine prcdef_5_init

```

Nothing to write.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: write => prcdef_5_write

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_write (object, unit)
  class(prcdef_5_t), intent(in) :: object
  integer, intent(in) :: unit
  end subroutine prcdef_5_write

```

Nothing to read.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: read => prcdef_5_read

```

```

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_read (object, unit)
  class(prcdef_5_t), intent(out) :: object
  integer, intent(in) :: unit
  end subroutine prcdef_5_read

```

Allocate the driver with the appropriate type.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: allocate_driver => prcdef_5_allocate_driver

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_allocate_driver (object, driver, basename)
  class(prcdef_5_t), intent(in) :: object
  class(prc_core_driver_t), intent(out), allocatable :: driver
  type(string_t), intent(in) :: basename
  allocate (prctest_5_t :: driver)
  end subroutine prcdef_5_allocate_driver

```

This time we need code:

```

<Process libraries: prcdef 5: TBP>+≡
  procedure, nopass :: needs_code => prcdef_5_needs_code

<Process libraries: test auxiliary>+≡
  function prcdef_5_needs_code () result (flag)
  logical :: flag
  flag = .true.
  end function prcdef_5_needs_code

```

For the test case, we implement a single feature proc1.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure, nopass :: get_features => prcdef_5_get_features

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (1))
  features = [ var_str ("proc1") ]
  end subroutine prcdef_5_get_features

```

Nothing to connect.

```

<Process libraries: prcdef 5: TBP>+≡
  procedure :: connect => prcdef_5_connect

<Process libraries: test auxiliary>+≡
  subroutine prcdef_5_connect (def, lib_driver, i, proc_driver)
  class(prcdef_5_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  end subroutine prcdef_5_connect

```

The driver type.

```
<Process libraries: test types>+≡
  type, extends (prc_core_driver_t) :: prctest_5_t
  contains
  <Process libraries: prctest 5: TBP>
  end type prctest_5_t
```

Return the type name.

```
<Process libraries: prctest 5: TBP>≡
  procedure, nopass :: type_name => prctest_5_type_name

<Process libraries: test auxiliary>+≡
  function prctest_5_type_name () result (type)
  type(string_t) :: type
  type = "test_file"
  end function prctest_5_type_name
```

Here is the actual test:

```
<Process libraries: execute tests>+≡
  call test (process_libraries_5, "process_libraries_5", &
    "build external process library", &
    u, results)

```

## Build and load library with test matrix element

Test 6: We write source code for a dummy process.

This process variant is identical to the previous case, but it supports a driver for the test procedure 'proc1'.

```

<Process libraries: test types>+≡
type, extends (prc_core_def_t) :: prcdef_6_t
contains
<Process libraries: prcdef 6: TBP>

```

```
end type prcdef_6_t
```

The process variant is named `test_file`.

```
<Process libraries: prcdef 6: TBP>≡
  procedure, nopass :: type_string => prcdef_6_type_string
<Process libraries: test auxiliary>+≡
  function prcdef_6_type_string () result (string)
  type(string_t) :: string
  string = "test_file"
  end function prcdef_6_type_string
```

We reuse the writer `test_writer_4` from the previous module.

```
<Process libraries: prcdef 6: TBP>+≡
  procedure :: init => prcdef_6_init
<Process libraries: test auxiliary>+≡
  subroutine prcdef_6_init (object)
  class(prcdef_6_t), intent(out) :: object
  allocate (test_writer_4_t :: object%writer)
  call object%writer%init_test ()
  end subroutine prcdef_6_init
```

Nothing to write.

```
<Process libraries: prcdef 6: TBP>+≡
  procedure :: write => prcdef_6_write
<Process libraries: test auxiliary>+≡
  subroutine prcdef_6_write (object, unit)
  class(prcdef_6_t), intent(in) :: object
  integer, intent(in) :: unit
  end subroutine prcdef_6_write
```

Nothing to read.

```
<Process libraries: prcdef 6: TBP>+≡
  procedure :: read => prcdef_6_read
<Process libraries: test auxiliary>+≡
  subroutine prcdef_6_read (object, unit)
  class(prcdef_6_t), intent(out) :: object
  integer, intent(in) :: unit
  end subroutine prcdef_6_read
```

Allocate the driver with the appropriate type.

```
<Process libraries: prcdef 6: TBP>+≡
  procedure :: allocate_driver => prcdef_6_allocate_driver
<Process libraries: test auxiliary>+≡
  subroutine prcdef_6_allocate_driver (object, driver, basename)
  class(prcdef_6_t), intent(in) :: object
  class(prc_core_driver_t), intent(out), allocatable :: driver
  type(string_t), intent(in) :: basename
  allocate (prctest_6_t :: driver)
  end subroutine prcdef_6_allocate_driver
```

This time we need code:

```

(Process libraries: prcdef 6: TBP)+≡
  procedure, nopass :: needs_code => prcdef_6_needs_code

(Process libraries: test auxiliary)+≡
  function prcdef_6_needs_code () result (flag)
    logical :: flag
    flag = .true.
  end function prcdef_6_needs_code

```

For the test case, we implement a single feature `proc1`.

```

(Process libraries: prcdef 6: TBP)+≡
  procedure, nopass :: get_features => prcdef_6_get_features

(Process libraries: test auxiliary)+≡

## 14.5 Process Library Stacks

For storing and handling multiple libraries, we define process library stacks. These are ordinary stacks where new entries are pushed onto the top.

```

<prclib_stacks.f90>≡
  <File header>

  module prclib_stacks

    <Use strings>
    use process_libraries

    <Standard module head>

    <Prclib stacks: public>

    <Prclib stacks: types>

    interface
      <Prclib stacks: sub interfaces>
    end interface

    end module prclib_stacks

<prclib_stacks_sub.f90>≡
  <File header>

  submodule (prclib_stacks) prclib_stacks_s

    use io_units
    use format_utils, only: write_separator

    implicit none

    contains

    <Prclib stacks: procedures>

```

```
end submodule prclib_stacks_s
```

### 14.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

```
<Prclib_stacks: public>≡
  public :: prclib_entry_t
<Prclib_stacks: types>≡
  type, extends (process_library_t) :: prclib_entry_t
  type(prclib_entry_t), pointer :: next => null ()
end type prclib_entry_t
```

### 14.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

```
<Prclib_stacks: public>+≡
  public :: prclib_stack_t
<Prclib_stacks: types>+≡
  type :: prclib_stack_t
  integer :: n = 0
  type(prclib_entry_t), pointer :: first => null ()
contains
  <Prclib_stacks: prclib_stack: TBP>
end type prclib_stack_t
```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

```
<Prclib_stacks: prclib_stack: TBP>≡
  procedure :: final => prclib_stack_final
<Prclib_stacks: sub interfaces>≡
  module subroutine prclib_stack_final (object)
    class(prclib_stack_t), intent(inout) :: object
  end subroutine prclib_stack_final
<Prclib_stacks: procedures>≡
  module subroutine prclib_stack_final (object)
    class(prclib_stack_t), intent(inout) :: object
    type(prclib_entry_t), pointer :: lib
    do while (associated (object%first))
      lib => object%first
      object%first => lib%next
      call lib%final ()
      deallocate (lib)
    end do
    object%n = 0
  end subroutine prclib_stack_final
```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: write => prclib_stack_write

<Prclib stacks: sub interfaces>+≡
  module subroutine prclib_stack_write (object, unit, libpath)
    class(prclib_stack_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
  end subroutine prclib_stack_write

<Prclib stacks: procedures>+≡
  module subroutine prclib_stack_write (object, unit, libpath)
    class(prclib_stack_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
    type(prclib_entry_t), pointer :: lib
    integer :: u
    u = given_output_unit (unit)
    call write_separator (u, 2)
    select case (object%n)
    case (0)
      write (u, "(1x,A)") "Process library stack: [empty]"
    case default
      write (u, "(1x,A)") "Process library stack:"
      lib => object%first
      do while (associated (lib))
        call write_separator (u)
        call lib%write (u, libpath)
        lib => lib%next
      end do
    end select
    call write_separator (u, 2)
  end subroutine prclib_stack_write

```

### 14.5.3 Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the library entry is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: push => prclib_stack_push

<Prclib stacks: sub interfaces>+≡
  module subroutine prclib_stack_push (stack, lib)
    class(prclib_stack_t), intent(inout) :: stack
    type(prclib_entry_t), intent(inout), pointer :: lib
  end subroutine prclib_stack_push

<Prclib stacks: procedures>+≡
  module subroutine prclib_stack_push (stack, lib)
    class(prclib_stack_t), intent(inout) :: stack
    type(prclib_entry_t), intent(inout), pointer :: lib
    lib%next => stack%first

```

```

stack%first => lib
lib => null ()
stack%n = stack%n + 1
end subroutine prclib_stack_push

```

#### 14.5.4 Accessing Contents

Return a pointer to the topmost stack element. The result type is just the bare `process_library_t`. There is no `target` attribute required since the stack elements are allocated via pointers.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: get_first_ptr => prclib_stack_get_first_ptr

<Prclib stacks: sub interfaces>+≡
  module function prclib_stack_get_first_ptr (stack) result (ptr)
    class(prclib_stack_t), intent(in) :: stack
    type(process_library_t), pointer :: ptr
  end function prclib_stack_get_first_ptr

<Prclib stacks: procedures>+≡
  module function prclib_stack_get_first_ptr (stack) result (ptr)
    class(prclib_stack_t), intent(in) :: stack
    type(process_library_t), pointer :: ptr
    if (associated (stack%first)) then
      ptr => stack%first%process_library_t
    else
      ptr => null ()
    end if
  end function prclib_stack_get_first_ptr

```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: get_names => prclib_stack_get_names

<Prclib stacks: sub interfaces>+≡
  module subroutine prclib_stack_get_names (stack, libname)
    class(prclib_stack_t), intent(in) :: stack
    type(string_t), dimension(:), allocatable, intent(out) :: libname
  end subroutine prclib_stack_get_names

<Prclib stacks: procedures>+≡
  module subroutine prclib_stack_get_names (stack, libname)
    class(prclib_stack_t), intent(in) :: stack
    type(string_t), dimension(:), allocatable, intent(out) :: libname
    type(prclib_entry_t), pointer :: lib
    integer :: i
    allocate (libname (stack%n))
    i = stack%n
    lib => stack%first
    do while (associated (lib))
      libname(i) = lib%get_name ()
    end do
  end subroutine prclib_stack_get_names

```

```

i = i - 1
lib => lib%next
end do
end subroutine prclib_stack_get_names

```

Return a pointer to the library with given name.

```

<Prclib stacks: prclib stack: TBP>+≡
  procedure :: get_library_ptr => prclib_stack_get_library_ptr

<Prclib stacks: sub interfaces>+≡
  module function prclib_stack_get_library_ptr (stack, libname) result (ptr)
    class(prclib_stack_t), intent(in) :: stack
    type(string_t), intent(in) :: libname
    type(process_library_t), pointer :: ptr
  end function prclib_stack_get_library_ptr

<Prclib stacks: procedures>+≡
  module function prclib_stack_get_library_ptr (stack, libname) result (ptr)
    class(prclib_stack_t), intent(in) :: stack
    type(string_t), intent(in) :: libname
    type(process_library_t), pointer :: ptr
    type(prclib_entry_t), pointer :: current
    current => stack%first
    do while (associated (current))
      if (current%get_name () == libname) then
        ptr => current%process_library_t
        return
      end if
      current => current%next
    end do
    ptr => null ()
  end function prclib_stack_get_library_ptr

```

### 14.5.5 Unit tests

Test module, followed by the corresponding implementation module.

```

<prclib_stacks_ut.f90>≡
  <File header>

  module prclib_stacks_ut
    use unit_tests
    use prclib_stacks_uti

    <Standard module head>

    <Prclib stacks: public test>

    contains

    <Prclib stacks: test driver>

  end module prclib_stacks_ut

```

```

<prclib_stacks_uti.f90>≡
  <File header>

  module prclib_stacks_uti

    <Use strings>

    use prclib_stacks

    <Standard module head>

    <Prclib stacks: test declarations>

    contains

    <Prclib stacks: tests>

  end module prclib_stacks_uti

```

API: driver for the unit tests below.

```

<Prclib stacks: public test>≡
  public :: prclib_stacks_test

<Prclib stacks: test driver>≡
  subroutine prclib_stacks_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
    <Prclib stacks: execute tests>
  end subroutine prclib_stacks_test

```

## Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

```

<Prclib stacks: execute tests>≡
  call test (prclib_stacks_1, "prclib_stacks_1", &
    "write an empty process library stack", &
    u, results)

<Prclib stacks: test declarations>≡
  public :: prclib_stacks_1

<Prclib stacks: tests>≡
  subroutine prclib_stacks_1 (u)
    integer, intent(in) :: u
    type(prclib_stack_t) :: stack

    write (u, "(A)")  "* Test output: prclib_stacks_1"
    write (u, "(A)")  "* Purpose: display an empty process library stack"
    write (u, "(A)")

    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: prclib_stacks_1"

```

```
end subroutine prclib_stacks_1
```

### Fill a process library stack

Fill a process library stack with two (identical) processes.

```
<Prclib_stacks: execute tests>+≡
  call test (prclib_stacks_2, "prclib_stacks_2", &
    "fill a process library stack", &
    u, results)
<Prclib_stacks: test declarations>+≡
  public :: prclib_stacks_2
<Prclib_stacks: tests>+≡
  subroutine prclib_stacks_2 (u)
    integer, intent(in) :: u
    type(prclib_stack_t) :: stack
    type(prclib_entry_t), pointer :: lib

    write (u, "(A)")  "* Test output: prclib_stacks_2"
    write (u, "(A)")  "*   Purpose: fill a process library stack"
    write (u, "(A)")

    write (u, "(A)")  "* Initialize two (empty) libraries &
&and push them on the stack"
    write (u, "(A)")

    allocate (lib)
    call lib%init (var_str ("lib1"))
    call stack%push (lib)

    allocate (lib)
    call lib%init (var_str ("lib2"))
    call stack%push (lib)

    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Cleanup"

    call stack%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: prclib_stacks_2"

  end subroutine prclib_stacks_2
```

## 14.6 Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements with the simplest possible structure.

This matrix element generator can only generate a single scattering process and a single decay process. The scattering process is a quartic interaction of a massless, neutral and colorless scalar  $s$  with unit coupling results in a trivial  $2 \rightarrow 2$  scattering process. The matrix element is implemented internally, so we do not need the machinery of external process libraries. The decay process is a decay of  $s$  into a pair of colored fermions  $f$ .

```

<prc_test.f90>≡
  <File header>

  module prc_test

    use, intrinsic :: iso_c_binding !NODEP!

    <Use kinds>
    <Use strings>
    use os_interface
    use particle_specifiers, only: new_prt_spec
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use process_libraries

    <Standard module head>

    <Test ME: public>

    <Test ME: types>

    interface
    <Test ME: sub interfaces>
    end interface

    contains

    <Test ME: main procedures>

  end module prc_test

<prc_test_sub.f90>≡
  <File header>

  submodule (prc_test) prc_test_s

    implicit none

    contains

    <Test ME: procedures>

  end submodule prc_test_s

```

### 14.6.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```
<Test ME: public>≡
  public :: prc_test_def_t

<Test ME: types>≡
  type, extends (prc_core_def_t) :: prc_test_def_t
  type(string_t) :: model_name
  type(string_t), dimension(:), allocatable :: prt_in
  type(string_t), dimension(:), allocatable :: prt_out
  contains
  <Test ME: test me def: TBP>
  end type prc_test_def_t

<Test ME: test me def: TBP>≡
  procedure, nopass :: type_string => prc_test_def_type_string

<Test ME: sub interfaces>≡
  module function prc_test_def_type_string () result (string)
  type(string_t) :: string
  end function prc_test_def_type_string

<Test ME: procedures>≡
  module function prc_test_def_type_string () result (string)
  type(string_t) :: string
  string = "test_me"
  end function prc_test_def_type_string
```

There is no 'feature' here since there is no external code.

```
<Test ME: test me def: TBP>+≡
  procedure, nopass :: get_features => prc_test_def_get_features

<Test ME: sub interfaces>+≡
  module subroutine prc_test_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  end subroutine prc_test_def_get_features

<Test ME: procedures>+≡
  module subroutine prc_test_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (0))
  end subroutine prc_test_def_get_features
```

Initialization: set some data (not really useful).

```
<Test ME: test me def: TBP>+≡
  procedure :: init => prc_test_def_init

<Test ME: sub interfaces>+≡
  module subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
  class(prc_test_def_t), intent(out) :: object
  type(string_t), intent(in) :: model_name
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  end subroutine prc_test_def_init
```

```

<Test ME: procedures>+≡
  module subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
  class(prc_test_def_t), intent(out) :: object
  type(string_t), intent(in) :: model_name
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  object%model_name = model_name
  allocate (object%prt_in (size (prt_in)))
  object%prt_in = prt_in
  allocate (object%prt_out (size (prt_out)))
  object%prt_out = prt_out
  end subroutine prc_test_def_init

```

Write/read process- and method-specific data. (No-op)

```

<Test ME: test me def: TBP>+≡
  procedure :: write => prc_test_def_write

<Test ME: sub interfaces>+≡
  module subroutine prc_test_def_write (object, unit)
  class(prc_test_def_t), intent(in) :: object
  integer, intent(in) :: unit
  end subroutine prc_test_def_write

<Test ME: procedures>+≡
  module subroutine prc_test_def_write (object, unit)
  class(prc_test_def_t), intent(in) :: object
  integer, intent(in) :: unit
  end subroutine prc_test_def_write

```

```

<Test ME: test me def: TBP>+≡
  procedure :: read => prc_test_def_read

<Test ME: sub interfaces>+≡
  module subroutine prc_test_def_read (object, unit)
  class(prc_test_def_t), intent(out) :: object
  integer, intent(in) :: unit
  end subroutine prc_test_def_read

<Test ME: procedures>+≡
  module subroutine prc_test_def_read (object, unit)
  class(prc_test_def_t), intent(out) :: object
  integer, intent(in) :: unit
  end subroutine prc_test_def_read

```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition. Due to a bug of bind(C) features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<Test ME: test me def: TBP>+≡
  procedure :: allocate_driver => prc_test_def_allocate_driver

```

```

<Test ME: main procedures>≡
subroutine prc_test_def_allocate_driver (object, driver, basename)
class(prc_test_def_t), intent(in) :: object
class(prc_core_driver_t), intent(out), allocatable :: driver
type(string_t), intent(in) :: basename
allocate (prc_test_t :: driver)
select type (driver)
type is (prc_test_t)
driver%id = basename
driver%model_name = object%model_name
select case (size (object%prt_in))
case (1); driver%scattering = .false.
case (2); driver%scattering = .true.
end select
end select
end subroutine prc_test_def_allocate_driver

```

Nothing to connect. This subroutine will not be called.

```

<Test ME: test me def: TBP>+≡
procedure :: connect => prc_test_def_connect

<Test ME: sub interfaces>+≡
module subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
class(prc_test_def_t), intent(in) :: def

## 14.6.2 Driver

```

<Test ME: public>+≡
public :: prc_test_t

<Test ME: types>+≡
type, extends (process_driver_internal_t) :: prc_test_t
type(string_t) :: id
type(string_t) :: model_name
logical :: scattering = .true.
contains
<Test ME: test me driver: TBP>
end type prc_test_t

```

In contrast to generic matrix-element implementations, we can hard-wire the amplitude method as a type-bound procedure.

```

<Test ME: test me driver: TBP>≡
  procedure, nopass :: get_amplitude => prc_test_get_amplitude

<Test ME: sub interfaces>+≡
  module function prc_test_get_amplitude (p) result (amp)
    complex(default) :: amp
    real(default), dimension(:,:), intent(in) :: p
  end function prc_test_get_amplitude

<Test ME: procedures>+≡
  module function prc_test_get_amplitude (p) result (amp)
    complex(default) :: amp
    real(default), dimension(:,:), intent(in) :: p
    amp = 1
  end function prc_test_get_amplitude

```

The reported type is the same as for the `prc_test_def_t` type.

```

<Test ME: test me driver: TBP>+≡
  procedure, nopass :: type_name => prc_test_type_name

<Test ME: sub interfaces>+≡
  module function prc_test_type_name () result (string)
    type(string_t) :: string
  end function prc_test_type_name

```

### 14.6.3 Shortcut

Since this module is there for testing purposes, we set up a subroutine that does all the work at once: create a library with the two processes (scattering and decay), configure and load, and set up the driver. Due to a bug of bind(C) features with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<Test ME: public>+≡
  public :: prc_test_create_library

<Test ME: main procedures>+≡
  subroutine prc_test_create_library &
    (libname, lib, scattering, decay, procname1, procname2)
    type(string_t), intent(in) :: libname
    type(process_library_t), intent(out) :: lib

```

```

logical, intent(in), optional :: scattering, decay
type(string_t), intent(in), optional :: procname1, procname2
type(string_t) :: model_name, procname
type(string_t), dimension(:), allocatable :: prt_in, prt_out
class(prc_core_def_t), allocatable :: def
type(process_def_entry_t), pointer :: entry
type(os_data_t) :: os_data
logical :: sca, dec
sca = .true.;   if (present (scattering)) sca = scattering
dec = .false.;  if (present (decay))      dec = decay

call os_data%init ()
call lib%init (libname)

```

### Generate and load the scattering process

The process is  $ss \rightarrow ss$ , where  $s$  is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

## Chapter 15

# Particles

This chapter collects modules that implement particle objects, for use in event records.

While within interactions, all correlations are manifest, a particle array is derived by selecting a particular quantum number set. This involves tracing over all other particles, as far as polarization is concerned. Thus, a particle has definite flavor, color, and a single-particle density matrix for polarization.

**su\_algebra** We make use of  $su(N)$  generators as the basis for representing polarization matrices. This module defines the basis and provides the necessary transformation routines.

**bloch\_vectors** This defines polarization objects in Bloch representation. The object describes the spin density matrix of a particle, currently restricted to spin  $0 \dots 2$ .

**polarizations** This extends the basic polarization object such that it supports properties of physical particles and appropriate constructors.

**particles** Particle objects and particle lists, as the base of event records.

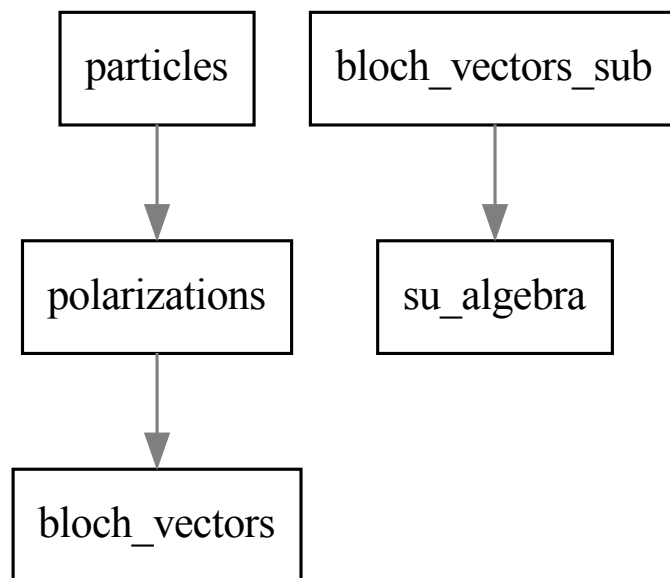

Figure 15.1: Module dependencies in `src/particles`.

## 15.1 $su(N)$ Algebra

We need a specific choice of basis for a well-defined component representation. The matrix elements of  $T^a$  are ordered as  $m = \ell, \ell - 1, \dots - \ell$ , i.e., from highest down to lowest weight, for both row and column.

We list first the generators of the  $su(2)$  subalgebras which leave  $|m|$  invariant ( $|m| \neq 0$ ):

$$T^{b+1, b+2, b+3} \equiv \sigma^{1,2,3} \quad (15.1)$$

acting on the respective subspace  $|m| = \ell, \ell - 1, \dots$  for  $b = 0, 1, \dots$ . This defines generators  $T^a$  for  $a = 1, \dots, 3N/2$  ( $\dots 3(N-1)/2$ ) for  $N$  even (odd), respectively.

The following generators successively extend this to  $su(4)$ ,  $su(6)$ ,  $\dots$  until  $su(N)$  by adding first the missing off-diagonal and then diagonal generators. The phase conventions are analogous.

(It should be possible to code these conventions for generic spin, but in the current implementation we restrict ourselves to  $s \leq 2$ , i.e.,  $N \leq 5$ .)

```

<su_algebra.f90>≡
  <File header>

  module su_algebra

    <Use kinds>

    <Standard module head>

    <SU algebra: public>

    interface
      <SU algebra: sub interfaces>
    end interface

  end module su_algebra

<su_algebra_sub.f90>≡
  <File header>

  submodule (su_algebra) su_algebra_s

    use physics_defs, only: SCALAR, SPINOR, VECTOR, VECTORSPINOR, TENSOR

    implicit none

    contains

    <SU algebra: procedures>

  end submodule su_algebra_s

```

### 15.1.1 $su(N)$ fundamental representation

The dimension of the basis for a given spin type. consecutively, starting at SCALAR=1.

```

<SU algebra: public>≡
  public :: algebra_dimension

<SU algebra: sub interfaces>≡
  module function algebra_dimension (s) result (n)
    integer :: n
    integer, intent(in) :: s
    end function algebra_dimension

<SU algebra: procedures>≡
  module function algebra_dimension (s) result (n)
    integer :: n
    integer, intent(in) :: s
    n = fundamental_dimension (s) ** 2 - 1
    end function algebra_dimension

```

The dimension of the fundamental (defining) representation that we use. This implementation assumes that the spin type is numerically equal to the fundamental dimension.

```

<SU algebra: public>+≡
  public :: fundamental_dimension

<SU algebra: sub interfaces>+≡
  module function fundamental_dimension (s) result (d)
    integer :: d
    integer, intent(in) :: s
    end function fundamental_dimension

<SU algebra: procedures>+≡
  module function fundamental_dimension (s) result (d)
    integer :: d
    integer, intent(in) :: s
    d = s
    end function fundamental_dimension

```

### 15.1.2 Mapping between helicity and matrix index

Return the helicity that corresponds to a particular entry in the polarization matrix representation. Helicities are counted downwards, in integers, and zero helicity is included (omitted) for odd (even) spin, respectively.

```

<SU algebra: public>+≡
  public :: helicity_value

<SU algebra: sub interfaces>+≡
  module function helicity_value (s, i) result (h)
    integer :: h
    integer, intent(in) :: s, i
    end function helicity_value

<SU algebra: procedures>+≡
  module function helicity_value (s, i) result (h)
    integer :: h
    integer, intent(in) :: s, i
    integer, dimension(1), parameter :: hh1 = [0]
    integer, dimension(2), parameter :: hh2 = [1, -1]

```

```

integer, dimension(3), parameter :: hh3 = [1, 0, -1]
integer, dimension(4), parameter :: hh4 = [2, 1, -1, -2]
integer, dimension(5), parameter :: hh5 = [2, 1, 0, -1, -2]
h = 0
select case (s)
case (SCALAR)
select case (i)
case (1:1); h = hh1(i)
end select
case (SPINOR)
select case (i)
case (1:2); h = hh2(i)
end select
case (VECTOR)
select case (i)
case (1:3); h = hh3(i)
end select
case (VECTORSPINOR)
select case (i)
case (1:4); h = hh4(i)
end select
case (TENSOR)
select case (i)
case (1:5); h = hh5(i)
end select
end select
end function helicity_value

```

Inverse: return the index that corresponds to a certain helicity value in the chosen representation.

```

<SU algebra: public>+≡
public :: helicity_index

<SU algebra: sub interfaces>+≡
module function helicity_index (s, h) result (i)
integer, intent(in) :: s, h
integer :: i
end function helicity_index

<SU algebra: procedures>+≡
module function helicity_index (s, h) result (i)
integer, intent(in) :: s, h
integer :: i
integer, dimension(0:0), parameter :: hi1 = [1]
integer, dimension(-1:1), parameter :: hi2 = [2, 0, 1]
integer, dimension(-1:1), parameter :: hi3 = [3, 2, 1]
integer, dimension(-2:2), parameter :: hi4 = [4, 3, 0, 2, 1]
integer, dimension(-2:2), parameter :: hi5 = [5, 4, 3, 2, 1]
select case (s)
case (SCALAR)
i = hi1(h)
case (SPINOR)
i = hi2(h)
case (VECTOR)
i = hi3(h)

```

```

case (VECTORSPINOR)
i = hi4(h)
case (TENSOR)
i = hi5(h)
end select
end function helicity_index

```

### 15.1.3 Generator Basis: Cartan Generators

For each supported spin type, we return specific properties of the set of generators via inquiry functions. This is equivalent to using explicit representations of the generators.

For easy access, the properties are hard-coded and selected via case expressions.

Return true if the generator #i is in the Cartan subalgebra, i.e., a diagonal matrix for spin type s.

```

<SU algebra: public>+≡
public :: is_cartan_generator

<SU algebra: sub interfaces>+≡
elemental module function is_cartan_generator (s, i) result (cartan)
logical :: cartan
integer, intent(in) :: s, i
end function is_cartan_generator

<SU algebra: procedures>+≡
elemental module function is_cartan_generator (s, i) result (cartan)
logical :: cartan
integer, intent(in) :: s, i
select case (s)
case (SCALAR)
case (SPINOR)
select case (i)
case (3); cartan = .true.
case default
cartan = .false.
end select
case (VECTOR)
select case (i)
case (3,8); cartan = .true.
case default
cartan = .false.
end select
case (VECTORSPINOR)
select case (i)
case (3,6,15); cartan = .true.
case default
cartan = .false.
end select
case (TENSOR)
select case (i)
case (3,6,15,24); cartan = .true.
case default

```

```

cartan = .false.
end select
case default
cartan = .false.
end select
end function is_cartan_generator

```

Return the index of Cartan generator #k in the chosen representation. This has to conform to `cartan` above.

```

<SU algebra: public>+≡
public :: cartan_index

<SU algebra: sub interfaces>+≡
elemental module function cartan_index (s, k) result (ci)
integer :: ci
integer, intent(in) :: s, k
end function cartan_index

<SU algebra: procedures>+≡
elemental module function cartan_index (s, k) result (ci)
integer :: ci
integer, intent(in) :: s, k
integer, dimension(1), parameter :: ci2 = [3]
integer, dimension(2), parameter :: ci3 = [3,8]
integer, dimension(3), parameter :: ci4 = [3,6,15]
integer, dimension(4), parameter :: ci5 = [3,6,15,24]
select case (s)
case (SPINOR)
ci = ci2(k)
case (VECTOR)
ci = ci3(k)
case (VECTORSPINOR)
ci = ci4(k)
case (TENSOR)
ci = ci5(k)
case default
ci = 0
end select
end function cartan_index

```

The element #k of the result vector `a` is equal to the  $(h, h)$  diagonal entry of the generator matrix  $T^k$ . That is, evaluating this for all allowed values of `h`, we recover the set of Cartan generator matrices.

```

<SU algebra: public>+≡
public :: cartan_element

<SU algebra: sub interfaces>+≡
module function cartan_element (s, h) result (a)
real(default), dimension(:), allocatable :: a
integer, intent(in) :: s, h
end function cartan_element

<SU algebra: procedures>+≡
module function cartan_element (s, h) result (a)
real(default), dimension(:), allocatable :: a

```

```

integer, intent(in) :: s, h
real(default), parameter :: sqrt2 = sqrt (2._default)
real(default), parameter :: sqrt3 = sqrt (3._default)
real(default), parameter :: sqrt10 = sqrt (10._default)
allocate (a (algebra_dimension (s)), source = 0._default)
select case (s)
case (SCALAR)
case (SPINOR)
select case (h)
case (1)
a(3) = 1._default / 2
case (-1)
a(3) = -1._default / 2
end select
case (VECTOR)
select case (h)
case (1)
a(3) = 1._default / 2
a(8) = 1._default / (2 * sqrt3)
case (-1)
a(3) = -1._default / 2
a(8) = 1._default / (2 * sqrt3)
case (0)
a(8) = -1._default / sqrt3
end select
case (VECTORSPINOR)

a(15) = 1._default / (2 * sqrt2)
case (1)
a(6) = 1._default / 2
a(15) = -1._default / (2 * sqrt2)
case (-1)
a(6) = -1._default / 2
a(15) = -1._default / (2 * sqrt2)
end select
case (TENSOR)
select case (h)
case (2)
a(3) = 1._default / 2
a(15) = 1._default / (2 * sqrt2)
a(24) = 1._default / (2 * sqrt10)
case (-2)
a(3) = -1._default / 2
a(15) = 1._default / (2 * sqrt2)
a(24) = 1._default / (2 * sqrt10)
case (1)
a(6) = 1._default / 2
a(15) = -1._default / (2 * sqrt2)
a(24) = 1._default / (2 * sqrt10)

```

```

case (-1)
a(6) = -1._default / 2
a(15) = -1._default / (2 * sqrt2)
a(24) = 1._default / (2 * sqrt10)
case (0)
a(24) = -4._default / (2 * sqrt10)
end select
end select
end function cartan_element

```

Given an array of diagonal matrix elements **rd** of a generator, compute the array **a** of basis coefficients. The array must be ordered as defined by **helicity\_value**, i.e., highest weight first. The calculation is organized such that the trace of the generator, i.e., the sum of **rd** values, drops out. The result array **a** has coefficients for all basis generators, but only Cartan generators can get a nonzero coefficient.

```

<SU algebra: public>+≡
  public :: cartan_coeff

<SU algebra: sub interfaces>+≡
  module function cartan_coeff (s, rd) result (a)
    real(default), dimension(:), allocatable :: a
    integer, intent(in) :: s
    real(default), dimension(:), intent(in) :: rd
  end function cartan_coeff

<SU algebra: procedures>+≡
  module function cartan_coeff (s, rd) result (a)
    real(default), dimension(:), allocatable :: a
    integer, intent(in) :: s
    real(default), dimension(:), intent(in) :: rd
    real(default), parameter :: sqrt2 = sqrt (2._default)
    real(default), parameter :: sqrt3 = sqrt (3._default)
    real(default), parameter :: sqrt10 = sqrt (10._default)
    integer :: n
    n = algebra_dimension (s)
    allocate (a (n), source = 0._default)
    select case (s)
    case (SPINOR)
      a(3) = rd(1) - rd(2)
    case (VECTOR)
      a(3) = rd(1) - rd(3)
      a(8) = (rd(1) - 2 * rd(2) + rd(3)) / sqrt3
    case (VECTORSPINOR)
      a(3) = rd(1) - rd(4)
      a(6) = rd(2) - rd(3)
      a(15) = (rd(1) - rd(2) - rd(3) + rd(4)) / sqrt2
    case (TENSOR)
      a(3) = rd(1) - rd(5)
      a(6) = rd(2) - rd(4)
      a(15) = (rd(1) - rd(2) - rd(4) + rd(5)) / sqrt2
      a(24) = (rd(1) + rd(2) - 4 * rd(3) + rd(4) + rd(5)) / sqrt10
    end select
  end function cartan_coeff

```

### 15.1.4 Roots (Off-Diagonal Generators)

Return the appropriate generator index for a given off-diagonal helicity combination. We require  $h_1 > h_2$ . We return the index of the appropriate real-valued generator if `r` is true, else the complex-valued one.

This is separate from the `cartan_coeff` function above. The reason is that the off-diagonal generators have only a single nonzero matrix element, so there is a one-to-one correspondence of helicity and index.

```

(SU algebra: public)+≡
  public :: root_index

(SU algebra: sub interfaces)+≡
  module function root_index (s, h1, h2, r) result (ai)
    integer :: ai
    integer, intent(in) :: s, h1, h2
    logical :: r
  end function root_index

(SU algebra: procedures)+≡
  module function root_index (s, h1, h2, r) result (ai)
    integer :: ai
    integer, intent(in) :: s, h1, h2
    logical :: r
    ai = 0
    select case (s)
    case (SCALAR)
    case (SPINOR)
    select case (h1)
    case (1)
    select case (h2)
    case (-1); ai = 1
    end select
    end select
    case (VECTOR)
    select case (h1)
    case (1)
    select case (h2)
    case (-1); ai = 1
    case (0); ai = 4
    end select
    case (0)
    select case (h2)
    case (-1); ai = 6
    end select
    end select
    case (VECTORSPINOR)
    select case (h1)
    case (2)
    select case (h2)
    case (-2); ai = 1
    case (1); ai = 7
    case (-1); ai = 11

```

```

end select

## 15.2 Bloch Representation

Particle polarization is determined by a particular quantum state which has just helicity information. Physically, this is the spin density matrix  $\rho$ , where we do not restrict ourselves to pure states.

We adopt the phase convention for a spin-1/2 particle that

$$\rho = \frac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \quad (15.2)$$

with the polarization axis  $\vec{\alpha}$ . For a particle with arbitrary spin  $s$ , and thus  $N = 2s + 1$  spin states, we extend the above definition to generalized Bloch form

$$\rho = \frac{1}{N} \left( 1 + \sqrt{2N(N-1)} \alpha^a T^a \right) \quad (15.3)$$

where the  $T^a$  ( $a = 1, \dots, N^2 - 1$ ) are a basis of  $su(N)$  algebra generators. These  $N \times N$  matrices are hermitean, traceless, and orthogonal via

$$\text{Tr } T^a T^b = \frac{1}{2} \delta^{ab} \quad (15.4)$$

In the spin-1/2 case, this reduces to the above (standard Bloch) representation since  $T^a = \sigma^a/2$ ,  $a = 1, 2, 3$ . For the spin-1 case, we could use  $T^a = \lambda^a/2$  with the Gell-Mann matrices,

$$\rho = \frac{1}{3} \left( 1 + \sqrt{3} \alpha^a \lambda^a \right), \quad (15.5)$$

The normalization is chosen that  $|\alpha| \leq 1$  for allowed density matrix, where  $|\alpha| = 1$  is a necessary, but not sufficient, condition for a pure state.

We need a specific choice of basis for a well-defined component representation. The matrix elements of  $T^a$  are ordered as  $m = \ell, \ell - 1, \dots, -\ell$ , i.e., from highest down to lowest weight, for both row and column.

We list first the generators of the  $su(2)$  subalgebras which leave  $|m|$  invariant ( $|m| \neq 0$ ):

$$T^{b+1, b+2, b+3} \equiv \sigma^{1, 2, 3} \quad (15.6)$$

acting on the respective subspace  $|m| = \ell, \ell - 1, \dots$  for  $b = 0, 1, \dots$ . This defines generators  $T^a$  for  $a = 1, \dots, 3N/2$  ( $\dots 3(N-1)/2$ ) for  $N$  even (odd), respectively.

The following generators successively extend this to  $su(4)$ ,  $su(6)$ ,  $\dots$  until  $su(N)$  by adding first the missing off-diagonal and then diagonal generators. The phase conventions are analogous.

(It should be possible to code these conventions for generic spin, but in the current implementation we restrict ourselves to  $s \leq 2$ , i.e.,  $N \leq 5$ .)

Particle polarization is determined by a particular quantum state which has just helicity information. Physically, this is the spin density matrix  $\rho$ , where we do not restrict ourselves to pure states.

We adopt the phase convention for a spin-1/2 particle that

$$\rho = \frac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \quad (15.7)$$

with the polarization axis  $\vec{\alpha}$ . For a particle with arbitrary spin  $s$ , and thus  $N = 2s + 1$  spin states, we extend the above definition to generalized Bloch form

$$\rho = \frac{1}{N} \left( 1 + \sqrt{2N(N-1)} \alpha^a T^a \right) \quad (15.8)$$

where the  $T^a$  ( $a = 1, \dots, N^2 - 1$ ) are a basis of  $su(N)$  algebra generators. These  $N \times N$  matrices are hermitean, traceless, and orthogonal via

$$\text{Tr } T^a T^b = \frac{1}{2} \delta^{ab} \quad (15.9)$$

In the spin-1/2 case, this reduces to the above (standard Bloch) representation since  $T^a = \sigma^a/2$ ,  $a = 1, 2, 3$ . For the spin-1 case, we could use  $T^a = \lambda^a/2$  with the Gell-Mann matrices,

$$\rho = \frac{1}{3} \left( 1 + \sqrt{3} \alpha^a \lambda^a \right), \quad (15.10)$$

The normalization is chosen that  $|\alpha| \leq 1$  for allowed density matrix, where  $|\alpha| = 1$  is a necessary, but not sufficient, condition for a pure state.

```

### 15.2.1 Preliminaries

The normalization factor  $\sqrt{2N(N-1)}/N$  that enters the Bloch representation.

```

<Bloch vectors: procedures>≡

```

```

function bloch_factor (s) result (f)
real(default) :: f
integer, intent(in) :: s
select case (s)
case (SCALAR)
f = 0
case (SPINOR)
f = 1
case (VECTOR)
f = 2 * sqrt (3._default) / 3
case (VECTORSPINOR)
f = 2 * sqrt (6._default) / 4
case (TENSOR)
f = 2 * sqrt (10._default) / 5
case default
f = 0
end select
end function bloch_factor

```

### 15.2.2 The basic polarization type

The basic polarization object holds just the entries of the Bloch vector as an allocatable array.

Bloch is active whenever the coefficient array is allocated. For convenience, we store the spin type ( $2s$ ) and the multiplicity ( $N$ ) together with the coefficient array ( $\alpha$ ). We have to allow for the massless case where  $s$  is arbitrary  $> 0$  but  $N = 2$ , and furthermore the chiral massless case where  $N = 1$ . In the latter case, the array remains deallocated but the chirality is set to  $\pm 1$ .

In the Bloch vector implementation, we do not distinguish between particle and antiparticle. If the distinction applies, it must be made by the caller when transforming between density matrix and Bloch vector.

```

<Bloch vectors: public>≡
public :: bloch_vector_t

<Bloch vectors: types>≡
type :: bloch_vector_t
private
integer :: spin_type = UNKNOWN
real(default), dimension(:), allocatable :: a
contains
<Bloch vectors: bloch vector: TBP>
end type bloch_vector_t

```

### 15.2.3 Direct Access

This basic initializer just sets the spin type, leaving the Bloch vector unallocated. The object therefore does not support nonzero polarization.

```

<Bloch vectors: bloch vector: TBP>≡
procedure :: init_unpolarized => bloch_vector_init_unpolarized

```

```

<Bloch vectors: sub interfaces>≡
  module subroutine bloch_vector_init_unpolarized (pol, spin_type)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
  end subroutine bloch_vector_init_unpolarized

```

```

<Bloch vectors: procedures>+≡
  module subroutine bloch_vector_init_unpolarized (pol, spin_type)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
    pol%spin_type = spin_type
  end subroutine bloch_vector_init_unpolarized

```

The standard initializer allocates the Bloch vector and initializes with zeros, so we can define a polarization later. We make sure that this works only for the supported spin type. Initializing with UNKNOWN spin type resets the Bloch vector to undefined, i.e., unpolarized state.

```

<Bloch vectors: bloch vector: TBP>+≡
  generic :: init => bloch_vector_init
  procedure, private :: bloch_vector_init

case (SCALAR, SPINOR, VECTOR, VECTORSPINOR, TENSOR)
pol%a(:) = cartan_coeff (s, rd) / bloch_factor (s)

```

```

end select
end subroutine bloch_vector_set_diagonal

```

### 15.2.7 Massless density matrix

This is a specific variant which initializes an equipartition for the maximum helicity, corresponding to an unpolarized massless particle.

```

<Bloch vectors: bloch vector: TBP>+≡
  procedure :: init_max_weight => bloch_vector_init_max_weight

<Bloch vectors: sub interfaces>+≡
  module subroutine bloch_vector_init_max_weight (pol, spin_type)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
  end subroutine bloch_vector_init_max_weight

<Bloch vectors: procedures>+≡
  module subroutine bloch_vector_init_max_weight (pol, spin_type)
    class(bloch_vector_t), intent(out) :: pol
    integer, intent(in) :: spin_type
    call pol%init (spin_type)
    select case (spin_type)
    case (VECTOR)
      call pol%set ([0.5_default, 0._default, 0.5_default])
    case (VECTORSPINOR)
      call pol%set ([0.5_default, 0._default, 0._default, 0.5_default])
    case (TENSOR)
      call pol%set ([0.5_default, 0._default, 0._default, 0._default, 0.5_default])
    end select
  end subroutine bloch_vector_init_max_weight

```

Initialize the maximum-weight submatrix with a three-component Bloch vector. This is not as trivial as it seems because we need the above initialization for the generalized Bloch in order to remove the lower weights from the density matrix.

```

<Bloch vectors: bloch vector: TBP>+≡

## 15.3 Polarization

Using generalized Bloch vectors and the  $su(N)$  algebra (see above) for the internal representation, we can define various modes of polarization. For spin-1/2, and analogously for massless spin- $s$  particles, we introduce

1. Trivial polarization:  $\vec{\alpha} = 0$ . [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]
2. Circular polarization:  $\vec{\alpha}$  points in  $\pm z$  direction.
3. Transversal polarization:  $\vec{\alpha}$  points orthogonal to the  $z$  direction, with a phase  $\phi$  that is 0 for the  $x$  axis, and  $\pi/2 = 90^\circ$  for the  $y$  axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.
4. Axis polarization, where we explicitly give  $\vec{\alpha}$ .

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. In effect, we concentrate on the first three entries in the  $\alpha^a$  array. For massless particles, this is sufficient. For massive particles, we then add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.
6. Diagonal polarization: Explicitly specify all components in the helicity basis. The  $su(N)$  representation consists of diagonal generators only, the Cartan subalgebra.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover practical applications.

```

### 15.3.1 The polarization type

Polarization is active whenever the coefficient array is allocated. For convenience, we store the spin type ( $2s$ ) and the multiplicity ( $N$ ) together with the coefficient array ( $\alpha$ ). We have to allow for the massless case where  $s$  is arbitrary  $> 0$  but  $N = 2$ , and furthermore the chiral massless case where  $N = 1$ . In the latter case, the array remains deallocated but the chirality is set to  $\pm 1$ .

There is a convention that an antiparticle transforms according to the complex conjugate representation. We apply this only when transforming from/to polarization defined by a three-vector. For antiparticles, the two-component flips sign in that case. When transforming from/to a state matrix or `pmatrix` representation, we do not apply this sign flip.

```

  end type polarization_t

```

### 15.3.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The Bloch vector is left undefined, so this initializer (in two versions) creates an unpolarized particle. Exception: a chiral particle is always polarized with definite helicity, it doesn't need a Bloch vector.

This is private.

```

A finalizer is no longer necessary.

### 15.3.3 I/O

The default setting produces a tabular output of the polarization vector entries. Optionally, we can create a state matrix and write its contents, emulating the obsolete original implementation.

If `all_states` is true (default), we generate all helicity combinations regardless of the matrix-element value. Otherwise, skip helicities with zero entry, or absolute value less than `tolerance`, if also given.

```

    case (0)
      diagonal = pol%bv%is_diagonal ()
    case default
      diagonal = .true.
    end select
  end function polarization_is_diagonal

```

### 15.3.5 Mapping between polarization and state matrix

Create the polarization object that corresponds to a state matrix. The state matrix is not necessarily normalized. The result will be either unpolarized, or a generalized Bloch vector that we compute in terms of the appropriate spin generator basis. To this end, we first construct the complete density matrix, then set the Bloch vector with this input.

For a naturally chiral particle (i.e., neutrino), we do not set the polarization vector, it is implied.

Therefore, we cannot account for any sign flip and transform as-is.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_state_matrix => polarization_init_state_matrix

```

```

<Polarizations: sub interfaces>+≡
module subroutine polarization_init_state_matrix (pol, state)
class(polarization_t), intent(out) :: pol
type(state_matrix_t), intent(in), target :: state
end subroutine polarization_init_state_matrix

```

```

<Polarizations: procedures>+≡
module subroutine polarization_init_state_matrix (pol, state)
class(polarization_t), intent(out) :: pol
type(state_matrix_t), intent(in), target :: state

call it%advance ()
end do
call state%freeze ()
end subroutine polarization_to_state_matrix

```

### 15.3.6 Specific initializers

Unpolarized particle, no nontrivial entries in the density matrix. This is the default initialization mode.

```

<Polarizations: polarization: TBP>+≡
procedure :: init_unpolarized => polarization_init_unpolarized

<Polarizations: sub interfaces>+≡
module subroutine polarization_init_unpolarized (pol, flv)
class(polarization_t), intent(out) :: pol
type(flavor_t), intent(in) :: flv
end subroutine polarization_init_unpolarized

<Polarizations: procedures>+≡
module subroutine polarization_init_unpolarized (pol, flv)
class(polarization_t), intent(out) :: pol
type(flavor_t), intent(in) :: flv
call pol%init (flv)
end subroutine polarization_init_unpolarized

```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1 - |f|}{2} \mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, & f < 0, \end{cases}$$

In the generalized Bloch representation, this is an entry for the  $T^3$  generator only, regardless of the spin representation.

A chiral particle is not affected.

```

(Polarizations: polarization: TBP)+≡

    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: f
  end subroutine polarization_init_circular

(Polarizations: procedures)+≡
  module subroutine polarization_init_circular (pol, flv, f)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: f
    call pol%init (flv)
    select case (pol%chirality)
    case (0)
      call pol%bv%init_vector (pol%spin_type, &
        [0._default, 0._default, f])
    end select
  end subroutine polarization_init_circular

```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2} \mathbf{1} + \frac{|f|}{2} \begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

for the highest-weight subspace. The lower weights are unaffected. The phase is  $\phi = 0$  for the  $x$ -axis,  $\phi = 90^\circ$  for the  $y$  axis as polarization vector.

For an antiparticle, the phase switches sign, and for  $f < 0$ , the off-diagonal elements switch sign.

A chiral particle is not affected.

```

(Polarizations: polarization: TBP)+≡
  procedure :: init_transversal => polarization_init_transversal

(Polarizations: sub interfaces)+≡
  module subroutine polarization_init_transversal (pol, flv, phi, f)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: phi, f
  end subroutine polarization_init_transversal

(Polarizations: procedures)+≡
  module subroutine polarization_init_transversal (pol, flv, phi, f)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: phi, f
    call pol%init (flv)
    select case (pol%chirality)
    case (0)
      if (pol%anti) then

```

```

call pol%bv%init_vector (pol%spin_type, &
[f * cos (phi), f * sin (phi), 0._default])
else
call pol%bv%init_vector (pol%spin_type, &
[f * cos (phi),-f * sin (phi), 0._default])
end if
end select
end subroutine polarization_init_transversal

```

For axis polarization, we again set only the entries with maximum weight, which for spin 1/2 means

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle, the imaginary part proportional to  $\alpha_2$  switches sign (complex conjugate). A chiral particle is not affected.

In the generalized Bloch representation, this translates into coefficients for  $T^{1,2,3}$ , all others stay zero.

```

<Polarizations: polarization: TBP>+=
  procedure :: init_axis => polarization_init_axis

<Polarizations: sub interfaces>+=
  module subroutine polarization_init_axis (pol, flv, alpha)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), dimension(3), intent(in) :: alpha
  end subroutine polarization_init_axis

<Polarizations: procedures>+=
  module subroutine polarization_init_axis (pol, flv, alpha)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), dimension(3), intent(in) :: alpha
    call pol%init (flv)
    select case (pol%chirality)
    case (0)
    if (pol%anti) then
    call pol%bv%init_vector (pol%spin_type, &
[alpha(1), alpha(2), alpha(3)])
    else
    call pol%bv%init_vector (pol%spin_type, &
[alpha(1),-alpha(2), alpha(3)])
    end if
    end select
  end subroutine polarization_init_axis

```

This version specifies the polarization axis in terms of  $r$  (polarization degree) and  $\theta, \phi$  (polar and azimuthal angles).

If one of the angles is a nonzero multiple of  $\pi$ , roundoff errors typically will result in tiny contributions to unwanted components. Therefore, include a catch for small numbers.

```

<Polarizations: polarization: TBP>+=
  procedure :: init_angles => polarization_init_angles

```

```

<Polarizations: sub interfaces>+≡
module subroutine polarization_init_angles (pol, flv, r, theta, phi)
class(polarization_t), intent(out) :: pol
type(flavor_t), intent(in) :: flv
real(default), intent(in) :: r, theta, phi
end subroutine polarization_init_angles

<Polarizations: procedures>+≡
module subroutine polarization_init_angles (pol, flv, r, theta, phi)

d = pol%bv%get_n_states ()
allocate (rd (d), source = 0._default)
rd(pol%bv%hel_index (0)) = f
call pol%bv%set (rd)
end if
case default
call pol%init_unpolarized (flv)

```

```

end select
end subroutine polarization_init_longitudinal

```

This is diagonal polarization: we specify all components explicitly. `rd` is the array of diagonal elements of the density matrix. We assume that the length of `rd` is equal to the particle multiplicity.

```

<Polarizations: polarization: TBP>+=
  procedure :: init_diagonal => polarization_init_diagonal

<Polarizations: sub interfaces>+=
  module subroutine polarization_init_diagonal (pol, flv, rd)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), dimension(:), intent(in) :: rd
  end subroutine polarization_init_diagonal

<Polarizations: procedures>+=
  module subroutine polarization_init_diagonal (pol, flv, rd)
    class(polarization_t), intent(out) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), dimension(:), intent(in) :: rd
    real(default) :: trace
    call pol%init_generic (flv)
    if (pol%bv%is_polarized ()) then
      trace = sum (rd)
      if (trace /= 0) call pol%bv%set (rd / trace)
    end if
  end subroutine polarization_init_diagonal

```

### 15.3.7 Operations

Combine polarization states by computing the outer product of the state matrices.

```

<Polarizations: public>+=
  public :: combine_polarization_states

<Polarizations: sub interfaces>+=
  module subroutine combine_polarization_states (pol, state)
    type(polarization_t), dimension(:), intent(in), target :: pol
    type(state_matrix_t), intent(out) :: state
  end subroutine combine_polarization_states

<Polarizations: procedures>+=
  module subroutine combine_polarization_states (pol, state)
    type(polarization_t), dimension(:), intent(in), target :: pol
    type(state_matrix_t), intent(out) :: state
    type(state_matrix_t), dimension(size(pol)), target :: pol_state
    integer :: i
    do i = 1, size (pol)
      call pol(i)%to_state (pol_state(i))
    end do
    call outer_multiply (pol_state, state)
    do i = 1, size (pol)

```

```

call pol_state(i)%final ()
end do
end subroutine combine_polarization_states

```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance. The norm of the returned axis is the polarization fraction for the highest-weight subspace. For a scalar particle, we return a zero vector. The same result applies if the highest-weight component vanishes.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

For an antiparticle, the `alpha(2)` coefficient flips sign.

```

(Polarizations: polarization: TBP)+≡
  procedure :: get_axis => polarization_get_axis

(Polarizations: sub interfaces)+≡
  module function polarization_get_axis (pol) result (alpha)
    class(polarization_t), intent(in), target :: pol
    real(default), dimension(3) :: alpha
  end function polarization_get_axis

(Polarizations: procedures)+≡
  module function polarization_get_axis (pol) result (alpha)
    class(polarization_t), intent(in), target :: pol
    real(default), dimension(3) :: alpha
    select case (pol%chirality)
    case (0)
      call pol%bv%to_vector (alpha)
      if (.not. pol%anti) alpha(2) = - alpha(2)
    case (-1)
      alpha = [0._default, 0._default, -1._default]
    case (1)
      alpha = [0._default, 0._default, 1._default]
    end select
  end function polarization_get_axis

```

This function returns polarization degree and polar and azimuthal angles  $(\theta, \phi)$  of the polarization axis. The same restrictions apply as above.

Since we call the `get_axis` method, the phase flips sign for an antiparticle.

```

(Polarizations: polarization: TBP)+≡
  procedure :: to_angles => polarization_to_angles

(Polarizations: sub interfaces)+≡
  module subroutine polarization_to_angles (pol, r, theta, phi)
    class(polarization_t), intent(in) :: pol
    real(default), intent(out) :: r, theta, phi
  end subroutine polarization_to_angles

(Polarizations: procedures)+≡
  module subroutine polarization_to_angles (pol, r, theta, phi)
    class(polarization_t), intent(in) :: pol
    real(default), intent(out) :: r, theta, phi

```

```

real(default), dimension(3) :: alpha
real(default) :: norm, r12
alpha = pol%get_axis ()
norm = sum (alpha**2)
r = sqrt (norm)
if (norm > 0) then
r12 = sqrt (alpha(1)**2 + alpha(2)**2)
theta = atan2 (r12, alpha(3))
if (any (alpha(1:2) /= 0)) then
phi = atan2 (alpha(2), alpha(1))
else
phi = 0
end if
else
theta = 0
phi = 0
end if
end subroutine polarization_to_angles

```

### 15.3.8 Polarization Iterator

The iterator acts like a state matrix iterator, i.e., it points to one helicity combination at a time and can return the corresponding helicity object and matrix-element value.

Since the polarization is stored as a Bloch vector, we recover the whole density matrix explicitly upon initialization, store it inside the iterator object, and then just return its elements one at a time.

For an unpolarized particle, the iterator returns a single state with undefined helicity. The value is the value of any diagonal density matrix element,  $1/n$  where  $n$  is the multiplicity.

```

⟨Polarizations: public⟩+≡
  public :: polarization_iterator_t

⟨Polarizations: types⟩+≡
  type :: polarization_iterator_t
  private
  type(polarization_t), pointer :: pol => null ()
  logical :: polarized = .false.
  integer :: h1 = 0
  integer :: h2 = 0
  integer :: i = 0
  integer :: j = 0
  complex(default), dimension(:,,:), allocatable :: r
  complex(default) :: value = 1._default
  real(default) :: tolerance = -1._default
  logical :: valid = .false.
  contains
  ⟨Polarizations: polarization iterator: TBP⟩
  end type polarization_iterator_t

```

Output for debugging purposes only, therefore no format for real/complex.

```

(Polarizations: polarization iterator: TBP)+≡
  procedure :: write => polarization_iterator_write

(Polarizations: sub interfaces)+≡
  module subroutine polarization_iterator_write (it, unit)

        do i = 1, size (it%r, 2)
          write (u, *) it%r(i,:)
        end do
      end if
    end if
  end subroutine polarization_iterator_write

```

Initialize, i.e., (virtually) point to the first helicity state supported by the polarization object. If the density matrix is nontrivial, we calculate it here.

Following the older state-matrix conventions, the iterator sequence starts at the lowest helicity value. In the current internal representation, this corresponds to the highest index value.

If the current matrix-element value is zero, advance the iterator. Advancing will stop at a nonzero value or if the iterator becomes invalid.

If **tolerance** is given, any state matrix entry less or equal will be treated as zero, causing the iterator to skip an entry. By default, the value is negative, so no entry is skipped.

```

(Polarizations: polarization iterator: TBP)+≡

### 15.3.9 Sparse Matrix

We introduce a simple implementation of a sparse matrix that can represent polarization (or similar concepts) for transfer to I/O within the program. It consists of an integer array that represents the index values, and a complex array that represents the nonvanishing entries. The number of nonvanishing entries must be known for initialization, but the entries are filled one at a time.

Here is a base type without the special properties of a spin-density matrix.

```

<Polarizations: public>+≡
    public :: smatrix_t

```

```

<Polarizations: types>+≡
  type :: smatrix_t
  private
  integer :: dim = 0
  integer :: n_entry = 0
  integer, dimension(:,:), allocatable :: index
  complex(default), dimension(:), allocatable :: value
  contains
  <Polarizations: smatrix: TBP>
  end type smatrix_t

```

Output.

```

<Polarizations: smatrix: TBP>≡
  procedure :: write => smatrix_write

<Polarizations: sub interfaces>+≡
  module subroutine smatrix_write (object, unit, indent)
  class(smatrix_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  end subroutine smatrix_write

<Polarizations: procedures>+≡
  module subroutine smatrix_write (object, unit, indent)
  class(smatrix_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  integer :: u, i, ind
  u = given_output_unit (unit)
  ind = 0; if (present (indent)) ind = indent
  if (allocated (object%value)) then
    if (size (object%value) > 0) then
      do i = 1, object%n_entry
        write (u, "(1x,A,'@(')", advance="no") repeat (" ", ind)
        write (u, "(SP,9999(I2.1,':',1x))", advance="no") &
          object%index(:,i)
        write (u, "('(', " // FMT_19 // ",','," // FMT_19 // &
          ",'))')") object%value(i)
      end do
    else
      write (u, "(1x,A)", advance="no") repeat (" ", ind)
      write (u, "(A)" "[empty matrix]"
    end if
  else
    write (u, "(1x,A)", advance="no") repeat (" ", ind)
    write (u, "(A)" "[undefined matrix]"
  end if
  end subroutine smatrix_write

```

Initialization: allocate arrays to the correct size. We specify both the dimension of the matrix (if different from two, this is rather a generic tensor) and the number of nonvanishing entries.

```

<Polarizations: smatrix: TBP>+≡
  procedure :: init => smatrix_init

logical :: exist
class(smatrix_t), intent(in) :: smatrix
exist = .not. all (smatrix%value == 0)
end function smatrix_exists

```

### 15.3.10 Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper spin-density matrix. After the matrix has been filled, we can fix spin type and multiplicity for a particle, check the matrix for consistency, and normalize it if necessary.

This implementation does not have an antiparticle flag, just like the state matrix object. We therefore cannot account for sign flips when using this object.

TODO: The `pure` flag is for informational purposes only, and it only represents a necessary condition if spin is greater than 1/2. We may either check purity for all spins or drop this.

```

Declare spin, multiplicity, and polarization degree. Check whether all entries fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type
2. the diagonal is real
3. only the upper of corresponding off-diagonal elements is specified, i.e., the row index is less than the column index
4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)
5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree.
6. If the trace of the matrix square and the trace of the matrix are unity, we may have a pure state. (For spin up to 1/2, this is actually sufficient.)

### 15.3.11 Data Transformation

Create a `polarization_t` object from the contents of a normalized `pmatrix_t` object. We scan the entries as present in `pmatrix` and transform them into a density matrix, if necessary. The density matrix then initializes the Bloch vector. This is analogous to `polarization_init_state_matrix`.

There is a subtlety associated with massless particles. Since the `pmatrix` doesn't contain the full density matrix but just the nontrivial part, we have to initialize the polarization object with the massless equipartition, which contains nonzero entries for the Cartan generators. The `set` method therefore should not erase those initial contents. This is a constraint for the implementation of `set`, as applied to the Bloch vector.

As mentioned above, `pmatrix_t` does not support an antiparticle flag.

```

### 15.4.1 The particle type

#### Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

```
⟨Particles: parameters⟩≡
  integer, parameter, public :: PRT_UNPOLARIZED = 0
  integer, parameter, public :: PRT_DEFINITE_HELICITY = 1
  integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2
```

#### Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, `hel` and `pol` are unspecified. If it has a definite helicity, the `hel` component is defined. If it has a generic polarization, the `pol` component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events. The `vertex` is an optional component that consists of a Lorentz 4-vector, denoting the position and time of the vertex (displaced vertex/time). `lifetime` is an optional component that accounts for the finite lifetime  $\tau$  of a decaying particle. In case there is no magnetic field etc., the true decay vertex of a particle in the detector would be  $\vec{v}' = \vec{v} + \tau \times \vec{p}/p^0$ , where  $p^0$  and  $\vec{p}$  are the energy and 3-momentum of the particle.

```

### 15.4.2 Particle sets

A particle set is what is usually called an event: an array of particles. The individual particle entries carry momentum, quantum numbers, polarization, and optionally connections. There is (also optionally) a correlated state-density matrix that maintains spin correlations that are lost in the individual particle entries.

```

  ⟨Particles: particle set: TBP⟩
  end type particle_set_t

```

A particle set can be initialized from an interaction or from a HepMC event record.

```

⟨Particles: particle set: TBP⟩≡
  generic :: init => init_interaction
  procedure :: init_interaction => particle_set_init_interaction

```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number `x`. The `mode` determines whether the individual particles become unpolarized, or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag `keep_correlations` tells whether the spin-correlation matrix is

to be calculated and stored in addition to the particles. The flag `keep_virtual` tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. `int` has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. `int_flows` contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

`int` and `int_flows` may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, `x(1)` can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

```

Build a particle set from scratch. This is used for testing purposes. The ordering of particles in the result is beam-incoming-remnant-virtual-outgoing.

Parent-child relations:

- Beams are parents of incoming and beam remnants. The assignment is alternating (first beam, second beam).
- Incoming are parents of virtual and outgoing, collectively.

More specific settings, such as resonance histories, cannot be set this way.

Beam-remnant particles are counted as virtual, but have a different status code.

We assume that the `pdg` array has the correct size.

```

Insert a new particle as an intermediate into a previously empty position.

Flavor and status are just set. Color is not set (but see below). The complicated part is reassigning parent-child relations. The inserted particle comes with an array `child` of its children which are supposed to be existing particles.

We first scan all particles that come before the new insertion. Whenever a particle has children that coincide with the children of the new particle, those child entries are removed. (a) If the new particle has no parent entry yet, those child entries are replaced by the index of the new particle and simultaneously, the particle is registered as a parent of the new particle. (b) If the current particle already has a parent entry, those child entries are removed.

When this is done, the new particle is registered as the (only) parent of its children.

```

Given the `particle_set` before radiation, the new momenta `p_radiated`, the emitter and the `flv_radiated` as well as the model and a random number `r_color` for choosing a color in ambiguous cases, we update the `particle_set`.

The reference for this procedure is [0709.2092], Sec. 4.5.1. We do not (yet) account for helicities and polarisations here nor do we update the beam remnant color and momenta.

```

### 15.4.5 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

#### Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

```
<Particles: particle set: TBP>+≡

This procedure aims at reconstructing the momenta of an interaction, given a particle set. The main task is to find the original hard process, by following the event history.

In-state: take those particles which are flagged as `PRT_INCOMING`

Out-state: try to be smart by checking the immediate children of the incoming particles. If the `state_flg` table is present, check any `PRT_RESONANT` particles that we get this way, whether they are potential out-particles by their PDG codes. If not, replace them by their children, recursively. (Resonances may have been inserted by the corresponding event transform.)

[WK 21-02-16] Revised the algorithm for the case `recover_beams` = false, i.e., the particle set contains beams and radiation. This does not mean that the particle set contains the complete radiation history. To make up for missing information, we follow the history in the interaction one step backwards and do a bit of guesswork to match this to the possibly incomplete history in the particle set. [The current implementation allows only for one stage of radiation; this could be improved by iterating the procedure!]

[WK 21-03-21] Amended the `find_hard_process_in_pset` algorithm as follows: Occasionally, PYTHIA adds a stepchild to the decay of a resonance that WHIZARD has inserted, a shower object that also has other particles in the event as parents. Such objects must not enter the hard-process record. Therefore, resonance child particle objects are ignored if they have more than one parent.

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

Furthermore, we assign to each vertex the vertex position from the parent(s). We check that these vertex positions coincide, and if not return a null vector.

#### 15.4.6 Expression interface

This converts a `particle_set` object as defined here to a more concise `subevt` object that can be used as the event root of an expression. In particular, the latter lacks virtual particles, spin correlations and parent-child relations.

We keep beam particles, incoming partons, and outgoing partons. Furthermore, we keep radiated particles (a.k.a. beam remnants) if they have no children in the current particle set, and mark them as outgoing particles.

If `colorize` is set and true, mark all particles in the subevent as colorized, and set color/anticolor flow indices where they are defined. Colorless particles do not get indices but are still marked as colorized, for consistency.

```

This routines orders the outgoing particles into clusters of colorless particles and such of particles ordered corresponding to the indices of the color lines. All outgoing particles in the ordered set appear as child of the corresponding outgoing particle in the unordered set, including colored beam remnants. We always start continue via the anti-color line, such that color flows within each

Lund string system is always continued from the anticolor of one particle to the identical color index of another particle.

## Chapter 16

# Beams

These modules implement beam configuration and beam structure, the latter in abstract terms.

**beam\_structures** The `beam_structure_t` type is a messenger type that communicates the user settings to the **WHIZARD** core.

**beams** Beam configuration.

**sf\_aux** Tools for handling structure functions and splitting

**sf\_mappings** Mapping functions, useful for structure function implementation

**sf\_base** The abstract structure-function interaction and structure-function chain types.

These are the implementation modules, the concrete counterparts of **sf\_base**:

**sf\_isr** ISR structure function (photon radiation inclusive and resummed in collinear and IR regions).

**sf\_epa** Effective Photon Approximation.

**sf\_ewa** Effective  $W$  (and  $Z$ ) approximation.

Figure 16.1: Module dependencies in `src/beams`.

**sf\_escan** Energy spectrum that emulates a uniform energy scan.

**sf\_gaussian** Gaussian beam spread

**sf\_beam\_events** Beam-event generator that reads its input from an external file.

**sf\_circe1** CIRCE1 beam spectra for electrons and photons.

**sf\_circe2** CIRCE2 beam spectra for electrons and photons.

**hoppet\_interface** Support for *b*-quark matching, add-on to PDF modules.

**sf\_pdf\_builtin** Direct support for selected hadron PDFs.

**sf\_lhapdf** LHAPDF library support.

## 16.1 Beam structure

This module stores the beam structure definition as it is declared in the SINDARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

```
(beam_structures.f90)≡
  <File header>

  module beam_structures

    <Use kinds>
    <Use strings>
    use lorentz
    use polarizations

    <Standard module head>

    <Beam structures: public>

    <Beam structures: types>

    <Beam structures: interfaces>

    interface
      <Beam structures: sub interfaces>
    end interface

  end module beam_structures

(beam_structures_sub.f90)≡
  <File header>

  submodule (beam_structures) beam_structures_s

    use io_units
    use format_defs, only: FMT_19
    use diagnostics

    implicit none

    contains

    <Beam structures: procedures>

  end submodule beam_structures_s
```

### 16.1.1 Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

```

⟨Beam structures: types⟩≡
  type :: beam_structure_entry_t
  logical :: is_valid = .false.
  type(string_t) :: name
  contains
  ⟨Beam structures: beam structure entry: TBP⟩
end type beam_structure_entry_t

```

Output.

```

⟨Beam structures: beam structure entry: TBP⟩≡
  procedure :: to_string => beam_structure_entry_to_string

⟨Beam structures: sub interfaces⟩≡
  module function beam_structure_entry_to_string (object) result (string)
    class(beam_structure_entry_t), intent(in) :: object
    type(string_t) :: string
  end function beam_structure_entry_to_string

⟨Beam structures: procedures⟩≡
  module function beam_structure_entry_to_string (object) result (string)
    class(beam_structure_entry_t), intent(in) :: object
    type(string_t) :: string
    if (object%is_valid) then
      string = object%name
    else
      string = "none"
    end if
  end function beam_structure_entry_to_string

```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

```

⟨Beam structures: types⟩+≡
  type :: beam_structure_record_t
  type(beam_structure_entry_t), dimension(:), allocatable :: entry
end type beam_structure_record_t

```

### 16.1.2 Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

```

⟨Beam structures: public⟩≡
  public :: beam_structure_t

⟨Beam structures: types⟩+≡
  type :: beam_structure_t
  private
  integer :: n_beam = 0
  type(string_t), dimension(:), allocatable :: prt
  type(beam_structure_record_t), dimension(:), allocatable :: record
  type(smatrix_t), dimension(:), allocatable :: smatrix
  real(default), dimension(:), allocatable :: pol_f

```

```

real(default), dimension(:), allocatable :: p
real(default), dimension(:), allocatable :: theta
real(default), dimension(:), allocatable :: phi
contains
<Beam structures: beam structure: TBP>
end type beam_structure_t

```

The finalizer deletes all contents explicitly, so we can continue with an empty beam record. (It is not needed for deallocation.) We have distinct finalizers for the independent parts of the beam structure.

```

<Beam structures: beam structure: TBP>≡
  procedure :: final_sf => beam_structure_final_sf
<Beam structures: sub interfaces>+≡
  module subroutine beam_structure_final_sf (object)
    class(beam_structure_t), intent(inout) :: object
  end subroutine beam_structure_final_sf
<Beam structures: procedures>+≡
  module subroutine beam_structure_final_sf (object)
    class(beam_structure_t), intent(inout) :: object
    if (allocated (object%prt)) deallocate (object%prt)
    if (allocated (object%record)) deallocate (object%record)
    object%n_beam = 0
  end subroutine beam_structure_final_sf

```

Output. The actual information fits in a single line, therefore we can provide a `to_string` method. The `show` method also lists the current values of relevant global variables.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: write => beam_structure_write
  procedure :: to_string => beam_structure_to_string

```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

```

<Beam structures: interfaces>≡
  abstract interface
    function strfun_mode_fun (name) result (n)
  import
    type(string_t), intent(in) :: name

end interface

```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

Check for a complete beam structure. The **applies** flag tells if the beam structure should actually be used for a process with the given **n\_in** number of incoming particles.

It set if the beam structure matches the process as either decay or scattering. It is unset if beam structure references a scattering setup but the process is a decay. It is also unset if the beam structure itself is empty.

If the beam structure cannot be used, terminate with fatal error.

```

### 16.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy `sqrts`, the Lorentz transformation `L` that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

```

⟨Beams: public⟩≡
  public :: beam_data_t

⟨Beams: types⟩≡
  type :: beam_data_t

```

```

logical :: initialized = .false.
integer :: n = 0
type(flavor_t), dimension(:), allocatable :: flv
real(default), dimension(:), allocatable :: mass
type(pmatrix_t), dimension(:), allocatable :: pmatrix
logical :: lab_is_cm = .true.
type(vector4_t), dimension(:), allocatable :: p_cm
type(vector4_t), dimension(:), allocatable :: p
type(lorentz_transformation_t), allocatable :: L_cm_to_lab
real(default) :: sqrts = 0
character(32) :: md5sum = ""
contains
  <Beams: beam data: TBP>
end type beam_data_t

```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

```

<Beams: procedures>≡

end select
end if
end subroutine beam_data_init_structure

```

### 16.2.3 Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color is inferred from flavor. Beam momenta and c.m. momenta coincide.

```

(Beams: beam data: TBP)+≡
  procedure :: init_sqrts => beam_data_init_sqrts

(Beams: sub interfaces)+≡
  module subroutine beam_data_init_sqrts &
    (beam_data, sqrts, flv, smatrix, pol_f)
    class(beam_data_t), intent(out) :: beam_data
    real(default), intent(in) :: sqrts
    type(flavor_t), dimension(:), intent(in) :: flv
    type(smatrix_t), dimension(:), intent(in), optional :: smatrix
    real(default), dimension(:), intent(in), optional :: pol_f
    end subroutine beam_data_init_sqrts

(Beams: procedures)+≡
  module subroutine beam_data_init_sqrts &
    (beam_data, sqrts, flv, smatrix, pol_f)
    class(beam_data_t), intent(out) :: beam_data
    real(default), intent(in) :: sqrts
    type(flavor_t), dimension(:), intent(in) :: flv
    type(smatrix_t), dimension(:), intent(in), optional :: smatrix
    real(default), dimension(:), intent(in), optional :: pol_f
    real(default), dimension(size(flv)) :: E, p
    call beam_data_init (beam_data, size (flv))
    beam_data%sqrts = sqrts
    beam_data%lab_is_cm = .true.
    select case (beam_data%n)
    case (1)
    E = sqrts; p = 0
    beam_data%p_cm = vector4_moving (E, p, 3)

```

```

beam_data%p = beam_data%p_cm
case (2)
beam_data%p_cm = colliding_momenta (sqrts, flv%get_mass ())
beam_data%p = colliding_momenta (sqrts, flv%get_mass ())
end select
call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
end subroutine beam_data_init_sqrts

```

This version sets beam momenta directly, assuming that they are asymmetric, i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a common initializer.

The Lorentz transformation that we compute here is not actually used in the calculation; instead, it will be recomputed for each event in the subroutine `phs_set_incoming_momenta`. We compute it here for the nominal beam setup nevertheless, so we can print it and, in particular, include it in the MD5 sum.

```

end subroutine beam_data_init_decay

```

## 16.2.5 The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

```

(Beams: public)+≡
  public :: beam_t

(Beams: types)+≡
  type :: beam_t
  private
  type(interaction_t) :: int
  end type beam_t

```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together with the associated values from the spin density matrix into the `interaction_t` object.

Calling the `add_state` method of the interaction object, we keep the entries of the helicity density matrix without adding them up. This ensures that for unpolarized states, we do not normalize but end up with an  $1/N$  entry, where  $N$  is the initial-state multiplicity.

```

type(beam_t), intent(out) :: beam_out
type(beam_t), intent(in) :: beam_in
beam_out%int = beam_in%int
end subroutine beam_assign

```

## 16.2.6 Inherited procedures

```

<Beams: public>+≡
public :: interaction_set_source_link_beam

<Beams: sub interfaces>+≡
module subroutine interaction_set_source_link_beam (int, i, beam1, i1)
type(interaction_t), intent(inout) :: int
type(beam_t), intent(in), target :: beam1

```

```

integer, intent(in) :: i, i1
end subroutine interaction_set_source_link_beam

<Beams: procedures>+≡
module subroutine interaction_set_source_link_beam (int, i, beam1, i1)
type(interaction_t), intent(inout) :: int
type(beam_t), intent(in), target :: beam1
integer, intent(in) :: i, i1
call int%set_source_link (i, beam1%int, i1)
end subroutine interaction_set_source_link_beam

```

### 16.2.7 Accessing contents

Return the interaction component – as a pointer, to avoid any copying.

```

<Beams: public>+≡
public :: beam_get_int_ptr

<Beams: sub interfaces>+≡
module function beam_get_int_ptr (beam) result (int)
type(interaction_t), pointer :: int
type(beam_t), intent(in), target :: beam
end function beam_get_int_ptr

<Beams: procedures>+≡
module function beam_get_int_ptr (beam) result (int)
type(interaction_t), pointer :: int
type(beam_t), intent(in), target :: beam
int => beam%int
end function beam_get_int_ptr

```

Set beam momenta directly. (Used for cascade decays.)

```

<Beams: public>+≡
public :: beam_set_momenta

<Beams: sub interfaces>+≡
module subroutine beam_set_momenta (beam, p)
type(beam_t), intent(inout) :: beam
type(vector4_t), dimension(:), intent(in) :: p
end subroutine beam_set_momenta

<Beams: procedures>+≡
module subroutine beam_set_momenta (beam, p)
type(beam_t), intent(inout) :: beam
type(vector4_t), dimension(:), intent(in) :: p
call beam%int%set_momenta (p)
end subroutine beam_set_momenta

```

### 16.2.8 Unit tests

Test module, followed by the corresponding implementation module.

  end submodule sf_aux_s
```

### 16.3.1 Momentum splitting

Let us consider first an incoming parton with momentum  $k$  and invariant mass squared  $s = k^2$  that splits into two partons with momenta  $q, p$  and invariant masses  $t = q^2$  and  $u = p^2$ . (This is an abuse of the Mandelstam notation.  $t$  is actually the momentum transfer, assuming that  $p$  is radiated and  $q$  initiates the hard process.) The energy is split among the partons such that if  $E = k^0$ , we have  $q^0 = xE$  and  $p^0 = \bar{x}E$ , where  $\bar{x} \equiv 1 - x$ .

We define the angle  $\theta$  as the polar angle of  $p$  w.r.t. the momentum axis of the incoming momentum  $k$ . Ignoring azimuthal angle, we can write the four-momenta in the basis  $(E, p_T, p_L)$  as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \quad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p}\sin\theta \\ \bar{x}\bar{p}\cos\theta \end{pmatrix}, \quad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p}\sin\theta \\ p - \bar{x}\bar{p}\cos\theta \end{pmatrix}, \quad (16.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \quad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \quad (16.2)$$

The second condition implies that, for positive  $u$ ,  $\bar{x}^2 > u/E^2$ , or equivalently

$$x < 1 - \sqrt{u}/E. \quad (16.3)$$

We are interested in the third mass-shell conditions:  $s$  and  $u$  are fixed, so we need  $t$  as a function of  $\cos\theta$ :

$$t = -2\bar{x}(E^2 - p\bar{p}\cos\theta) + s + u. \quad (16.4)$$

Solving for  $\cos\theta$ , we get

$$\cos\theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \quad (16.5)$$

We can compute  $\sin\theta$  numerically as  $\sin^2\theta = 1 - \cos^2\theta$ , but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for  $t$ . The cosine must be between  $-1$  and  $1$ , so the bounds are

$$t_0 = -2\bar{x}(E^2 + p\bar{p}) + s + u, \quad (16.6)$$

$$t_1 = -2\bar{x}(E^2 - p\bar{p}) + s + u. \quad (16.7)$$

Computing  $\sin^2\theta$  from  $\cos\theta$  above, we observe that the numerator is a quadratic polynomial in  $t$  which has the zeros  $t_0$  and  $t_1$ , while the common denominator is given by  $(2\bar{x}p\bar{p})^2$ . Hence, we can write

$$\sin^2\theta = -\frac{(t-t_0)(t-t_1)}{(2\bar{x}p\bar{p})^2} \quad \text{and} \quad \cos\theta = \frac{(t-t_0) + (t-t_1)}{4\bar{x}p\bar{p}}, \quad (16.8)$$

which is free of large cancellations near  $t = t_0$  or  $t = t_1$ .

If all is massless, i.e.,  $s = u = 0$ , this simplifies to

$$t_0 = -4\bar{x}E^2, \quad t_1 = 0, \quad (16.9)$$

$$\sin^2\theta = -\frac{t}{\bar{x}E^2} \left(1 + \frac{t}{4\bar{x}E^2}\right), \quad \cos\theta = 1 + \frac{t}{2\bar{x}E^2}. \quad (16.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

Note: contents are public only for easy access in unit test.

```
<SF aux: public>≡

    end subroutine splitting_data_write

```

### 16.3.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated particle.  $m2$  is the *physical* mass squared of the outgoing particle. The  $t$  bounds depend on the chosen  $x$  value and cannot be determined yet.

```

<SF aux: splitting data: TBP>+≡
  procedure :: init => splitting_data_init

<SF aux: sub interfaces>+≡
  module subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
    class(splitting_data_t), intent(out) :: d
    type(vector4_t), intent(in) :: k
    real(default), intent(in) :: mk2, mr2, mo2
    logical, intent(in), optional :: collinear
    end subroutine splitting_data_init

<SF aux: procedures>+≡
  module subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
    class(splitting_data_t), intent(out) :: d
    type(vector4_t), intent(in) :: k
    real(default), intent(in) :: mk2, mr2, mo2
    logical, intent(in), optional :: collinear
    if (present (collinear)) d%collinear = collinear
    d%E = energy (k)
    d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
    d%p = sqrt (d%E**2 - mk2)
    d%s = mk2
    d%u = mr2
    d%m2 = mo2
    end subroutine splitting_data_init

```

Retrieve the  $x$  bounds, if needed for  $x$  sampling. Generating an  $x$  value is done by the caller, since this is the part that depends on the nature of the structure function.

```

<SF aux: splitting data: TBP>+≡
  procedure :: get_x_bounds => splitting_get_x_bounds

<SF aux: sub interfaces>+≡
  module function splitting_get_x_bounds (d) result (x)
    class(splitting_data_t), intent(in) :: d
    real(default), dimension(2) :: x
    end function splitting_get_x_bounds

<SF aux: procedures>+≡
  module function splitting_get_x_bounds (d) result (x)
    class(splitting_data_t), intent(in) :: d
    real(default), dimension(2) :: x
    x = [ d%x0, d%x1 ]
    end function splitting_get_x_bounds

```

Now set the momentum fraction and compute  $t_0$  and  $t_1$ .

[The calculation of  $t_1$  is subject to numerical problems. The exact formula is ( $s = m_i^2$ ,  $u = m_r^2$ )

$$t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\sqrt{E^2 - m_r^2/\bar{x}^2}. \quad (16.11)$$

The structure-function paradigm is useful only if  $E \gg m_i, m_r$ . In a Taylor expansion for large  $E$ , the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \quad (16.12)$$

There are two cases of interest:  $m_i = m_o$  and  $m_r = 0$ ,

$$t_1 = xm_o^2 \quad (16.13)$$

and  $m_i = m_r$  and  $m_o = 0$ ,

$$t_1 = -\frac{x^2}{\bar{x}}m_i^2. \quad (16.14)$$

In both cases,  $t_1 \leq m_o^2$ .]

That said, it turns out that taking the  $t_1$  evaluation at face value leads to less problems than the approximation. We express the angles in terms of  $t - t_0$  and  $t - t_1$ . Numerical noise in  $t_1$  can then be tolerated.

```

<SF aux: splitting data: TBP>+=
  procedure :: set_t_bounds => splitting_set_t_bounds
<SF aux: sub interfaces>+=
  elemental module subroutine splitting_set_t_bounds (d, x, xb)

        d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
      else
        d%pb = 0
      end if
    end if
    tp = -2 * d%xb * d%E**2 + d%s + d%u
    tm = -2 * d%xb * d%p * d%pb
    d%t0 = tp + tm
    d%t1 = tp - tm
    d%t = d%t1
  end subroutine splitting_set_t_bounds

```

### 16.3.3 Sampling recoil

Compute a value for the momentum transfer  $t$ , using a random number  $r$ . We assume a logarithmic distribution for  $t - m^2$ , corresponding to the propagator  $1/(t - m^2)$  with the physical mass  $m$  for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for  $t$  is zero. In that case, the  $t$  value is set to zero and the splitting will be collinear.

```

<SF aux: splitting data: TBP>+≡
  procedure :: sample_t => splitting_sample_t

<SF aux: sub interfaces>+≡
  module subroutine splitting_sample_t (d, r, t0, t1)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    real(default), intent(in), optional :: t0, t1
  end subroutine splitting_sample_t

<SF aux: procedures>+≡
  module subroutine splitting_sample_t (d, r, t0, t1)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    real(default), intent(in), optional :: t0, t1
    real(default) :: tt0, tt1, tt0m, tt1m
    if (d%collinear) then
      d%t = d%t1
    else
      tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
      tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
      tt0m = tt0 - d%m2
      tt1m = tt1 - d%m2
      if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
        epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
        d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
      else
        d%t = tt1
      end if
    end if
  end subroutine splitting_sample_t

```

The inverse operation: Given  $t$ , we recover the value of  $r$  that would have produced this value.

```

<SF aux: splitting data: TBP>+≡
  procedure :: inverse_t => splitting_inverse_t

<SF aux: sub interfaces>+≡
  module subroutine splitting_inverse_t (d, r, t0, t1)
    class(splitting_data_t), intent(in) :: d
    real(default), intent(out) :: r
    real(default), intent(in), optional :: t0, t1
  end subroutine splitting_inverse_t

<SF aux: procedures>+≡
  module subroutine splitting_inverse_t (d, r, t0, t1)
    class(splitting_data_t), intent(in) :: d

```

```

real(default), intent(out) :: r
real(default), intent(in), optional :: t0, t1
real(default) :: tt0, tt1, tt0m, tt1m
if (d%collinear) then
  r = 0
else
  tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
  tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
  tt0m = tt0 - d%m2
  tt1m = tt1 - d%m2
  if (tt0m < 0 .and. tt1m < 0) then
    r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
  else
    r = 0
  end if
end if
end subroutine splitting_inverse_t

```

This is trivial, but provided for convenience:

```

<SF aux: splitting data: TBP>+≡
  procedure :: sample_phi => splitting_sample_phi

<SF aux: sub interfaces>+≡
  module subroutine splitting_sample_phi (d, r)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    end subroutine splitting_sample_phi

<SF aux: procedures>+≡
  module subroutine splitting_sample_phi (d, r)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    if (d%collinear) then
      d%phi = 0
    else
      d%phi = (1-r) * d%phi0 + r * d%phi1
    end if
  end subroutine splitting_sample_phi

```

Inverse:

```

<SF aux: splitting data: TBP>+≡
  procedure :: inverse_phi => splitting_inverse_phi

<SF aux: sub interfaces>+≡
  module subroutine splitting_inverse_phi (d, r)
    class(splitting_data_t), intent(in) :: d
    real(default), intent(out) :: r
    end subroutine splitting_inverse_phi

<SF aux: procedures>+≡
  module subroutine splitting_inverse_phi (d, r)
    class(splitting_data_t), intent(in) :: d
    real(default), intent(out) :: r
    if (d%collinear) then
      r = 0
    end if
  end subroutine splitting_inverse_phi

```

```

else
r = (d%phi - d%phi0) / (d%phi1 - d%phi0)
end if
end subroutine splitting_inverse_phi

```

### 16.3.4 Splitting

In this function, we actually perform the splitting. The incoming momentum  $k$  is split into (if no recoil)  $q_1 = (1 - x)k$  and  $q_2 = xk$ .

Apart from the splitting data, we need the incoming momentum  $k$ , the momentum transfer  $t$ , and the azimuthal angle  $\phi$ . The momentum fraction  $x$  is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit  $t_1$ , so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

```

<SF aux: splitting data: TBP>+=
  procedure :: split_momentum => splitting_split_momentum

<SF aux: sub interfaces>+=

end if
end function splitting_split_momentum

```

Momenta generated by splitting will in general be off-shell. They are on-shell only if they are collinear and massless. This subroutine puts them on shell by brute force, violating either momentum or energy conservation. The direction of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

```

### 16.3.5 Recovering the splitting

This is the inverse problem. We have on-shell momenta and want to deduce the splitting parameters  $x$ ,  $t$ , and  $\phi$ .

Update 2018-08-22: As a true inverse to `splitting_split_momentum`, we now use not just a single momentum `q2` as before, but the momentum pair `q1`, `q2` for recovering  $x$  and  $\bar{x}$  separately. If  $x$  happens to be close to 1, we would completely lose the tiny  $\bar{x}$  value, otherwise, and thus get a meaningless result.

```

## Momentum splitting: massless radiation

Compute momentum splitting for generic kinematics. It turns out that for  $x = 0.5$ , where  $t - m^2$  is the geometric mean between its upper and lower bounds (this can be directly seen from the logarithmic distribution in the function `sample_t` for  $r \equiv x = 1 - x = 0.5$ ), we arrive at an exact number  $t = -0.15$  for the given input values.

## Endpoint stability

Compute momentum splitting for collinear kinematics close to both endpoints. In particular, check both directions  $x \rightarrow$  momenta and momenta  $\rightarrow x$ .

For purely massless collinear splitting, the KEEP\_XXX flag is irrelevant. We choose KEEP\_ENERGY here.

## 16.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of  $x_1, x_2, \dots$  as parameters for the beams, we generate one parameter that is equal, or related to, the product  $x_1 x_2 \dots$  (so it directly corresponds to  $\sqrt{s}$ ). The other parameters describe the distribution of energy (loss) between beams and radiations.

```

<sf_mappings.f90>≡
  <File header>

  module sf_mappings

    <Use kinds>
    use kinds, only: double

    <Standard module head>

    <SF mappings: public>

    <SF mappings: parameters>

    <SF mappings: types>

    <SF mappings: interfaces>

    interface
    <SF mappings: sub interfaces>
    end interface

    contains

    <SF mappings: main procedures>

  end module sf_mappings
<sf_mappings_sub.f90>≡
  <File header>

  submodule (sf_mappings) sf_mappings_s

    use io_units
    use constants, only: pi, zero, one
    use numeric_utils
    use diagnostics

    implicit none

    contains

    <SF mappings: procedures>

  end submodule sf_mappings_s

```

### 16.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

```
<SF mappings: public>≡  
  public :: sf_mapping_t  
<SF mappings: types>≡  
  type, abstract :: sf_mapping_t  
  integer, dimension(:), allocatable :: i  
  contains  
  <SF mappings: sf mapping: TBP>  
  end type sf_mapping_t
```

The output routine is deferred:

```
<SF mappings: sf mapping: TBP>≡  
  procedure (sf_mapping_write), deferred :: write  
<SF mappings: interfaces>≡  
  abstract interface  
    subroutine sf_mapping_write (object, unit)  
    import  
    class(sf_mapping_t), intent(in) :: object  
    integer, intent(in), optional :: unit  
    end subroutine sf_mapping_write  
  end interface
```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

```
<SF mappings: sf mapping: TBP>+≡  
  procedure :: base_init => sf_mapping_base_init  
<SF mappings: sub interfaces>≡  
  module subroutine sf_mapping_base_init (mapping, n_par)  
    class(sf_mapping_t), intent(out) :: mapping  
    integer, intent(in) :: n_par  
    end subroutine sf_mapping_base_init  
<SF mappings: procedures>≡  
  module subroutine sf_mapping_base_init (mapping, n_par)  
    class(sf_mapping_t), intent(out) :: mapping  
    integer, intent(in) :: n_par  
    allocate (mapping%i (n_par))  
    mapping%i = 0  
    end subroutine sf_mapping_base_init
```

Set an index value.

```
<SF mappings: sf mapping: TBP>+≡  
  procedure :: set_index => sf_mapping_set_index  
<SF mappings: sub interfaces>+≡  
  module subroutine sf_mapping_set_index (mapping, j, i)  
    class(sf_mapping_t), intent(inout) :: mapping  
    integer, intent(in) :: j, i  
    end subroutine sf_mapping_set_index
```

```

<SF mappings: procedures>+≡
  module subroutine sf_mapping_set_index (mapping, j, i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j, i
    mapping%i(j) = i
  end subroutine sf_mapping_set_index

```

Retrieve an index value.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: get_index => sf_mapping_get_index

<SF mappings: sub interfaces>+≡
  module function sf_mapping_get_index (mapping, j) result (i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j
    integer :: i
  end function sf_mapping_get_index

<SF mappings: procedures>+≡
  module function sf_mapping_get_index (mapping, j) result (i)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: j
    integer :: i
    i = mapping%i(j)
  end function sf_mapping_get_index

```

Return the dimensionality, i.e., the number of parameters.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: get_n_dim => sf_mapping_get_n_dim

<SF mappings: sub interfaces>+≡
  module function sf_mapping_get_n_dim (mapping) result (n)
    class(sf_mapping_t), intent(in) :: mapping
    integer :: n
  end function sf_mapping_get_n_dim

<SF mappings: procedures>+≡
  module function sf_mapping_get_n_dim (mapping) result (n)
    class(sf_mapping_t), intent(in) :: mapping
    integer :: n
    n = size (mapping%i)
  end function sf_mapping_get_n_dim

```

Computation: the values **p** are the input parameters, the values **r** are the output parameters. The values **rb** are defined as  $\bar{r} = 1 - r$ , but provided explicitly. They allow us to avoid numerical problems near  $r = 1$ .

The extra parameter **x\_free** indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is **f**. We modify only the two parameters indicated by the indices **i**.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_compute), deferred :: compute

```

```

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
    import
    class(sf_mapping_t), intent(inout) :: mapping
    real(default), dimension(:), intent(out) :: r, rb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: p, pb
    real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_compute
  end interface

```

The inverse mapping. Use *r* and/or *rb* to reconstruct *p* and also compute *f*.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_inverse), deferred :: inverse

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
    import
    class(sf_mapping_t), intent(inout) :: mapping
    real(default), dimension(:), intent(in) :: r, rb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(out) :: p, pb
    real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_inverse
  end interface

```

## 16.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: check => sf_mapping_check

<SF mappings: sub interfaces>+≡
  module subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: u
    real(default), dimension(:), intent(in) :: p_in, pb_in
    character(*), intent(in) :: fmt_p
    character(*), intent(in), optional :: fmt_f
    end subroutine sf_mapping_check

<SF mappings: procedures>+≡
  module subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: u

end subroutine sf_mapping_check

```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

#### 16.4.4 Implementation: resonance pair mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio, then it maps  $p_1$  to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in  $p_1$  results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

end subroutine sf_res_mapping_single_inverse

```

#### 16.4.6 Implementation: on-shell mapping

This is a degenerate version of the unit-square mapping where the product  $r_1 r_2$  is constant. This product is given by the rescaled squared mass. We introduce an artificial first parameter  $p_1$  to keep the counting, but nothing depends on it. The second parameter is the same  $p_2$  as for the standard unit-square mapping for  $\alpha = 1$ , it parameterizes the ratio of  $r_1$  and  $r_2$ .

```

<SF mappings: public>+≡
  public :: sf_os_mapping_t
<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_os_mapping_t
  real(default) :: m = 0
  real(default) :: lm2 = 0
  contains
  <SF mappings: sf on-shell mapping: TBP>
end type sf_os_mapping_t

```

Output.

```

<SF mappings: sf on-shell mapping: TBP>≡
  procedure :: write => sf_os_mapping_write
<SF mappings: sub interfaces>+≡
  module subroutine sf_os_mapping_write (object, unit)
    class(sf_os_mapping_t), intent(in) :: object
    integer, intent(in), optional :: unit

end subroutine sf_os_mapping_inverse

```

#### 16.4.7 Implementation: on-shell single mapping

This is a degenerate version of the unit-interval mapping where the result  $r$  is constant. The value is given by the rescaled squared mass. The input parameter  $p_1$  is actually ignored, nothing depends on it.

```

<SF mappings: public>+≡
public :: sf_os_mapping_single_t

<SF mappings: types>+≡
type, extends (sf_mapping_t) :: sf_os_mapping_single_t
real(default) :: m = 0
real(default) :: lm2 = 0
contains
<SF mappings: sf on-shell mapping single: TBP>
end type sf_os_mapping_single_t

```

Output.

```

<SF mappings: sf on-shell mapping single: TBP>≡
procedure :: write => sf_os_mapping_single_write

<SF mappings: sub interfaces>+≡
module subroutine sf_os_mapping_single_write (object, unit)
class(sf_os_mapping_single_t), intent(in) :: object
integer, intent(in), optional :: unit
end subroutine sf_os_mapping_single_write

<SF mappings: procedures>+≡
module subroutine sf_os_mapping_single_write (object, unit)
class(sf_os_mapping_single_t), intent(in) :: object
integer, intent(in), optional :: unit

```

```

integer :: u
u = given_output_unit (unit)
write (u, "(1x,A)", advance="no") "map"
if (any (object%i /= 0)) then
write (u, "(',I0,')'", advance="no") object%i
end if
write (u, "(A,F7.5,A)" " ": on-shell (" , object%m, ")")
end subroutine sf_os_mapping_single_write

```

Initialize: index pair and dimensionless mass parameter.

```

<SF mappings: sf on-shell mapping single: TBP>+≡
  procedure :: init => sf_os_mapping_single_init

<SF mappings: sub interfaces>+≡
  module subroutine sf_os_mapping_single_init (mapping, m)
  class(sf_os_mapping_single_t), intent(out) :: mapping
  real(default), intent(in) :: m
  end subroutine sf_os_mapping_single_init

<SF mappings: procedures>+≡
  module subroutine sf_os_mapping_single_init (mapping, m)
  class(sf_os_mapping_single_t), intent(out) :: mapping

  end subroutine sf_os_mapping_single_inverse

```

## 16.4.8 Implementation: endpoint mapping

This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ . The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in  $r_1$  and/or  $r_2$ . The singularity is smeared to an interval of width  $\epsilon$ . If nonzero, we distinguish the kinematical momentum fractions  $r_i$  from effective values  $x_i$ , which should go into the structure-function evaluation. A bin of width  $\epsilon$  in  $r$  is mapped to  $x = 1$  exactly, while the interval  $(0, 1 - \epsilon)$  is mapped to  $(0, 1)$  in  $x$ . The Jacobian reflects this distinction, and the logical `in_peak` allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

### 16.4.9 Implementation: endpoint mapping with resonance

Like the endpoint mapping for  $p_2$ , but replace the endpoint mapping by a Breit-Wigner mapping for  $p_1$ . This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter  $p_1$  remains equal to  $r_1 r_2$ , as in the standard s-channel mapping.

```

<SF mappings: public>+≡
  public :: sf_epr_mapping_t

<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_epr_mapping_t
  real(default) :: a = 1
  real(default) :: m = 0
  real(default) :: w = 0

#### 16.4.11 Implementation: ISR endpoint mapping

Similar to the endpoint mapping above: This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ .

The enhancement is such that ISR singularity  $(1 - x)^{-1+\epsilon}$  is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

```

<SF mappings: public>+≡
public :: sf_ip_mapping_t

<SF mappings: types>+≡
type, extends (sf_mapping_t) :: sf_ip_mapping_t

#### 16.4.12 Implementation: ISR endpoint mapping, resonant

Similar to the endpoint mapping above: This maps the unit square  $(r_1, r_2)$  such that  $p_1$  is the product  $r_1 r_2$ , while  $p_2$  is related to the ratio. Furthermore, we enhance the region at  $r_1 = 1$  and  $r_2 = 1$ , which translates into  $p_1 = 1$  and  $p_2 = 0, 1$ .

The enhancement is such that ISR singularity  $(1 - x)^{-1+\epsilon}$  is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

The resonance can be turned off by the flag **resonance**.

```

<SF mappings: public>+≡
  public :: sf_ipr_mapping_t

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping, adapted for an s-channel resonance. The first two internal parameters apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. The first and third parameters are the result of an overall resonance mapping, so on the outside, the first parameter is the total momentum fraction, the third one describes the distribution between beamstrahlung and ISR.

## 16.4.17 Basic formulas

### Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ( $\ln x$  which is zero at  $x = 1$ ), corresponding to an initial concentration of sampling points at the maximum energy. If **power** is greater than one (the default), points are also concentrated at the lower end.

The formula is (**power**= $\alpha$ ):

$$r_1 = (p_1^{p_2})^\alpha \quad (16.15)$$

$$r_2 = (p_1^{1-p_2})^\alpha \quad (16.16)$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \quad (16.17)$$

and for the default case  $\alpha = 1$ :

$$r_1 = p_1^{p_2} \quad (16.18)$$

$$r_2 = p_1^{1-p_2} \quad (16.19)$$

$$f = |\log p_1| \quad (16.20)$$

*<SF mappings: procedures>+≡*

```

subroutine map_unit_square (r, factor, p, power)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), intent(in), optional :: power
  real(default) :: xx, yy
  factor = 1
  xx = p(1)
  yy = p(2)
  if (present(power)) then
    if (p(1) > 0 .and. power > 1) then
      xx = p(1)**power
    end if
  end if

```

```

factor = factor * power * xx / p(1)
end if
end if
if (.not. vanishes (xx)) then
r(1) = xx ** yy
r(2) = xx / r(1)
factor = factor * abs (log (xx))
else
r = 0
end if
end subroutine map_unit_square

```

This is the inverse mapping.

*(SF mappings: procedures)*+≡

```

subroutine map_unit_square_inverse (r, factor, p, power)
real(kind=default), dimension(2), intent(in) :: r
real(kind=default), intent(out) :: factor
real(kind=default), dimension(2), intent(out) :: p
real(kind=default), intent(in), optional :: power
real(kind=default) :: lg, xx, yy
factor = 1
xx = r(1) * r(2)
if (.not. vanishes (xx)) then
lg = log (xx)
if (.not. vanishes (lg)) then
yy = log (r(1)) / lg
else
yy = 0
end if
p(2) = yy
factor = factor * abs (lg)
if (present(power)) then
p(1) = xx**(1._default/power)
factor = factor * power * xx / p(1)
else
p(1) = xx
end if
else
p = 0
end if
end subroutine map_unit_square_inverse

```

### Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be numerically stable near  $x = 1$  and  $y = 0, 1$ . The formulas are again

$$r_1 = p_1^{p_2}, \quad r_2 = p_1^{\bar{p}_2}, \quad f = -\log p_1 \quad (16.21)$$

but we compute both  $r_i$  and  $\bar{r}_i$  simultaneously and make direct use of both  $p_i$  and  $\bar{p}_i$  as appropriate.

*(SF mappings: procedures)*+≡

```

subroutine map_unit_square_prec (r, rb, factor, p, pb)
real(default), dimension(2), intent(out) :: r
real(default), dimension(2), intent(out) :: rb
real(default), intent(out) :: factor
real(default), dimension(2), intent(in) :: p
real(default), dimension(2), intent(in) :: pb
if (p(1) > 0.5_default) then
call compute_prec_xy_1 (r(1), rb(1), p(1), pb(1), p (2))
call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
factor = - log_prec (p(1), pb(1))
else if (.not. vanishes (p(1))) then
call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
factor = - log_prec (p(1), pb(1))
else
r = 0
rb = 1
factor = 0
end if
end subroutine map_unit_square_prec

```

This is the inverse mapping.

$\langle SF \text{ mappings: procedures} \rangle + \equiv$

```

subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
real(default), dimension(2), intent(in) :: r
real(default), dimension(2), intent(in) :: rb
real(default), intent(out) :: factor
real(default), dimension(2), intent(out) :: p
real(default), dimension(2), intent(out) :: pb
call inverse_prec_x (r, rb, p(1), pb(1))
if (all (r > 0)) then
if (rb(1) < rb(2)) then
call inverse_prec_y (r, rb, p(2), pb(2))
else
call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
end if
factor = - log_prec (p(1), pb(1))
else
p(1) = 0
pb(1) = 1
p(2) = 0.5_default
pb(2) = 0.5_default
factor = 0
end if
end subroutine map_unit_square_inverse_prec

```

This is an auxiliary function: evaluate the expression  $\bar{z} = 1 - x^y$  in a numerically stable way. Instabilities occur for  $y = 0$  and  $x = 1$ . The idea is to replace the bracket by the first terms of its Taylor expansion around  $x = 1$  (read  $\bar{x} \equiv 1 - x$ )

$$1 - x^y = y\bar{x} \left( 1 + \frac{1}{2}(1-y)\bar{x} + \frac{1}{6}(2-y)(1-y)\bar{x}^2 \right) \quad (16.22)$$

whenever this is the better approximation. Actually, the relative numerical

error of the exact formula is about  $\eta/(y\bar{x})$  where  $\eta$  is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by  $(y\bar{x})$ .

The first subroutine computes  $z$  and  $\bar{z}$  near  $x = 1$  where  $\log x$  should be expanded, the second one near  $x = 0$  where  $\log x$  can be kept.

```

(SF mappings: procedures)+≡
subroutine compute_prec_xy_1 (z, zb, x, xb, y)
real(default), intent(out) :: z, zb
real(default), intent(in) :: x, xb, y
real(default) :: a1, a2, a3
a1 = y * xb
a2 = a1 * (1 - y) * xb / 2
a3 = a2 * (2 - y) * xb / 3
if (abs (a3) < epsilon (a3)) then
zb = a1 + a2 + a3
z = 1 - zb
else
z = x ** y
zb = 1 - z
end if
end subroutine compute_prec_xy_1

subroutine compute_prec_xy_0 (z, zb, x, xb, y)
real(default), intent(out) :: z, zb
real(default), intent(in) :: x, xb, y
real(default) :: a1, a2, a3, lx
lx = -log (x)
a1 = y * lx
a2 = a1 * y * lx / 2
a3 = a2 * y * lx / 3
if (abs (a3) < epsilon (a3)) then
zb = a1 + a2 + a3
z = 1 - zb
else
z = x ** y
zb = 1 - z
end if
end subroutine compute_prec_xy_0

```

For the inverse calculation, we evaluate  $x = r_1 r_2$  in a stable way. Since it is just a polynomial, the expansion near  $x = 1$  is analytically exact, and we don't need to choose based on precision.

Fixed WK 2023-02-21: case selection (a0 check) was flipped. Note that the first case applies to small  $\mathbf{rb}$ , i.e., to  $\mathbf{x}$  near 1.

```

(SF mappings: procedures)+≡
subroutine inverse_prec_x (r, rb, x, xb)
real(default), dimension(2), intent(in) :: r, rb
real(default), intent(out) :: x, xb
real(default) :: a0, a1
a0 = rb(1) + rb(2)
a1 = rb(1) * rb(2)
if (a0 < 0.5_default) then
xb = a0 - a1

```

```

x = 1 - xb
else
x = r(1) * r(2)
xb = 1 - x
end if
end subroutine inverse_prec_x

```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \quad (16.23)$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near  $r_i = 1$ . A series expansion is required if  $r_1 \ll r_2$ , since then  $y$  becomes small. (We assume  $r_1 < r_2$  here; for the opposite case, the arguments can be exchanged.)

Fixed WK 2023-02-21: removed special casing for either log near zero within the first branch. (y or yb was set to zero.) In some application (ISR peak mapping with resonance nearby) that apparent safeguard turned out to be fatal.

*(SF mappings: procedures)*+≡

```

subroutine inverse_prec_y (r, rb, y, yb)
real(default), dimension(2), intent(in) :: r, rb
real(default), intent(out) :: y, yb
real(default) :: log1, log2, a1, a2, a3
log1 = log_prec (r(1), rb(1))
log2 = log_prec (r(2), rb(2))
if (abs (log2**3) < epsilon (one)) then
y = one / (one + log2 / log1)
yb = one / (one + log1 / log2)
else
a1 = - rb(1) / log2
a2 = - rb(1) ** 2 * (one / log2**2 + one / (2 * log2))
a3 = - rb(1) ** 3 * (one / log2**3 + one / log2**2 + one/(3 * log2))
if (abs (a3) < epsilon (a3)) then
y = a1 + a2 + a3
yb = one - y
else
y = one / (one + log2 / log1)
yb = one / (one + log1 / log2)
end if
end if
end subroutine inverse_prec_y

```

### Mapping for on-shell s-channel

The limiting case, if the product  $r_1 r_2$  is fixed for on-shell production. The parameter  $p_1$  is ignored. In the inverse mapping, it is returned zero.

The parameter `x_free`, if present, rescales the total energy. If it is less than one, the rescaled mass parameter  $m^2$  should be increased accordingly.

Public for access in unit test.

### Mapping for on-shell s-channel, single parameter

This is a pseudo-mapping which applies if there is actually just one parameter  $p$ . The output parameter  $r$  is fixed for on-shell production. The lone parameter  $p_1$  is ignored. In the inverse mapping, it is returned zero.

The parameter  $x_{\text{free}}$ , if present, rescales the total energy. If it is less than one, the rescaled mass parameter  $m^2$  should be increased accordingly.

Public for access in unit test.

```

<SF mappings: public>+≡
  public :: map_on_shell_single
  public :: map_on_shell_single_inverse

<SF mappings: sub interfaces>+≡

## Mapping for a Breit-Wigner resonance

This is the standard Breit-Wigner mapping. We apply it to a single variable, independently of or in addition to a unit-square mapping. We assume here that the limits for the variable are 0 and 1, and that the mass  $m$  and width  $w$  are rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If `x_free` is set, it rescales the total energy and thus mass and width, since these are defined with respect to the total energy.

*(SF mappings: procedures)* +=

```

subroutine map_breit_wigner (r, factor, p, m, w, x_free)
  real(default), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), intent(in) :: p
  real(default), intent(in) :: m
  real(default), intent(in) :: w
  real(default), intent(in), optional :: x_free
  real(default) :: m2, mw, a1, a2, a3, z, tmp
  m2 = m ** 2
  mw = m * w
  if (present (x_free)) then
    m2 = m2 / x_free
    mw = mw / x_free
  end if
  a1 = atan (- m2 / mw)
  a2 = atan ((1 - m2) / mw)
  a3 = (a2 - a1) * mw
  z = (1-p) * a1 + p * a2
  if (-pi/2 < z .and. z < pi/2) then
    tmp = tan (z)
    r = max (m2 + mw * tmp, 0._default)
    factor = a3 * (1 + tmp ** 2)
  else
    r = 0
    factor = 0
  end if
end subroutine map_breit_wigner

## Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the endpoint(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2}x)) \quad (16.24)$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

```
<SF mappings: procedures>+≡
subroutine map_endpoint_1 (x3, factor, x1, a)
  real(default), intent(out) :: x3, factor
  real(default), intent(in) :: x1
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x1) < 1) then
    x2 = tan (x1 * pi / 2)
    x3 = tanh (a * x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
  else
    x3 = x1
    factor = 0
  end if
end subroutine map_endpoint_1

subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
  real(default), intent(in) :: x3
  real(default), intent(out) :: x1, factor
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x3) < 1) then
    x2 = atanh (x3) / a
    x1 = 2 / pi * atan (x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
  else
    x1 = x3
    factor = 0
  end if
end subroutine map_endpoint_inverse_1

subroutine map_endpoint_01 (x4, factor, x0, a)
  real(default), intent(out) :: x4, factor
  real(default), intent(in) :: x0
  real(default), intent(in) :: a
  real(default) :: x1, x3
  x1 = 2 * x0 - 1
  call map_endpoint_1 (x3, factor, x1, a)
  x4 = (x3 + 1) / 2
end subroutine map_endpoint_01

subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
  real(default), intent(in) :: x4
  real(default), intent(out) :: x0, factor
```

```

real(default), intent(in) :: a
real(default) :: x1, x3
x3 = 2 * x4 - 1
call map_endpoint_inverse_1 (x3, factor, x1, a)
x0 = (x1 + 1) / 2
end subroutine map_endpoint_inverse_01

```

### Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity which is of power type at  $x = 1$ , i.e., if

$$\sigma = \int_0^1 dx f(x) G(x) = \int_0^1 dx \epsilon (1-x)^{-1+\epsilon} G(x), \quad (16.25)$$

we replace this by

$$r = x^\epsilon \implies \sigma = \int_0^1 dr G(1 - (1-r)^{1/\epsilon}). \quad (16.26)$$

We expect that  $\epsilon$  is small.

The actual mapping is  $r \rightarrow x$  (so  $x$  emerges closer to 1). The Jacobian that we return is thus  $1/f(x)$ . We compute the mapping in terms of  $\bar{x} \equiv 1 - x$ , so we can achieve the required precision. Because some compilers show quite wild numeric fluctuations, we internally convert numeric types to explicit `double` precision.

```

<SF mappings: public>+≡
  public :: map_power_1
  public :: map_power_inverse_1

<SF mappings: sub interfaces>+≡
  module subroutine map_power_1 (xb, factor, rb, eps)
    real(default), intent(out) :: xb, factor
    real(default), intent(in) :: rb
    real(default), intent(in) :: eps
  end subroutine map_power_1
  module subroutine map_power_inverse_1 (xb, factor, rb, eps)
    real(default), intent(in) :: xb
    real(default), intent(out) :: rb, factor
    real(default), intent(in) :: eps
  end subroutine map_power_inverse_1

<SF mappings: procedures>+≡
  module subroutine map_power_1 (xb, factor, rb, eps)
    real(default), intent(out) :: xb, factor
    real(default), intent(in) :: rb
    real(double) :: rb_db, factor_db, eps_db, xb_db
    real(default), intent(in) :: eps
    rb_db = real (rb, kind=double)
    eps_db = real (eps, kind=double)
    xb_db = rb_db ** (1 / eps_db)
    if (rb_db > 0) then
      factor_db = xb_db / rb_db / eps_db
    end if
  end subroutine map_power_1

```

```

factor = real (factor_db, kind=default)
else
factor = 0
end if

r = 1 - ub / 2
else if (zp < zm) then
call map_power_inverse_1 (zp, factor, ub, eps)
r = ub / 2
else
factor = 1 / eps
ub = 1
r = ub / 2
end if
end subroutine map_power_inverse_01

```

### Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping that applies to multiple structure functions. This is described by an extension of the `sf_mapping_t` type. In addition, it may contain mappings that apply to (other) individual structure functions. The details of these mappings are implementation-specific.

The `sf_channel_t` type combines this information. It contains an array of map codes, one for each structure-function entry. The code values are:

**none** MC input parameters  $r$  directly become energy fractions  $x$

**single** default mapping for a single structure-function entry

**multi/s** map  $r \rightarrow x$  such that one MC input parameter is  $\hat{s}/s$

**multi/resonance** as before, adapted to s-channel resonance

**multi/on-shell** as before, adapted to an on-shell particle in the s channel

**multi/endpoint** like multi/s, but enhance the region near  $r_i = 1$

**multi/endpoint/res** endpoint mapping with resonance

**multi/endpoint/os** endpoint mapping for on-shell

**multi/power/os** like multi/endpoint, regulating a power singularity

$\langle SF \text{ mappings: parameters} \rangle \equiv$

```

integer, parameter :: SFMAP_NONE = 0
integer, parameter :: SFMAP_SINGLE = 1
integer, parameter :: SFMAP_MULTI_S = 2
integer, parameter :: SFMAP_MULTI_RES = 3
integer, parameter :: SFMAP_MULTI_ONS = 4
integer, parameter :: SFMAP_MULTI_EP = 5
integer, parameter :: SFMAP_MULTI_EPR = 6

```

```

integer, parameter :: SFMAP_MULTI_EPO = 7
integer, parameter :: SFMAP_MULTI_IP = 8
integer, parameter :: SFMAP_MULTI_IPR = 9
integer, parameter :: SFMAP_MULTI_IPO = 10
integer, parameter :: SFMAP_MULTI_EI = 11
integer, parameter :: SFMAP_MULTI_SRS = 13
integer, parameter :: SFMAP_MULTI_SON = 14

```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

```

⟨SF mappings: public⟩+≡
  public :: sf_channel_t

⟨SF mappings: types⟩+≡
  type :: sf_channel_t
  integer, dimension(:), allocatable :: map_code
  class(sf_mapping_t), allocatable :: multi_mapping
  contains
  ⟨SF mappings: sf channel: TBP⟩
end type sf_channel_t

```

The output format prints a single character for each structure-function entry and, if applicable, an account of the mapping parameters.

```

end subroutine sf_mappings_3

```

### Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by  $|\log m^2|$ , so this is also the value of the integral. The factor results from the variable change in the  $\delta$  function  $\delta(m^2 - x_1 x_2)$  which multiplies the cross section

for the case at hand.

For the test, the (rescaled) resonance mass is set at  $1/2$  the energy.

```

<SF mappings: execute tests>+≡

### 16.5.1 Abstract rescale data-type

NLO calculations require the treatment of initial state parton radiation. The radiation of a parton rescales the energy fraction which enters the hard process. We allow for different rescale settings by extending the abstract. `sf_rescale_t` data type.

```

    <SF base: public>≡
    public :: sf_rescale_t

    <SF base: types>≡
    type, abstract :: sf_rescale_t
    integer :: i_beam = 0
    contains
    <SF base: rescaling function: TBP>
    end type sf_rescale_t

    <SF base: rescaling function: TBP>≡
    procedure (sf_rescale_apply), deferred :: apply

```

```

<SF base: interfaces>≡
  abstract interface
    subroutine sf_rescale_apply (func, x)
    import
    class(sf_rescale_t), intent(in) :: func
    real(default), intent(inout) :: x
  end subroutine sf_rescale_apply
end interface

<SF base: rescaling function: TBP>+≡
  procedure :: set_i_beam => sf_rescale_set_i_beam

<SF base: sub interfaces>≡
  module subroutine sf_rescale_set_i_beam (func, i_beam)
  class(sf_rescale_t), intent(inout) :: func
  integer, intent(in) :: i_beam
  end subroutine sf_rescale_set_i_beam

<SF base: procedures>≡
  module subroutine sf_rescale_set_i_beam (func, i_beam)
  class(sf_rescale_t), intent(inout) :: func
  integer, intent(in) :: i_beam
  func%i_beam = i_beam
  end subroutine sf_rescale_set_i_beam

<SF base: public>+≡
  public :: sf_rescale_collinear_t

<SF base: types>+≡
  type, extends (sf_rescale_t) :: sf_rescale_collinear_t
  real(default) :: xi_tilde
  contains
  <SF base: rescale collinear: TBP>
  end type sf_rescale_collinear_t

```

For the subtraction terms we need to rescale the Born  $x$  of both beams in the collinear limit. This leaves one beam unaffected and rescales the other according to

$$x = \frac{\bar{x}}{1 - \xi} \quad (16.27)$$

which is the collinear limit of `sf_rescale_real_apply`.

```

<SF base: rescale collinear: TBP>≡
  procedure :: apply => sf_rescale_collinear_apply

<SF base: sub interfaces>+≡
  module subroutine sf_rescale_collinear_apply (func, x)
  class(sf_rescale_collinear_t), intent(in) :: func
  real(default), intent(inout) :: x
  end subroutine sf_rescale_collinear_apply

<SF base: procedures>+≡
  module subroutine sf_rescale_collinear_apply (func, x)
  class(sf_rescale_collinear_t), intent(in) :: func
  real(default), intent(inout) :: x

```

```

real(default) :: xi
if (debug2_active (D_BEAMS)) then
print *, 'Rescaling function - Collinear: '
print *, 'Input, unscaled x: ', x
print *, 'xi_tilde: ', func%xi_tilde
end if
xi = func%xi_tilde * (one - x)
x = x / (one - xi)
if (debug2_active (D_BEAMS)) print *, 'rescaled x: ', x
end subroutine sf_rescale_collinear_apply

<SF base: rescale collinear: TBP>+≡

<SF base: sub interfaces>+≡
  module subroutine sf_rescale_collinear_set (func, xi_tilde)
  class(sf_rescale_collinear_t), intent(inout) :: func
  real(default), intent(in) :: xi_tilde
  end subroutine sf_rescale_collinear_set

<SF base: procedures>+≡
  module subroutine sf_rescale_collinear_set (func, xi_tilde)
  class(sf_rescale_collinear_t), intent(inout) :: func
  real(default), intent(in) :: xi_tilde
  func%xi_tilde = xi_tilde
  end subroutine sf_rescale_collinear_set

<SF base: public>+≡
  public :: sf_rescale_real_t

<SF base: types>+≡
  type, extends (sf_rescale_t) :: sf_rescale_real_t
  real(default) :: xi, y
  contains
  <SF base: rescale real: TBP>
  end type sf_rescale_real_t

```

In case of IS Splittings, the beam  $x$  changes from Born to real and thus needs to be rescaled according to

$$x_{\oplus} = \frac{\bar{x}_{\oplus}}{\sqrt{1-\xi}} \sqrt{\frac{2-\xi(1-y)}{2-\xi(1+y)}}, \quad x_{\ominus} = \frac{\bar{x}_{\ominus}}{\sqrt{1-\xi}} \sqrt{\frac{2-\xi(1+y)}{2-\xi(1-y)}} \quad (16.28)$$

#### 16.5.4 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

```

<SF base: public>+≡
  public :: sf_int_t

<SF base: types>+≡
  type, abstract, extends (interaction_t) :: sf_int_t
  integer :: status = SF_UNDEFINED
  real(default), dimension(:), allocatable :: mi2
  real(default), dimension(:), allocatable :: mr2
  real(default), dimension(:), allocatable :: mo2
  integer :: on_shell_mode = KEEP_ENERGY
  logical :: qmin_defined = .false.
  logical :: qmax_defined = .false.
  real(default), dimension(:), allocatable :: qmin
  real(default), dimension(:), allocatable :: qmax
  integer, dimension(:), allocatable :: beam_index
  integer, dimension(:), allocatable :: incoming
  integer, dimension(:), allocatable :: radiated
  integer, dimension(:), allocatable :: outgoing
  integer, dimension(:), allocatable :: par_index
  integer, dimension(:), allocatable :: par_primary
contains
  <SF base: sf int: TBP>
end type sf_int_t

```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

```

<SF base: parameters>≡
  integer, parameter, public :: SF_UNDEFINED = 0
  integer, parameter, public :: SF_INITIAL = 1
  integer, parameter, public :: SF_DONE_LINKS = 2
  integer, parameter, public :: SF_FAILED_MASK = 3
  integer, parameter, public :: SF_DONE_MASK = 4
  integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
  integer, parameter, public :: SF_DONE_CONNECTIONS = 6
  integer, parameter, public :: SF_SEED_KINEMATICS = 10
  integer, parameter, public :: SF_FAILED_KINEMATICS = 11
  integer, parameter, public :: SF_DONE_KINEMATICS = 12

```

```

integer, parameter, public :: SF_FAILED_EVALUATION = 13
integer, parameter, public :: SF_EVALUATED = 20

```

Write a string version of the status code:

```

<SF base: procedures>+=
subroutine write_sf_status (status, u)
integer, intent(in) :: status
integer, intent(in) :: u
select case (status)
case (SF_UNDEFINED)
write (u, "(1x,'[',A,']')") "undefined"
case (SF_INITIAL)
write (u, "(1x,'[',A,']')") "initialized"
case (SF_DONE_LINKS)
write (u, "(1x,'[',A,']')") "links set"
case (SF_FAILED_MASK)
write (u, "(1x,'[',A,']')") "mask mismatch"
case (SF_DONE_MASK)

    logical, intent(in), optional :: testflag
  end subroutine sf_int_write
end interface

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually required for non-collinear splitting.

```

sf_int%outgoing = outgoing
end subroutine sf_int_set_outgoing

```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

```

<SF base: sf_int: TBP>+≡
  procedure (sf_int_init), deferred :: init

<SF base: interfaces>+≡
abstract interface
  subroutine sf_int_init (sf_int, data)
  import
  class(sf_int_t), intent(out) :: sf_int
  class(sf_data_t), intent(in), target :: data
end subroutine sf_int_init
end interface

```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

The **target** attribute is formally required since some overriding implementations use a temporary pointer (iterator) to the state-matrix component. It doesn't appear to make a real difference, though.

```

<SF base: sf_int: TBP>+≡
  procedure :: setup_constants => sf_int_setup_constants

<SF base: sub interfaces>+≡
  module subroutine sf_int_setup_constants (sf_int)

end do
call sf_int%seed_kinematics (k)
end if
end if
end subroutine sf_int_seed_energies

```

Tell if in generator mode. By default, this is false. To be overridden where appropriate; we may refer to the `is_generator` method of the `data` component in the concrete type.

```

⟨SF base: sf_int: TBP⟩+≡
  procedure :: is_generator => sf_int_is_generator

⟨SF base: sub interfaces⟩+≡
  module function sf_int_is_generator (sf_int) result (flag)
    class(sf_int_t), intent(in) :: sf_int
    logical :: flag
  end function sf_int_is_generator

⟨SF base: procedures⟩+≡
  module function sf_int_is_generator (sf_int) result (flag)
    class(sf_int_t), intent(in) :: sf_int
    logical :: flag
    flag = .false.
  end function sf_int_is_generator

```

Generate free parameters `r`. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value `x_free` is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

```

⟨SF base: sf_int: TBP⟩+≡
  procedure :: generate_free => sf_int_generate_free

⟨SF base: sub interfaces⟩+≡
  module subroutine sf_int_generate_free (sf_int, r, rb, x_free)

    class(sf_int_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: r, rb
    real(default), intent(inout) :: x_free
    r = 0
    rb = 1
  end subroutine sf_int_generate_free

```

Complete the structure-function kinematics, derived from an input parameter (array)  $r$  between 0 and 1. The interaction momenta are calculated, and we return  $x$  (the momentum fraction), and  $f$  (the Jacobian factor for the map  $r \rightarrow x$ ), if `map` is set.

If the `map` flag is unset,  $r$  and  $x$  values will coincide, and  $f$  will become unity. If it is set, the structure-function implementation chooses a convenient mapping from  $r$  to  $x$  with Jacobian  $f$ .

In the `inverse_kinematics` variant, we exchange the intent of `x` and `r`. The momenta are calculated only if the optional flag `set_momenta` is present and set. Internal parameters of `sf_int` are calculated only if the optional flag `set_x` is present and set.

Update 2018-08-22: Throughout this algorithm, we now carry  $xb=1-x$  together with  $x$  values, as we did for  $r$  before. This allows us to handle unstable endpoint numerics wherever necessary. The only place where the changes actually did matter was for inverse kinematics in the ISR setup, with a very soft photon, but it might be most sensible to apply the extension with  $xb$  everywhere.

```

The inverse procedure: we compute the  $x$  array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

Update 2017-08-22: recover also  $xb$ , using the updated `recover` method of the splitting-data object. Th

### 16.5.6 Direct calculations

Compute a structure function value (array) directly, given an array of  $x$  values and a scale. If the energy is also given, we initialize the kinematics for that energy, otherwise take it from a previous run.

We assume that the  $E$  array has dimension  $n\_in$ , and the  $x$  array has  $n\_par$ .

Note: the output  $x$  values ( $xx$  and  $xxb$ ) are unused in this use case.

```

<SF base: sf_int: TBP>+≡
procedure :: compute_values => sf_int_compute_values

### 16.5.7 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

```

<SF base: types>+≡
  type :: sf_instance_t
  class(sf_int_t), allocatable :: int
  type(enumerator_t) :: eval
  real(default), dimension(:,:), allocatable :: r
  real(default), dimension(:,:), allocatable :: rb
  real(default), dimension(:), allocatable :: f

```

```

logical, dimension(:), allocatable :: m
real(default), dimension(:), allocatable :: x
real(default), dimension(:), allocatable :: xb
end type sf_instance_t

```

### 16.5.8 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and `n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

```

### 16.5.9 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the random-number generator. The `r` array results from applying global mappings. The `x` array results from applying structure-function local mappings. The `x` values can be interpreted directly as momentum fractions (or angle fractions,

where recoil is involved). The **f** factor is the Jacobian that results from applying all mappings.

Update 2017-08-22: carry and output all complements (**pb**, **rb**, **xb**). Previously, **xb** was not included in the record, and the output did not contain either. It does become more verbose, however.

The **mapping** entry may store a global mapping that is applied to a combination of *x* values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the **p** array to the **r** array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the `p` etc. arrays.

The brute-force assignment of the `sf` component would be straightforward, but we provide a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained `interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time

calling the proper defined assignment. Furthermore, we allocate the parameter arrays for each structure function.

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the **channel** object are allocatable and thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

```

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

```

Exchange the quantum-number masks between the interactions in the chain, so we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the `setup_constants` method, which prepares constant data that depend on the matrix element structure.

```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

```

<SF base: init evaluators: find outgoing particles>≡
subroutine find_outgoing_particles ()

```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, the use up the MC input parameter array `p` to compute the radiated and outgoing momenta.

In the multi-channel case, `c_sel` is the channel which we use for computing the kinematics and the `x` values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the `r` array, and the Jacobian `f`.

We first apply any global mapping to transform the input **p** into the array **r**. This is then given to the structure functions which compute the final array **x** and Jacobian factors **f**, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the  $x$  parameters and reconstruct the momenta and the MC input parameters  $p$ . We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all  $x$  parameters, and then inverts mappings. See below `recover_kinematics`.

```

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the  $x$  and  $p$  parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

if (chain%status >= SF_DONE_KINEMATICS) then
int => beam_get_int_ptr (chain%beam_t)
call int%send_momenta ()
end if
end subroutine sf_chain_instance_return_beam_momenta

```

Evaluate all interactions in the chain and the product evaluators. We provide a scale argument that is given to all structure functions in the chain.

Hadronic NLO calculations involve rescaled fractions of the original beam momentum. In particular, we have to handle the following cases:

- normal evaluation (where  $i_{\text{sub}} = 0$ ) for all terms except the real non-subtracted,
- rescaled momentum fraction for both beams in the case of the real non-subtracted term ( $i_{\text{sub}} = 0$ ),
- and rescaled momentum fraction for one of both beams in the case of the subtraction and DGLAP component ( $i_{\text{sub}} = 1, 2$ ).

For the collinear final or initial state counter terms, we apply a rescaling to one beam, and keep the other beam as is. We redo it then vice versa having now two subtractions.

### 16.5.12 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

#### Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

```
<SF base: public test auxiliary>≡
  public :: sf_test_data_t

<SF base: test types>≡
  type, extends (sf_data_t) :: sf_test_data_t
  class(model_data_t), pointer :: model => null ()
  integer :: mode = 0
  type(flavor_t) :: flv_in
  type(flavor_t) :: flv_out
  type(flavor_t) :: flv_rad
  real(default) :: m = 0
  logical :: collinear = .true.
  real(default), dimension(:), allocatable :: qbounds
  contains
  <SF base: sf test data: TBP>
  end type sf_test_data_t
```

Output.

```
<SF base: sf test data: TBP>≡
  procedure :: write => sf_test_data_write

<SF base: test auxiliary>≡
  subroutine sf_test_data_write (data, unit, verbose)
    class(sf_test_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "SF test data:"
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
    write (u, "(3x,A)", advance="no") "incoming  = "

### 16.5.13 Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two radiated and two outgoing particles.

#### Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```

⟨SF base: test types⟩+=
  type, extends (sf_data_t) :: sf_test_spectrum_data_t
  class(model_data_t), pointer :: model => null ()
  type(flavor_t) :: flv_in
  type(flavor_t) :: flv_out

```

```

type(flavor_t) :: flv_rad
logical :: with_radiation = .true.
real(default) :: m = 0
contains
<SF base: sf test spectrum data: TBP>
end type sf_test_spectrum_data_t

```

Output.

```

<SF base: sf test spectrum data: TBP>≡
  procedure :: write => sf_test_spectrum_data_write

<SF base: test auxiliary>+≡
  subroutine sf_test_spectrum_data_write (data, unit, verbose)
    class(sf_test_spectrum_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "SF test spectrum data:"
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
    write (u, "(3x,A)", advance="no") "incoming  = "
    call data%flv_in%write (u); write (u, *)
    write (u, "(3x,A)", advance="no") "outgoing   = "
    call data%flv_out%write (u); write (u, *)
    write (u, "(3x,A)", advance="no") "radiated   = "

## Structure function instance configuration

We create a structure-function chain instance which implements a configured structure-function chain. We link the momentum entries in the interactions and compute kinematics.

We do not actually connect the interactions and create evaluators. We skip this step and manually advance the status of the chain instead.

```

## Structure function chain evaluation

Here, we test the complete workflow for a structure-function chain with generator. First, we create the template chain, then initialize an instance. We set up links, mask, and evaluators. Finally, we set kinematics and evaluate the matrix elements and their products.

```

<SF base: execute tests>+≡
  call test (sf_base_14, "sf_base_14", &

### 16.6.1 Physics

The ISR structure function is in the most crude approximation (LLA without  $\alpha$  corrections, i.e.  $\epsilon^0$ )

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (16.29)$$

where  $m$  is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

In  $f_0(x)$ , there is an integrable singularity at  $x = 1$  which does not spoil the integration, but would lead to an unbounded  $f_{\max}$ . Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \quad (16.30)$$

such that

$$\int dx f_0(x) = \int dx' \quad (16.31)$$

For the detailed form of the QED ISR structure function cf. Chap. 10.

### 16.6.2 Implementation

In the concrete implementation, the zeroth order mapping (16.30) is implemented, and the Jacobian is equal to  $f_i(x)/f_0(x)$ . This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (16.32)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1-x^2}{2(1-x')} \quad (16.33)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 - \frac{1-x^2}{2(1-x')} \\ - \frac{(1+3x^2)\ln x + (1-x)(4(1+x)\ln(1-x) + 5+x)}{8(1-x')}\epsilon \end{aligned} \quad (16.34)$$

For  $x = 1$  (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (16.35)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (16.36)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \quad (16.37)$$

The last line in (16.34) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (16.38)$$

(Mathematica result), independent of  $\epsilon$ . For  $x$  values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

### 16.6.3 The ISR data block

```

<SF isr: public>≡

```

#### 16.6.4 The ISR object

The `isr_t` data type is a  $1 \rightarrow 2$  interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```

<SF isr: public>+≡
  public :: isr_t
<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
  private
  type(isr_data_t), pointer :: data => null ()
  real(default) :: x = 0
  real(default) :: xb= 0
  contains
  <SF isr: isr: TBP>
  end type isr_t

```

Type string: has to be here, but there is no string variable on which ISR depends.  
Hence, a dummy routine.

```

  end subroutine isr_set_order

```

### 16.6.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is  $\bar{x} = 1 - x$ .

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian `f` and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian `f` includes the value of the (zeroth-order) structure function, and strongly peaked.

```

<SF isr: isr: TBP>+≡
  procedure :: complete_kinematics => isr_complete_kinematics

<SF isr: sub interfaces>+≡
  module subroutine isr_complete_kinematics (sf_int, x, xb, f, r, rb, map)
    class(isr_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
  end subroutine isr_complete_kinematics

<SF isr: procedures>+≡
  module subroutine isr_complete_kinematics (sf_int, x, xb, f, r, rb, map)
    class(isr_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default) :: eps
    eps = sf_int%data%eps

```

```

if (map) then
call map_power_1 (sf_int%xb, f, rb(1), eps)
else
sf_int%xb = rb(1)
if (rb(1) > 0) then
f = 1
else
f = 0
end if
end if
sf_int%x = 1 - sf_int%xb
x(1) = sf_int%x
xb(1) = sf_int%xb
if (size (x) == 3) then
x(2:3) = r(2:3)
xb(2:3) = rb(2:3)
end if
call sf_int%split_momentum (x, xb)
select case (sf_int%status)
case (SF_FAILED_KINEMATICS)
sf_int%x = 0
sf_int%xb = 0
f = 0
end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the  $x$  array from the momentum configuration. In the specific case of ISR, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

```

<SF isr: isr: TBP>+≡
  procedure :: recover_x => sf_isr_recover_x

<SF isr: sub interfaces>+≡
  module subroutine sf_isr_recover_x (sf_int, x, xb, x_free)
    class(isr_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
  end subroutine sf_isr_recover_x

<SF isr: procedures>+≡
  module subroutine sf_isr_recover_x (sf_int, x, xb, x_free)
    class(isr_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
    sf_int%xb = xb(1)
  end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

For extracting  $x$ , we rely on the stored  $\bar{x}$  value, since the  $x$  value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

<SF isr: isr: TBP>+≡
  procedure :: inverse_kinematics => isr_inverse_kinematics

### 16.6.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

<SF isr: isr: TBP>+≡

### 16.7.1 Physics

The EPA structure function for a photon inside an (elementary) particle  $p$  with energy  $E$ , mass  $m$  and charge  $q_p$  (e.g., electron) is given by ( $\bar{x} \equiv 1 - x$ )

There are several variants of the EPA, which are steered by the `\$epa\_mode` switch. The formula (6.17b) from the report by Budnev et al. is given by

$$f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} \left[ \left( \bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} - \left( 1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{\frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left( 1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (16.39)$$

If no explicit  $Q$  bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (16.40)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (16.41)$$

The second and third terms in (16.39) are negative definite (and subleading). Noting that  $\bar{x} + x^2/2$  is bounded between  $1/2$  and  $1$ , we derive that  $f(x)$  is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (16.42)$$

where we allow for explicit  $Q$  bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (16.43)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4[x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (16.44)$$

such that  $x(0) = x_0$  and  $x(1) = x_1$  and

$$\frac{dx}{dx'} = \left( \frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (16.45)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (16.46)$$

such that (16.43) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (16.47)$$

where  $x'$  is calculated from  $x$  via (16.44).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x(L - \log x) - \log x_0(L - \log x_0)}{\log x_1(L - \log x_1) - \log x_0(L - \log x_0)} . \quad (16.48)$$

Taking the Eq. (6.16e) from the Budnev et al. report, and integrating it over  $q^2$  yields the modified result

$$f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} \left[ \left( \bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} - x^2 \frac{m^2}{Q_{\min}^2} \left( 1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (16.49)$$

This is closer to many standard papers from LEP times, and to textbook formulae like e.g. in Peskin/Schroeder. For historical reasons, we keep Eq. (16.39) as the default in WHIZARD.

## 16.7.2 The EPA data block

The EPA parameters are:  $\alpha$ ,  $E_{\max}$ ,  $m$ ,  $Q_{\min}$ , and  $x_{\min}$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition  $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1}(L - \ln x_{0/1})$ , the c.m. energy squared and the incoming particle mass.

### 16.7.3 The EPA object

The `epa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

#### 16.7.4 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The  $x$  value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is  $\bar{x} = 1 - x$ .

```

⟨SF epa: epa: TBP⟩+≡
  procedure :: complete_kinematics => epa_complete_kinematics

⟨SF epa: sub interfaces⟩+≡
  module subroutine epa_complete_kinematics (sf_int, x, xb, f, r, rb, map)

end select
end subroutine epa_complete_kinematics

```

Overriding the default method: we compute the  $x$  array from the momentum configuration. In the specific case of EPA, we also set the internally stored  $x$  and  $\bar{x}$  values, so they can be used in the following routine.

Note: the extraction of  $\bar{x}$  is not numerically safe, but it cannot be as long as the base `recover_x` is not.

```

<SF epa: epa: TBP>+≡
  procedure :: recover_x => sf_epa_recover_x

```

### 16.7.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for  $x$ , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

Fix 2020-03-10: Divide by two if there is polarization. In the polarized case, the outgoing electron/positron retains the incoming polarization. The latter is summed over when convoluting with the beam, but there are still two states with different outgoing polarization but identical structure-function value. This leads to double-counting for the overall cross section.

Fix 2022-02-18: The above fix was wrong! The structure function was divided by 4 because there are four entries in the complete electron density matrix. Now it is divided by 2 if there is more than one entry, unchanged otherwise.

### 16.8.1 Physics

The EWA structure function for a  $Z$  or  $W$  inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal ( $\pm$ ) and longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (16.50)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[ \ln \left( \frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (16.51)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (16.52)$$

where  $p_{\perp,\max}$  is the cutoff in transversal momentum,  $M$  is the vector-boson mass,  $v$  and  $a$  are the vector and axial-vector couplings, and  $\bar{x} \equiv 1-x$ . Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (16.53)$$

The vector and axial couplings for a fermion branching into a  $W$  are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (16.54)$$

For  $Z$  emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (16.55)$$

where  $t_3 = \pm\frac{1}{2}$  is the fermion isospin, and  $q$  its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of  $v$  and  $a$  is irrelevant.

The EWA depends on the parameters  $g$ ,  $\sin^2\theta_w$ ,  $M_W$ , and  $M_Z$ . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a  $1/x$  singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial  $x$  bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (16.56)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (16.57)$$

As a user parameter, we have the cutoff  $p_{\perp, \max}$ . The divergence  $1/x$  also requires a  $x_0$  cutoff; and for completeness we introduce a corresponding  $x_1$ . Physically, the minimal sensible value of  $x$  is  $M^2/s$ , although the approximation loses its value already at higher  $x$  values.

## 16.8.2 The EWA data block

The EWA parameters are:  $p_{T, \max}$ ,  $c_V$ ,  $c_A$ , and  $m$ . Instead of  $m$  we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a  $W$  or a  $Z$  is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors  $g/2 = e/2/\sin \theta_W$ .

In principle, for EWA it would make sense to allow the user to also set the upper bound for  $x$ ,  $x_{\max}$ , but we fix it to one here.

### 16.8.3 The EWA object

The `ewa_t` data type is a  $1 \rightarrow 2$  interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision:  $W/Z$  bosons may be radiated from quarks. In that case, the partons are massless and  $q_{\min}$  applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated,  $W/Z$ ), where the  $W/Z$  initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the  $W/Z$  polarization. If we are having  $Z$  bosons, both up- and down-type fermions can participate. Otherwise, with a  $W^+$  an up-type fermion is transferred to a down-type fermion, and the other way round.

```

### 16.8.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the  $x$  value is transformed. Higher orders affect the function value. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, the exponential mapping for the  $1/x$  singularity discussed above is applied.

### 16.8.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for  $x$ , one for  $Q^2$ , and two for the polar and azimuthal angles. Alternatively, we can skip  $p_T$  generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated  $x$  values are identical.

```

<SF ewa: ewa: TBP>+≡

## 16.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum  $f(x)$ , applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (16.58)$$

We want to compute the distribution of  $E = \sqrt{\hat{s}} = \sqrt{xs}$ , i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (16.59)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (16.60)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (16.61)$$

We implement this as a spectrum with a single parameter  $x$ . The parameters for the individual beams are computed as  $x_i = \sqrt{x}$ , so they are equal and the kinematics is always symmetric.

### 16.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and  $\sqrt{s}$  if it should be normalized to the total energy. In the latter case, the differential distribution  $d\sigma/d\sqrt{\hat{s}}$  coincides with the partonic cross section  $\hat{\sigma}$  as a function of  $\sqrt{\hat{s}}$ .

## 16.10 Gaussian beam spread

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `gaussian_t` objects act as proxies to this registry.

```

<sf_gaussian.f90>≡

## 16.11 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of  $x$  values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `beam_events_t` objects act as proxies to this registry.

```
(sf_beam_events.f90)≡
  <File header>

  module sf_beam_events

    <Use kinds>
    <Use strings>
    use file_registries
    use pdg_arrays
    use model_data
    use flavors
    use quantum_numbers
    use state_matrices
    use polarizations
    use sf_base

    <Standard module head>

    <SF beam events: public>

    <SF beam events: types>

    <SF beam events: variables>

    interface
      <SF beam events: sub interfaces>
    end interface

    contains

    <SF beam events: main procedures>

  end module sf_beam_events

(sf_beam_events_sub.f90)≡
  <File header>

  submodule (sf_beam_events) sf_beam_events_s
```

```

### 16.12.1 Physics

Beamstrahlung is applied before ISR. The **CIRCE1** implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the **CIRCE1** parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1-x)^\gamma \quad (16.62)$$

for  $x < 1 - \epsilon$  (resp.  $x > \epsilon$  in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at  $x = 1$  (resp.  $x = 0$ ). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the **kirke** version of the **CIRCE1** subroutines, and is used here.

The parameter **circe1\\_eps** sets the peak mapping of the **CIRCE1** structure function. Its default value is  $10^{-5}$ . The other parameters are the parameterization version and revision number, the accelerator type, and the  $\sqrt{s}$  value used by **CIRCE1**. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter **circe1\\_epsilon** which is taken from the **CIRCE1** internal data structure.

The  $\sqrt{s}$  value, if not explicitly set, is taken from the process data. Note that interpolating  $\sqrt{s}$  is not recommended; one should rather choose one of the distinct values known to **CIRCE1**.

### 16.12.2 The CIRCE1 data block

The **CIRCE1** parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter  $\epsilon$ ,  $\sqrt{s}$  and several steering parameters: **ver**, **rev**, **acc**, **chat**.

In generator mode, the  $x$  values are actually discarded and a random number generator is used instead.

### 16.12.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must

extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe1: types>+≡
  type, extends (circe1_rng_t) :: rng_obj_t
  class(rng_t), allocatable :: rng
  contains
  procedure :: generate => rng_obj_generate
  end type rng_obj_t

<SF circe1: sub interfaces>+≡
  module subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
  end subroutine rng_obj_generate

<SF circe1: procedures>+≡
  module subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

#### 16.12.4 The CIRCE1 object

This is a  $2 \rightarrow 4$  interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

In the case that no radiated particle is kept (which actually is the default), polarization is always transferred to the electrons, too. If there is a recoil photon in the event, the radiated particles are 3 and 4, respectively, and 5 and 6 are the outgoing ones (triggering the hard scattering process), while in the case of no radiation, the outgoing particles are 3 and 4, respectively. In the case of the electron being the radiated particle, helicity is not kept.

```

<SF circe1: public>+≡
  public :: circe1_t

### 16.13.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

### 16.13.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

### 16.13.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```
<SF circe2: types>+≡
  type, extends (circe2_rng_t) :: rng_obj_t
  class(rng_t), allocatable :: rng
  contains
  procedure :: generate => rng_obj_generate
  end type rng_obj_t

<SF circe2: sub interfaces>+≡
  module subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
  end subroutine rng_obj_generate

<SF circe2: procedures>+≡
  module subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate
```

### 16.13.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a  $2 \rightarrow 2$  interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

#### 16.15.4 The PDF object

The PDF  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

### 16.15.5 Kinematics

Set kinematics. If `map` is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

⟨SF pdf builtin: pdf builtin: TBP⟩+≡

### 16.15.6 Structure function

Once the scale is also known, we can actually call the PDF and set the values. Contrary to LHAPDF, the wrapper already takes care of adjusting to the  $x$  and  $Q$  bounds. Account for the Jacobian.

The parameter `negative_sf` is necessary to determine if we allow for negative PDF values. The class `rescale` gives rescaling prescription for NLO convolution of the structure function in combination with `i_sub`.

```

character(*), parameter :: LHAPDF6_DEFAULT_PROTON = "CT10"

```

### 16.16.3 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

```

<SF lhpdf: interfaces>≡
interface
subroutine InitPDFsetM (set, file)
integer, intent(in) :: set
character(*), intent(in) :: file
end subroutine InitPDFsetM
end interface

<SF lhpdf: interfaces>+≡
interface
subroutine InitPDFM (set, mem)
integer, intent(in) :: set, mem
end subroutine InitPDFM
end interface

<SF lhpdf: interfaces>+≡
interface
subroutine numberPDFM (set, n_members)
integer, intent(in) :: set
integer, intent(out) :: n_members

```

```

end subroutine numberPDFM
end interface

```

```

⟨SF lhpdf: interfaces⟩+≡
interface
subroutine evolvePDFM (set, x, q, ff)
integer, intent(in) :: set
double precision, intent(in) :: x, q
double precision, dimension(-6:6), intent(out) :: ff
end subroutine evolvePDFM
end interface

```

```

⟨SF lhpdf: interfaces⟩+≡
interface
subroutine evolvePDFphotonM (set, x, q, ff, fphot)
integer, intent(in) :: set
double precision, intent(in) :: x, q
double precision, dimension(-6:6), intent(out) :: ff
double precision, intent(out) :: fphot
end subroutine evolvePDFphotonM
end interface

```

```

⟨SF lhpdf: interfaces⟩+≡
interface
subroutine evolvePDFpM (set, x, q, s, scheme, ff)
integer, intent(in) :: set
double precision, intent(in) :: x, q, s
integer, intent(in) :: scheme
double precision, dimension(-6:6), intent(out) :: ff
end subroutine evolvePDFpM
end interface

```

```

⟨SF lhpdf: interfaces⟩+≡
interface

integer, intent(in) :: set, mem
double precision, intent(out) :: q2max
end subroutine GetQ2maxM
end interface

```

```

<SF lhpdf: interfaces>+=
interface
function has_photon () result(flag)
logical :: flag
end function has_photon
end interface

```

#### 16.16.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global object. We implement it as a private module variable. To access it from elsewhere, the caller has to create and initialize an object of type `lhpdf_status_t`, which acts as a proxy.

```

<SF lhpdf: types>=
type :: lhpdf_global_status_t
private
logical, dimension(3) :: initialized = .false.
end type lhpdf_global_status_t

```

```

<SF lhpdf: variables>=
type(lhpdf_global_status_t), save :: lhpdf_global_status

```

```

<SF lhpdf: procedures>=
function lhpdf_global_status_is_initialized (set) result (flag)
logical :: flag
integer, intent(in), optional :: set
if (present (set)) then
select case (set)
case (1:3); flag = lhpdf_global_status%initialized(set)
case default; flag = .false.
end select
else
flag = any (lhpdf_global_status%initialized)
end if
end function lhpdf_global_status_is_initialized

```

```

<SF lhpdf: procedures>+≡
  subroutine lhpdf_global_status_set_initialized (set)
    integer, intent(in) :: set
    lhpdf_global_status%initialized(set) = .true.
  end subroutine lhpdf_global_status_set_initialized

```

This is the only public procedure, it tells the system to forget about previous initialization, allowing for changing the chosen PDF set. Note that such a feature works only if the global program flow is serial, so no two distinct sets are accessed simultaneously. But this applies to LHAPDF anyway.

```

<SF lhpdf: public>≡
  public :: lhpdf_global_reset
<SF lhpdf: sub interfaces>≡
  module subroutine lhpdf_global_reset ()
  end subroutine lhpdf_global_reset
<SF lhpdf: procedures>+≡
  module subroutine lhpdf_global_reset ()
    lhpdf_global_status%initialized = .false.
  end subroutine lhpdf_global_reset

```

### 16.16.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an  $\alpha_s$  formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf_builtin` is that there things are outsourced to a separate module (inc. `lhpdf_status` etc.).

```

<SF lhpdf: public>+≡
  public :: lhpdf_initialize
<SF lhpdf: sub interfaces>+≡
  module subroutine lhpdf_initialize &
    (set, prefix, file, member, pdf, b_match)
    integer, intent(in) :: set
    type(string_t), intent(inout) :: prefix
    type(string_t), intent(inout) :: file
    type(lhpdf_pdf_t), intent(inout), optional :: pdf
    integer, intent(inout) :: member
    logical, intent(in), optional :: b_match

```

```

end subroutine lhpdf_initialize

exist = member >= 0 .and. member <= n_members
end function dataset_member_exists
end subroutine lhpdf_initialize

```

### 16.16.6 Kinematics

Set kinematics. If map is unset, the  $r$  and  $x$  values coincide, and the Jacobian  $f(r)$  is trivial.

If map is set, we are asked to provide an efficient mapping. For the test case, we set  $x = r^2$  and consequently  $f(r) = 2r$ .

```

⟨SF lhpdf: lhpdf: TBP⟩≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

⟨SF lhpdf: sub interfaces⟩+≡
  module subroutine lhpdf_complete_kinematics &
    (sf_int, x, xb, f, r, rb, map)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
  end subroutine lhpdf_complete_kinematics

⟨SF lhpdf: procedures⟩+≡
  module subroutine lhpdf_complete_kinematics &
    (sf_int, x, xb, f, r, rb, map)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb

```

```

real(default), intent(out) :: f
real(default), dimension(:), intent(in) :: r
real(default), dimension(:), intent(in) :: rb
logical, intent(in) :: map
if (map) then
call msg_fatal ("LHAPDF: map flag not supported")
else
x(1) = r(1)
xb(1)= rb(1)
f = 1
end if
call sf_int%split_momentum (x, xb)
select case (sf_int%status)
case (SF_DONE_KINEMATICS)
sf_int%x = x(1)
case (SF_FAILED_KINEMATICS)
sf_int%x = 0
f = 0
end select
end subroutine lhpdf_complete_kinematics

```

Overriding the default method: we compute the  $x$  value from the momentum configuration. In this specific case, we also set the internally stored  $x$  value, so it can be used in the following routine.

```

<SF lhpdf: lhpdf: TBP>+≡
  procedure :: recover_x => lhpdf_recover_x

<SF lhpdf: sub interfaces>+≡
  module subroutine lhpdf_recover_x (sf_int, x, xb, x_free)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
  end subroutine lhpdf_recover_x

<SF lhpdf: procedures>+≡
  module subroutine lhpdf_recover_x (sf_int, x, xb, x_free)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, xb, x_free)
    sf_int%x = x(1)
  end subroutine lhpdf_recover_x

```

Compute inverse kinematics. Here, we start with the  $x$  array and compute the “input”  $r$  values and the Jacobian  $f$ . After this, we can set momenta by the same formula as for normal kinematics.

```

<SF lhpdf: lhpdf: TBP>+≡
  procedure :: inverse_kinematics => lhpdf_inverse_kinematics

<SF lhpdf: sub interfaces>+≡
  module subroutine lhpdf_inverse_kinematics &
    (sf_int, x, xb, f, r, rb, map, set_momenta)

```

```

class(lhapdf_t), intent(inout) :: sf_int
real(default), dimension(:), intent(in) :: x
real(default), dimension(:), intent(in) :: xb
real(default), intent(out) :: f
real(default), dimension(:), intent(out) :: r
real(default), dimension(:), intent(out) :: rb
logical, intent(in) :: map
logical, intent(in), optional :: set_momenta
end subroutine lhpdf_inverse_kinematics

<SF lhpdf: procedures>+≡
module subroutine lhpdf_inverse_kinematics &
(sf_int, x, xb, f, r, rb, map, set_momenta)
class(lhapdf_t), intent(inout) :: sf_int
real(default), dimension(:), intent(in) :: x
real(default), dimension(:), intent(in) :: xb
real(default), intent(out) :: f
real(default), dimension(:), intent(out) :: r
real(default), dimension(:), intent(out) :: rb
logical, intent(in) :: map
logical, intent(in), optional :: set_momenta
logical :: set_mom
set_mom = .false.; if (present (set_momenta)) set_mom = set_momenta
if (map) then
call msg_fatal ("LHAPDF: map flag not supported")
else
r(1) = x(1)
rb(1)= xb(1)
f = 1
end if
if (set_mom) then
call sf_int%split_momentum (x, xb)
select case (sf_int%status)
case (SF_FAILED_KINEMATICS); f = 0
end select
end if
end subroutine lhpdf_inverse_kinematics

```

### 16.16.7 The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

```

<SF lhpdf: public>+≡

```

Generate PDF data. This is provided as a function, but it has the side-effect of initializing the requested PDF set. A finalizer is not needed.

The library uses double precision, so since the default precision may be extended or quadruple, we use auxiliary variables for type casting.

```

### 16.16.8 The LHAPDF object

The `lhpdf_t` data type is a  $1 \rightarrow 2$  interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the  $x$  momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a  $1 \rightarrow 2$  splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

### 16.16.9 Structure function

We have to cast the LHAPDF arguments to/from double precision (possibly from/to extended/quadruple precision), if necessary. Some structure functions can yield negative results (sea quarks close to  $x = 1$ ). In an NLO computation,

this is perfectly fine and we keep negative values. Unlike total cross sections, PDFs do not have to be positive definite. For LO however, negative PDFs would cause negative event weights so we set these values to zero instead.

```

## 16.17 Easy PDF Access

For the shower, subtraction and matching, it is very useful to have direct access to  $f(x, Q)$  independently of the used library.

`<pdf.f90>`≡  
*<File header>*

module pdf

*<Use kinds with double>*

```

use beam_structures
use lhpdf !NODEP!
use pdf_builtin !NODEP!

<Standard module head>

<PDF: public>

<PDF: parameters>

<PDF: types>

interface
<PDF: sub interfaces>
end interface

end module pdf

<pdf_sub.f90>≡
<File header>

submodule (pdf) pdf_s

use io_units
use system_dependencies, only: LHAPDF5_AVAILABLE, LHAPDF6_AVAILABLE
use diagnostics

implicit none

contains

<PDF: procedures>

end submodule pdf_s

```

We support the following implementations:

```

<PDF: parameters>≡
integer, parameter, public :: STRF_NONE = 0
integer, parameter, public :: STRF_LHAPDF6 = 1
integer, parameter, public :: STRF_LHAPDF5 = 2
integer, parameter, public :: STRF_PDF_BUILTIN = 3

```

A container to bundle all necessary PDF data. Could be moved to a more central location.

```

<PDF: public>≡
public :: pdf_data_t

contains

<Dispatch beams: procedures>

end submodule dispatch_beams_s

```

This data type is a container for transferring structure-function specific data from the `dispatch_sf_data` to the `dispatch_sf_channels` subroutine.

```

<Dispatch beams: public>≡
  public :: sf_prop_t

<Dispatch beams: types>≡
  type :: sf_prop_t
  real(default), dimension(2) :: isr_eps = 1
  end type sf_prop_t

```

Allocate a structure-function configuration object according to the `sf_method` string.

The `sf_prop` object can be used to transfer structure-function specific data up and to the `dispatch_sf_channels` subroutine below, so they can be used for particular mappings.

The `var_list_global` object is used for the RNG generator seed. It is intent(inout) because the RNG generator seed may change during initialization.

The `pdg_in` array is the array of incoming flavors, corresponding to the upstream structure function or the beam array. This will be checked for the structure function in question and replaced by the outgoing flavors. The `pdg_prc` array is the array of incoming flavors (beam index, component index) for the hard process. Due to a bug in gfortran 7/8/9 this has to remain in the main module.

```

end select
end function strfun_mode

```

Dispatch a whole structure-function chain, given beam data and beam structure data.

This could be done generically, but we should look at the specific combination of structure functions in order to select appropriate mappings.

The `beam_structure` argument gets copied because we want to expand it to canonical form (one valid structure-function entry per record) before proceeding further.

The `pdg_prc` argument is the array of incoming flavors. The first index is the beam index, the second one the process component index. Each element is itself a PDG array, nontrivial if there is a flavor sum for the incoming state of this component.

The dispatcher is divided in two parts. The first part configures the structure function data themselves. After this, we can configure the phase space for the elementary process.

```

### 16.18.1 QCD and QED coupling

Allocate the `alpha` (running coupling) component of the `qcd` block with a concrete implementation, depending on the variable settings in the `global` record.

If a fixed  $\alpha_s$  is requested, we do not allocate the `qcd%alpha` object. In this case, the matrix element code will just take the model parameter as-is, which implies fixed  $\alpha_s$ . If the object is allocated, the  $\alpha_s$  value is computed and updated for each matrix-element call.

Also fetch the `alphas_nf` variable from the list and store it in the QCD record. This is not used in the  $\alpha_s$  calculation, but the QCD record thus becomes a messenger for this user parameter. Gfortran 7/8/9 bug: has to be part of main module.

## Chapter 17

# Interface for Matrix Element Objects

These modules manage internal and, in particular, external matrix-element code.

**prc\_core** We define the abstract **prc\_core\_t** type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes. This abstract type supplements the **prc\_core\_def\_t** type and related types in another module. Together, they provide a complete set of matrix-element handlers that are implemented in the concrete types below.

These are the implementations:

**prc\_template\_me** Implements matrix-element code without actual content (trivial value), but full-fledged interface. This can be used for injecting user-defined matrix-element code.

**prc\_omega** Matrix elements calculated by **O'MEGA** are the default for WHIZARD. Here, we provide all necessary support.

**prc\_external** Matrix elements provided or using external (not **O'MEGA**) code or libraries. This is an abstract type, with concrete extensions below:

**prc\_external\_test** Concrete implementation of the external-code type, actually using some pre-defined test matrix elements.

**prc\_gosam** Interface for matrix elements computed using **GoSam**.

**prc\_openloops** Interface for matrix elements computed using **OpenLoops**.

**prc\_recola** Interface for matrix elements computed using **Recola**.

**prc\_threshold** Interface for matrix elements for the top-pair threshold, that use external libraries.

Figure 17.1: Module dependencies in `src/me_methods`.

## 17.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the `O’MEGA` matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

**`prc_core_def_t`** process and matrix-element configuration

**`prc_writer_t`** (optional) writing external matrix-element code

**`prc_driver_t`** accessing the matrix element (internal or external)

**`prc_core_t`** evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the `processes` module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the `processes` module.

### 17.1.1 The process core

The process core is of abstract data type. Different types of matrix elements will be represented by different implementations.

```

<Prc core: public>≡
  public :: prc_core_t

<Prc core: types>≡
  type, abstract :: prc_core_t
  class(prc_core_def_t), pointer :: def => null ()
  logical :: data_known = .false.
  type(process_constants_t) :: data
  class(prc_core_driver_t), allocatable :: driver

```

```

logical :: use_color_factors = .false.
integer :: nc = 3
contains
  <Prc core: process core: TBP>
end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
  import
    class(prc_core_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine prc_core_write
end interface

```

Just type the name of the actual core method.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_write_name), deferred :: write_name

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_write_name (object, unit)
  import
    class(prc_core_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine prc_core_write_name
end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: sub interfaces>≡
  module subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
  end subroutine prc_core_init

```

```

<Prc core: procedures>≡
  module subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

<Prc core: sub interfaces>+≡
  module function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object
    logical :: flag
  end function prc_core_has_matrix_element

<Prc core: procedures>+≡
  module function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object
    logical :: flag
    flag = object%data%n_flv /= 0
  end function prc_core_has_matrix_element

```

Return true if this process-core type needs extra code that has to be compiled and/or linked, beyond the default O'MEGA framework. This depends only on the concrete type, and the default is no.

```

<Prc core: process core: TBP>+≡
  procedure, nopass :: needs_external_code => prc_core_needs_external_code

<Prc core: sub interfaces>+≡
  module function prc_core_needs_external_code () result (flag)
    logical :: flag
  end function prc_core_needs_external_code

<Prc core: procedures>+≡
  module function prc_core_needs_external_code () result (flag)
    logical :: flag
    flag = .false.
  end function prc_core_needs_external_code

```

The corresponding procedure to create and load extra libraries. The base procedure must not be called but has to be overridden, if extra code is required.

```

<Prc core: process core: TBP>+≡
  procedure :: prepare_external_code => &
    prc_core_prepare_external_code

```

```

<Prc core: sub interfaces>+≡

    class(prc_core_t), intent(inout) :: core
    integer, intent(in), dimension(:, :), allocatable :: flv_states
    type(var_list_t), intent(in) :: var_list
    type(os_data_t), intent(in) :: os_data
    type(string_t), intent(in) :: libname
    type(model_data_t), intent(in), target :: model
    integer, intent(in) :: i_core
    logical, intent(in) :: is_nlo
    call core%write ()
    call msg_bug ("prc_core_prepare_external_code called &
    &but not overridden")
  end subroutine prc_core_prepare_external_code

```

Return true if this process-core type uses the BLHA interface. This depends only on the concrete type, and the default is no.

```

<Prc core: process core: TBP>+≡
  procedure, nopass :: uses_blha => prc_core_uses_blha

<Prc core: sub interfaces>+≡
  module function prc_core_uses_blha () result (flag)
    logical :: flag
  end function prc_core_uses_blha

<Prc core: procedures>+≡
  module function prc_core_uses_blha () result (flag)
    logical :: flag
    flag = .false.
  end function prc_core_uses_blha

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_is_allowed), deferred :: is_allowed

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
    import
    class(prc_core_t), intent(in) :: object

```

```

integer, intent(in) :: i_term, f, h, c
logical :: flag
end function prc_core_is_allowed
end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: sub interfaces>+≡
  module subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
  end subroutine prc_core_get_constants

<Prc core: procedures>+≡
  module subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that  $\alpha_s$  is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the process-specific workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: sub interfaces>+≡
  module function prc_core_get_alpha_s (object, core_state) result (alpha_qcd)
    class(prc_core_t), intent(in) :: object
    class(prc_core_state_t), intent(in), allocatable :: core_state
    real(default) :: alpha_qcd
  end function prc_core_get_alpha_s

<Prc core: procedures>+≡
  module function prc_core_get_alpha_s (object, core_state) result (alpha_qcd)
    class(prc_core_t), intent(in) :: object
    class(prc_core_state_t), intent(in), allocatable :: core_state
    real(default) :: alpha_qcd
    alpha_qcd = -1
  end function prc_core_get_alpha_s

```

We follow the same strategy for the electromagnetic coupling  $\alpha_{em}$ .

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_qed => prc_core_get_alpha_qed

```

```

<Prc core: sub interfaces>+≡
module function prc_core_get_alpha_qed &
(object, core_state) result (alpha_qed)
class(prc_core_t), intent(in) :: object
class(prc_core_state_t), intent(in), allocatable :: core_state
real(default) :: alpha_qed
end function prc_core_get_alpha_qed

```

```

<Prc core: procedures>+≡
module function prc_core_get_alpha_qed &
(object, core_state) result (alpha_qed)
class(prc_core_t), intent(in) :: object
class(prc_core_state_t), intent(in), allocatable :: core_state
real(default) :: alpha_qed
alpha_qed = -1
end function prc_core_get_alpha_qed

```

Setup an index mapping for flavor structures and helicities that give the same matrix element. The index mapping is according to the order of flavor structures known to the `prc_core` class. This procedure here acts as a fallback in case there is no overridden procedure in the `prc_core` extension.

```

<Prc core: process core: TBP>+≡
procedure :: set_equivalent_flv_hel_indices => &
prc_core_set_equivalent_flv_hel_indices

```

  type(interaction_t), intent(inout) :: int_eff
  class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine prc_core_compute_eff_kinematics
end interface

```

The process core must implement this function. Here, *j* is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `core_state` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

<Prc core: interfaces>+≡
  abstract interface
  function prc_core_compute_amplitude &
    (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, &
    core_state) result (amp)
  import
  complex(default) :: amp
  class(prc_core_t), intent(in) :: object
  integer, intent(in) :: j
  type(vector4_t), dimension(:), intent(in) :: p
  integer, intent(in) :: f, h, c
  real(default), intent(in) :: fac_scale, ren_scale

```

```

real(default), intent(in), allocatable :: alpha_qcd_forced
class(prc_core_state_t), intent(inout), allocatable, optional :: &
core_state
end function prc_core_compute_amplitude
end interface

```

### 17.1.2 Storage for intermediate results

The abstract `prc_core_state_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```

<Prc core: public>+≡
  public :: prc_core_state_t

<Prc core: types>+≡
  type, abstract :: prc_core_state_t
  contains
  procedure(workspace_write), deferred :: write
  procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
end type prc_core_state_t

```

For debugging, we should at least have an output routine.

```

<Prc core: interfaces>+≡
  abstract interface
  subroutine workspace_write (object, unit)
  import
  class(prc_core_state_t), intent(in) :: object
  integer, intent(in), optional :: unit
  end subroutine workspace_write
end interface

```

This is used during the NLO calculation, see there for more information.

```

<Prc core: interfaces>+≡
  abstract interface
  subroutine workspace_reset_new_kinematics (object)
  import
  class(prc_core_state_t), intent(inout) :: object
  end subroutine workspace_reset_new_kinematics
end interface

```

### 17.1.3 Helicity selection data

This is intended for use with `O'MEGA`, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is  $10^{10}$ ) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

```

<Prc core: public>+≡
  public :: helicity_selection_t

<Prc core: types>+≡
  type :: helicity_selection_t
  logical :: active = .false.
  real(default) :: threshold = 0
  integer :: cutoff = 0
  contains
  <Prc core: helicity selection: TBP>
  end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>≡
  procedure :: write => helicity_selection_write

<Prc core: sub interfaces>+≡
  module subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine helicity_selection_write

<Prc core: procedures>+≡
  module subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%active) then
      write (u, "(3x,A)") "Helicity selection data:"
      write (u, "(5x,A,ES17.10)") &
        "threshold =", object%threshold
      write (u, "(5x,A,I0)") &
        "cutoff    = ", object%cutoff
    end if
  end subroutine helicity_selection_write

```

## 17.2 Test process type

For the following tests, we define a simple implementation of the abstract `prc_core_t`, designed such as to complement the `prc_test_t` process definition type.

Note that it is not given that the actual process is defined as `prc_test_t` type. We enforce this by calling `prc_test_create_library`. The driver component in the process core will then become of type `prc_test_t`.

```

<prc_test_core.f90>≡
  <File header>

```

```

module prc_test_core

  <Use kinds>
  use lorentz
  use interactions
  use prc_test
  use prc_core

  <Standard module head>

  <Prc test core: public>

  <Prc test core: types>

  interface
    <Prc test core: sub interfaces>
  end interface

  end module prc_test_core

  <prc_test_core_sub.f90>≡
  <File header>

  submodule (prc_test_core) prc_test_core_s

  use io_units

  implicit none

  contains

  <Prc test core: procedures>

  end submodule prc_test_core_s

  <Prc test core: public>≡
  public :: test_t

  <Prc test core: types>≡
  type, extends (prc_core_t) :: test_t
  contains
    <Prc test core: test type: TBP>
  end type test_t

  <Prc test core: test type: TBP>≡
  procedure :: write => test_write

  <Prc test core: sub interfaces>≡
  module subroutine test_write (object, unit)
    class(test_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine test_write

```

```

<Prc test core: procedures>+=
  module subroutine test_write (object, unit)
    class(test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "test type implementing prc_test"
  end subroutine test_write

```

```

<Prc test core: test type: TBP>+=
  procedure :: write_name => test_write_name

```

```

<Prc test core: sub interfaces>+=
  module subroutine test_write_name (object, unit)
    class(test_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine test_write_name

```

```

<Prc test core: procedures>+=
  module subroutine test_write_name (object, unit)
    class(test_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "Core: prc_test"
  end subroutine test_write_name

```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

```

<Prc test core: test type: TBP>+=
  procedure :: needs_mcset => test_needs_mcset
  procedure :: get_n_terms => test_get_n_terms
  procedure :: is_allowed => test_is_allowed

```

```

<Prc test core: sub interfaces>+=
  module function test_needs_mcset (object) result (flag)
    class(test_t), intent(in) :: object
    logical :: flag
  end function test_needs_mcset

    integer, intent(in) :: i_term, f, h, c
    logical :: flag
  end function test_is_allowed

```

```

<Prc test core: procedures>+=
  module function test_needs_mcset (object) result (flag)
    class(test_t), intent(in) :: object
    logical :: flag
    flag = .true.
  end function test_needs_mcset

```

```

module function test_get_n_terms (object) result (n)
class(test_t), intent(in) :: object
integer :: n
n = 1
end function test_get_n_terms

module function test_is_allowed (object, i_term, f, h, c) result (flag)
class(test_t), intent(in) :: object
integer, intent(in) :: i_term, f, h, c
logical :: flag
flag = .true.
end function test_is_allowed

```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

```

<Prc test core: test type: TBP>+≡
  procedure :: compute_hard_kinematics => test_compute_hard_kinematics

<Prc test core: sub interfaces>+≡
  module subroutine test_compute_hard_kinematics &
    (object, p_seed, i_term, int_hard, core_state)
    class(test_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(prc_core_state_t), intent(inout), allocatable :: core_state
  end subroutine test_compute_hard_kinematics

<Prc test core: procedures>+≡
  module subroutine test_compute_hard_kinematics &
    (object, p_seed, i_term, int_hard, core_state)
    class(test_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(prc_core_state_t), intent(inout), allocatable :: core_state
    call int_hard%set_momenta (p_seed)
  end subroutine test_compute_hard_kinematics

```

This procedure is not called for `test_t`, just a placeholder.

```

<Prc test core: test type: TBP>+≡
  procedure :: compute_eff_kinematics => test_compute_eff_kinematics

<Prc test core: sub interfaces>+≡
  module subroutine test_compute_eff_kinematics &

allocate (parray (0:3,n_tot))
forall (i = 1:n_tot) parray(:,i) = vector4_get_components (p(i))
amp = driver%get_amplitude (parray)
end select
end function test_compute_amplitude

```

## 17.3 Template matrix elements

Here, we provide template matrix elements that are in structure very similar to O'MEGA matrix elements, but do not need its infrastructure. Per default, the matrix elements are flat, i.e. they have the constant value one. Analogous to the O'MEGA implementation, this section implements the interface to the templates (via the makefile) and the driver.

```

<prc_template_me.f90>≡
<File header>

module prc_template_me

use, intrinsic :: iso_c_binding !NODEP!

use kinds
<Use strings>
use os_interface
use lorentz
use interactions

```

```

use model_data

use particle_specifiers, only: new_prt_spec
use process_constants
use prclib_interfaces
use prc_core_def
use process_libraries
use prc_core

<Standard module head>

<Template matrix elements: public>

<Template matrix elements: types>

<Template matrix elements: interfaces>

interface
<Template matrix elements: sub interfaces>
end interface

contains

<Template matrix elements: main procedures>

end module prc_template_me
<prc_template_me_sub.f90>≡
<File header>

submodule (prc_template_me) prc_template_me_s

use io_units
use system_defs, only: TAB
use diagnostics
use flavors

implicit none

contains

<Template matrix elements: procedures>

end submodule prc_template_me_s

```

### 17.3.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

<Template matrix elements: public>≡
public :: template_me_def_t

```

```

<Template matrix elements: types>≡
  type, extends (prc_core_def_t) :: template_me_def_t
  contains
  <Template matrix elements: template ME def: TBP>
  end type template_me_def_t

<Template matrix elements: template ME def: TBP>≡
  procedure, nopass :: type_string => template_me_def_type_string

<Template matrix elements: sub interfaces>≡
  module function template_me_def_type_string () result (string)
    type(string_t) :: string
  end function template_me_def_type_string

<Template matrix elements: procedures>≡
  module function template_me_def_type_string () result (string)
    type(string_t) :: string
    string = "template"
  end function template_me_def_type_string

```

Initialization: allocate the writer for the template matrix element. Also set any data for this process that the writer needs. Gfortran 7/8/9 bug, has to remain in the main module.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: init => template_me_def_init

<Template matrix elements: main procedures>≡
  subroutine template_me_def_init &
    (object, model, prt_in, prt_out, unity)
    class(template_me_def_t), intent(out) :: object
    class(model_data_t), intent(in), target :: model
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in) :: unity
    allocate (template_me_writer_t :: object%writer)
    select type (writer => object%writer)
    type is (template_me_writer_t)
    call writer%init (model, prt_in, prt_out, unity)
    end select
  end subroutine template_me_def_init

```

Write/read process- and method-specific data.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: write => template_me_def_write

<Template matrix elements: sub interfaces>+≡
  module subroutine template_me_def_write (object, unit)
    class(template_me_def_t), intent(in) :: object
    integer, intent(in) :: unit
  end subroutine template_me_def_write

<Template matrix elements: procedures>+≡
  module subroutine template_me_def_write (object, unit)
    class(template_me_def_t), intent(in) :: object
    integer, intent(in) :: unit

```

```

select type (writer => object%writer)
type is (template_me_writer_t)
call writer%write (unit)
end select
end subroutine template_me_def_write

```

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: read => template_me_def_read

<Template matrix elements: sub interfaces>+≡
  module subroutine template_me_def_read (object, unit)
    class(template_me_def_t), intent(out) :: object
    integer, intent(in) :: unit
  end subroutine template_me_def_read

<Template matrix elements: procedures>+≡
  module subroutine template_me_def_read (object, unit)
    class(template_me_def_t), intent(out) :: object
    integer, intent(in) :: unit
    call msg_bug &
      ("WHIZARD template process definition: input not supported (yet)")
  end subroutine template_me_def_read

```

Allocate the driver for template matrix elements. Gfortran 7/8/9 bug, has to remain in the main module.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure :: allocate_driver => template_me_def_allocate_driver

<Template matrix elements: main procedures>+≡
  subroutine template_me_def_allocate_driver (object, driver, basename)
    class(template_me_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (template_me_driver_t :: driver)
  end subroutine template_me_def_allocate_driver

```

We need code:

```

<Template matrix elements: template ME def: TBP>+≡
  procedure, nopass :: needs_code => template_me_def_needs_code

<Template matrix elements: sub interfaces>+≡
  module function template_me_def_needs_code () result (flag)
    logical :: flag
  end function template_me_def_needs_code

<Template matrix elements: procedures>+≡
  module function template_me_def_needs_code () result (flag)
    logical :: flag
    flag = .true.
  end function template_me_def_needs_code

```

These are the features that a template matrix element provides.

```

<Template matrix elements: template ME def: TBP>+≡
  procedure, nopass :: get_features => template_me_def_get_features

```

```

<Template matrix elements: sub interfaces>+≡
module subroutine template_me_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
end subroutine template_me_def_get_features

<Template matrix elements: procedures>+≡
module subroutine template_me_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (5))
  features = [ &
    var_str ("init"), &
    var_str ("update_alpha_s"), &
    var_str ("is_allowed"), &
    var_str ("new_event"), &
    var_str ("get_amplitude")]
end subroutine template_me_def_get_features

```

The interface of the specific features.

```

<Template matrix elements: interfaces>≡
abstract interface
  subroutine init_t (par, scheme) bind(C)
  import
  real(c_default_float), dimension(*), intent(in) :: par
  integer(c_int), intent(in) :: scheme
end subroutine init_t
end interface

abstract interface

      call c_f_procpointer (fptra, proc_driver%is_allowed)
      fid = 4
      call lib_driver%get_fptra (pid, fid, fptra)
      call c_f_procpointer (fptra, proc_driver%new_event)
      fid = 5
      call lib_driver%get_fptra (pid, fid, fptra)
      call c_f_procpointer (fptra, proc_driver%get_amplitude)
    end select
  end subroutine template_me_def_connect

```

### 17.3.2 The Template Matrix element writer

Unlike O'MEGA, the template matrix element is directly written by the main WHIZARD program, so there will be no entry in the makefile for calling an external program. The template matrix element writer is responsible for writing interfaces and wrappers.

```

<Template matrix elements: types>+≡
  type, extends (prc_writer_f_module_t) :: template_me_writer_t
  class(model_data_t), pointer :: model => null ()

```

```

type(string_t) :: model_name
logical :: unity
type(string_t), dimension(:), allocatable :: prt_in
type(string_t), dimension(:), allocatable :: prt_out
integer :: n_in
integer :: n_out
integer :: n_tot
contains
  <Template matrix elements: template ME writer: TBP>
end type template_me_writer_t

```

The reported type is the same as for the `template_me_def_t` type.

```

<Template matrix elements: template ME writer: TBP>≡
  procedure, nopass :: type_name => template_me_writer_type_name
<Template matrix elements: sub interfaces>+≡
  module function template_me_writer_type_name () result (string)
    type(string_t) :: string
  end function template_me_writer_type_name
<Template matrix elements: procedures>+≡
  module function template_me_writer_type_name () result (string)
    type(string_t) :: string
    string = "template"
  end function template_me_writer_type_name

```

Taking into account the prefix for template ME module names.

```

<Template matrix elements: template ME writer: TBP>+≡
  procedure, nopass :: get_module_name => template_me_writer_get_module_name
<Template matrix elements: sub interfaces>+≡
  module function template_me_writer_get_module_name (id) result (name)
    type(string_t) :: name
    type(string_t), intent(in) :: id
  end function template_me_writer_get_module_name
<Template matrix elements: procedures>+≡

  type(string_t) :: string
  string = "template"
  end function template_me_driver_type_name

```

### 17.3.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an template matrix element. Gfortran 7/8/9 bug, remains in main module.

```

<Template matrix elements: public>+≡
  public :: template_me_make_process_component
<Template matrix elements: main procedures>+≡
  subroutine template_me_make_process_component (entry, component_index, &
  model, model_name, prt_in, prt_out, unity)
  class(process_def_entry_t), intent(inout) :: entry
  integer, intent(in) :: component_index
  type(string_t), intent(in) :: model_name
  class(model_data_t), intent(in), target :: model
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  logical, intent(in) :: unity
  class(prc_core_def_t), allocatable :: def
  allocate (template_me_def_t :: def)
  select type (def)
  type is (template_me_def_t)
  call def%init (model, prt_in, prt_out, unity)
  end select

```

```

call entry%import_component (component_index, &
n_out = size (prt_out), &
prt_in = new_prt_spec (prt_in), &
prt_out = new_prt_spec (prt_out), &
method = var_str ("template"), &
variant = def)
end subroutine template_me_make_process_component

```

### 17.3.5 The prc\_template\_me\_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`template_me_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`template_me_driver_t`).

```

<Template matrix elements: public>+≡
  public :: prc_template_me_t

<Template matrix elements: types>+≡
  type, extends (prc_core_t) :: prc_template_me_t
  real(default), dimension(:), allocatable :: par
  integer :: scheme = 0
  contains
  <Template matrix elements: prc template ME: TBP>
end type prc_template_me_t

```

The workspace associated to a `prc_template_me_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Template matrix elements: types>+≡
  type, extends (prc_core_state_t) :: template_me_state_t
  logical :: new_kinematics = .true.
  real(default) :: alpha_qcd = -1
  real(default) :: alpha_qed = -1
  contains
  procedure :: write => template_me_state_write
  procedure :: reset_new_kinematics => template_me_state_reset_new_kinematics
end type template_me_state_t

```

```

<Template matrix elements: sub interfaces>+≡
  module subroutine template_me_state_write (object, unit)
  class(template_me_state_t), intent(in) :: object
  integer, intent(in), optional :: unit
  end subroutine template_me_state_write

```

```

<Template matrix elements: procedures>+≡
  module subroutine template_me_state_write (object, unit)
  class(template_me_state_t), intent(in) :: object
  integer, intent(in), optional :: unit

```

```

integer :: u
u = given_output_unit (unit)
write (u, "(3x,A,L1)") "Template ME state: new kinematics = ", &
object%new_kinematics
end subroutine template_me_state_write

```

```

<Template matrix elements: sub interfaces>+≡
module subroutine template_me_state_reset_new_kinematics (object)
class(template_me_state_t), intent(inout) :: object
end subroutine template_me_state_reset_new_kinematics

<Template matrix elements: procedures>+≡
module subroutine template_me_state_reset_new_kinematics (object)
class(template_me_state_t), intent(inout) :: object
end subroutine template_me_state_reset_new_kinematics

```

Allocate the workspace with the above specific type. Gfortran 7/8/9 bug, has to remain in the main module.

```

<Template matrix elements: prc template ME: TBP>≡
procedure :: allocate_workspace => prc_template_me_allocate_workspace

<Template matrix elements: main procedures>+≡
subroutine prc_template_me_allocate_workspace (object, core_state)
class(prc_template_me_t), intent(in) :: object
class(prc_core_state_t), intent(inout), allocatable :: core_state
allocate (template_me_state_t :: core_state)
end subroutine prc_template_me_allocate_workspace

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters.

```

<Template matrix elements: prc template ME: TBP>+≡
procedure :: write => prc_template_me_write

 end if  
 end subroutine prc\_template\_me\_set\_parameters

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated

driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

```

<Template matrix elements: prc template ME: TBP>+≡
  procedure :: init => prc_template_me_init

<Template matrix elements: sub interfaces>+≡

  end subroutine prc_template_me_compute_eff_kinematics

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index `j` is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

```

<Template matrix elements: prc template ME: TBP>+≡

    end subroutine prc_template_me_test

```

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it

happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

## 17.4 O'MEGA Interface

The standard method for process computation with WHIZARD is the O'MEGA matrix element generator.

This section implements the interface to the code generator (via the makefile) and the driver for the features provided by the O'MEGA matrix element.

There are actually two different methods steered by this interface, the traditional one which delivers compiled Fortran code, while the O'MEGA virtual machine (OVM) produces bytecode with look-up tables.

```

⟨prc_omega.f90⟩≡

    implicit none

    contains

    <Omega interface: procedures>

    end submodule prc_omega_s

```

### 17.4.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

```

    <Omega interface: public>≡
    public :: omega_def_t

    <Omega interface: types>≡
    type, extends (prc_core_def_t) :: omega_def_t
    logical :: ufo = .false.
    logical :: ovm = .false.
    contains
    <Omega interface: omega def: TBP>
    end type omega_def_t

    <Omega interface: omega def: TBP>≡
    procedure, nopass :: type_string => omega_def_type_string

```

```

<Omega interface: sub interfaces>≡
  module function omega_def_type_string () result (string)
    type(string_t) :: string
    end function omega_def_type_string

```

```

<Omega interface: procedures>≡
  module function omega_def_type_string () result (string)
    type(string_t) :: string
    string = "omega"
    end function omega_def_type_string

```

Initialization: allocate the writer for the O'MEGA matrix element. The writer type depends on the settings of the ufo and ovm flags. Also set any data for this process that the writer needs. Gfortran 7/8/9 bug, has to remain in the main module.

```

<Omega interface: omega def: TBP>+≡
  procedure :: init => omega_def_init

```

```

<Omega interface: main procedures>≡
  subroutine omega_def_init (object, &
    model_name, prt_in, prt_out, &

  module function omega_driver_type_name () result (string)
    type(string_t) :: string
    string = "omega"
    end function omega_driver_type_name

```

#### 17.4.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as appropriate for an O'MEGA matrix element. Gfortran 7/8/9 bug, has to remain in the main module.

```

<Omega interface: public>+≡
  public :: omega_make_process_component

<Omega interface: main procedures>+≡
  subroutine omega_make_process_component (entry, component_index, &
    model_name, prt_in, prt_out, &
    ufo, ufo_path, restrictions, cms_scheme, &
    openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color)
    class(process_def_entry_t), intent(inout) :: entry
    integer, intent(in) :: component_index
    type(string_t), intent(in) :: model_name
    type(string_t), dimension(:), intent(in) :: prt_in
    type(string_t), dimension(:), intent(in) :: prt_out
    logical, intent(in), optional :: ufo
    type(string_t), intent(in), optional :: ufo_path
    type(string_t), intent(in), optional :: restrictions
    logical, intent(in), optional :: cms_scheme
    logical, intent(in), optional :: openmp_support
    logical, intent(in), optional :: report_progress
    logical, intent(in), optional :: write_omega_output
    type(string_t), intent(in), optional :: extra_options
    logical, intent(in), optional :: diags, diags_color
    logical :: ufo_model
    class(prc_core_def_t), allocatable :: def
    ufo_model = .false.; if (present (ufo)) ufo_model = ufo
    allocate (omega_def_t :: def)
    select type (def)
    class is (omega_def_t)
    call def%init (model_name, prt_in, prt_out, &
      .false., ufo_model, ufo_path, &
      restrictions, cms_scheme, &
      openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color)
    end select
    call entry%import_component (component_index, &
      n_out = size (prt_out), &
      prt_in = new_prt_spec (prt_in), &
      prt_out = new_prt_spec (prt_out), &

```

```

method = var_str ("omega"), &
variant = def)
end subroutine omega_make_process_component

```

### 17.4.5 The prc\_omega\_t wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`omega_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`omega_driver_t`).

```

<Omega interface: public>+≡
  public :: prc_omega_t

<Omega interface: types>+≡
  type, extends (prc_core_t) :: prc_omega_t
  real(default), dimension(:), allocatable :: par
  integer :: scheme = 0
  type(helicity_selection_t) :: helicity_selection
  type(qcd_t) :: qcd
  type(qed_t) :: qed
  contains
  <Omega interface: prc omega: TBP>
end type prc_omega_t

```

The workspace associated to a `prc_omega_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

```

<Omega interface: public>+≡
  public :: omega_state_t

<Omega interface: types>+≡
  type, extends (prc_core_state_t) :: omega_state_t
  logical :: new_kinematics = .true.
  real(default) :: alpha_qcd = -1
  real(default) :: alpha_qed = -1
  contains
  <Omega interface: omega state: TBP>
end type omega_state_t

```

```

<Omega interface: omega state: TBP>≡
  procedure :: write => omega_state_write

<Omega interface: sub interfaces>+≡
  module subroutine omega_state_write (object, unit)
    class(omega_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine omega_state_write

```

```

<Omega interface: procedures>+≡
module subroutine omega_state_write (object, unit)
class(omega_state_t), intent(in) :: object
integer, intent(in), optional :: unit
integer :: u
u = given_output_unit (unit)
write (u, "(3x,A,L1)" "0'Mega state: new kinematics = ", &
object%new_kinematics
end subroutine omega_state_write

<Omega interface: omega state: TBP>+≡
procedure :: reset_new_kinematics => omega_state_reset_new_kinematics

<Omega interface: sub interfaces>+≡
module subroutine omega_state_reset_new_kinematics (object)
class(omega_state_t), intent(inout) :: object
end subroutine omega_state_reset_new_kinematics

<Omega interface: procedures>+≡
module subroutine omega_state_reset_new_kinematics (object)
class(omega_state_t), intent(inout) :: object
object%new_kinematics = .true.
end subroutine omega_state_reset_new_kinematics

```

Allocate the workspace with the above specific type. Gfortran 7/8/9 bug, has to remain in main module.

```

<Omega interface: prc omega: TBP>≡
procedure :: allocate_workspace => prc_omega_allocate_workspace

<Omega interface: main procedures>+≡

```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters and the helicity selection data. (The latter are printed only if active.)

```

```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the `init` method of the base type, which we nevertheless can access via its binding `base_init`. When done, we have an allocated driver. The driver will call the `init` procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

If requested, we initialize the helicity selection counter.

```

    (0._c_default_float, 0_c_int)
    end if
    end if
    end select
  end subroutine prc_omega_reset_helicity_selection

```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index  $j$  is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

The core objects computes the appropriate  $\alpha_s$  value via the `qcd` subobject, taking into account the provided `ren_scale` value. However, if the extra parameter `alpha_qcd_forced` is allocated, it overrides this setting.

The `is_allowed` query is not redundant, since the status may change during the run if helicities are switched off.

### Generate, compile and load a simple process matrix element

The process is  $e^+e^- \rightarrow \mu^+\mu^-$  for vanishing masses and  $e = 0.3$ . We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to  $e^2$ . (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

### Check prc\_omega\_t wrapper and options

The process is  $e^-e^+ \rightarrow e^-e^+$  for vanishing masses and  $e = 0.3$ . We build the library using the high-level procedure `omega_make_process_component` and the “black box” `prc_omega_t` object. Two variants with different settings for restrictions and OpenMP.

For GNU make, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

```

## UFO model file support

Again, the process is  $e^-e^+ \rightarrow e^-e^+$  for vanishing masses and  $e = 0.3$ . We build the library using the high-level procedure `omega_make_process_component` and the “black box” `prc_omega_t` object. OMega must be able to digest the specified

UFO file and provide use with a fresh model file that can be read after producing the process code.

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

```

## 17.5 External matrix elements (squared)

This defines an abstract framework that can handle matrix elements which are computed outside of WHIZARD. Such matrix elements typically (i) require extra

code or libraries to be configured linked at execution time, and (ii) provide only plain or correlated squared matrix elements instead of amplitudes.

In particular, matrix-element libraries that conform to the BLHA standard belong to this class. They have their own (also abstract) extension of the abstract `prc_external_t` type introduced here. `prc_external_t`-type.

```

## 17.5.2 Abstract interface to external matrix elements

This process class allows us to factor out common necessities of processes that involve external code or libraries.

## Workspace

This is the workspace that is available for external matrix elements.

```
<Prc external: public>≡
  public :: prc_external_state_t

<Prc external: types>+≡
  type, abstract, extends (prc_core_state_t) :: prc_external_state_t
  logical :: new_kinematics = .true.
  real(default) :: alpha_qcd = -1
  real(default) :: alpha_qed = -1
  contains
  <Prc external: external state: TBP>
  end type prc_external_state_t

<Prc external: external state: TBP>≡
  procedure :: reset_new_kinematics => prc_external_state_reset_new_kinematics

<Prc external: sub interfaces>+≡
  module subroutine prc_external_state_reset_new_kinematics (object)
    class(prc_external_state_t), intent(inout) :: object
    end subroutine prc_external_state_reset_new_kinematics

<Prc external: procedures>+≡
  module subroutine prc_external_state_reset_new_kinematics (object)
    class(prc_external_state_t), intent(inout) :: object
    object%new_kinematics = .true.
    end subroutine prc_external_state_reset_new_kinematics
```

## Driver

We have to add two O'Mega-routines to the external matrix-element driver to ensure proper process setup. The problem is that during the setup of the real component, the particle and flavor data are taken from the Born component to set up the subtraction terms. However, the Born component expects this data to be obtained from the Omega code, accessed by the driver.

```
<Prc external: public>+≡
  public :: prc_external_driver_t

<Prc external: types>+≡
  type, abstract, extends (prc_core_driver_t) :: prc_external_driver_t
  procedure(omega_update_alpha_s), nopass, pointer :: &
    update_alpha_s => null ()
  procedure(omega_is_allowed), nopass, pointer :: &
    is_allowed => null ()
  end type prc_external_driver_t
```

## Core

```
<Prc external: public>+≡
  public :: prc_external_t
```

```

<Prc external: types>+≡
  type, abstract, extends (prc_core_t) :: prc_external_t
  type(qcd_t) :: qcd
  type(qed_t) :: qed
  integer :: n_flv = 1
  real(default), dimension(:), allocatable :: par
  integer :: scheme = 0
  type(sf_handler_t) :: sf_handler
  real(default) :: maximum_accuracy = 10000.0
  contains
  <Prc external: prc external: TBP>
  end type prc_external_t

```

By definition, this class of process-core types require extra code.

```

<Prc external: prc external: TBP>≡
  procedure, nopass :: needs_external_code => &
  prc_external_needs_external_code

<Prc external: sub interfaces>+≡
