### **Abstract**

WHIZARD is an application of the VAMP algorithm: Adaptive multi-channel integration and event generation. The bare VAMP library is augmented by modules for Lorentz algebra, particles, phase space, etc., such that physical processes with arbitrary complex final states [well, in principle. . .] can be integrated and *unweighted* events be generated.

<b>1</b>	<b>Changes</b>	<b>28</b>
<b>2</b>	<b>Preliminaries</b>	<b>29</b>
<b>3</b>	<b>Utilities</b>	<b>31</b>
3.1	File Utilities . . . . .	31
3.1.1	Deleting a file . . . . .	32
3.2	File Registries . . . . .	33
3.2.1	File handle . . . . .	34
3.2.2	File handles registry . . . . .	36
3.3	String Utilities . . . . .	39
3.3.1	Upper and Lower Case . . . . .	40
3.3.2	C-Fortran String Conversion . . . . .	41
3.3.3	Number Conversion . . . . .	43
3.3.4	String splitting . . . . .	45
3.4	Format Utilities . . . . .	46
3.4.1	Line Output . . . . .	47
3.4.2	Array Output . . . . .	48
3.4.3	TEX-compatible Output . . . . .	49
3.4.4	Metapost-compatible Output . . . . .	51
3.4.5	Conditional Formatting . . . . .	51
3.4.6	Guard tiny values . . . . .	52
3.4.7	Compressed output of integer arrays . . . . .	52
3.5	Format Definitions . . . . .	53
3.6	Numeric Utilities . . . . .	54
3.6.1	Integration routines . . . . .	67
3.6.2	Suppression of numerical noise . . . . .	80
3.7	Binary Tree . . . . .	84
3.7.1	Unit tests . . . . .	95
3.8	Array List . . . . .	98
3.8.1	Unit tests . . . . .	106
3.9	Queue . . . . .	109
3.10	Iterator . . . . .	112
3.10.1	Unit tests . . . . .	116

<b>4</b>	<b>Testing</b>	<b>119</b>
4.1	Unit tests . . . . .	119
4.1.1	Parameters . . . . .	120
4.1.2	Type for storing test results . . . . .	120
4.1.3	Wrapup . . . . .	124
4.1.4	Tool for Unit Tests . . . . .	124
<b>5</b>	<b>System: Interfaces and Handlers</b>	<b>128</b>
5.1	Constants . . . . .	128
5.1.1	Version . . . . .	129
5.1.2	Text Buffer . . . . .	129
5.1.3	IOSTAT Codes . . . . .	129
5.1.4	Character Codes . . . . .	129
5.2	C wrapper for sigaction . . . . .	130
5.3	C wrapper for printf . . . . .	132
5.4	Error, Message and Signal Handling . . . . .	133
5.4.1	Logfile . . . . .	158
5.4.2	Checking values . . . . .	160
5.4.3	Signal handling . . . . .	164
5.5	Operating-system interface . . . . .	167
5.5.1	Path variables . . . . .	168
5.5.2	System dependencies . . . . .	169
5.5.3	Dynamic linking . . . . .	177
5.5.4	Predicates . . . . .	181
5.5.5	Shell access . . . . .	181
5.5.6	Querying for a directory . . . . .	182
5.5.7	Pack/unpack . . . . .	183
5.5.8	Fortran compiler and linker . . . . .	184
5.5.9	Controlling OpenMP . . . . .	187
5.5.10	Controlling MPI . . . . .	189
5.5.11	Unit tests . . . . .	190
5.6	Interface for formatted I/O . . . . .	193
5.6.1	Parsing a C format string . . . . .	194
5.6.2	API . . . . .	201
5.6.3	Unit tests . . . . .	202
5.7	CPU timing . . . . .	204
5.7.1	Timer . . . . .	211
5.7.2	Unit tests . . . . .	213
<b>6</b>	<b>Combinatorics</b>	<b>219</b>
6.1	Bytes and such . . . . .	219
6.1.1	8-bit words: bytes . . . . .	221
6.1.2	32-bit words . . . . .	223
6.1.3	Operations on 32-bit words . . . . .	227
6.1.4	64-bit words . . . . .	230
6.2	Hashtables . . . . .	233
6.2.1	The hash function . . . . .	233
6.2.2	The hash table . . . . .	234
6.2.3	Hashtable insertion . . . . .	236
6.2.4	Hashtable lookup . . . . .	237

6.3	MD5 Checksums . . . . .	239
6.3.1	Blocks . . . . .	240

```

We are strict with our names:

```
<Standard module head>≡
implicit none
private
```

This is the way to invoke the kinds module (not contained in this source)

```
<Use kinds>≡
use kinds, only: default
```

*<Use kinds with double>*≡

```
use kinds, only: default, double
```

And we make heavy use of variable-length strings

*<Use strings>*≡

```
use iso_varying_string, string_t => varying_string
```

Access to the `debug_on` master switch

*<Use debug>*≡

```
use debug_master, only: debug_on
```

And we need the Fortran 2008 MPI module, if compiled with MPI.

*<Use mpi f08>*≡

*<MPI: Use mpi f08>*≡

```
use mpi_f08 !NODEP!
```

## Chapter 3

# Utilities

These modules are intended as part of WHIZARD, but in fact they are generic and could be useful for any purpose.

The modules depend only on modules from the **basics** set.

**file\_utils** Procedures that deal with external files, if not covered by Fortran built-ins.

**file\_registries** Manage files that are accessed by their name.

**string\_utils** Some string-handling utilities. Includes conversion to C string.

**format\_utils** Utilities for pretty-printing.

**format\_defs** Predefined format strings.

**numeric\_utils** Utilities for comparing numerical values.

**data\_utils** Utilities for data structures, i.e. a fixed size queue, polymorphic binary tree and dynamic array list.

### 3.1 File Utilities

This module provides miscellaneous tools associated with named external files. Currently only:

- Delete a named file

```
<file_utils.f90>≡  
  <File header>  
  
  module file_utils  
  
    <Standard module head>  
  
    <File utils: public>  
  
    interface  
      <File utils: sub interfaces>  
    end interface
```

No internal dependencies

Figure 3.1: Module dependencies in `src/utilities`.

```
end module file_utils
<file_utils_sub.f90>≡
  <File header>

  submodule (file_utils) file_utils_s

  use io_units

  implicit none

  contains

  <File utils: procedures>

  end submodule file_utils_s
```

### 3.1.1 Deleting a file

Fortran does not contain a command for deleting a file. Here, we provide a subroutine that deletes a file if it exists. We do not handle the subtleties, so we assume that it is writable if it exists.

```
<File utils: public>≡
  public :: delete_file

<File utils: sub interfaces>≡
  module subroutine delete_file (name)
    character(*), intent(in) :: name
  end subroutine delete_file

<File utils: procedures>≡
  module subroutine delete_file (name)
    character(*), intent(in) :: name
```

```

logical :: exist
integer :: u
inquire (file = name, exist = exist)
if (exist) then
  u = free_unit ()
  open (unit = u, file = name)
  close (u, status = "delete")
end if
end subroutine delete_file

```

## 3.2 File Registries

This module provides a file-registry facility. We can open and close files multiple times without inadvertently accessing a single file by two different I/O unit numbers. Opening a file the first time enters it into the registry. Opening again just returns the associated I/O unit. The registry maintains a reference count, so closing a file does not actually complete until the last reference is released.

File access will always be sequential, however. The file can't be opened at different positions simultaneously.

```

<file_registries.f90>≡
  <File header>

  module file_registries

    <Use strings>

    <Standard module head>

    <File registries: public>

    <File registries: types>

    interface
      <File registries: sub interfaces>
    end interface

  end module file_registries

<file_registries_sub.f90>≡
  <File header>

  submodule (file_registries) file_registries_s

    use io_units

    implicit none

    contains

    <File registries: procedures>

  end submodule file_registries_s

```

### 3.2.1 File handle

This object holds a filename (fully qualified), the associated unit, and a reference count. The idea is that the object should be deleted when the reference count drops to zero.

```
<File registries: types>≡
  type :: file_handle_t
  type(string_t) :: file
  integer :: unit = 0
  integer :: refcount = 0
  contains
  <File registries: file handle: TBP>
  end type file_handle_t
```

Debugging output:

```
<File registries: file handle: TBP>≡
  procedure :: write => file_handle_write

<File registries: sub interfaces>≡
  module subroutine file_handle_write (handle, u, show_unit)
    class(file_handle_t), intent(in) :: handle
    integer, intent(in) :: u
    logical, intent(in), optional :: show_unit
  end subroutine file_handle_write

<File registries: procedures>≡
  module subroutine file_handle_write (handle, u, show_unit)
    class(file_handle_t), intent(in) :: handle
    integer, intent(in) :: u
    logical, intent(in), optional :: show_unit
    logical :: show_u
    show_u = .false.; if (present (show_unit)) show_u = show_unit
    if (show_u) then
      write (u, "(3x,A,1x,I0,1x,'(,I0,')')") &
        char (handle%file), handle%unit, handle%refcount
    else
      write (u, "(3x,A,1x,'(,I0,')')") &
        char (handle%file), handle%refcount
    end if
  end subroutine file_handle_write
```

Initialize with a file name, don't open the file yet:

```
<File registries: file handle: TBP>+≡
  procedure :: init => file_handle_init

<File registries: sub interfaces>+≡
  module subroutine file_handle_init (handle, file)
    class(file_handle_t), intent(out) :: handle
    type(string_t), intent(in) :: file
  end subroutine file_handle_init

<File registries: procedures>+≡
  module subroutine file_handle_init (handle, file)
    class(file_handle_t), intent(out) :: handle
    type(string_t), intent(in) :: file
```

```

    handle%file = file
end subroutine file_handle_init

```

We check the `refcount` before actually opening the file.

```

<File registries: file handle: TBP>+≡
    procedure :: open => file_handle_open

<File registries: sub interfaces>+≡
    module subroutine file_handle_open (handle)
    class(file_handle_t), intent(inout) :: handle
    end subroutine file_handle_open

<File registries: procedures>+≡
    module subroutine file_handle_open (handle)
    class(file_handle_t), intent(inout) :: handle
    if (handle%refcount == 0) then
    handle%unit = free_unit ()
    open (unit = handle%unit, file = char (handle%file), action = "read", &
    status = "old")
    end if
    handle%refcount = handle%refcount + 1
    end subroutine file_handle_open

```

Analogously, close if the `refcount` drops to zero. The caller may then delete the object.

```

<File registries: file handle: TBP>+≡
    procedure :: close => file_handle_close

<File registries: sub interfaces>+≡
    module subroutine file_handle_close (handle)
    class(file_handle_t), intent(inout) :: handle
    end subroutine file_handle_close

<File registries: procedures>+≡
    module subroutine file_handle_close (handle)
    class(file_handle_t), intent(inout) :: handle
    handle%refcount = handle%refcount - 1
    if (handle%refcount == 0) then
    close (handle%unit)
    handle%unit = 0
    end if
    end subroutine file_handle_close

```

The I/O unit will be nonzero when the file is open.

```

<File registries: file handle: TBP>+≡
    procedure :: is_open => file_handle_is_open

<File registries: sub interfaces>+≡
    module function file_handle_is_open (handle) result (flag)
    class(file_handle_t), intent(in) :: handle
    logical :: flag
    end function file_handle_is_open

```

```

<File registries: procedures>+≡
module function file_handle_is_open (handle) result (flag)
class(file_handle_t), intent(in) :: handle
logical :: flag
flag = handle%unit /= 0
end function file_handle_is_open

```

Return the filename, so we can identify the entry.

```

<File registries: file handle: TBP>+≡
procedure :: get_file => file_handle_get_file

<File registries: sub interfaces>+≡
module function file_handle_get_file (handle) result (file)
class(file_handle_t), intent(in) :: handle
type(string_t) :: file
end function file_handle_get_file

<File registries: procedures>+≡
module function file_handle_get_file (handle) result (file)
class(file_handle_t), intent(in) :: handle
type(string_t) :: file
file = handle%file
end function file_handle_get_file

```

For debugging, return the I/O unit number.

```

<File registries: file handle: TBP>+≡
procedure :: get_unit => file_handle_get_unit

<File registries: sub interfaces>+≡
module function file_handle_get_unit (handle) result (unit)
class(file_handle_t), intent(in) :: handle
integer :: unit
end function file_handle_get_unit

<File registries: procedures>+≡
module function file_handle_get_unit (handle) result (unit)
class(file_handle_t), intent(in) :: handle
integer :: unit
unit = handle%unit
end function file_handle_get_unit

```

### 3.2.2 File handles registry

This is implemented as a doubly-linked list. The list exists only once in the program, as a private module variable.

Extend the handle type to become a list entry:

```

<File registries: types>+≡
type, extends (file_handle_t) :: file_entry_t
type(file_entry_t), pointer :: prev => null ()
type(file_entry_t), pointer :: next => null ()
end type file_entry_t

```

The actual registry. We need only the pointer to the first entry.

```

<File registries: public>≡
    public :: file_registry_t

<File registries: types>+≡
    type :: file_registry_t
    type(file_entry_t), pointer :: first => null ()
    contains
    <File registries: file registry: TBP>
    end type file_registry_t

```

Debugging output.

```

<File registries: file registry: TBP>≡
    procedure :: write => file_registry_write

<File registries: sub interfaces>+≡
    module subroutine file_registry_write (registry, unit, show_unit)
    class(file_registry_t), intent(in) :: registry
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_unit
    end subroutine file_registry_write

<File registries: procedures>+≡
    module subroutine file_registry_write (registry, unit, show_unit)
    class(file_registry_t), intent(in) :: registry
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_unit
    type(file_entry_t), pointer :: entry
    integer :: u
    u = given_output_unit (unit)
    if (associated (registry%first)) then
    write (u, "(1x,A)") "File registry:"
    entry => registry%first
    do while (associated (entry))
    call entry%write (u, show_unit)
    entry => entry%next
    end do
    else
    write (u, "(1x,A)") "File registry: [empty]"
    end if
    end subroutine file_registry_write

```

Open a file: find the appropriate entry. Create a new entry and add to the list if necessary. The list is extended at the beginning. Return the I/O unit number for the records.

```

<File registries: file registry: TBP>+≡
    procedure :: open => file_registry_open

<File registries: sub interfaces>+≡
    module subroutine file_registry_open (registry, file, unit)
    class(file_registry_t), intent(inout) :: registry
    type(string_t), intent(in) :: file
    integer, intent(out), optional :: unit
    end subroutine file_registry_open

```

```

<File registries: procedures>+≡
module subroutine file_registry_open (registry, file, unit)
class(file_registry_t), intent(inout) :: registry
type(string_t), intent(in) :: file
integer, intent(out), optional :: unit
type(file_entry_t), pointer :: entry
entry => registry%first
FIND_ENTRY: do while (associated (entry))
if (entry%get_file () == file) exit FIND_ENTRY
entry => entry%next
end do FIND_ENTRY
if (.not. associated (entry)) then
allocate (entry)
call entry%init (file)
if (associated (registry%first)) then
registry%first%prev => entry
entry%next => registry%first
end if
registry%first => entry
end if
call entry%open ()
if (present (unit)) unit = entry%get_unit ()
end subroutine file_registry_open

```

Close a file: find the appropriate entry. Delete the entry if there is no file connected to it anymore.

```

<File registries: file registry: TBP>+≡
procedure :: close => file_registry_close

<File registries: sub interfaces>+≡
module subroutine file_registry_close (registry, file)
class(file_registry_t), intent(inout) :: registry
type(string_t), intent(in) :: file
end subroutine file_registry_close

<File registries: procedures>+≡
module subroutine file_registry_close (registry, file)
class(file_registry_t), intent(inout) :: registry
type(string_t), intent(in) :: file
type(file_entry_t), pointer :: entry
entry => registry%first
FIND_ENTRY: do while (associated (entry))
if (entry%get_file () == file) exit FIND_ENTRY
entry => entry%next
end do FIND_ENTRY
if (associated (entry)) then
call entry%close ()
if (.not. entry%is_open ()) then
if (associated (entry%prev)) then
entry%prev%next => entry%next
else
registry%first => entry%next
end if
if (associated (entry%next)) then
entry%next%prev => entry%prev

```

```

end if
deallocate (entry)
end if
end if
end subroutine file_registry_close

```

### 3.3 String Utilities

This module provides tools associated with strings (built-in and variable). Currently:

- Upper and lower case for strings
- Convert to null-terminated C string

```

⟨string_utils.f90⟩≡
  ⟨File header⟩

  module string_utils

    use, intrinsic :: iso_c_binding

    ⟨Use kinds⟩
    ⟨Use strings⟩

    ⟨Standard module head⟩

    ⟨String utils: public⟩

    ⟨String utils: interfaces⟩

```

### 3.3.1 Upper and Lower Case

These are, unfortunately, not part of Fortran.

```
<String utils: public>≡
  public :: upper_case
  public :: lower_case

<String utils: interfaces>≡
  interface upper_case
    module procedure upper_case_char, upper_case_string
  end interface
  interface lower_case
    module procedure lower_case_char, lower_case_string
  end interface

<String utils: sub interfaces>≡
  module function upper_case_char (string) result (new_string)
    character(*), intent(in) :: string
    character(len(string)) :: new_string
  end function upper_case_char
  module function lower_case_char (string) result (new_string)
    character(*), intent(in) :: string
    character(len(string)) :: new_string
  end function lower_case_char
  module function upper_case_string (string) result (new_string)
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
  end function upper_case_string
  module function lower_case_string (string) result (new_string)
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
  end function lower_case_string

<String utils: procedures>≡
  module function upper_case_char (string) result (new_string)
    character(*), intent(in) :: string
    character(len(string)) :: new_string
    integer :: pos, code
    integer, parameter :: offset = ichar('A')-ichar('a')
    do pos = 1, len (string)
      code = ichar (string(pos:pos))
      select case (code)
        case (ichar('a'):ichar('z'))
          new_string(pos:pos) = char (code + offset)
        case default
          new_string(pos:pos) = string(pos:pos)
      end select
    end do
  end function upper_case_char

  module function lower_case_char (string) result (new_string)
    character(*), intent(in) :: string
    character(len(string)) :: new_string
    integer :: pos, code
    integer, parameter :: offset = ichar('a')-ichar('A')
    do pos = 1, len (string)
```

```

code = ichar (string(pos:pos))
select case (code)
case (ichar('A'):ichar('Z'))
new_string(pos:pos) = char (code + offset)
case default
new_string(pos:pos) = string(pos:pos)
end select
end do
end function lower_case_char

module function upper_case_string (string) result (new_string)
type(string_t), intent(in) :: string
type(string_t) :: new_string
new_string = upper_case_char (char (string))
end function upper_case_string

module function lower_case_string (string) result (new_string)
type(string_t), intent(in) :: string
type(string_t) :: new_string
new_string = lower_case_char (char (string))
end function lower_case_string

```

### 3.3.2 C-Fortran String Conversion

Convert a FORTRAN string to a null-terminated C string.

```

<String utils: public>+≡
public :: string_f2c

<String utils: interfaces>+≡
interface string_f2c
module procedure string_f2c_char, string_f2c_var_str
end interface string_f2c

<String utils: sub interfaces>+≡
pure module function string_f2c_char (i) result (o)
character(*), intent(in) :: i
character(kind=c_char, len=len (i) + 1) :: o
end function string_f2c_char
pure module function string_f2c_var_str (i) result (o)
type(string_t), intent(in) :: i
character(kind=c_char, len=len (i) + 1) :: o
end function string_f2c_var_str

<String utils: procedures>+≡
pure module function string_f2c_char (i) result (o)
character(*), intent(in) :: i
character(kind=c_char, len=len (i) + 1) :: o
o = i // c_null_char
end function string_f2c_char

pure module function string_f2c_var_str (i) result (o)
type(string_t), intent(in) :: i
character(kind=c_char, len=len (i) + 1) :: o
o = char (i) // c_null_char

```

```
end function string_f2c_var_str
```

The same task done by a subroutine, analogous to the C `strcpy` function. We append a null char and copy the characters to the output string, given by a character array – which is equal to a `c_char` character string by the rule of sequence association.

Note: Just like with the `strcpy` function, there is no bounds check.

```
<String utils: public>+≡
  public :: strcpy_f2c

<String utils: sub interfaces>+≡
  module subroutine strcpy_f2c (fstring, cstring)
    character(*), intent(in) :: fstring
    character(c_char), dimension(*), intent(inout) :: cstring
  end subroutine strcpy_f2c

<String utils: procedures>+≡
  module subroutine strcpy_f2c (fstring, cstring)
    character(*), intent(in) :: fstring
    character(c_char), dimension(*), intent(inout) :: cstring

    integer :: i

    do i = 1, len (fstring)
      cstring(i) = fstring(i:i)
    end do
    cstring(len(fstring)+1) = c_null_char

  end subroutine strcpy_f2c
```

Convert a null-terminated C string to a Fortran string. The C-string argument is sequence-associated to a one-dimensional array of C characters, where we do not know the dimension.

To convert this to a `string_t` object, we need to assign it or to wrap it by another `var_str` conversion.

```
<String utils: public>+≡
  public :: string_c2f

<String utils: sub interfaces>+≡
  module function string_c2f (cstring) result (fstring)
    character(c_char), dimension(*), intent(in) :: cstring
    character(:), allocatable :: fstring
  end function string_c2f

<String utils: procedures>+≡
  module function string_c2f (cstring) result (fstring)
    character(c_char), dimension(*), intent(in) :: cstring
    character(:), allocatable :: fstring

    integer :: i, n

    n = 0
    do while (cstring(n+1) /= c_null_char)
      n = n + 1
```

```

end do

allocate (character(n) :: fstring)
do i = 1, n
  fstring(i:i) = cstring(i)
end do

end function string_c2f

```

### 3.3.3 Number Conversion

Create a string from a number. We use fixed format for the reals and variable format for integers.

```

<String utils: public>+≡
  public :: str

<String utils: interfaces>+≡
  interface str
    module procedure str_log, str_logs, str_int, str_ints, &
      str_real, str_reals, str_complex, str_complexs
  end interface

<String utils: sub interfaces>+≡
  module function str_log (l) result (s)
    logical, intent(in) :: l
    type(string_t) :: s
  end function str_log
  module function str_logs (x) result (s)
    logical, dimension(:), intent(in) :: x
    type(string_t) :: s
  end function str_logs
  module function str_int (i) result (s)
    integer, intent(in) :: i
    type(string_t) :: s
  end function str_int
  module function str_ints (x) result (s)
    integer, dimension(:), intent(in) :: x
    type(string_t) :: s
  end function str_ints
  module function str_real (x) result (s)
    real(default), intent(in) :: x
    type(string_t) :: s
  end function str_real
  module function str_reals (x) result (s)
    real(default), dimension(:), intent(in) :: x
    type(string_t) :: s
  end function str_reals
  module function str_complex (x) result (s)
    complex(default), intent(in) :: x
    type(string_t) :: s
  end function str_complex
  module function str_complexs (x) result (s)
    complex(default), dimension(:), intent(in) :: x

```

```

type(string_t) :: s
end function str_complexs

<String utils: procedures>+≡
module function str_log (l) result (s)
logical, intent(in) :: l
type(string_t) :: s
if (l) then
s = "True"
else
s = "False"
end if
end function str_log

module function str_logs (x) result (s)
logical, dimension(:), intent(in) :: x
<concatenate strings>
end function str_logs

module function str_int (i) result (s)
integer, intent(in) :: i
type(string_t) :: s
character(32) :: buffer
write (buffer, "(I0)") i
s = var_str (trim (adjustl (buffer)))
end function str_int

module function str_ints (x) result (s)
integer, dimension(:), intent(in) :: x
<concatenate strings>
end function str_ints

module function str_real (x) result (s)
real(default), intent(in) :: x
type(string_t) :: s
character(32) :: buffer
write (buffer, "(ES17.10)") x
s = var_str (trim (adjustl (buffer)))
end function str_real

module function str_reals (x) result (s)
real(default), dimension(:), intent(in) :: x
<concatenate strings>
end function str_reals

module function str_complex (x) result (s)
complex(default), intent(in) :: x
type(string_t) :: s
s = str_real (real (x)) // " + i " // str_real (aimag (x))
end function str_complex

module function str_complexs (x) result (s)
complex(default), dimension(:), intent(in) :: x
<concatenate strings>
end function str_complexs

```

```

⟨concatenate strings⟩≡
  type(string_t) :: s
  integer :: i
  s = '['
  do i = 1, size(x) - 1
    s = s // str(x(i)) // ', '
  end do
  s = s // str(x(size(x))) // ']'

```

Auxiliary: Read real, integer, string value.

```

⟨String utils: public⟩+≡
  public :: read_rval
  public :: read_ival

⟨String utils: sub interfaces⟩+≡
  module function read_rval (s) result (rval)
    real(default) :: rval
    type(string_t), intent(in) :: s
  end function read_rval
  module function read_ival (s) result (ival)
    integer :: ival
    type(string_t), intent(in) :: s
  end function read_ival

⟨String utils: procedures⟩+≡
  module function read_rval (s) result (rval)
    real(default) :: rval
    type(string_t), intent(in) :: s
    character(80) :: buffer
    buffer = s
    read (buffer, *)  rval
  end function read_rval

  module function read_ival (s) result (ival)
    integer :: ival
    type(string_t), intent(in) :: s
    character(80) :: buffer
    buffer = s
    read (buffer, *)  ival
  end function read_ival

```

### 3.3.4 String splitting

```

⟨String utils: public⟩+≡
  public :: string_contains_word

⟨String utils: sub interfaces⟩+≡
  pure module function string_contains_word &
    (str, word, include_identical) result (val)
    logical :: val
    type(string_t), intent(in) :: str, word
    logical, intent(in), optional :: include_identical
  end function string_contains_word

```

```

<String utils: procedures>+≡
  pure module function string_contains_word &
    (str, word, include_identical) result (val)
    logical :: val
    type(string_t), intent(in) :: str, word
    type(string_t) :: str_tmp, str_out
    logical, intent(in), optional :: include_identical
    logical :: yorn
    str_tmp = str
    val = .false.
    yorn = .false.; if (present (include_identical)) yorn = include_identical
    if (yorn) val = str == word
    call split (str_tmp, str_out, word)
    val = val .or. (str_out /= "")
  end function string_contains_word

```

Create an array of strings using a separator.

```

<String utils: public>+≡
  public :: split_string

<String utils: sub interfaces>+≡
  pure module subroutine split_string (str, separator, str_array)
    type(string_t), dimension(:), allocatable, intent(out) :: str_array
    type(string_t), intent(in) :: str, separator
  end subroutine split_string

<String utils: procedures>+≡
  pure module subroutine split_string (str, separator, str_array)
    type(string_t), dimension(:), allocatable, intent(out) :: str_array
    type(string_t), intent(in) :: str, separator
    type(string_t) :: str_tmp, str_out
    integer :: n_str
    n_str = 0; str_tmp = str
    do while (string_contains_word (str_tmp, separator))
      n_str = n_str + 1
      call split (str_tmp, str_out, separator)
    end do
    allocate (str_array (n_str))
    n_str = 1; str_tmp = str
    do while (string_contains_word (str_tmp, separator))
      call split (str_tmp, str_array (n_str), separator)
      n_str = n_str + 1
    end do
  end subroutine split_string

```

### 3.4 Format Utilities

This module provides miscellaneous tools associated with formatting and pretty-printing.

- Horizontal separator lines in output
- Indenting an output line

- Formatting a number for T<sub>E</sub>X output.
- Formatting a number for MetaPost output.
- Alternate numeric formats.

```

⟨format_utils.f90⟩≡
  ⟨File header⟩

  module format_utils

    ⟨Use kinds⟩
    ⟨Use strings⟩

    ⟨Standard module head⟩

    ⟨Format utils: public⟩

    interface
      ⟨Format utils: sub interfaces⟩
    end interface

    end module format_utils

⟨format_utils_sub.f90⟩≡
  ⟨File header⟩

  submodule (format_utils) format_utils_s

    use string_utils, only: lower_case
    use io_units, only: given_output_unit

    implicit none

    contains

    ⟨Format utils: procedures⟩

    end submodule format_utils_s

```

### 3.4.1 Line Output

Write a separator line.

```

⟨Format utils: public⟩≡
  public :: write_separator

⟨Format utils: sub interfaces⟩≡
  module subroutine write_separator (u, mode)
    integer, intent(in) :: u
    integer, intent(in), optional :: mode
  end subroutine write_separator

```

```

<Format utils: procedures>+=
module subroutine write_separator (u, mode)
integer, intent(in) :: u
integer, intent(in), optional :: mode
integer :: m
m = 1; if (present (mode)) m = mode
select case (m)
case default
write (u, "(A)") repeat("-", 72)
case (1)
write (u, "(A)") repeat("-", 72)
case (2)
write (u, "(A)") repeat("=", 72)
end select
end subroutine write_separator

```

Indent the line with given number of blanks.

```

<Format utils: public>+=
public :: write_indent

<Format utils: sub interfaces>+=
module subroutine write_indent (unit, indent)
integer, intent(in) :: unit
integer, intent(in), optional :: indent
end subroutine write_indent

<Format utils: procedures>+=
module subroutine write_indent (unit, indent)
integer, intent(in) :: unit
integer, intent(in), optional :: indent
if (present (indent)) then
write (unit, "(1x,A)", advance="no") repeat(" ", indent)
end if
end subroutine write_indent

```

### 3.4.2 Array Output

Write an array of integers.

```

<Format utils: public>+=
public :: write_integer_array

<Format utils: sub interfaces>+=
module subroutine write_integer_array (array, unit, n_max, no_skip)
integer, intent(in), dimension(:) :: array
integer, intent(in), optional :: unit
integer, intent(in), optional :: n_max
logical, intent(in), optional :: no_skip
end subroutine write_integer_array

<Format utils: procedures>+=
module subroutine write_integer_array (array, unit, n_max, no_skip)
integer, intent(in), dimension(:) :: array
integer, intent(in), optional :: unit
integer, intent(in), optional :: n_max

```

```

logical, intent(in), optional :: no_skip
integer :: u, i, n
logical :: yorn
u = given_output_unit (unit)
yorn = .false.; if (present (no_skip)) yorn = no_skip
if (present (n_max)) then
  n = n_max
else
  n = size (array)
end if
do i = 1, n
  if (i < n .or. yorn) then
    write (u, "(I0, A)", advance = "no") array(i), ", "
  else
    write (u, "(I0)") array(i)
  end if
end do
end subroutine write_integer_array

```

### 3.4.3 T<sub>E</sub>X-compatible Output

Quote underscore characters for use in T<sub>E</sub>X output.

```

<Format utils: public>+≡
  public :: quote_underscore

<Format utils: sub interfaces>+≡
  module function quote_underscore (string) result (quoted)
    type(string_t) :: quoted
    type(string_t), intent(in) :: string
  end function quote_underscore

<Format utils: procedures>+≡
  module function quote_underscore (string) result (quoted)
    type(string_t) :: quoted
    type(string_t), intent(in) :: string
    type(string_t) :: part
    type(string_t) :: buffer
    buffer = string
    quoted = ""
    do
      call split (part, buffer, "_")
      quoted = quoted // part
      if (buffer == "") exit
      quoted = quoted // "\_"
    end do
  end function quote_underscore

```

Format a number with  $n$  significant digits for use in T<sub>E</sub>X documents.

```

<Format utils: public>+≡
  public :: tex_format

```

```

<Format utils: sub interfaces>+≡
module function tex_format (rval, n_digits) result (string)
  type(string_t) :: string
  real(default), intent(in) :: rval
  integer, intent(in) :: n_digits
end function tex_format

<Format utils: procedures>+≡
module function tex_format (rval, n_digits) result (string)
  type(string_t) :: string
  real(default), intent(in) :: rval
  integer, intent(in) :: n_digits
  integer :: e, n, w, d
  real(default) :: absval
  real(default) :: mantissa
  character :: sign
  character(20) :: format
  character(80) :: cstr
  n = min (abs (n_digits), 16)
  if (rval == 0) then
    string = "0"
  else
    absval = abs (rval)
    e = int (log10 (absval))
    if (rval < 0) then
      sign = "-"
    else
      sign = ""
    end if
    select case (e)
    case (-3)
      d = max (n - 1, 0)
      w = max (d + 2, 2)
      write (format, "('(F',IO,'.',IO,'A,IO,A)')") w, d
      mantissa = absval * 10._default ** (1 - e)
      write (cstr, fmt=format) mantissa, "\times 10^{", e - 1, "}"
    case (-2:0)
      d = max (n - e, 1 - e)
      w = max (d + e + 2, d + 2)
      write (format, "('(F',IO,'.',IO,')')") w, d
      write (cstr, fmt=format) absval
    case (1:2)
      d = max (n - e - 1, -e, 0)
      w = max (d + e + 2, d + 2, e + 2)
      write (format, "('(F',IO,'.',IO,')')") w, d
      write (cstr, fmt=format) absval
    case default
      d = max (n - 1, 0)
      w = max (d + 2, 2)
      write (format, "('(F',IO,'.',IO,'A,IO,A)')") w, d
      mantissa = absval * 10._default ** (- e)
      write (cstr, fmt=format) mantissa, "\times 10^{", e, "}"
    end select
    string = sign // trim (cstr)
  end if
end module

```

```
end function tex_format
```

### 3.4.4 Metapost-compatible Output

Write a number for use in Metapost code:

```
<Format utils: public>+≡
  public :: mp_format

<Format utils: sub interfaces>+≡
  module function mp_format (rval) result (string)
    type(string_t) :: string
    real(default), intent(in) :: rval
  end function mp_format

<Format utils: procedures>+≡
  module function mp_format (rval) result (string)
    type(string_t) :: string
    real(default), intent(in) :: rval
    character(16) :: tmp
    write (tmp, "(G16.8)")  rval
    string = lower_case (trim (adjustl (trim (tmp))))
  end function mp_format
```

### 3.4.5 Conditional Formatting

Conditional format string, intended for switchable numeric precision.

```
<Format utils: public>+≡
  public :: pac_fmt

<Format utils: sub interfaces>+≡
  module subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
    character(*), intent(in) :: fmt_orig, fmt_pac
    character(*), intent(out) :: fmt
    logical, intent(in), optional :: pacify
  end subroutine pac_fmt

<Format utils: procedures>+≡
  module subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
    character(*), intent(in) :: fmt_orig, fmt_pac
    character(*), intent(out) :: fmt
    logical, intent(in), optional :: pacify
    logical :: pacified
    pacified = .false.
    if (present (pacify))  pacified = pacify
    if (pacified) then
      fmt = fmt_pac
    else
      fmt = fmt_orig
    end if
  end subroutine pac_fmt
```

### 3.4.6 Guard tiny values

This function can be applied if values smaller than  $10^{-99}$  would cause an underflow in the output format. We know that Fortran fixed-format can handle this by omitting the exponent letter, but we should expect non-Fortran or Fortran list-directed input, which would fail. We reset such values to  $\pm 10^{-99}$ , assuming that such tiny values would not matter, except for being non-zero.

```
<Format utils: public>+≡
  public :: refmt_tiny

<Format utils: sub interfaces>+≡
  elemental module function refmt_tiny (val) result (trunc_val)
    real(default), intent(in) :: val
    real(default) :: trunc_val
  end function refmt_tiny

<Format utils: procedures>+≡
  elemental module function refmt_tiny (val) result (trunc_val)
    real(default), intent(in) :: val
    real(default) :: trunc_val
    real(default), parameter :: tiny_val = 1.e-99_default

    if (val /= 0) then
      if (abs (val) < tiny_val) then
        trunc_val = sign (tiny_val, val)
      else
        trunc_val = val
      end if
    else
      trunc_val = val
    end if

  end function refmt_tiny
```

### 3.4.7 Compressed output of integer arrays

```
<Format utils: public>+≡
  public :: write_compressed_integer_array

<Format utils: sub interfaces>+≡
  module subroutine write_compressed_integer_array (chars, array)
    character(len=*), intent(out) :: chars
    integer, intent(in), allocatable, dimension(:) :: array
  end subroutine write_compressed_integer_array

<Format utils: procedures>+≡
  module subroutine write_compressed_integer_array (chars, array)
    character(len=*), intent(out) :: chars
    integer, intent(in), allocatable, dimension(:) :: array
    logical, dimension(:), allocatable :: used
    character(len=16) :: tmp
    type(string_t) :: string
    integer :: i, j, start_chain, end_chain
    chars = '[none]'
    string = ""
```

```

if (allocated (array)) then
if (size (array) > 0) then
allocate (used (size (array)))
used = .false.
do i = 1, size (array)
if (.not. used(i)) then
start_chain = array(i)
end_chain = array(i)
used(i) = .true.
EXTEND: do
do j = 1, size (array)
if (array(j) == end_chain + 1) then
end_chain = array(j)
used(j) = .true.
cycle EXTEND
end if
if (array(j) == start_chain - 1) then
start_chain = array(j)
used(j) = .true.
cycle EXTEND
end if
end do
exit
end do EXTEND
if (end_chain - start_chain > 0) then
write (tmp, "(I0,A,I0)") start_chain, "-", end_chain
else
write (tmp, "(I0)") start_chain
end if
string = string // trim (tmp)
if (any (.not. used)) then
string = string // ', '
end if
end if
end do
chars = string

### 3.5 Format Definitions

This module provides named integer parameters that specify certain format strings, used for numerical output.

*<format\_defs.f90>*≡

*<File header>*

module format\_defs

*<Standard module head>*

*⟨Format defs: public parameters⟩*

```
end module format_defs
```

We collect format strings for various numerical output formats here.

```
⟨Format defs: public parameters⟩≡  
character(*), parameter, public :: FMT_19 = "ES19.12"  
character(*), parameter, public :: FMT_18 = "ES18.11"  
character(*), parameter, public :: FMT_17 = "ES17.10"  
character(*), parameter, public :: FMT_16 = "ES16.9"  
character(*), parameter, public :: FMT_15 = "ES15.8"  
character(*), parameter, public :: FMT_14 = "ES14.7"  
character(*), parameter, public :: FMT_13 = "ES13.6"  
character(*), parameter, public :: FMT_12 = "ES12.5"  
character(*), parameter, public :: FMT_11 = "ES11.4"  
character(*), parameter, public :: FMT_10 = "ES10.3"
```

Fixed-point formats for better readability, where appropriate.

```
⟨Format defs: public parameters⟩+≡  
character(*), parameter, public :: FMF_12 = "F12.9"
```

## 3.6 Numeric Utilities

```
⟨numeric_utils.f90⟩≡  
⟨File header⟩

!***begin prologue dimach
!***purpose return floating point machine dependent constants.
!***library slatec
!***category r1
!***type single precision (dimach-s, dimach-d)
!***keywords machine constants
!***author fox, p. a., (bell labs)
!          hall, a. d., (bell labs)
!          schryer, n. l., (bell labs)
!***description
!
! dimach can be used to obtain machine-dependent parameters for the
! local machine environment. it is a function subprogram with one
! (input) argument, and can be referenced as follows:
!
!          a = dimach(i)
!
! where i=1,...,5. the (output) value of a above is determined by
! the (input) value of i. the results for various values of i are
! discussed below.
!
! dimach(1) = b**(emin-1), the smallest positive magnitude.
! dimach(2) = b**emax*(1 - b**(-t)), the largest magnitude.
! dimach(3) = b**(-t), the smallest relative spacing.
! dimach(4) = b**(1-t), the largest relative spacing.
! dimach(5) = log10(b)
!
! assume single precision numbers are represented in the t-digit,
! base-b form
!
!          sign (b**e)*( (x(1)/b) + ... + (x(t)/b**t) )
!
! where 0 .le. x(i) .lt. b for i=1,...,t, 0 .lt. x(1), and
! emin .le. e .le. emax.

```

```

!
!   the values of b, t, emin and emax are provided in i1mach as
!   follows:
!   i1mach(10) = b, the base.
!   i1mach(11) = t, the number of base-b digits.
!   i1mach(12) = emin, the smallest exponent e.
!   i1mach(13) = emax, the largest exponent e.

end subroutine iterator_1

```

# Chapter 4

## Testing

This part contains tools for automatic testing.

**unit\_tests** A handler that executes test procedures and compares and collects results.

### 4.1 Unit tests

We provide functionality for automated unit tests. Each test is required to produce output which is compared against a reference file. If the two are identical, we signal success. Otherwise, we signal failure and write the output to a file.

```
(unit_tests.f90)≡  
  <File header>  
  
  module unit_tests  
  
    <Use strings>  
  
    <Standard module head>  
  
    <Tests: public>  
  
    <Tests: types>  
  
    <Tests: interfaces>  
  
    interface  
      <Tests: sub interfaces>  
    end interface  
  
  end module unit_tests  
  
(unit_tests_sub.f90)≡  
  <File header>  
  
  submodule (unit_tests) unit_tests_s  
  
  use io_units
```

No internal dependencies

Figure 4.1: Module dependencies in `src/testing`.

```
implicit none

<Tests: parameters>

contains

<Tests: procedures>

end submodule unit_tests_s
```

#### 4.1.1 Parameters

Building blocks of file names. The directory names and suffixes are hard-coded here, and they must reflect actual Makefile targets where applicable.

```
<Tests: parameters>≡
  character(*), parameter :: ref_prefix = "ref-output/"
  character(*), parameter :: ref = ".ref"

  character(*), parameter :: err_prefix = "err-output/"
  character(*), parameter :: err = ".out"
```

#### 4.1.2 Type for storing test results

We store the results of the individual unit tests in a linked list. Here is the entry:

```
<Tests: public>≡
  public :: test_results_t

<Tests: types>≡
  type :: test_result_t
```

```

logical :: success = .false.
type(string_t) :: name
type(string_t) :: description
type(test_result_t), pointer :: next => null ()
end type test_result_t

```

```

type :: test_results_t
private
type(test_result_t), pointer :: first => null ()
type(test_result_t), pointer :: last => null ()
integer :: n_success = 0
integer :: n_failure = 0
contains
<Tests: test results: TBP>
end type test_results_t

```

Add a test result.

```

<Tests: test results: TBP>≡
  procedure :: add => test_results_add

<Tests: sub interfaces>≡
  module subroutine test_results_add (list, name, description, success)
    class(test_results_t), intent(inout) :: list
    character(len=*), intent(in) :: name
    character(len=*), intent(in) :: description
    logical, intent(in) :: success
  end subroutine test_results_add

<Tests: procedures>≡
  module subroutine test_results_add (list, name, description, success)
    class(test_results_t), intent(inout) :: list
    character(len=*), intent(in) :: name
    character(len=*), intent(in) :: description
    logical, intent(in) :: success
    type(test_result_t), pointer :: result
    allocate (result)
    result%success = success
    result%name = name
    result%description = description
    if (associated (list%first)) then
      list%last%next => result
    else
      list%first => result
    end if
    list%last => result
    if (success) then
      list%n_success = list%n_success + 1
    else
      list%n_failure = list%n_failure + 1
    end if
  end subroutine test_results_add

```

Display the current state.

```

<Tests: test results: TBP>+≡

```

```

    procedure, private :: write => test_results_write

    <Tests: sub interfaces>+≡
    module subroutine test_results_write (list, u)
    class(test_results_t), intent(in) :: list

    integer :: n
    n = list%n_success
  end function test_results_get_n_pass

  module function test_results_get_n_fail (list) result (n)
    class(test_results_t), intent(in) :: list
    integer :: n
    n = list%n_failure
  end function test_results_get_n_fail

  module function test_results_get_n_total (list) result (n)
    class(test_results_t), intent(in) :: list
    integer :: n
    n = list%n_success + list%n_failure
  end function test_results_get_n_total
```

Delete the list.

```
<Tests: test results: TBP>+≡
  procedure, private :: final => test_results_final

<Tests: sub interfaces>+≡
  module subroutine test_results_final (list)
    class(test_results_t), intent(inout) :: list
  end subroutine test_results_final

<Tests: procedures>+≡
  module subroutine test_results_final (list)
    class(test_results_t), intent(inout) :: list
    type(test_result_t), pointer :: result
    do while (associated (list%first))
      result => list%first
      list%first => result%next
    end do
```

```

deallocate (result)
end do
list%last => null ()
list%n_success = 0
list%n_failure = 0
end subroutine test_results_final

```

### 4.1.3 Wrapup

This will write results, report status, and finalize. This is the only method which we need to access from outside.

```

<Tests: test results: TBP>+≡
  procedure :: wrapup => test_results_wrapup

<Tests: sub interfaces>+≡
  module subroutine test_results_wrapup (list, u, success)
    class(test_results_t), intent(inout) :: list
    integer, intent(in) :: u
    logical, intent(out), optional :: success
    end subroutine test_results_wrapup

<Tests: procedures>+≡
  module subroutine test_results_wrapup (list, u, success)
    class(test_results_t), intent(inout) :: list
    integer, intent(in) :: u
    logical, intent(out), optional :: success
    call list%write (u)
    if (present (success)) call list%report (success)
    call list%final ()
    end subroutine test_results_wrapup

```

### 4.1.4 Tool for Unit Tests

This procedure takes a test routine as an argument. It runs the test, output directed to a temporary file. Then, it compares the file against a reference file.

The test routine must take the output unit as argument. We export this abstract interface, so the test drivers can reference it for declaring the actual test routines.

```

<Tests: public>+≡
  public :: unit_test

<Tests: interfaces>≡
  abstract interface
    subroutine unit_test (u)
      integer, intent(in) :: u
    end subroutine unit_test
  end interface

```

The test routine can print to screen and, optionally, to a logging unit. This driver runs the test given as an argument, directing its output to a scratch file which is then checked against a ref file. Only if it differs, it is copied to an err file.

NB: We call `fatal_force_crash` to produce a deliberate crash with back-trace on any fatal error, if the runtime system does allow it. This is not normal behavior, but should be useful if something goes wrong.

```

<Tests: public>+≡
  public :: test

<Tests: sub interfaces>+≡
  module subroutine test (test_proc, name, description, u_log, results)
    procedure(unit_test) :: test_proc
    character(*), intent(in) :: name
    character(*), intent(in) :: description
    integer, intent(in) :: u_log
    type(test_results_t), intent(inout) :: results
  end subroutine test

<Tests: procedures>+≡
  module subroutine test (test_proc, name, description, u_log, results)
    procedure(unit_test) :: test_proc
    character(*), intent(in) :: name
    character(*), intent(in) :: description
    integer, intent(in) :: u_log
    type(test_results_t), intent(inout) :: results
    integer :: u_test
    logical :: success

    call start_test (u_log, name)

    u_test = free_unit ()
    open (unit = u_test, status="scratch", action="readwrite")
    call fatal_force_crash ()
    call test_proc (u_test)
    rewind (u_test)

    call compare_test_results (u_test, u_log, name, success)
    call results%add (name, description, success)
    close (u_test)

  end subroutine test

```

Startup message. We expose this, as well as the comparison routine, for re-use in external test programs.

```

<Tests: public>+≡
  public :: start_test

<Tests: sub interfaces>+≡
  module subroutine start_test (u_log, name)
    integer, intent(in) :: u_log
    character(*), intent(in) :: name
  end subroutine start_test

```

```

<Tests: procedures>+≡
module subroutine start_test (u_log, name)
integer, intent(in) :: u_log
character(*), intent(in) :: name

write (*, "(A)", advance="no") "Running test: " // name
write (u_log, "(A)") "Test: " // name

end subroutine start_test

```

Do the actual comparison, given an open I/O unit `u_test`. In case of failure, copy the test results to an error file.

```

<Tests: public>+≡
public :: compare_test_results

<Tests: sub interfaces>+≡
module subroutine compare_test_results (u_test, u_log, name, success)
integer, intent(in) :: u_test
integer, intent(in) :: u_log
character(*), intent(in) :: name
logical, intent(out) :: success
end subroutine compare_test_results

<Tests: procedures>+≡
module subroutine compare_test_results (u_test, u_log, name, success)

end if

end subroutine compare_test_results

```

## Chapter 5

# System: Interfaces and Handlers

Here, we collect modules that deal with the “system”: operating-system interfaces, error handlers and diagnostics.

**system\_defs** Constants relevant for the modules in this set.

**diagnostics** Error and diagnostic message handling. Any messages and errors issued by WHIZARD functions are handled by the subroutines in this module, if possible.

**os\_interface** Execute system calls, build and link external object files and libraries.

**cputime** Timer data type and methods, for measuring performance.

### 5.1 Constants

The parameters here are used in various parts of the program, starting from the modules in the current chapter. Some of them may be modified if the need arises.

```
<system_defs.f90>≡  
  <File header>  
  
  module system_defs  
  
    use, intrinsic :: iso_fortran_env, only: iostat_end, iostat_eor !NODEP!  
  
    <Standard module head>  
  
    <System defs: public parameters>  
  
  end module system_defs
```

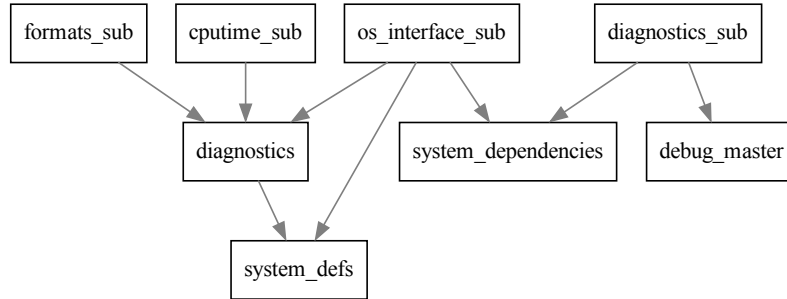

Figure 5.1: Module dependencies in `src/system`.

### 5.1.1 Version

The version string is used for checking files. Note that the string length **MUST** NOT be changed, because reading binary files relies on it.

```

<System defs: public parameters>≡
  integer, parameter, public :: VERSION_STRLEN = 255
  character(len=VERSION_STRLEN), parameter, public :: &
    & VERSION_STRING = "WHIZARD version <Version> (<Date>)"

```

### 5.1.2 Text Buffer

There is a hard limit on the line length which we should export. This buffer size is used both by the message handler, the lexer, and some further modules.

```

<System defs: public parameters>+≡
  integer, parameter, public :: BUFFER_SIZE = 1000

```

### 5.1.3 IOSTAT Codes

Defined in `iso_fortran_env`, but we would like to use shorthands.

```

<System defs: public parameters>+≡
  integer, parameter, public :: EOF = iostat_end, EOR = iostat_eor

```

### 5.1.4 Character Codes

Single-character constants.

```

<System defs: public parameters>+≡
  character, parameter, public :: BLANK = ' '
  character, parameter, public :: TAB = achar(9)
  character, parameter, public :: CR = achar(13)
  character, parameter, public :: LF = achar(10)

```

```
character, parameter, public :: BACKSLASH = achar(92)
```

Character strings that indicate character classes.

```
<System defs: public parameters>+≡
character(*), parameter, public :: WHITESPACE_CHARS = BLANK// TAB // CR // LF
character(*), parameter, public :: LCLETTERS = "abcdefghijklmnopqrstuvwxyz"
character(*), parameter, public :: UCLETTERS = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
character(*), parameter, public :: DIGIT_CHARS = "0123456789"
```

## 5.2 C wrapper for sigaction

This implements calls to `sigaction` and the appropriate signal handlers in C. The functionality is needed for the `diagnostics` module.

```
<signal_interface.c>≡
/*
<File header>
*/
#include <signal.h>
#include <stdlib.h>

extern int wo_sigint;
extern int wo_sigterm;
extern int wo_sigxcpu;
extern int wo_sigxfsz;

static void wo_handler_sigint (int sig) {
wo_sigint = sig;
}

static void wo_handler_sigterm (int sig) {
wo_sigterm = sig;
}

static void wo_handler_sigxcpu (int sig) {
wo_sigxcpu = sig;
}

static void wo_handler_sigxfsz (int sig) {
wo_sigxfsz = sig;
}

int wo_mask_sigint () {
struct sigaction sa;
sigset_t blocks;
sigfillset (&blocks);
sa.sa_flags = 0;
sa.sa_mask = blocks;
sa.sa_handler = wo_handler_sigint;
return sigaction(SIGINT, &sa, NULL);
}
```

```

int wo_mask_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigterm;
    return sigaction(SIGTERM, &sa, NULL);
}

```

```

int wo_mask_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxcpu;
    return sigaction(SIGXCPU, &sa, NULL);
}

```

```

int wo_mask_sigxfsz () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxfsz;
    return sigaction(SIGXFSZ, &sa, NULL);
}

```

```

int wo_release_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGINT, &sa, NULL);
}

```

```

int wo_release_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGTERM, &sa, NULL);
}

```

```

int wo_release_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
}

```

```

sa.sa_flags = 0;
sa.sa_mask = blocks;
sa.sa_handler = SIG_DFL;
return sigaction(SIGXCPU, &sa, NULL);
}

int wo_release_sigxfsz () {
struct sigaction sa;
sigset_t blocks;
sigfillset (&blocks);
sa.sa_flags = 0;
sa.sa_mask = blocks;
sa.sa_handler = SIG_DFL;
return sigaction(SIGXFSZ, &sa, NULL);
}

```

### 5.3 C wrapper for printf

The `printf` family of functions is implemented in C with an undefined number of arguments. This is not supported by the `bind(C)` interface. We therefore write wrappers for the versions of `sprintf` that we will actually use.

This is used by the `formats` module.

```

⟨sprintf_interface.c⟩≡
/*
⟨File header⟩
*/
#include <stdio.h>

int sprintf_none(char* str, const char* format) {
return sprintf(str, format);
}

int sprintf_int(char* str, const char* format, int val) {
return sprintf(str, format, val);
}

int sprintf_double(char* str, const char* format, double val) {
return sprintf(str, format, val);
}

int sprintf_str(char* str, const char* format, const char* val) {
return sprintf(str, format, val);
}

⟨sprintf interfaces⟩≡
interface
function sprintf_none (str, fmt) result (stat) bind(C)
use iso_c_binding !NODEP!
integer(c_int) :: stat
character(c_char), dimension(*) , intent(inout) :: str
character(c_char), dimension(*) , intent(in) :: fmt
end function sprintf_none

```

```

end interface

interface
function sprintf_int (str, fmt, val) result (stat) bind(C)
use iso_c_binding !NODEP!
integer(c_int) :: stat
character(c_char), dimension(*), intent(inout) :: str
character(c_char), dimension(*), intent(in) :: fmt
integer(c_int), value :: val
end function sprintf_int
end interface

interface
function sprintf_double (str, fmt, val) result (stat) bind(C)
use iso_c_binding !NODEP!
integer(c_int) :: stat
character(c_char), dimension(*), intent(inout) :: str
character(c_char), dimension(*), intent(in) :: fmt
real(c_double), value :: val
end function sprintf_double
end interface

interface
function sprintf_str(str, fmt, val) result (stat) bind(C)
use iso_c_binding !NODEP!
integer(c_int) :: stat
character(c_char), dimension(*), intent(inout) :: str
character(c_char), dimension(*), intent(in) :: fmt
character(c_char), dimension(*), intent(in) :: val
end function sprintf_str
end interface

```

## 5.4 Error, Message and Signal Handling

We are not so ambitious as to do proper exception handling in WHIZARD, but at least it may be useful to have a common interface for diagnostics: Results, messages, warnings, and such. As module variables we keep a buffer where the current message may be written to and a level indicator which tells which messages should be written on screen and which ones should be skipped. Alternatively, a string may be directly supplied to the message routine: this overrides the buffer, avoiding the necessity of formatted I/O in trivial cases.

```

<diagnostics.f90>≡
  <File header>

  module diagnostics

  use, intrinsic :: iso_c_binding !NODEP!

  <Use kinds>
  <Use strings>

```

```

use system_defs, only: BUFFER_SIZE, MAX_ERRORS

<Standard module head>

<Diagnostics: public>

<Diagnostics: parameters>

<Diagnostics: types>

<Diagnostics: variables>

<Diagnostics: interfaces>

interface
<Diagnostics: sub interfaces>
end interface

end module diagnostics

<Diagnostics: external procedures>
<diagnostics_sub.f90>≡
<File header>

submodule (diagnostics) diagnostics_s

use, intrinsic :: iso_fortran_env, only: output_unit !NODEP!

use system_dependencies
<Use debug>
use string_utils, only: str
use io_units

implicit none

contains

<Diagnostics: procedures>

end submodule diagnostics_s

```

Diagnostics levels:

```

<Diagnostics: public>≡

```

Mask fatal errors so that are treated as normal errors. Useful for interactive mode.

```

<Diagnostics: public>+≡
  public :: mask_fatal_errors
<Diagnostics: variables>+≡
  logical, save :: mask_fatal_errors = .false.

```

How to handle bugs and unmasked fatal errors. Either execute a normal stop statement, or call the C `exit()` function, or try to cause a program crash by dereferencing a null pointer.

These procedures are appended to the `diagnostics` source code, but not as module procedures but as external procedures. This avoids a circular module dependency across source directories.

```

<Diagnostics: parameters>+≡
  integer, parameter, public :: TERM_STOP = 0, TERM_EXIT = 1, TERM_CRASH = 2
<Diagnostics: public>+≡
  public :: handle_fatal_errors
<Diagnostics: variables>+≡
  integer, save :: handle_fatal_errors = TERM_EXIT
<Diagnostics: external procedures>≡
  subroutine fatal_force_crash ()
  use diagnostics, only: handle_fatal_errors, TERM_CRASH !NODEP!
  implicit none
  handle_fatal_errors = TERM_CRASH
  end subroutine fatal_force_crash

  subroutine fatal_force_exit ()
  use diagnostics, only: handle_fatal_errors, TERM_EXIT !NODEP!
  implicit none
  handle_fatal_errors = TERM_EXIT
  end subroutine fatal_force_exit

  subroutine fatal_force_stop ()
  use diagnostics, only: handle_fatal_errors, TERM_STOP !NODEP!
  implicit none
  handle_fatal_errors = TERM_STOP
  end subroutine fatal_force_stop

```

Keep track of errors. This might be used for exception handling, later. The counter is incremented only for screen messages, to avoid double counting.

```

<Diagnostics: public>+≡
  public :: msg_count
<Diagnostics: variables>+≡
  integer, dimension(TERMINATE:WARNING), save :: msg_count = 0

```

Keep a list of all errors and warnings. Since we do not know the number of entries beforehand, we use a linked list.

```

<Diagnostics: types>+=
  type :: string_list
  character(len=BUFFER_SIZE) :: string
  type(string_list), pointer :: next
end type string_list
  type :: string_list_pointer
  type(string_list), pointer :: first, last
end type string_list_pointer

```

```

<Diagnostics: variables>+=
  type(string_list_pointer), dimension(TERMINATE:WARNING), save :: &
  & msg_list = string_list_pointer (null(), null())

```

Create a format string indicating color

Add the current message buffer contents to the internal list.

```

<Diagnostics: procedures>+=
  subroutine msg_add (level)
    integer, intent(in) :: level
    type(string_list), pointer :: message
    select case (level)
    case (TERMINATE:WARNING)
      allocate (message)
      message%string = msg_buffer
      nullify (message%next)
      if (.not.associated (msg_list(level)%first)) &
        & msg_list(level)%first => message
      if (associated (msg_list(level)%last)) &
        & msg_list(level)%last%next => message
      msg_list(level)%last => message
      msg_count(level) = msg_count(level) + 1
    end select
  end subroutine msg_add

```

Initialization:

```

<Diagnostics: public>+=
  public :: msg_list_clear

<Diagnostics: sub interfaces>+=
  module subroutine msg_list_clear
  end subroutine msg_list_clear

<Diagnostics: procedures>+=
  module subroutine msg_list_clear
    integer :: level
    type(string_list), pointer :: message
    do level = TERMINATE, WARNING
      do while (associated (msg_list(level)%first))
        message => msg_list(level)%first
        msg_list(level)%first => message%next
        deallocate (message)
      end do
      nullify (msg_list(level)%last)
    end do
  end module subroutine msg_list_clear

```

```

end do
msg_count = 0
end subroutine msg_list_clear

```

Display the summary of errors and warnings (no need to count fatals...)

```

<Diagnostics: public>+≡
  public :: msg_summary

<Diagnostics: sub interfaces>+≡
  module subroutine msg_summary (unit)
    integer, intent(in), optional :: unit
  end subroutine msg_summary

<Diagnostics: procedures>+≡
  module subroutine msg_summary (unit)
    integer, intent(in), optional :: unit
    call expect_summary (unit)
    1  format (A,1x,I2,1x,A,I2,1x,A)
    if (msg_count(ERROR) > 0 .and. msg_count(WARNING) > 0) then
      write (msg_buffer, 1) "There were", &
        & msg_count(ERROR), "error(s) and ", &

  else
    write (u, "(A)") trim (message%string)
  end if
  message => message%next
end do
flush (u)
end subroutine msg_listing

```

The message buffer:

```

<Diagnostics: public>+≡
  public :: msg_buffer

<Diagnostics: variables>+≡
  character(len=BUFFER_SIZE), save :: msg_buffer = " "

```

After a message is issued, the buffer should be cleared:

```

<Diagnostics: procedures>+≡
  subroutine buffer_clear
    msg_buffer = " "
  end subroutine buffer_clear

<Diagnostics: public>+≡
  public :: create_col_string

<Diagnostics: sub interfaces>+≡
  module function create_col_string (color) result (col_string)
    type(string_t) :: col_string
    integer, intent(in) :: color
  end function create_col_string

<Diagnostics: procedures>+≡
  module function create_col_string (color) result (col_string)
    type(string_t) :: col_string
    integer, intent(in) :: color
    character(2) :: buf
    write (buf, '(I2)') color
    col_string = var_str ("[" // var_str (buf) // var_str ("m")
  end function create_col_string

```

The generic handler for messages. If the unit is omitted (or = 6), the message is written to standard output if the precedence is sufficiently high (as determined by the value of `msg_level`). If the string is omitted, the buffer is used. In any case, the buffer is cleared after printing. In accordance with FORTRAN custom, the first column in the output is left blank. For messages and warnings, an additional exclamation mark and a blank is prepended. Furthermore, each message is appended to the internal message list (without prepending anything).

```

<Diagnostics: procedures>+≡

```

The number of non-fatal errors that we allow before stopping the program. We might trade this later for an adjustable number.

```

<System defs: public parameters>+≡
integer, parameter, public :: MAX_ERRORS = 10

```

The specific handlers. In the case of fatal errors, bugs (failed assertions) and normal termination execution is stopped. For non-fatal errors a message is printed to standard output if no unit is given. Only if the number of MAX\_ERRORS errors is reached, we abort the program. There are no further actions in the other cases, but this may change.

Debugging aids. Print messages or values of various kinds. All versions ultimately call `msg_debug_none`, which in turn uses `message_print`.

Safeguard: force crash if a routine (i.e., a debugging routine below) is called while the master switch `debug_on` is unset. Such calls should always be hidden behind `if (debug_on)`, since they can significantly slow down the program.

```

<debug guard>≡
  if (.not. debug_on) call msg_bug ("msg_debug called with debug_on=.false.")

```

The `debug_on` flag is provided by the `debug_master` module, and we can assume that it is a compile-time parameter.

```

```

### 5.4.2 Checking values

The `expect` function does not just check a value for correctness (actually, it checks if a logical expression is true); it records its result here. If failures are present when the program terminates, the exit code is nonzero.

```

<Diagnostics: variables>+≡
integer, save :: expect_total = 0
integer, save :: expect_failures = 0

<Diagnostics: public>+≡
public :: expect_record

<Diagnostics: sub interfaces>+≡
module subroutine expect_record (success)
logical, intent(in) :: success
end subroutine expect_record

<Diagnostics: procedures>+≡
module subroutine expect_record (success)
logical, intent(in) :: success
expect_total = expect_total + 1
if (.not. success) expect_failures = expect_failures + 1
end subroutine expect_record

<Diagnostics: public>+≡
public :: expect_clear

<Diagnostics: sub interfaces>+≡
module subroutine expect_clear ()
end subroutine expect_clear

<Diagnostics: procedures>+≡
module subroutine expect_clear ()
expect_total = 0
expect_failures = 0
end subroutine expect_clear

<Diagnostics: public>+≡
public :: expect_summary

```

*<Diagnostics: sub interfaces>+≡*

```
module subroutine expect_summary (unit, force)
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: force
end subroutine expect_summary
```

*<Diagnostics: procedures>+≡*

```
module subroutine expect_summary (unit, force)
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: force
  logical :: force_output
  force_output = .false.; if (present (force)) force_output = force
  if (expect_total /= 0 .or. force_output) then
    call msg_message ("Summary of value checks:", unit)
    write (msg_buffer, "(2x,A,1x,I0,1x,A,1x,A,1x,I0)" &
      "Failures:", expect_failures, "/", "Total:", expect_total)
    call msg_message (unit=unit)
  end if
end subroutine expect_summary
```

c = char (cmplx2string (x))
end function cmplx2char

```

### 5.4.3 Signal handling

Killing the program by external signals may leave the files written by it in an undefined state. This can be avoided by catching signals and deferring program termination. Instead of masking only critical sections, we choose to mask signals globally (done in the main program) and terminate the program at predefined checkpoints only. Checkpoints are after each command, within the sampling function (so the program can be terminated after each event), and after each iteration in the phase-space generation algorithm.

Signal handling is done via a C interface to the `sigaction` system call. When a signal is raised that has been masked by the handler, the corresponding variable is set to the value of the signal. The variables are visible from the C signal handler.

The signal `SIGINT` is for keyboard interrupt (ctrl-C), `SIGTERM` is for system interrupt, e.g., at shutdown. The `SIGXCPU` and `SIGXFSZ` signals may be issued by batch systems.

```

<Diagnostics: public>+≡
public :: wo_sigint
public :: wo_sigterm
public :: wo_sigxcpu
public :: wo_sigxfsz

<Diagnostics: variables>+≡
integer(c_int), bind(C), volatile :: wo_sigint = 0
integer(c_int), bind(C), volatile :: wo_sigterm = 0
integer(c_int), bind(C), volatile :: wo_sigxcpu = 0
integer(c_int), bind(C), volatile :: wo_sigxfsz = 0

```

Here are the interfaces to the C functions. The routine `mask_term_signals` forces termination signals to be delayed. `release_term_signals` restores normal behavior. However, the program can be terminated anytime by calling `terminate_now_if_signal` which inspects the signals and terminates the program if requested..

```

<Diagnostics: public>+≡
public :: mask_term_signals

```

```

<Diagnostics: sub interfaces>+≡

## 5.5 Operating-system interface

For specific purposes, we need direct access to the OS (system calls). This is, of course, system dependent. The current version is valid for GNU/Linux; we expect to use a preprocessor for this module if different OSs are to be supported.

The current implementation lacks error handling.

```

<os_interface.f90>≡
  <File header>

  module os_interface

    use, intrinsic :: iso_c_binding !NODEP!

```

```

    <Use strings>

    <Standard module head>

    <OS interface: public>

    <OS interface: types>

    <OS interface: interfaces>

    interface
    <OS interface: sub interfaces>
    end interface

    end module os_interface

    <os_interface_sub.f90>≡
    <File header>

    submodule (os_interface) os_interface_s

    use system_defs, only: DLERROR_LEN, ENVVAR_LEN
    use io_units
    use diagnostics
    use system_dependencies

    <Use mpi f08>

    implicit none

    contains

    <OS interface: procedures>

    end submodule os_interface_s

```

### 5.5.1 Path variables

This is a transparent container for storing user-defined path variables.

```

    <OS interface: public>≡
    public :: paths_t

    <OS interface: types>≡
    type :: paths_t
    type(string_t) :: prefix
    type(string_t) :: exec_prefix
    type(string_t) :: bindir
    type(string_t) :: libdir
    type(string_t) :: includedir
    type(string_t) :: datarootdir
    type(string_t) :: localprefix
    type(string_t) :: libtool
    type(string_t) :: lhapdfdir

```

```

end type paths_t

<OS interface: public>+≡
  public :: paths_init

<OS interface: sub interfaces>≡
  module subroutine paths_init (paths)
    type(paths_t), intent(out) :: paths
  end subroutine paths_init

<OS interface: procedures>≡
  module subroutine paths_init (paths)
    type(paths_t), intent(out) :: paths
    paths%prefix = ""
    paths%exec_prefix = ""
    paths%bindir = ""
    paths%libdir = ""
    paths%includedir = ""
    paths%datarootdir = ""
    paths%localprefix = ""
    paths%libtool = ""
    paths%lhapidfdir = ""
  end subroutine paths_init

```

### 5.5.2 System dependencies

We store all potentially system- and user/run-dependent data in a transparent container. This includes compiler/linker names and flags, file extensions, etc. There are actually two different possibilities for extensions of shared libraries, depending on whether the Fortran compiler or the system linker (usually the C compiler) has been used for linking. The default for the Fortran compiler on most systems is `.so`.

```

<OS interface: public>+≡
  public :: os_data_t

<OS interface: types>+≡
  type :: os_data_t
    logical :: use_libtool
    logical :: use_testfiles

```

### 5.5.3 Dynamic linking

We define a type that holds the filehandle for a dynamically linked library (shared object), together with functions to open and close the library, and to access functions in this library.

```

<OS interface: public>+≡
  public :: dlaccess_t
<OS interface: types>+≡
  type :: dlaccess_t
  private
  type(string_t) :: filename
  type(c_ptr) :: handle = c_null_ptr
  logical :: is_open = .false.
  logical :: has_error = .false.
  type(string_t) :: error
  contains
  <OS interface: dlaccess: TBP>
end type dlaccess_t

```

Output. This is called by the output routine for the process library.

```

<OS interface: dlaccess: TBP>≡
  procedure :: write => dlaccess_write
<OS interface: sub interfaces>+≡
  module subroutine dlaccess_write (object, unit)
  class(dlaccess_t), intent(in) :: object
  integer, intent(in) :: unit
  end subroutine dlaccess_write
<OS interface: procedures>+≡
  module subroutine dlaccess_write (object, unit)
  class(dlaccess_t), intent(in) :: object
  integer, intent(in) :: unit
  write (unit, "(1x,A)") "DL access info:"
  write (unit, "(3x,A,L1)") "is open = ", object%is_open
  if (object%has_error) then
  write (unit, "(3x,A,A,A)") "error = ', char (object%error), '''
  else
  write (unit, "(3x,A)") "error = [none]"
  end if
end subroutine dlaccess_write

```

The interface to the library functions:

```

<OS interface: interfaces>≡
  interface
    function dlopen (filename, flag) result (handle) bind(C)
    import
    character(c_char), dimension(*) :: filename
    integer(c_int), value :: flag
    type(c_ptr) :: handle
    end function dlopen
  end interface

  interface
    function dlclose (handle) result (status) bind(C)
    import
    type(c_ptr), value :: handle
    integer(c_int) :: status
    end function dlclose
  end interface

  interface
    function dlerror () result (str) bind(C)
    import
    type(c_ptr) :: str
    end function dlerror
  end interface

  interface
    function dlsym (handle, symbol) result (fptr) bind(C)
    import
    type(c_ptr), value :: handle
    character(c_char), dimension(*) :: symbol
    type(c_funptr) :: fptr
    end function dlsym
  end interface

```

This reads an error string and transforms it into a `string_t` object, if an error has occurred. If not, set the error flag to false and return an empty string.

```

<System defs: public parameters>+≡
  integer, parameter, public :: DLERROR_LEN = 160

<OS interface: procedures>+≡
  subroutine read_dlerror (has_error, error)
    logical, intent(out) :: has_error
    type(string_t), intent(out) :: error
    type(c_ptr) :: err_cptr
    character(len=DLERROR_LEN, kind=c_char), pointer :: err_fptr
    integer :: str_end
    err_cptr = dlerror ()
    if (c_associated (err_cptr)) then
      call c_f_pointer (err_cptr, err_fptr)
      has_error = .true.
      str_end = scan (err_fptr, c_null_char)
      if (str_end > 0) then
        error = err_fptr(1:str_end-1)
      end if
    end if
  end subroutine

```

```

else
error = err_fptr
end if
else
has_error = .false.
error = ""
end if
end subroutine read_dlerror

```

This is the Fortran API. Init/final open and close the file, i.e., load and unload the library.

Note that a library can be opened more than once, and that for an ultimate close as many `dlclose` calls as `dlopen` calls are necessary. However, we assume that it is opened and closed only once.

```

<OS interface: public>+≡
  public :: dlaccess_init
  public :: dlaccess_final

<OS interface: dlaccess: TBP>+≡
  procedure :: init => dlaccess_init
  procedure :: final => dlaccess_final

<OS interface: sub interfaces>+≡
  module subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
  class(dlaccess_t), intent(out) :: dlaccess
  type(string_t), intent(in) :: prefix, libname
  type(os_data_t), intent(in), optional :: os_data
  end subroutine dlaccess_init
  module subroutine dlaccess_final (dlaccess)
  class(dlaccess_t), intent(inout) :: dlaccess
  end subroutine dlaccess_final

<OS interface: procedures>+≡
  module subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
  class(dlaccess_t), intent(out) :: dlaccess
  type(string_t), intent(in) :: prefix, libname
  type(os_data_t), intent(in), optional :: os_data
  type(string_t) :: filename
  logical :: exist
  dlaccess%filename = libname
  filename = prefix // "/" // libname
  inquire (file=char(filename), exist=exist)
  if (.not. exist) then
  filename = prefix // "/.libs/" // libname
  inquire (file=char(filename), exist=exist)
  if (.not. exist) then
  dlaccess%has_error = .true.
  dlaccess%error = "Library '" // filename // "' not found"
  return
  end if
  end if
  dlaccess%handle = dlopen (char (filename) // c_null_char, ior ( &
  RTLD_LAZY, RTLD_LOCAL))
  dlaccess%is_open = c_associated (dlaccess%handle)
  call read_dlerror (dlaccess%has_error, dlaccess%error)

```

```

end subroutine dlaccess_init

module subroutine dlaccess_final (dlaccess)
class(dlaccess_t), intent(inout) :: dlaccess
integer(c_int) :: status
if (dlaccess%is_open) then
status = dlclose (dlaccess%handle)
dlaccess%is_open = .false.
call read_dlerror (dlaccess%has_error, dlaccess%error)
end if
end subroutine dlaccess_final

```

Return true if an error has occurred.

```

<OS interface: public>+≡
public :: dlaccess_has_error

<OS interface: sub interfaces>+≡
module function dlaccess_has_error (dlaccess) result (flag)
logical :: flag
type(dlaccess_t), intent(in) :: dlaccess
end function dlaccess_has_error

<OS interface: procedures>+≡
module function dlaccess_has_error (dlaccess) result (flag)
logical :: flag
type(dlaccess_t), intent(in) :: dlaccess
flag = dlaccess%has_error
end function dlaccess_has_error

```

Return the error string currently stored in the dlaccess object.

```

<OS interface: public>+≡
public :: dlaccess_get_error

<OS interface: sub interfaces>+≡
module function dlaccess_get_error (dlaccess) result (error)
type(string_t) :: error
type(dlaccess_t), intent(in) :: dlaccess
end function dlaccess_get_error

<OS interface: procedures>+≡
module function dlaccess_get_error (dlaccess) result (error)
type(string_t) :: error
type(dlaccess_t), intent(in) :: dlaccess
error = dlaccess%error
end function dlaccess_get_error

```

The symbol handler returns the C address of the function with the given string name. (It is a good idea to use `bind(C)` for all functions accessed by this, such that the name string is well-defined.) Call `c_f_procpointer` to cast this into a Fortran procedure pointer with an appropriate interface.

```

<OS interface: public>+≡
public :: dlaccess_get_c_funptr

```

```

<OS interface: sub interfaces>+≡
  module function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
    type(c_funptr) :: fptr
    type(dlaccess_t), intent(inout) :: dlaccess
    type(string_t), intent(in) :: fname
  end function dlaccess_get_c_funptr

<OS interface: procedures>+≡
  module function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
    type(c_funptr) :: fptr
    type(dlaccess_t), intent(inout) :: dlaccess
    type(string_t), intent(in) :: fname
    fptr = dlsym (dlaccess%handle, char (fname) // c_null_char)
    call read_dlerror (dlaccess%has_error, dlaccess%error)
  end function dlaccess_get_c_funptr

```

### 5.5.4 Predicates

Return true if the library is loaded. In particular, this is false if loading was unsuccessful.

```

<OS interface: public>+≡
  public :: dlaccess_is_open

<OS interface: sub interfaces>+≡
  module function dlaccess_is_open (dlaccess) result (flag)
    logical :: flag
    type(dlaccess_t), intent(in) :: dlaccess
  end function dlaccess_is_open

<OS interface: procedures>+≡
  module function dlaccess_is_open (dlaccess) result (flag)
    logical :: flag
    type(dlaccess_t), intent(in) :: dlaccess
    flag = dlaccess%is_open
  end function dlaccess_is_open

```

### 5.5.5 Shell access

This is the standard system call for executing a shell command, such as invoking a compiler.

In F2008 there will be the equivalent built-in command `execute_command_line`.

```

<OS interface: public>+≡
  public :: os_system_call

<OS interface: sub interfaces>+≡
  module subroutine os_system_call (command_string, status, verbose)
    type(string_t), intent(in) :: command_string
    integer, intent(out), optional :: status
    logical, intent(in), optional :: verbose
  end subroutine os_system_call

```

```

<OS interface: procedures>+≡
module subroutine os_system_call (command_string, status, verbose)
  type(string_t), intent(in) :: command_string
  integer, intent(out), optional :: status
  logical, intent(in), optional :: verbose
  logical :: verb
  integer :: stat
  verb = .false.; if (present (verbose)) verb = verbose
  if (verb) &
    call msg_message ("command: " // char (command_string))
  stat = system (char (command_string) // c_null_char)
  if (present (status)) then
    status = stat
  else if (stat /= 0) then
    if (.not. verb) &
      call msg_message ("command: " // char (command_string))
    write (msg_buffer, "(A,I0)") "Return code = ", stat
    call msg_message ()
    call msg_fatal ("System command returned with nonzero status code")
  end if
end subroutine os_system_call

```

```

<OS interface: interfaces>+≡
interface
function system (command) result (status) bind(C)
import
integer(c_int) :: status
character(c_char), dimension(*) :: command
end function system
end interface

```

### 5.5.6 Querying for a directory

This queries for the existence of a directory. There is no standard way to achieve this in FORTRAN, and if we were to call into `libc`, we would need access to C macros for evaluating the result, so we resort to calling `test` as a system call.

```

<OS interface: public>+≡
public :: os_dir_exist

<OS interface: sub interfaces>+≡
module function os_dir_exist (name) result (res)
  type(string_t), intent(in) :: name
  logical :: res
end function os_dir_exist

<OS interface: procedures>+≡
module function os_dir_exist (name) result (res)
  type(string_t), intent(in) :: name
  logical :: res
  integer :: status
  call os_system_call ('test -d "' // name // '"', status=status)
  res = status == 0
end function os_dir_exist

```

```

<OS interface: public>+≡
  public :: os_file_exist
<OS interface: sub interfaces>+≡
  module function os_file_exist (name) result (exist)
    type(string_t), intent(in) :: name
    logical :: exist
  end function os_file_exist
<OS interface: procedures>+≡
  module function os_file_exist (name) result (exist)
    type(string_t), intent(in) :: name
    logical :: exist
    inquire (file = char (name), exist=exist)
  end function os_file_exist

```

### 5.5.7 Pack/unpack

The argument to **pack** may be a file or a directory. The name of the packed file will get the **pack\_ext** extension appended. The argument to **unpack** must be a file, with the extension already included in the file name.

```

<OS interface: public>+≡
  public :: os_pack_file
  public :: os_unpack_file
<OS interface: sub interfaces>+≡
  module subroutine os_pack_file (file, os_data, status)
    type(string_t), intent(in) :: file
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
  end subroutine os_pack_file
  module subroutine os_unpack_file (file, os_data, status)
    type(string_t), intent(in) :: file
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
  end subroutine os_unpack_file
<OS interface: procedures>+≡
  module subroutine os_pack_file (file, os_data, status)
    type(string_t), intent(in) :: file
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
    type(string_t) :: command_string
    command_string = os_data%pack_cmd // " " &
    // file // os_data%pack_ext // " " // file
    call os_system_call (command_string, status)
  end subroutine os_pack_file

  module subroutine os_unpack_file (file, os_data, status)
    type(string_t), intent(in) :: file
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
    type(string_t) :: command_string

```

```

command_string = os_data%unpack_cmd // " " // file
call os_system_call (command_string, status)
end subroutine os_unpack_file

```

### 5.5.8 Fortran compiler and linker

Compile a single module for use in a shared library, but without linking.

```

<OS interface: public>+≡
  public :: os_compile_shared

<OS interface: sub interfaces>+≡
  module subroutine os_compile_shared (src, os_data, status)
    type(string_t), intent(in) :: src
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
  end subroutine os_compile_shared

<OS interface: procedures>+≡
  module subroutine os_compile_shared (src, os_data, status)
    type(string_t), intent(in) :: src
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
    type(string_t) :: command_string
    if (os_data%use_libtool) then
      command_string = &
        os_data%whizard_libtool // " -mode=compile " // &
        os_data%fc // " " // &
        "-c " // &
        os_data%whizard_includes // " " // &
        os_data%fcflags // " " // &
        "' ' // src // os_data%fc_src_ext // '"
    else
      command_string = &
        os_data%fc // " " // &
        "-c " // &
        os_data%fcflags_pic // " " // &
        os_data%whizard_includes // " " // &
        os_data%fcflags // " " // &
        "' ' // src // os_data%fc_src_ext // '"
    end if
    call os_system_call (command_string, status)
  end subroutine os_compile_shared

```

Link an array of object files to build a shared object library. In the libtool case, we have to specify a `-rpath`, otherwise only a static library can be built. However, since the library is never installed, this `rpath` is irrelevant.

```

<OS interface: public>+≡
  public :: os_link_shared

<OS interface: sub interfaces>+≡
  module subroutine os_link_shared (objlist, lib, os_data, status)
    type(string_t), intent(in) :: objlist, lib
    type(os_data_t), intent(in) :: os_data

```

```

integer, intent(out), optional :: status
end subroutine os_link_shared

<OS interface: procedures>+≡
module subroutine os_link_shared (objlist, lib, os_data, status)
type(string_t), intent(in) :: objlist, lib
type(os_data_t), intent(in) :: os_data
integer, intent(out), optional :: status
type(string_t) :: command_string
if (os_data%use_libtool) then
command_string = &
os_data%whizard_libtool // " -mode=link " // &
os_data%fc // " " // &
"-module " // &
"-rpath /usr/local/lib" // " " // &
os_data%fcflags // " " // &
os_data%whizard_ldflags // " " // &
os_data%ldflags // " " // &
"-o '" // lib // ".la' " // &
objlist
else
command_string = &
os_data%ld // " " // &
os_data%ldflags_so // " " // &
os_data%fcflags // " " // &
os_data%whizard_ldflags // " " // &
os_data%ldflags // " " // &
"-o '" // lib // "." // os_data%fc_shrlib_ext // "' " // &
objlist
end if
call os_system_call (command_string, status)
end subroutine os_link_shared

```

Link an array of object files / libraries to build a static executable.

```

<OS interface: public>+≡
public :: os_link_static

<OS interface: sub interfaces>+≡
module subroutine os_link_static (objlist, exec_name, os_data, status)
type(string_t), intent(in) :: objlist, exec_name
type(os_data_t), intent(in) :: os_data
integer, intent(out), optional :: status
end subroutine os_link_static

<OS interface: procedures>+≡
module subroutine os_link_static (objlist, exec_name, os_data, status)
type(string_t), intent(in) :: objlist, exec_name
type(os_data_t), intent(in) :: os_data
integer, intent(out), optional :: status
type(string_t) :: command_string
if (os_data%use_libtool) then
command_string = &
os_data%whizard_libtool // " -mode=link " // &
os_data%fc // " " // &
"-static " // &

```

```

os_data%fcflags // " " // &
os_data%whizard_ldflags // " " // &
os_data%ldflags // " " // &
os_data%ldflags_static // " " // &
"-o '" // exec_name // "' " // &
objlist // " " // &
os_data%ldflags_hepmc // " " // &
os_data%ldflags_lcio // " " // &
os_data%ldflags_hoppet // " " // &
os_data%ldflags_looptools
else
command_string = &
os_data%ld // " " // &
os_data%ldflags_so // " " // &
os_data%fcflags // " " // &
os_data%whizard_ldflags // " " // &
os_data%ldflags // " " // &
os_data%ldflags_static // " " // &
"-o '" // exec_name // "' " // &
objlist // " " // &
os_data%ldflags_hepmc // " " // &
os_data%ldflags_lcio // " " // &
os_data%ldflags_hoppet // " " // &
os_data%ldflags_looptools
end if
call os_system_call (command_string, status)
end subroutine os_link_static

```

Determine the name of the shared library to link. If libtool is used, this is encoded in the .la file which resides in place of the library itself.

```

<OS interface: public>+≡
public :: os_get_dlname

<OS interface: sub interfaces>+≡
module function os_get_dlname (lib, os_data, ignore, silent) result (dlname)
type(string_t) :: dlname
type(string_t), intent(in) :: lib
type(os_data_t), intent(in) :: os_data
logical, intent(in), optional :: ignore, silent
end function os_get_dlname

<OS interface: procedures>+≡
module function os_get_dlname (lib, os_data, ignore, silent) result (dlname)
type(string_t) :: dlname
type(string_t), intent(in) :: lib
type(os_data_t), intent(in) :: os_data
logical, intent(in), optional :: ignore, silent
type(string_t) :: filename
type(string_t) :: buffer
logical :: exist, required, quiet
integer :: u
u = free_unit ()
if (present (ignore)) then
required = .not. ignore
else

```

```

required = .true.
end if
if (present (silent)) then
quiet = silent
else
quiet = .false.
end if
if (os_data%use_libtool) then
filename = lib // ".la"
inquire (file=char(filename), exist=exist)
if (exist) then
open (unit=u, file=char(filename), action="read", status="old")
SCAN_LTFILE: do
call get (u, buffer)
if (extract (buffer, 1, 7) == "dlname=") then
dlname = extract (buffer, 9)
dlname = remove (dlname, len (dlname))
exit SCAN_LTFILE
end if
end do SCAN_LTFILE
close (u)
else if (required) then
if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
// "': libtool archive not found")
dlname = ""
else
if (.not. quiet) call msg_message ("[No compiled library '" &
// char (lib) // "']")
dlname = ""
end if
else
dlname = lib // "." // os_data%fc_shrlib_ext
inquire (file=char(dlname), exist=exist)
if (.not. exist) then
if (required) then
if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
// "' not found")
else
if (.not. quiet) call msg_message &
("[No compiled process library '" // char (lib) // "']")
dlname = ""
end if
end if
end if
end if
end function os_get_dlname

```

### 5.5.9 Controlling OpenMP

OpenMP is handled automatically by the library for the most part. Here is a convenience routine for setting the number of threads, with some diagnostics.

```

<OS interface: public>+≡
public :: openmp_set_num_threads_verbose

```

```

<OS interface: sub interfaces>+≡
  module subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
    integer, intent(in) :: num_threads
    logical, intent(in), optional :: openmp_logging
    end subroutine openmp_set_num_threads_verbose

<OS interface: procedures>+≡
  module subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
    integer, intent(in) :: num_threads
    integer :: n_threads
    logical, intent(in), optional :: openmp_logging
    logical :: logging
    if (present (openmp_logging)) then
      logging = openmp_logging
    else
      logging = .true.
    end if
    n_threads = num_threads
    if (openmp_is_active ()) then
      if (num_threads == 1) then
        if (logging) then
          write (msg_buffer, "(A,IO,A)") "OpenMP: Using ", num_threads, &
            " thread"
          call msg_message
        end if
        n_threads = num_threads
      else if (num_threads > 1) then
        if (logging) then
          write (msg_buffer, "(A,IO,A)") "OpenMP: Using ", num_threads, &
            " threads"
          call msg_message
        end if
        n_threads = num_threads
      else
        if (logging) then
          write (msg_buffer, "(A,IO,A)") "OpenMP: " &
            // "Illegal value of openmp_num_threads (", num_threads, &
            ") ignored"
          call msg_error
        end if
        n_threads = openmp_get_default_max_threads ()
        if (logging) then
          write (msg_buffer, "(A,IO,A)") "OpenMP: Using ", &
            n_threads, " threads"
          call msg_message
        end if
        end if
        if (n_threads > openmp_get_default_max_threads ()) then
          if (logging) then
            write (msg_buffer, "(A,IO)") "OpenMP: " &
              // "Number of threads is greater than library default of ", &
              openmp_get_default_max_threads ()
            call msg_warning
          end if
        end if
      end if
    end if
  end subroutine

```

```

call openmp_set_num_threads (n_threads)
else if (num_threads /= 1) then
  if (logging) then
    write (msg_buffer, "(A,IO,A)") "openmp_num_threads set to ", &
    num_threads, ", but OpenMP is not active: ignored"
    call msg_warning
  end if
end if
end subroutine openmp_set_num_threads_verbose

```

### 5.5.10 Controlling MPI

The overall MPI handling has to be defined in a context specific way, but we can simplify things like logging or receiving `n_size` or `rank`.

```

<OS interface: public>+≡
  public :: mpi_set_logging

<OS interface: sub interfaces>+≡
  module subroutine mpi_set_logging (mpi_logging)
    logical, intent(in) :: mpi_logging
  end subroutine mpi_set_logging

<OS interface: procedures>+≡
  module subroutine mpi_set_logging (mpi_logging)
    logical, intent(in) :: mpi_logging
    integer :: n_size, rank
    call mpi_get_comm_id (n_size, rank)
    if (mpi_logging .and. n_size > 1) then

## 5.6 Interface for formatted I/O

For access to formatted printing (possibly input), we interface the C `printf` family of functions. There are two important issues here:

1. `printf` takes an arbitrary number of arguments, relying on the C stack. This is not interoperable. We interface it with C wrappers that output a single integer, real or string and restrict the allowed formats accordingly.
2. Restricting format strings is essential also for preventing format string attacks. Allowing arbitrary format string would create a real security hole in a Fortran program.
3. The string returned by `sprintf` must be allocated to the right size.

### 5.6.1 Parsing a C format string

The C format string contains characters and format conversion specifications. The latter are initiated by a % sign. If the next letter is also a %, a percent sign is printed and no conversion is done. Otherwise, a conversion is done and applied to the next argument in the argument list. First comes an optional flag (#, 0, -, +, or space), an optional field width (decimal digits starting not with zero), an optional precision (period, then another decimal digit string), a length modifier (irrelevant for us, therefore not supported), and a conversion specifier: **d** or **i** for integer; **e**, **f**, **g** (also upper case) for double-precision real, **s** for a string.

We explicitly exclude all other conversion specifiers, and we check the specifiers against the actual arguments.

#### A type for passing arguments

This is a polymorphic type that can hold integer, real (double), and string arguments.

```

<Formats: parameters>≡
integer, parameter, public :: ARGTYPE_NONE = 0
integer, parameter, public :: ARGTYPE_LOG = 1
integer, parameter, public :: ARGTYPE_INT = 2
integer, parameter, public :: ARGTYPE_REAL = 3
integer, parameter, public :: ARGTYPE_STR = 4

```

The integer and real entries are actually scalars, but we avoid relying on the allocatable-scalar feature and make them one-entry arrays. The character entry is a real array which is a copy of the string.

Logical values are mapped to strings (true or false), so this type parameter value is mostly unused.

```

<Formats: public>≡
public :: sprintf_arg_t

<Formats: types>≡
type :: sprintf_arg_t
private
integer :: type = ARGTYPE_NONE
integer(c_int), dimension(:), allocatable :: ival

write (msg_buffer, *) "Output: '", result, "'"
call msg_message ()
call msg_error ("I/O error in sprintf call")
actual_length = 0
end if
end subroutine sprintf_arg_apply_sprintf
```

## Container type for the output

There is a procedure which chops the format string into pieces that contain at most one conversion specifier. Pairing this with a `sprintf_arg` object, we get the actual input to the `sprintf` interface. The type below holds this input and can allocate the output string.

*(Formats: types)+≡*

```
type :: sprintf_interface_t
private
character(c_char), dimension(:), allocatable :: input_fmt
type(sprintf_arg_t) :: arg
character(c_char), dimension(:), allocatable :: output_str
integer :: output_str_len = 0
end type sprintf_interface_t
```

*(Formats: procedures)+≡*

```
subroutine sprintf_interface_init (intf, fmt, arg)
```

```

type(sprintf_interface_t), intent(out) :: intf
type(string_t), intent(in) :: fmt
type(sprintf_arg_t), intent(in) :: arg
integer :: fmt_len, i
fmt_len = len (fmt)
allocate (intf%input_fmt (fmt_len + 1))
do i = 1, fmt_len
  intf%input_fmt(i) = extract (fmt, i, i)
end do
intf%input_fmt(fmt_len+1) = c_null_char
intf%arg = arg
allocate (intf%output_str (len (fmt) + sprintf_arg_get_length (arg) + 1))
end subroutine sprintf_interface_init

```

*(Formats: procedures)+≡*

```

subroutine sprintf_interface_write (intf, unit)
type(sprintf_interface_t), intent(in) :: intf
integer, intent(in), optional :: unit
integer :: u
u = given_output_unit (unit)
write (u, *) "Format string = ", "'", intf%input_fmt, "'"
write (u, "(1x,A,1x)", advance = "no") "Argument = "
call sprintf_arg_write (intf%arg, unit)
if (intf%output_str_len > 0) then
  write (u, *) "Result string = ", &
    "'", intf%output_str (1:intf%output_str_len), "'"
end if
end subroutine sprintf_interface_write

```

Return the output string:

*(Formats: procedures)+≡*

```

function sprintf_interface_get_result (intf) result (string)
type(string_t) :: string
type(sprintf_interface_t), intent(in) :: intf
character(kind = c_char, len = max (intf%output_str_len, 0)) :: buffer
integer :: i
if (intf%output_str_len > 0) then
  do i = 1, intf%output_str_len
    buffer(i:i) = intf%output_str(i)
  end do
  string = buffer(1:intf%output_str_len)
else
  string = ""
end if
end function sprintf_interface_get_result

```

*(Formats: procedures)+≡*

```

subroutine sprintf_interface_apply_sprintf (intf)
type(sprintf_interface_t), intent(inout) :: intf
call sprintf_arg_apply_sprintf &
  (intf%arg, intf%input_fmt, intf%output_str, intf%output_str_len)
end subroutine sprintf_interface_apply_sprintf

```

Import the interfaces defined in the previous section:

```

<Formats: interfaces> +=
  <sprintf interfaces>

```

### Scan the format string

Chop it into pieces that contain one conversion specifier each. The zero-th piece contains the part before the first specifier. Check the specifiers and allow only the subset that we support. Also check for an exact match between conversion specifiers and input arguments. The result is an allocated array of `sprintf_interface` object; each one contains a piece of the format string and the corresponding argument.

```

<Formats: procedures> +=
  subroutine chop_and_check_format_string (fmt, arg, intf)
    type(string_t), intent(in) :: fmt
    type(sprintf_arg_t), dimension(:), intent(in) :: arg

## 5.7 CPU timing

The time is stored in a simple derived type which just holds a floating-point number.

```
<cputime.f90>≡
  <File header>

  module cputime

    <Use kinds>
    <Use strings>

    <Standard module head>

    <CPU time: public>

    <CPU time: types>

    <CPU time: interfaces>

    interface
      <CPU time: sub interfaces>
    end interface

  end module cputime

<cputime_sub.f90>≡
  <File header>

  submodule (cputime) cputime_s

    use io_units
    use diagnostics

    implicit none

    contains

    <CPU time: procedures>

  end submodule cputime_s
```

The CPU time is a floating-point number with an arbitrary reference time. It is single precision (default real, not `real(default)`). It is measured in seconds.

```
<CPU time: public>≡
  public :: time_t

<CPU time: types>≡
  type :: time_t
  private
```

```

    logical :: known = .false.
    real :: value = 0
    contains
    <CPU time: time: TBP>
    end type time_t

<CPU time: time: TBP>≡
    procedure :: write => time_write

<CPU time: sub interfaces>≡
    module subroutine time_write (object, unit)
    class(time_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine time_write

<CPU time: procedures>≡
    module subroutine time_write (object, unit)
    class(time_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)", advance="no") "Time in seconds ="
    if (object%known) then
    write (u, "(1x,ES10.3)") object%value
    else
    write (u, "(1x,A)") "[unknown]"
    end if
    end subroutine time_write

```

Set the current time

```

<CPU time: time: TBP>+≡
    procedure :: set_current => time_set_current

### 5.7.1 Timer

A timer can measure real (wallclock) time differences. The base type corresponds to the result, i.e., time difference. The object contains two further times for start and stop time.

```
<CPU time: public>+≡
  public :: timer_t

<CPU time: types>+≡
  type, extends (time_t) :: timer_t
  private
  logical :: running = .false.
  type(time_t) :: t1, t2
  contains
  <CPU time: timer: TBP>
  end type timer_t
```

Output. If the timer is running, we indicate this, otherwise write just the result.

```
<CPU time: timer: TBP>≡
  procedure :: write => timer_write

<CPU time: sub interfaces>+≡
  module subroutine timer_write (object, unit)
    class(timer_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine timer_write

<CPU time: procedures>+≡
  module subroutine timer_write (object, unit)
    class(timer_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%running) then
      write (u, "(1x,A)") "Time in seconds = [running]"
    else
      call object%time_t%write (u)
    end if
  end subroutine timer_write
```

Start the timer: store the current time in the first entry and adapt the status. We forget any previous values.

```
<CPU time: timer: TBP>+≡
  procedure :: start => timer_start

<CPU time: sub interfaces>+≡
  module subroutine timer_start (timer)
    class(timer_t), intent(out) :: timer
  end subroutine timer_start

<CPU time: procedures>+≡
  module subroutine timer_start (timer)
    class(timer_t), intent(out) :: timer
    call timer%t1%set_current ()
    timer%running = .true.
```

```
end subroutine timer_start
```

Restart the timer: simply adapt the status, keeping the start time.

```
<CPU time: timer: TBP>+≡
  procedure :: restart => timer_restart

<CPU time: sub interfaces>+≡
  module subroutine timer_restart (timer)
    class(timer_t), intent(inout) :: timer
  end subroutine timer_restart

<CPU time: procedures>+≡
  module subroutine timer_restart (timer)
    class(timer_t), intent(inout) :: timer
    if (timer%t1%known .and. .not. timer%running) then
      timer%running = .true.
    else
      call msg_bug ("Timer: restart attempt from wrong status")
    end if
  end subroutine timer_restart
```

Stop the timer: store the current time in the second entry, adapt the status, and compute the elapsed time.

```
<CPU time: timer: TBP>+≡
  procedure :: stop => timer_stop

<CPU time: sub interfaces>+≡
  module subroutine timer_stop (timer)
    class(timer_t), intent(inout) :: timer
  end subroutine timer_stop

<CPU time: procedures>+≡
  module subroutine timer_stop (timer)
    class(timer_t), intent(inout) :: timer
    call timer%t2%set_current ()
    timer%running = .false.
    call timer%evaluate ()
  end subroutine timer_stop
```

Manually set the time (for unit test)

```
<CPU time: timer: TBP>+≡
  procedure :: set_test_time1 => timer_set_test_time1
  procedure :: set_test_time2 => timer_set_test_time2

<CPU time: sub interfaces>+≡
  module subroutine timer_set_test_time1 (timer, t)
    class(timer_t), intent(inout) :: timer
    integer, intent(in) :: t
  end subroutine timer_set_test_time1
  module subroutine timer_set_test_time2 (timer, t)
    class(timer_t), intent(inout) :: timer
    integer, intent(in) :: t
  end subroutine timer_set_test_time2
```

```

<CPU time: procedures>+≡
  module subroutine timer_set_test_time1 (timer, t)
    class(timer_t), intent(inout) :: timer
    integer, intent(in) :: t
    timer%t1 = t
  end subroutine timer_set_test_time1

  module subroutine timer_set_test_time2 (timer, t)
    class(timer_t), intent(inout) :: timer
    integer, intent(in) :: t
    timer%t2 = t
  end subroutine timer_set_test_time2

```

This is separate, available for the unit test.

```

<CPU time: timer: TBP>+≡
  procedure :: evaluate => timer_evaluate

<CPU time: sub interfaces>+≡
  module subroutine timer_evaluate (timer)
    class(timer_t), intent(inout) :: timer
  end subroutine timer_evaluate

<CPU time: procedures>+≡
  module subroutine timer_evaluate (timer)
    class(timer_t), intent(inout) :: timer
    timer%time_t = timer%t2 - timer%t1
  end subroutine timer_evaluate

```

## 5.7.2 Unit tests

Test module, followed by the corresponding implementation module.

```

<cputime_ut.f90>≡
  <File header>

  module cputime_ut
    use unit_tests
    use cputime_uti

write (u, "(A)") "* Test output end: cputime_2"

end subroutine cputime_2

```

## Chapter 6

# Combinatorics

These modules implement standard algorithms (sorting, hashing, etc.) that are not available in Fortran.

Fortran doesn't support generic programming, therefore the algorithms are implemented only for specific data types.

**bytes** Derived types for bytes and words.

**hashes** Types and tools for setting up hashtables.

**md5** The MD5 algorithm for message digest.

**permutations** Permuting an array of integers.

**sorting** Sorting integer and real values.

**grids**  $d$ -dimensional grids can be saved to disk and used for interpolation, maximum finding, etc.

### 6.1 Bytes and such

In a few instances we will need the notion of a byte (8-bit) and a word (32 bit), even a 64-bit word. A block of 512 bit is also needed (for MD5).

We rely on integers up to 64 bit being supported by the processor. The main difference to standard integers is the interpretation as unsigned integers.

`<bytes.f90>`  $\equiv$   
*<File header>*

```
module bytes
```

```
use kinds, only: i8, i32, i64
```

*<Standard module head>*

*<Bytes: public>*

*<Bytes: types>*

Figure 6.1: Module dependencies in `src/combinatorics`.

```

    <Bytes: parameters>

    <Bytes: interfaces>

    interface
    <Bytes: sub interfaces>
    end interface

    end module bytes

    <bytes_sub.f90>≡
    <File header>

    submodule (bytes) bytes_s

    use io_units

    implicit none

    contains

    <Bytes: procedures>

    end submodule bytes_s

```

### 6.1.1 8-bit words: bytes

This is essentially a wrapper around 8-bit integers. The wrapper emphasises their special interpretation as a sequence of bits. However, we interpret bytes as unsigned integers.

```

    <Bytes: public>≡
    public :: byte_t

    <Bytes: types>≡
    type :: byte_t
    private
    integer(i8) :: i
    end type byte_t

    <Bytes: public>+≡
    public :: byte_zero

    <Bytes: parameters>≡
    type(byte_t), parameter :: byte_zero = byte_t (0_i8)

```

Set a byte from 8-bit integer:

```

    <Bytes: public>+≡
    public :: assignment(=)

    <Bytes: interfaces>≡
    interface assignment(=)
    module procedure set_byte_from_i8
    end interface

```

```

<Bytes: sub interfaces>≡
  module subroutine set_byte_from_i8 (b, i)
    type(byte_t), intent(out) :: b
    integer(i8), intent(in) :: i
  end subroutine set_byte_from_i8

```

```

<Bytes: procedures>≡
  module subroutine set_byte_from_i8 (b, i)
    type(byte_t), intent(out) :: b
    integer(i8), intent(in) :: i
    b%i = i
  end subroutine set_byte_from_i8

```

Write a byte in one of two formats: either as a hexadecimal number (two digits, default) or as a decimal number (one to three digits). The decimal version is nontrivial because bytes are unsigned integers. Optionally append a newline.

```

<Bytes: public>+≡
  public :: byte_write

```

```

<Bytes: interfaces>+≡
  interface byte_write
    module procedure byte_write_unit, byte_write_string
  end interface

```

```

<Bytes: sub interfaces>+≡
  module subroutine byte_write_unit (b, unit, decimal, newline)
    type(byte_t), intent(in), optional :: b
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: decimal, newline
  end subroutine byte_write_unit

```

```

<Bytes: procedures>+≡
  module subroutine byte_write_unit (b, unit, decimal, newline)
    type(byte_t), intent(in), optional :: b
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: decimal, newline
    logical :: dc, nl
    type(word32_t) :: w
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    dc = .false.; if (present (decimal)) dc = decimal
    nl = .false.; if (present (newline)) nl = newline
    if (dc) then
      w = b
      write (u, '(I3)', advance='no') w%i
    else
      write (u, '(z2.2)', advance='no') b%i
    end if
    if (nl) write (u, *)
  end subroutine byte_write_unit

```

The string version is hex-only

```

<Bytes: sub interfaces>+≡
  module subroutine byte_write_string (b, s)
    type(byte_t), intent(in) :: b

```

```

character(len=2), intent(inout) :: s
end subroutine byte_write_string

```

*<Bytes: procedures>+≡*

```

module subroutine byte_write_string (b, s)
type(byte_t), intent(in) :: b
character(len=2), intent(inout) :: s
write (s, '(z2.2)') b%i
end subroutine byte_write_string

```

### 6.1.2 32-bit words

This is not exactly a 32-bit integer. A word is to be filled with bytes, and it may be partially filled. The filling is done lowest-byte first, highest-byte last. We count the bits, so fill should be either 0, 8, 16, 24, or 32. In printing words, we correspondingly distinguish between printing zeros and printing blanks.

*<Bytes: public>+≡*

```

public :: word32_t

```

*<Bytes: types>+≡*

```

type :: word32_t
private
integer(i32) :: i
integer :: fill = 0
end type word32_t

```

Assignment: the word is filled by inserting a 32-bit integer

*<Bytes: interfaces>+≡*

```

interface assignment(=)
module procedure word32_set_from_i32
module procedure word32_set_from_byte
end interface

```

*<Bytes: sub interfaces>+≡*

```

module subroutine word32_set_from_i32 (w, i)
type(word32_t), intent(out) :: w
integer(i32), intent(in) :: i
end subroutine word32_set_from_i32

```

*<Bytes: procedures>+≡*

```

module subroutine word32_set_from_i32 (w, i)
type(word32_t), intent(out) :: w
integer(i32), intent(in) :: i
w%i = i
w%fill = 32
end subroutine word32_set_from_i32

```

Reverse assignment to a 32-bit integer. We do not check the fill status.

*<Bytes: interfaces>+≡*

```

interface assignment(=)
module procedure i32_from_word32
end interface

```

```

<Bytes: sub interfaces>+≡
  module subroutine i32_from_word32 (i, w)
    integer(i32), intent(out) :: i
    type(word32_t), intent(in) :: w
  end subroutine i32_from_word32

```

```

<Bytes: procedures>+≡
  module subroutine i32_from_word32 (i, w)
    integer(i32), intent(out) :: i
    type(word32_t), intent(in) :: w
    i = w%i
  end subroutine i32_from_word32

```

Filling with a 8-bit integer is slightly tricky, because in this interpretation integers are unsigned.

```

<Bytes: sub interfaces>+≡
  module subroutine word32_set_from_byte (w, b)
    type(word32_t), intent(out) :: w
    type(byte_t), intent(in) :: b
  end subroutine word32_set_from_byte

```

```

<Bytes: procedures>+≡
  module subroutine word32_set_from_byte (w, b)
    type(word32_t), intent(out) :: w
    type(byte_t), intent(in) :: b
    if (b%i >= 0_i8) then
      w%i = b%i
    else
      w%i = 2_i32*(huge(0_i8)+1_i32) + b%i
    end if
    w%fill = 32
  end subroutine word32_set_from_byte

```

Check the fill status

```

<Bytes: public>+≡
  public :: word32_empty, word32_filled, word32_fill

```

```

<Bytes: sub interfaces>+≡
  module function word32_empty (w)
    type(word32_t), intent(in) :: w
    logical :: word32_empty
  end function word32_empty
  module function word32_filled (w)
    type(word32_t), intent(in) :: w
    logical :: word32_filled
  end function word32_filled
  module function word32_fill (w)
    type(word32_t), intent(in) :: w
    integer :: word32_fill
  end function word32_fill

```

```

<Bytes: procedures>+≡
  module function word32_empty (w)
    type(word32_t), intent(in) :: w
    logical :: word32_empty

```

```

word32_empty = (w%fill == 0)
end function word32_empty

module function word32_filled (w)
type(word32_t), intent(in) :: w
logical :: word32_filled
word32_filled = (w%fill == 32)
end function word32_filled

module function word32_fill (w)
type(word32_t), intent(in) :: w
integer :: word32_fill
word32_fill = w%fill
end function word32_fill

```

Partial assignment: append a byte to a partially filled word. (Note: no assignment if the word is filled, so check this before if necessary.)

```

<Bytes: public>+≡
  public :: word32_append_byte

<Bytes: sub interfaces>+≡
  module subroutine word32_append_byte (w, b)
    type(word32_t), intent(inout) :: w
    type(byte_t), intent(in) :: b
  end subroutine word32_append_byte

<Bytes: procedures>+≡
  module subroutine word32_append_byte (w, b)
    type(word32_t), intent(inout) :: w
    type(byte_t), intent(in) :: b
    type(word32_t) :: w1
    if (.not. word32_filled (w)) then
      w1 = b
      call mvbits (w1%i, 0, 8, w%i, w%fill)
      w%fill = w%fill + 8
    end if
  end subroutine word32_append_byte

```

Extract a byte from a word. The argument *i* is the position, which may be 0, 1, 2, or 3.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```

<Bytes: public>+≡
  public :: byte_from_word32

<Bytes: sub interfaces>+≡
  module function byte_from_word32 (w, i) result (b)
    type(word32_t), intent(in) :: w
    integer, intent(in) :: i
    type(byte_t) :: b
  end function byte_from_word32

```

```

<Bytes: procedures>+≡
module function byte_from_word32 (w, i) result (b)
  type(word32_t), intent(in) :: w
  integer, intent(in) :: i
  type(byte_t) :: b
  integer(i32) :: j
  j = 0
  if (i >= 0 .and. i*8 < w%fill) then
    call mvbits (w%i, i*8, 8, j, 0)
  end if
  b%i = int (ibclr (j, 7), kind=i8)
  if (btest (j, 7)) b%i = ibset (b%i, 7)
end function byte_from_word32

```

Write a word to file or STDOUT. We understand words as unsigned integers, therefore we cannot use the built-in routine unchanged. However, we can make use of the existence of 64-bit integers and their output routine.

In hexadecimal format, the default version prints eight hex characters, highest-first. The `bytes` version prints four bytes (two-hex characters), lowest first, with spaces in-between. The decimal bytes version is analogous. In the `bytes` version, missing bytes are printed as whitespace.

```

<Bytes: public>+≡
  public :: word32_write

<Bytes: interfaces>+≡
  interface word32_write
    module procedure word32_write_unit
  end interface

<Bytes: sub interfaces>+≡
  module subroutine word32_write_unit (w, unit, bytes, decimal, newline)
    type(word32_t), intent(in) :: w
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal, newline
  end subroutine word32_write_unit

<Bytes: procedures>+≡
  module subroutine word32_write_unit (w, unit, bytes, decimal, newline)
    type(word32_t), intent(in) :: w
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal, newline
    logical :: dc, by, nl
    type(word64_t) :: ww
    integer :: i, u
    u = given_output_unit (unit); if (u < 0) return
    by = .false.; if (present (bytes)) by = bytes
    dc = .false.; if (present (decimal)) dc = decimal
    nl = .false.; if (present (newline)) nl = newline
    if (by) then
      do i = 0, 3
        if (i>0) write (u, '(1x)', advance='no')
        if (8*i < w%fill) then
          call byte_write (byte_from_word32 (w, i), unit, decimal=decimal)
        else if (dc) then
          write (u, '(3x)', advance='no')

```

```

else
write (u, '(2x)', advance='no')
end if
end do
else if (dc) then
ww = w
write (u, '(I10)', advance='no') ww%i
else
select case (w%fill)
case ( 0)
case ( 8); write (6, '(1x,z8.2)', advance='no') ibits (w%i, 0, 8)
case (16); write (6, '(1x,z8.4)', advance='no') ibits (w%i, 0,16)
case (24); write (6, '(1x,z8.6)', advance='no') ibits (w%i, 0,24)
case (32); write (6, '(1x,z8.8)', advance='no') ibits (w%i, 0,32)
end select
end if
if (nl) write (u, *)
end subroutine word32_write_unit

```

### 6.1.3 Operations on 32-bit words

Define the usual logical operations, as well as addition (mod  $2^{32}$ ). We assume that all operands are completely filled.

*(Bytes: public)*+≡  
public :: not, ior, ieor, iand, ishft, ishftc

*(Bytes: interfaces)*+≡  
interface not  
module procedure word\_not  
end interface  
interface ior  
module procedure word\_or  
end interface  
interface ieor  
module procedure word\_eor  
end interface  
interface iand  
module procedure word\_and  
end interface  
interface ishft  
module procedure word\_shft  
end interface  
interface ishftc  
module procedure word\_shftc  
end interface

*(Bytes: sub interfaces)*+≡  
module function word\_not (w1) result (w2)  
type(word32\_t), intent(in) :: w1  
type(word32\_t) :: w2  
end function word\_not  
module function word\_or (w1, w2) result (w3)  
type(word32\_t), intent(in) :: w1, w2

```

type(word32_t) :: w3

#### 6.1.4 64-bit words

These objects consist of two 32-bit words. They thus can hold integer numbers larger than  $2^{32}$  (to be exact,  $2^{31}$  since FORTRAN integers are signed). The order is low-word, high-word.

```

<Bytes: public>+≡
public :: word64_t

<Bytes: types>+≡
type :: word64_t
private
integer(i64) :: i
end type word64_t

```

Set a 64 bit word:

```

<Bytes: interfaces>+≡
interface assignment(=)
module procedure word64_set_from_i64
module procedure word64_set_from_word32
end interface

<Bytes: sub interfaces>+≡
module subroutine word64_set_from_i64 (ww, i)
type(word64_t), intent(out) :: ww
integer(i64), intent(in) :: i
end subroutine word64_set_from_i64

<Bytes: procedures>+≡
module subroutine word64_set_from_i64 (ww, i)
type(word64_t), intent(out) :: ww
integer(i64), intent(in) :: i
ww%i = i
end subroutine word64_set_from_i64

```

Filling with a 32-bit word:

```

<Bytes: sub interfaces>+≡
  module subroutine word64_set_from_word32 (ww, w)
    type(word64_t), intent(out) :: ww
    type(word32_t), intent(in) :: w
    end subroutine word64_set_from_word32

<Bytes: procedures>+≡
  module subroutine word64_set_from_word32 (ww, w)
    type(word64_t), intent(out) :: ww
    type(word32_t), intent(in) :: w
    if (w%i >= 0_i32) then
      ww%i = w%i
    else
      ww%i = 2_i64*(huge(0_i32)+1_i64) + w%i
    end if
    end subroutine word64_set_from_word32

```

Extract a byte from a word. The argument *i* is the position, which may be between 0 and 7.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```

<Bytes: public>+≡
  public :: byte_from_word64, word32_from_word64

<Bytes: sub interfaces>+≡
  module function byte_from_word64 (ww, i) result (b)
    type(word64_t), intent(in) :: ww
    integer, intent(in) :: i
    type(byte_t) :: b
    end function byte_from_word64

<Bytes: procedures>+≡
  module function byte_from_word64 (ww, i) result (b)
    type(word64_t), intent(in) :: ww
    integer, intent(in) :: i
    type(byte_t) :: b
    integer(i64) :: j
    j = 0
    if (i >= 0 .and. i*8 < 64) then
      call mvbits (ww%i, i*8, 8, j, 0)
    end if
    b%i = int (ibclr (j, 7), kind=i8)
    if (btest (j, 7)) b%i = ibset (b%i, 7)
    end function byte_from_word64

```

Extract a 32-bit word from a 64-bit word. The position is either 0 or 1.

```

<Bytes: sub interfaces>+≡
  module function word32_from_word64 (ww, i) result (w)
    type(word64_t), intent(in) :: ww
    integer, intent(in) :: i
    type(word32_t) :: w
    end function word32_from_word64

```

```

<Bytes: procedures>+≡
module function word32_from_word64 (ww, i) result (w)
  type(word64_t), intent(in) :: ww
  integer, intent(in) :: i
  type(word32_t) :: w
  integer(i64) :: j
  j = 0
  select case (i)
  case (0); call mvbits (ww%i, 0, 32, j, 0)
  case (1); call mvbits (ww%i, 32, 32, j, 0)
  end select
  w = int (ibclr (j, 31), kind=i32)
  if (btest (j, 31)) w = ibset (w%i, 31)
end function word32_from_word64

```

Print a 64-bit word. Decimal version works up to  $2^{63}$ . The `words` version uses the 'word32' printout, separated by two spaces. The low-word is printed first. The `bytes` version also uses the 'word32' printout. This implies that the lowest byte is first. The default version prints a hexadecimal number without spaces, highest byte first.

```

<Bytes: public>+≡

```

```

  public :: word64_write

```

```

<Bytes: interfaces>+≡

```

```

  interface word64_write
  module procedure word64_write_unit
  end interface

```

```

<Bytes: sub interfaces>+≡

```

```

module subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
  type(word64_t), intent(in) :: ww
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: words, bytes, decimal, newline
end subroutine word64_write_unit

```

```

<Bytes: procedures>+≡

```

```

module subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
  type(word64_t), intent(in) :: ww
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: words, bytes, decimal, newline
  logical :: wo, by, dc, nl
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  wo = .false.; if (present (words)) wo = words

  nl = .false.; if (present (newline)) nl = newline
  if (wo .or. by) then
    call word32_write_unit (word32_from_word64 (ww, 0), unit, by, dc)
    write (u, '(2x)', advance='no')
    call word32_write_unit (word32_from_word64 (ww, 1), unit, by, dc)
  else if (dc) then
    write (u, '(I19)', advance='no') ww%i
  else
    write (u, '(Z16)', advance='no') ww%i
  end if
end subroutine word64_write_unit

```

```

end if
if (nl) write (u, *)
end subroutine word64_write_unit

```

## 6.2 Hashtables

Hash tables, like lists, are not part of Fortran and must be defined on a per-case basis. In this section we define a module that contains a hash function.

Furthermore, for reference there is a complete framework of hashtable type definitions and access functions. This code is to be replicated where hash tables are used, mutatis mutandis.

```

(hashses.f90)≡
  ⟨File header⟩

  module hashes

    use kinds, only: i8, i32

    ⟨Standard module head⟩

    ⟨Hashes: public⟩

    interface
      ⟨Hashes: sub interfaces⟩
    end interface

  end module hashes

(hashses_sub.f90)≡
  ⟨File header⟩

  submodule (hashses) hashes_s

    use bytes

    implicit none

    contains

    ⟨Hashes: procedures⟩

  end submodule hashes_s

```

### 6.2.1 The hash function

This is the one-at-a-time hash function by Bob Jenkins (from Wikipedia), re-implemented in Fortran. The function works on an array of bytes (8-bit integers), as could be produced by, e.g., the `transfer` function, and returns a single 32-bit integer. For determining the position in a hashtable, one can pick the lower bits of the result as appropriate to the hashtable size (which should be a

power of 2). Note that we are working on signed integers, so the interpretation of values differs from the C version. This should not matter in practice, however.

```

<Hashes: public>≡
  public :: hash

<Hashes: sub interfaces>≡
  module function hash (key) result (hashval)
    integer(i32) :: hashval
    integer(i8), dimension(:), intent(in) :: key
  end function hash

<Hashes: procedures>≡
  module function hash (key) result (hashval)
    integer(i32) :: hashval
    integer(i8), dimension(:), intent(in) :: key
    type(word32_t) :: w
    integer :: i
    w = 0_i32
    do i = 1, size (key)
      w = w + key(i)
      w = w + ishft (w, 10)
      w = ieor (w, ishft (w, -6))
    end do
    w = w + ishft (w, 3)
    w = ieor (w, ishft (w, -11))
    w = w + ishft (w, 15)
    hashval = w
  end function hash

```

## 6.2.2 The hash table

We define a generic hashtable type (that depends on the `hash_data_t` type) together with associated methods.

This is a template:

```

<Hashtables: types>≡
  type :: hash_data_t
  integer :: i
  end type hash_data_t

```

Associated methods:

```

<Hashtables: procedures>≡
  subroutine hash_data_final (data)
    type(hash_data_t), intent(inout) :: data
  end subroutine hash_data_final

  subroutine hash_data_write (data, unit)
    type(hash_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, *) data%i
  end subroutine hash_data_write

```

Each hash entry stores the unmasked hash value, the key, and points to actual data if present. Note that this could be an allocatable scalar in principle, but making it a pointer avoids deep copy when expanding the hashtable.

```

<Hashtables: types>+≡
  type :: hash_entry_t
  integer(i32) :: hashval = 0
  integer(i8), dimension(:), allocatable :: key
  type(hash_data_t), pointer :: data => null ()
end type hash_entry_t

```

The hashtable object holds the actual table, the number of filled entries and the number of entries after which the size should be doubled. The mask is equal to the table size minus one and thus coincides with the upper bound of the table index, which starts at zero.

```

<Hashtables: types>+≡
  type :: hashtable_t
  integer :: n_entries = 0
  real :: fill_ratio = 0
  integer :: n_entries_max = 0
  integer(i32) :: mask = 0
  type(hash_entry_t), dimension(:), allocatable :: entry
end type hashtable_t

```

Initializer: The size has to be a power of two, the fill ratio is a real (machine-default!) number between 0 and 1.

```

<Hashtables: procedures>+≡
  subroutine hashtable_init (hashtable, size, fill_ratio)
  type(hashtable_t), intent(out) :: hashtable
  integer, intent(in) :: size
  real, intent(in) :: fill_ratio
  hashtable%fill_ratio = fill_ratio
  hashtable%n_entries_max = size * fill_ratio
  hashtable%mask = size - 1
  allocate (hashtable%entry (0:hashtable%mask))
end subroutine hashtable_init

```

Finalizer: This calls a `hash_data_final` subroutine which must exist.

```

<Hashtables: procedures>+≡
  subroutine hashtable_final (hashtable)
  type(hashtable_t), intent(inout) :: hashtable
  integer :: i
  do i = 0, hashtable%mask
  if (associated (hashtable%entry(i)%data)) then
  call hash_data_final (hashtable%entry(i)%data)
  deallocate (hashtable%entry(i)%data)
  end if
  end do
  deallocate (hashtable%entry)
end subroutine hashtable_final

```

Output. Here, we refer to a `hash_data_write` subroutine.

```

(Hashtables: procedures) +=
  subroutine hashtable_write (hashtable, unit)
    type(hashtable_t), intent(in) :: hashtable
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit); if (u < 0) return
    do i = 0, hashtable%mask
      if (associated (hashtable%entry(i)%data)) then
        write (u, *) i, "(hash =", hashtable%entry(i)%hashval, ")", &
          hashtable%entry(i)%key
        call hash_data_write (hashtable%entry(i)%data, unit)
      end if
    end do
  end subroutine hashtable_write

```

### 6.2.3 Hashtable insertion

Insert a single entry with the hash value as trial place. If the table is filled, first expand it.

```

(Hashtables: procedures) +=
  subroutine hashtable_insert (hashtable, key, data)
    type(hashtable_t), intent(inout) :: hashtable
    integer(i8), dimension(:), intent(in) :: key
    type(hash_data_t), intent(in), target :: data
    integer(i32) :: h
    if (hashtable%n_entries >= hashtable%n_entries_max) &
      call hashtable_expand (hashtable)
    h = hash (key)
    call hashtable_insert_rec (hashtable, h, h, key, data)
  end subroutine hashtable_insert

```

We need this auxiliary routine for doubling the size of the hashtable. We rely on the fact that default assignment copies the data pointer, not the data themselves. The temporary array must not be finalized; it is deallocated automatically together with its allocatable components.

```

(Hashtables: procedures) +=
  subroutine hashtable_expand (hashtable)
    type(hashtable_t), intent(inout) :: hashtable
    type(hash_entry_t), dimension(:), allocatable :: table_tmp
    integer :: i, s
    allocate (table_tmp (0:hashtable%mask))
    table_tmp = hashtable%entry
    deallocate (hashtable%entry)
    s = 2 * size (table_tmp)
    hashtable%n_entries = 0
    hashtable%n_entries_max = s * hashtable%fill_ratio
    hashtable%mask = s - 1
    allocate (hashtable%entry (0:hashtable%mask))
    do i = 0, ubound (table_tmp, 1)
      if (associated (table_tmp(i)%data)) then

```

```

call hashtable_insert_rec (hashtable, table_tmp(i)%hashval, &
table_tmp(i)%hashval, table_tmp(i)%key, table_tmp(i)%data)
end if
end do
end subroutine hashtable_expand

```

Insert a single entry at a trial place  $h$ , reduced to the table size. Collision resolution is done simply by choosing the next element, recursively until the place is empty. For bookkeeping, we preserve the original hash value. For a good hash function, there should be no clustering.

Note that if the new key exactly matches an existing key, nothing is done.

```

(Hashtables: procedures) +=
recursive subroutine hashtable_insert_rec (hashtable, h, hashval, key, data)
type(hashtable_t), intent(inout) :: hashtable
integer(i32), intent(in) :: h, hashval
integer(i8), dimension(:), intent(in) :: key
type(hash_data_t), intent(in), target :: data
integer(i32) :: i
i = iand (h, hashtable%mask)
if (associated (hashtable%entry(i)%data)) then
if (size (hashtable%entry(i)%key) /= size (key)) then
call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
else if (any (hashtable%entry(i)%key /= key)) then
call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
end if
else
hashtable%entry(i)%hashval = hashval
allocate (hashtable%entry(i)%key (size (key)))
hashtable%entry(i)%key = key
hashtable%entry(i)%data => data
hashtable%n_entries = hashtable%n_entries + 1
end if
end subroutine hashtable_insert_rec

```

## 6.2.4 Hashtable lookup

The lookup function has to parallel the insert function. If the place is filled, check if the key matches. Yes: return the pointer; no: increment the hash value and check again.

```

(Hashtables: procedures) +=
function hashtable_lookup (hashtable, key) result (ptr)
type(hash_data_t), pointer :: ptr
type(hashtable_t), intent(in) :: hashtable
integer(i8), dimension(:), intent(in) :: key
ptr => hashtable_lookup_rec (hashtable, hash (key), key)
end function hashtable_lookup

```

```

(Hashtables: procedures) +=
recursive function hashtable_lookup_rec (hashtable, h, key) result (ptr)
type(hash_data_t), pointer :: ptr
type(hashtable_t), intent(in) :: hashtable

```

```

integer(i32), intent(in) :: h
integer(i8), dimension(:), intent(in) :: key
integer(i32) :: i
i = iand (h, hashtable%mask)
if (associated (hashtable%entry(i)%data)) then
if (size (hashtable%entry(i)%key) == size (key)) then
if (all (hashtable%entry(i)%key == key)) then
ptr => hashtable%entry(i)%data
else
ptr => hashtable_lookup_rec (hashtable, h + 1, key)
end if
else
ptr => hashtable_lookup_rec (hashtable, h + 1, key)
end if
else
ptr => null ()
end if
end function hashtable_lookup_rec

```

*(Hashtables: public)*≡

```
public :: hashtable_test
```

*(Hashtables: procedures)*+≡

```

subroutine hashtable_test ()
type(hash_data_t), pointer :: data
type(hashtable_t) :: hashtable
integer(i8) :: i
call hashtable_init (hashtable, 16, 0.25)
do i = 1, 10
allocate (data)
data%i = i*i
call hashtable_insert (hashtable, [i, i+i], data)
end do
call hashtable_insert (hashtable, [2_i8, 4_i8], data)
call hashtable_write (hashtable)
data => hashtable_lookup (hashtable, [5_i8, 10_i8])
if (associated (data)) then
print *, "lookup:", data%i
else
print *, "lookup: -"
end if
data => hashtable_lookup (hashtable, [6_i8, 12_i8])
if (associated (data)) then
print *, "lookup:", data%i
else
print *, "lookup: -"
end if
data => hashtable_lookup (hashtable, [4_i8, 9_i8])
if (associated (data)) then
print *, "lookup:", data%i
else
print *, "lookup: -"
end if
call hashtable_final (hashtable)

```

```
end subroutine hashtable_test
```

## 6.3 MD5 Checksums

Implementing MD5 checksums allows us to check input/file integrity on the basis of a well-known standard. The building blocks have been introduced in the `bytes` module.

```
<md5.f90>≡
  <File header>

  module md5

    use bytes

    <Standard module head>

    <MD5: public>

    <MD5: types>

    <MD5: interfaces>

    interface
      <MD5: sub interfaces>
    end interface

  end module md5

<md5_sub.f90>≡
  <File header>

  submodule (md5) md5_s

    use kinds, only: i8, i32, i64
    use system_defs, only: BUFFER_SIZE
    use system_defs, only: LF, EOR, EOF
    use io_units
    use diagnostics

    implicit none

    <MD5: variables>

    contains

    <MD5: procedures>

  end submodule md5_s
```

### 6.3.1 Blocks

A block is a sequence of 16 words (64 bytes or 512 bits). We anticipate that blocks will be linked, so include a pointer to the next block. There is a fill status (word counter), as there is one for each word. The fill status is equal to the number of bytes that are in, so it may be between 0 and 64.

```
<MD5: types>≡
  type :: block_t
  private
  type(word32_t), dimension(0:15) :: w
  type(block_t), pointer :: next => null ()
  integer :: fill = 0
end type block_t
```

Check if a block is completely filled or empty:

```
<MD5: procedures>≡
  function block_is_empty (b)
    type(block_t), intent(in) :: b
    logical :: block_is_empty
    block_is_empty = (b%fill == 0 .and. word32_empty (b%w(0)))
  end function block_is_empty

  function block_is_filled (b)
    type(block_t), intent(in) :: b
    logical :: block_is_filled
    block_is_filled = (b%fill == 64)
  end function block_is_filled
```

Append a single byte to a block. Works only if the block is not yet filled.

```
<MD5: procedures>+≡
  subroutine block_append_byte (bl, by)
    type(block_t), intent(inout) :: bl
    type(byte_t), intent(in) :: by
    if (.not. block_is_filled (bl)) then
      call word32_append_byte (bl%w(bl%fill/4), by)
      bl%fill = bl%fill + 1
    end if
  end subroutine block_append_byte
```

The printing routine allows for printing as sequences of words or bytes, decimal or hex.

```
<MD5: interfaces>≡
  interface block_write
    module procedure block_write_unit
  end interface

<MD5: sub interfaces>≡
  module subroutine block_write_unit (b, unit, bytes, decimal)
    type(block_t), intent(in) :: b
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal
  end subroutine block_write_unit
```

*<MD5: procedures>+≡*

```

module subroutine block_write_unit (b, unit, bytes, decimal)
  type(block_t), intent(in) :: b
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: bytes, decimal
  logical :: by, dc
  integer :: i, u
  u = given_output_unit (unit); if (u < 0) return
  by = .false.; if (present (bytes)) by = bytes
  dc = .false.; if (present (decimal)) dc = decimal
  do i = 0, b%fill/4 - 1
    call newline_or_blank (u, i, by, dc)
    call word32_write (b%w(i), unit, bytes, decimal)
  end do
  if (.not. block_is_filled (b)) then
    i = b%fill/4
    if (.not. word32_empty (b%w(i))) then
      call newline_or_blank (u, i, by, dc)
      call word32_write (b%w(i), unit, bytes, decimal)
    end if
  end if
  write (u, *)
  contains
  subroutine newline_or_blank (u, i, bytes, decimal)
    integer, intent(in) :: u, i
    logical, intent(in) :: bytes, decimal
    if (decimal) then
      select case (i)
      case (0)
      case (2,4,6,8,10,12,14); write (u, *)
      case default
        write (u, '(2x)', advance='no')
      end select
    else if (bytes) then
      select case (i)
      case (0)
      case (4,8,12); write (u, *)
      case default
        write (u, '(2x)', advance='no')
      end select
    else
      if (i == 8) write (u, *)
    end if
  end subroutine newline_or_blank
end subroutine block_write_unit

```

### 6.3.2 Messages

A message (within this module) is a linked list of blocks.

*<MD5: types>+≡*

```

type :: message_t
private

```

```

type(block_t), pointer :: first => null ()
type(block_t), pointer :: last => null ()
integer :: n_blocks = 0
end type message_t

```

Clear the message list

```

<MD5: procedures>+≡
subroutine message_clear (m)
type(message_t), intent(inout) :: m
type(block_t), pointer :: b
nullify (m%last)
do
b => m%first
if (.not.(associated (b))) exit
m%first => b%next
deallocate (b)
end do
m%n_blocks = 0
end subroutine message_clear

```

Append an empty block to the message list

```

<MD5: procedures>+≡
subroutine message_append_new_block (m)
type(message_t), intent(inout) :: m
if (associated (m%last)) then
allocate (m%last%next)
m%last => m%last%next
m%n_blocks = m%n_blocks + 1
else
allocate (m%first)
m%last => m%first
m%n_blocks = 1
end if
end subroutine message_append_new_block

```

Initialize: clear and allocate the first (empty) block.

```

<MD5: procedures>+≡
subroutine message_init (m)
type(message_t), intent(inout) :: m
call message_clear (m)
call message_append_new_block (m)
end subroutine message_init

```

Append a single byte to a message. If necessary, allocate a new block. If the message is empty, initialize it.

```

<MD5: procedures>+≡
subroutine message_append_byte (m, b)
type(message_t), intent(inout) :: m
type(byte_t), intent(in) :: b
if (.not. associated (m%last)) then
call message_init (m)
else if (block_is_filled (m%last)) then

```

```

call message_append_new_block (m)
end if
call block_append_byte (m%last, b)
end subroutine message_append_byte

```

Append zero bytes until the current block is filled up to the required position. If we are already beyond that, append a new block and fill that one.

```

<MD5: procedures>+≡
subroutine message_pad_zero (m, i)
type(message_t), intent(inout) :: m
integer, intent(in) :: i
type(block_t), pointer :: b
integer :: j
if (associated (m%last)) then
b => m%last
if (b%fill > i) then
do j = b%fill + 1, 64 + i
call message_append_byte (m, byte_zero)
end do
else
do j = b%fill + 1, i
call message_append_byte (m, byte_zero)
end do
end if
end if
end subroutine message_pad_zero

```

This returns the number of bits within a message. We need a 64-bit word for the result since it may be more than  $2^{31}$ . This is also required by the MD5 standard.

```

<MD5: procedures>+≡
function message_bits (m) result (length)
type(message_t), intent(in) :: m
type(word64_t) :: length
type(block_t), pointer :: b
integer(i64) :: n_blocks_filled, n_bytes_extra
if (m%n_blocks > 0) then
b => m%last
if (block_is_filled (b)) then
n_blocks_filled = m%n_blocks
n_bytes_extra = 0
else
n_blocks_filled = m%n_blocks - 1
n_bytes_extra = b%fill
end if
length = n_blocks_filled * 512 + n_bytes_extra * 8
else
length = 0_i64
end if
end function message_bits

```

### 6.3.3 Message I/O

Append the contents of a string to a message. We first cast the character string into a 8-bit integer array and then append this byte by byte.

*(MD5: procedures)+≡*

```
subroutine message_append_string (m, s)
  type(message_t), intent(inout) :: m
  character(len=*), intent(in) :: s
  integer(i64) :: i, n_bytes
  integer(i8), dimension(:), allocatable :: buffer
  integer(i8), dimension(1) :: mold
  type(byte_t) :: b
  n_bytes = size (transfer (s, mold))
  allocate (buffer (n_bytes))
  buffer = transfer (s, mold)
  do i = 1, size (buffer)
    b = buffer(i)
    call message_append_byte (m, b)
  end do
  deallocate (buffer)
end subroutine message_append_string
```

Append the contents of a 32-bit integer to a message. We first cast the 32-bit integer into a 8-bit integer array and then append this byte by byte.

*(MD5: procedures)+≡*

```
subroutine message_append_i32 (m, x)
  type(message_t), intent(inout) :: m
  integer(i32), intent(in) :: x
  integer(i8), dimension(4) :: buffer
  type(byte_t) :: b
  integer :: i
  buffer = transfer (x, buffer, size(buffer))
  do i = 1, size (buffer)
    b = buffer(i)
    call message_append_byte (m, b)
  end do
end subroutine message_append_i32
```

Append one line from file to a message. Include the newline character.

*(MD5: procedures)+≡*

```
subroutine message_append_from_unit (m, u, iostat)
  type(message_t), intent(inout) :: m
  integer, intent(in) :: u
  integer, intent(out) :: iostat
  character(len=BUFFER_SIZE) :: buffer
  read (u, *, iostat=iostat) buffer
  call message_append_string (m, trim (buffer))
  call message_append_string (m, LF)
end subroutine message_append_from_unit
```

Fill a message from file. (Each line counts as a string.)

*(MD5: procedures)+≡*

```

subroutine message_read_from_file (m, f)
type(message_t), intent(inout) :: m
character(len=*), intent(in) :: f
integer :: u, iostat
u = free_unit ()
open (file=f, unit=u, action='read')
do
call message_append_from_unit (m, u, iostat=iostat)
if (iostat < 0) exit
end do
close (u)
end subroutine message_read_from_file

```

Write a message. After each block, insert an empty line.

*<MD5: interfaces>+≡*

```

interface message_write
module procedure message_write_unit
end interface

```

*<MD5: sub interfaces>+≡*

```

module subroutine message_write_unit (m, unit, bytes, decimal)
type(message_t), intent(in) :: m
integer, intent(in), optional :: unit
logical, intent(in), optional :: bytes, decimal
end subroutine message_write_unit

```

*<MD5: procedures>+≡*

```

module subroutine message_write_unit (m, unit, bytes, decimal)
type(message_t), intent(in) :: m
integer, intent(in), optional :: unit
logical, intent(in), optional :: bytes, decimal
type(block_t), pointer :: b
integer :: u
u = given_output_unit (unit); if (u < 0) return
b => m%first
if (associated (b)) then
do
call block_write_unit (b, unit, bytes, decimal)
b => b%next
if (.not. associated (b)) exit
write (u, *)
end do
end if
end subroutine message_write_unit

```

### 6.3.4 Auxiliary functions

These four functions on three words are defined in the MD5 standard:

*<MD5: procedures>+≡*

```

function ff (x, y, z)
type(word32_t), intent(in) :: x, y, z
type(word32_t) :: ff
ff = ior (iand (x, y), iand (not (x), z))

```

```

end function ff

function fg (x, y, z)
type(word32_t), intent(in) :: x, y, z
type(word32_t) :: fg
fg = ior (iand (x, z), iand (y, not (z)))
end function fg

function fh (x, y, z)
type(word32_t), intent(in) :: x, y, z
type(word32_t) :: fh
fh = ieor (ieor (x, y), z)
end function fh

function fi (x, y, z)
type(word32_t), intent(in) :: x, y, z
type(word32_t) :: fi
fi = ieor (y, ior (x, not (z)))
end function fi

```

### 6.3.5 Auxiliary stuff

This defines and initializes the table of transformation constants:

```

⟨MD5: variables⟩≡
  type(word32_t), dimension(64), save :: t
  logical, save :: table_initialized = .false.

⟨MD5: procedures⟩+≡
  subroutine table_init
  type(word64_t) :: ww
  integer :: i
  if (.not.table_initialized) then
  do i = 1, 64
  ww = int (4294967296d0 * abs (sin (i * 1d0)), kind=i64)
  t(i) = word32_from_word64 (ww, 0)
  end do
  table_initialized = .true.
  end if
  end subroutine table_init

```

This encodes the message digest (4 words) into a 32-character string.

```

⟨MD5: procedures⟩+≡
  function digest_string (aa) result (s)
  type(word32_t), dimension (0:3), intent(in) :: aa
  character(len=32) :: s
  integer :: i, j
  do i = 0, 3
  do j = 0, 3
  call byte_write (byte_from_word32 (aa(i), j), s(i*8+j*2+1:i*8+j*2+2))
  end do
  end do
  end function digest_string

```

### 6.3.6 MD5 algorithm

Pad the message with a byte x80 and then pad zeros up to a full block minus two words; in these words, insert the message length (before padding) as a 64-bit word, low-word first.

```
(MD5: procedures)+≡
subroutine message_pad (m)
  type(message_t), intent(inout) :: m
  type(word64_t) :: length
  integer(i8), parameter :: ipad = -128 ! z'80'
  type(byte_t) :: b
  integer :: i
  length = message_bits (m)
  b = ipad
  call message_append_byte (m, b)
  call message_pad_zero (m, 56)
  do i = 0, 7
    call message_append_byte (m, byte_from_word64 (length, i))
  end do
end subroutine message_pad
```

Apply a series of transformations onto a state **a,b,c,d**, where the transform function uses each word of the message together with the predefined words. Finally, encode the state as a 32-character string.

```
(MD5: procedures)+≡
subroutine message_digest (m, s)
  type(message_t), intent(in) :: m
  character(len=32), intent(out) :: s
  integer(i32), parameter :: ia = 1732584193 ! z'67452301'
  integer(i32), parameter :: ib = -271733879 ! z'efcdab89'
  integer(i32), parameter :: ic = -1732584194 ! z'98badcfe'
  integer(i32), parameter :: id = 271733878 ! z'10325476'
  type(word32_t) :: a, b, c, d
  type(word32_t) :: aa, bb, cc, dd
  type(word32_t), dimension(0:15) :: x
  type(block_t), pointer :: bl
  call table_init
  a = ia; b = ib; c = ic; d = id
  bl => m%first
  do
    if (.not.associated (bl)) exit
    x = bl%w
    aa = a; bb = b; cc = c; dd = d
    call transform (ff, a, b, c, d, 0, 7, 1)
    call transform (ff, d, a, b, c, 1, 12, 2)

```

```

a = a + aa
b = b + bb
c = c + cc
d = d + dd
bl => bl%next
end do
s = digest_string ([a, b, c, d])
contains
<MD5: Internal subroutine transform>
end subroutine message_digest

```

And this is the actual transformation that depends on one of the previous functions, four words, and three integers. The implicit arguments are **x**, the word from the message to digest, and **t**, the entry in the predefined table.

```

<MD5: Internal subroutine transform>≡
subroutine transform (f, a, b, c, d, k, s, i)
interface
function f (x, y, z)
import word32_t
type(word32_t), intent(in) :: x, y, z
type(word32_t) :: f
end function f
end interface
type(word32_t), intent(inout) :: a
type(word32_t), intent(in) :: b, c, d
integer, intent(in) :: k, s, i
a = b + ishftc (a + f(b, c, d) + x(k) + t(i), s)
end subroutine transform

```

### 6.3.7 User interface

```

<MD5: public>≡
public :: md5sum

<MD5: interfaces>+≡
interface md5sum
module procedure md5sum_from_string
module procedure md5sum_from_unit
end interface

```

This function computes the MD5 sum of the input string and returns it as a 32-character string

```

<MD5: sub interfaces>+≡
module function md5sum_from_string (s) result (digest)
character(len=*), intent(in) :: s
character(len=32) :: digest
end function md5sum_from_string

<MD5: procedures>+≡
module function md5sum_from_string (s) result (digest)
character(len=*), intent(in) :: s
character(len=32) :: digest
type(message_t) :: m

```

```

call message_append_string (m, s)
call message_pad (m)
call message_digest (m, digest)
call message_clear (m)
end function md5sum_from_string

```

This funct. reads from unit u (an unformatted sequence of integers) and computes the MD5 sum.

```

⟨MD5: sub interfaces⟩+≡
module function md5sum_from_unit (u) result (digest)
integer, intent(in) :: u
character(len=32) :: digest
end function md5sum_from_unit

⟨MD5: procedures⟩+≡
module function md5sum_from_unit (u) result (digest)
integer, intent(in) :: u
character(len=32) :: digest
type(message_t) :: m
character :: char
integer :: iostat
READ_CHARS: do
read (u, "(A)", advance="no", iostat=iostat) char
select case (iostat)
case (0)
call message_append_string (m, char)
case (EOR)
call message_append_string (m, LF)
case (EOF)
exit READ_CHARS
case default
call msg_fatal &

end select
end do READ_CHARS
call message_pad (m)
call message_digest (m, digest)
call message_clear (m)
end function md5sum_from_unit

```

### 6.3.8 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨md5_ut.f90⟩≡
⟨File header⟩

module md5_ut
use unit_tests
use md5_uti

⟨Standard module head⟩

```

```

    <MD5: public test>

contains

    <MD5: test driver>

end module md5_ut
<md5_uti.f90>≡
    <File header>

module md5_uti

use diagnostics

use md5

    <Standard module head>

    <MD5: test declarations>

contains

    <MD5: tests>

end module md5_uti

```

API: driver for the unit tests below.

```

<MD5: public test>≡
    public :: md5_test

<MD5: test driver>≡
    subroutine md5_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <MD5: execute tests>
    end subroutine md5_test

```

This function checks the implementation by computing the checksum of certain strings and comparing them with the known values.

```

<MD5: execute tests>≡
    call test (md5_1, "md5_1", &
        "check MD5 sums", &
        u, results)

<MD5: test declarations>≡
    public :: md5_1

<MD5: tests>≡
    subroutine md5_1 (u)
        integer, intent(in) :: u
        character(32) :: s
        integer, parameter :: n = 7
        integer :: i
        character(80), dimension(n) :: teststring
        data teststring(1) /"/

```

```

interface
  <Permutations: sub interfaces>
end interface

end module permutations

<permutations_sub.f90>≡
  <File header>

  submodule (permutations) permutations_s

  implicit none

  <Permutations: variables>

  contains

  <Permutations: procedures>

end submodule permutations_s

```

### 6.4.1 Permutations

A permutation is an array of integers. Each integer between one and `size` should occur exactly once.

```

<Permutations: public>≡
  public :: permutation_t

<Permutations: types>≡
  type :: permutation_t
  private
  integer, dimension(:), allocatable :: p
end type permutation_t

```

Initialize with the identity permutation.

```

<Permutations: public>+≡
  public :: permutation_init
  public :: permutation_final

<Permutations: sub interfaces>≡
  elemental module subroutine permutation_init (p, size)
    type(permutation_t), intent(inout) :: p
    integer, intent(in) :: size
  end subroutine permutation_init
  elemental module subroutine permutation_final (p)
    type(permutation_t), intent(inout) :: p
  end subroutine permutation_final

<Permutations: procedures>≡
  elemental module subroutine permutation_init (p, size)
    type(permutation_t), intent(inout) :: p
    integer, intent(in) :: size
    integer :: i

```

```

allocate (p%p (size))
forall (i = 1:size)
p%p(i) = i
end forall
end subroutine permutation_init

elemental module subroutine permutation_final (p)
type(permutation_t), intent(inout) :: p
deallocate (p%p)
end subroutine permutation_final

```

I/O:

```

<Permutations: public>+≡
public :: permutation_write

<Permutations: sub interfaces>+≡
module subroutine permutation_write (p, u)
type(permutation_t), intent (in) :: p
integer, intent(in) :: u
end subroutine permutation_write

<Permutations: procedures>+≡
module subroutine permutation_write (p, u)
type(permutation_t), intent (in) :: p
integer, intent(in) :: u
integer :: i
do i = 1, size (p%p)
if (size (p%p) < 10) then
write (u,"(1x,I1)", advance="no") p%p(i)
else
write (u,"(1x,I3)", advance="no") p%p(i)
end if
end do
write (u, *)
end subroutine permutation_write

```

Administration:

```

<Permutations: public>+≡
public :: permutation_size

<Permutations: sub interfaces>+≡
elemental module function permutation_size (perm) result (s)
type(permutation_t), intent(in) :: perm
integer :: s
end function permutation_size

<Permutations: procedures>+≡
elemental module function permutation_size (perm) result (s)
type(permutation_t), intent(in) :: perm
integer :: s
s = size (perm%p)
end function permutation_size

```

Extract an entry in a permutation.

```

<Permutations: public>+≡
  public :: permute

<Permutations: sub interfaces>+≡
  elemental module function permute (i, p) result (j)
    integer, intent(in) :: i
    type(permutation_t), intent(in) :: p
    integer :: j
  end function permute

<Permutations: procedures>+≡
  elemental module function permute (i, p) result (j)
    integer, intent(in) :: i
    type(permutation_t), intent(in) :: p
    integer :: j
    if (i > 0 .and. i <= size (p%p)) then
      j = p%p(i)
    else
      j = 0
    end if
  end function permute

```

Check whether a permutation is valid: Each integer in the range occurs exactly once.

```

<Permutations: public>+≡
  public :: permutation_ok

<Permutations: sub interfaces>+≡
  elemental module function permutation_ok (perm) result (ok)
    type(permutation_t), intent(in) :: perm
    logical :: ok
  end function permutation_ok

<Permutations: procedures>+≡
  elemental module function permutation_ok (perm) result (ok)
    type(permutation_t), intent(in) :: perm
    logical :: ok
    integer :: i
    logical, dimension(:), allocatable :: set
    ok = .true.
    allocate (set (size (perm%p)))
    set = .false.
    do i = 1, size (perm%p)
      ok = (perm%p(i) > 0 .and. perm%p(i) <= size (perm%p))
      if (.not.ok) return
      set(perm%p(i)) = .true.
    end do
    ok = all (set)
  end function permutation_ok

```

Find the permutation that transforms the second array into the first one. We assume that this is possible and unique and all bounds are set correctly.

This cannot be elemental.

```

<Permutations: public>+≡

```

```

public :: permutation_find

<Permutations: sub interfaces>+≡
module subroutine permutation_find (perm, a1, a2)
  type(permutation_t), intent(inout) :: perm
  integer, dimension(:), intent(in) :: a1, a2
end subroutine permutation_find

<Permutations: procedures>+≡
module subroutine permutation_find (perm, a1, a2)
  type(permutation_t), intent(inout) :: perm
  integer, dimension(:), intent(in) :: a1, a2
  integer :: i, j
  if (allocated (perm%p)) deallocate (perm%p)
  allocate (perm%p (size (a1)))
  do i = 1, size (a1)
    do j = 1, size (a2)
      if (a1(i) == a2(j)) then
        perm%p(i) = j
        exit
      end if
    end do
    perm%p(i) = 0
  end do
end do
end subroutine permutation_find

```

Find all permutations that transform an array of integers into itself. The resulting permutation list is allocated with the correct length and filled.

The first step is to count the number of different entries in `code`. Next, we scan `code` again and assign a mask to each different entry, true for all identical entries. Finally, we recursively permute the identity for each possible mask.

The permutation is done as follows: A list of all permutations of the initial one with respect to the current mask is generated, then the permutations are generated in turn for each permutation in this list with the next mask. The result is always stored back into the main list, starting from the end of the current list.

```

<Permutations: public>+≡
public :: permutation_array_make

<Permutations: sub interfaces>+≡
module subroutine permutation_array_make (pa, code)
  type(permutation_t), dimension(:), allocatable, intent(out) :: pa
  integer, dimension(:), intent(in) :: code
end subroutine permutation_array_make

<Permutations: procedures>+≡
module subroutine permutation_array_make (pa, code)
  type(permutation_t), dimension(:), allocatable, intent(out) :: pa
  integer, dimension(:), intent(in) :: code
  logical, dimension(size(code)) :: mask
  logical, dimension(:,:), allocatable :: imask
  integer, dimension(:), allocatable :: n_i
  type(permutation_t) :: p_init
  type(permutation_t), dimension(:), allocatable :: p_tmp
  integer :: psize, i, j, k, n_different, n, nn_k

```

```

psize = size (code)
mask = .true.
n_different = 0
do i=1, psize
  if (mask(i)) then
    n_different = n_different + 1
    mask = mask .and. (code /= code(i))
  end if
end do

nn_k = nn_k * n_i(k)
end do
call permutation_final (p_init)
deallocate (imask, n_i)
end subroutine permutation_array_make

```

Make a list of permutations of the elements marked true in the `mask` array. The final permutation list must be allocated with the correct length ( $n!$ ). The third argument is the initial permutation to start with, which must have the same length as the `mask` array (this is not checked).

*(Permutations: procedures)* +=

```

subroutine permutation_array_with_mask (pa, mask, p_init)
  type(permutation_t), dimension(:), intent(inout) :: pa
  logical, dimension(:), intent(in) :: mask
  type(permutation_t), intent(in) :: p_init
  integer :: plen
  integer :: i, ii, j, fac_i, k, x
  integer, dimension(:), allocatable :: index
  plen = size (pa)

```

```

allocate (index(count(mask)))
ii = 0
do i = 1, size (mask)
  if (mask(i)) then
    ii = ii + 1
    index(ii) = i
  end if
end do
pa = p_init
ii = 0
fac_i = 1
do i = 1, size (mask)
  if (mask(i)) then
    ii = ii + 1
    fac_i = fac_i * ii
    x = permute (i, p_init)
    do j = 1, plen
      k = ii - mod (((j-1)*fac_i)/plen, ii)
      call insert (pa(j), x, k, ii, index)
    end do
  end if
end do
deallocate (index)
contains
subroutine insert (p, x, k, n, index)
  type(permutation_t), intent(inout) :: p
  integer, intent(in) :: x, k, n
  integer, dimension(:), intent(in) :: index
  integer :: i
  do i = n, k+1, -1
    p%p(index(i)) = p%p(index(i-1))
  end do
  p%p(index(k)) = x
end subroutine insert
end subroutine permutation_array_with_mask

```

The factorial function is needed for pre-determining the number of permutations that will be generated:

```

<Permutations: public>+≡
  public :: factorial

<Permutations: sub interfaces>+≡
  elemental module function factorial (n) result (f)
    integer, intent(in) :: n
    integer :: f
  end function factorial

<Permutations: procedures>+≡
  elemental module function factorial (n) result (f)
    integer, intent(in) :: n
    integer :: f
    integer :: i
    f = 1
    do i=2, abs(n)
      f = f*i
    end do
  end function factorial

```

```

end do
end function factorial

```

## 6.4.2 Operations on binary codes

Binary codes are needed for phase-space trees. Since the permutation function uses permutations, and no other special type is involved, we put the functions here.

This is needed for phase space trees: permute bits in a tree binary code. If no permutation is given, leave as is. (We may want to access the permutation directly here if this is efficiency-critical.)

```

<Permutations: public>+=
  public :: tc_permute

<Permutations: sub interfaces>+=
  module function tc_permute (k, perm, mask_in) result (pk)
    integer(TC), intent(in) :: k, mask_in
    type(permutation_t), intent(in) :: perm
    integer(TC) :: pk
  end function tc_permute

<Permutations: procedures>+=
  module function tc_permute (k, perm, mask_in) result (pk)
    integer(TC), intent(in) :: k, mask_in
    type(permutation_t), intent(in) :: perm
    integer(TC) :: pk
    integer :: i
    pk = iand (k, mask_in)
    do i = 1, size (perm%p)
      if (btest(k,i-1)) pk = ibset (pk, perm%p(i)-1)
    end do
  end function tc_permute

```

This routine returns the number of set bits in the tree code value `k`. Hence, it is the number of externals connected to the current line. If `mask` is present, the complement of the tree code is also considered, and the smaller number is returned. This gives the true distance from the external states, taking into account the initial particles. The complement number is increased by one, since for a scattering diagram the vertex with the sum of all final-state codes is still one point apart from the initial particles.

```

<Permutations: public>+=
  public :: tc_decay_level

<Permutations: interfaces>=
  interface tc_decay_level
    module procedure decay_level_simple
    module procedure decay_level_complement
  end interface

<Permutations: sub interfaces>+=
  module function decay_level_complement (k, mask) result (l)
    integer(TC), intent(in) :: k, mask

```

```

integer :: l
end function decay_level_complement
module function decay_level_simple (k) result(l)
integer(TC), intent(in) :: k
integer :: l
end function decay_level_simple
<Permutations: procedures>+≡
module function decay_level_complement (k, mask) result (l)
integer(TC), intent(in) :: k, mask
integer :: l
l = min (decay_level_simple (k), &
& decay_level_simple (ieor (k, mask)) + 1)
end function decay_level_complement

module function decay_level_simple (k) result(l)
integer(TC), intent(in) :: k
integer :: l
integer :: i
l = 0
do i=0, bit_size(k)-1
if (btest(k,i)) l = l+1
end do
end function decay_level_simple

```

## 6.5 Sorting

This small module provides functions for sorting integer or real arrays.

```

<sorting.f90>≡
<File header>

module sorting

<Use kinds>

<Standard module head>

<Sorting: public>

<Sorting: interfaces>

interface
<Sorting: sub interfaces>
end interface

end module sorting

<sorting_sub.f90>≡
<File header>

submodule (sorting) sorting_s

use diagnostics

```

```

implicit none

contains

<Sorting: procedures>

end submodule sorting_s

```

### 6.5.1 Implementation

The `sort` function returns, for a given integer or real array, the array sorted by increasing value. The current implementation is *mergesort*, which has  $O(n \ln n)$  behavior in all cases, and is stable for elements of equal value.

The `sort_abs` variant sorts by increasing absolute value, where for identical absolute value, the positive number comes first.

```

<Sorting: public>≡
  public :: sort
  public :: sort_abs

<Sorting: interfaces>≡
  interface sort
    module procedure sort_int
    module procedure sort_real
  end interface

  interface sort_abs
    module procedure sort_int_abs
  end interface

```

This variant of integer sort returns The body is identical, just the interface differs.

```

<Sorting: sub interfaces>≡
  module function sort_int (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
  end function sort_int
  module function sort_real (val_in) result (val)
    real(default), dimension(:), intent(in) :: val_in
    real(default), dimension(size(val_in)) :: val
  end function sort_real
  module function sort_int_abs (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
  end function sort_int_abs

<Sorting: procedures>≡
  module function sort_int (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
    <Sorting: sort>
  end function sort_int

```

```

module function sort_real (val_in) result (val)
  real(default), dimension(:), intent(in) :: val_in
  real(default), dimension(size(val_in)) :: val
  <Sorting: sort>
end function sort_real

```

```

module function sort_int_abs (val_in) result (val)
  integer, dimension(:), intent(in) :: val_in
  integer, dimension(size(val_in)) :: val
  <Sorting: sort abs>
end function sort_int_abs

```

```

<Sorting: sort>≡
  val = val_in( order (val_in) )

```

```

<Sorting: sort abs>≡
  val = val_in( order_abs (val_in) )

```

The `order` function returns, for a given integer or real array, the array of indices of the elements sorted by increasing value.

```

<Sorting: public>+≡
  public :: order
  public :: order_abs

```

```

<Sorting: interfaces>+≡
  interface order
    module procedure order_int
    module procedure order_real
  end interface

```

```

  interface order_abs
    module procedure order_int_abs
  end interface

```

```

<Sorting: sub interfaces>+≡
  module function order_int (val) result (idx)
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
  end function order_int
  module function order_real (val) result (idx)
    real(default), dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
  end function order_real
  module function order_int_abs (val) result (idx)
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
  end function order_int_abs

```

```

<Sorting: procedures>+≡
  module function order_int (val) result (idx)
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
    <Sorting: order>
  end function order_int

```

```

module function order_real (val) result (idx)
  real(default), dimension(:), intent(in) :: val
  integer, dimension(size(val)) :: idx
  <Sorting: order>
end function order_real

module function order_int_abs (val) result (idx)
  integer, dimension(:), intent(in) :: val
  integer, dimension(size(val)) :: idx
  <Sorting: order abs>
end function order_int_abs

```

We start by individual elements, merge them to pairs, merge those to four-element subarrays, and so on. The last subarray can extend only up to the original array bound, of course, and the second of the subarrays to merge should contain at least one element.

```

<Sorting: order>≡
  <Sorting: order1>
  call merge (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
  <Sorting: order2>

<Sorting: order abs>≡
  <Sorting: order1>
  call merge_abs (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
  <Sorting: order2>

<Sorting: order1>≡
  integer :: n, i, s, b1, b2, e1, e2
  n = size (idx)
  do i = 1, n
    idx(i) = i
  end do
  s = 1
  do while (s < n)
    do b1 = 1, n-s, 2*s
      b2 = b1 + s
      e1 = b2 - 1
      e2 = min (e1 + s, n)

```

The merging step does the actual sorting. We take two sorted array sections and merge them to a sorted result array. We are working on the indices, and comparing is done by taking the associated `val` which is real or integer.

```

<Sorting: interfaces>+≡
  interface merge
    module procedure merge_int
    module procedure merge_real
  end interface

  interface merge_abs

```

```

module procedure merge_int_abs
end interface

<Sorting: sub interfaces>+=
  module subroutine merge_int (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    integer, dimension(:), intent(in) :: val
  end subroutine merge_int
  module subroutine merge_real (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    real(default), dimension(:), intent(in) :: val
  end subroutine merge_real
  module subroutine merge_int_abs (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    integer, dimension(:), intent(in) :: val
  end subroutine merge_int_abs

  <Sorting: procedures>+=
    module subroutine merge_int (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
      <Sorting: merge>
    end subroutine merge_int

    module subroutine merge_real (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      real(default), dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
      <Sorting: merge>
    end subroutine merge_real

    module subroutine merge_int_abs (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
      <Sorting: merge abs>
    end subroutine merge_int_abs

    <Sorting: merge>≡
      <Sorting: merge1>
      if (val(src1(i1)) <= val(src2(i2))) then
        <Sorting: merge2>

    We keep the elements if the absolute values are strictly ordered. If they are
    equal in magnitude, we keep them if the larger value comes first, or if they are
    equal.

    <Sorting: merge abs>≡

```

```

    <Sorting: merge1>
    if (abs (val(src1(i1))) < abs (val(src2(i2))) .or. &
        (abs (val(src1(i1))) == abs (val(src2(i2))) .and. &
        val(src1(i1)) >= val(src2(i2)))) then
    <Sorting: merge2>

<Sorting: merge1>≡
    integer :: i1, i2, i
    i1 = 1
    i2 = 1
    do i = 1, size (tmp)

<Sorting: merge2>≡
    tmp(i) = src1(i1); i1 = i1 + 1
    if (i1 > size (src1)) then
    tmp(i+1:) = src2(i2:)
    exit
    end if
    else
    tmp(i) = src2(i2); i2 = i2 + 1
    if (i2 > size (src2)) then
    tmp(i+1:) = src1(i1:)
    exit
    end if
    end if
    end do
    res = tmp

```

### 6.5.2 Unit tests

Test module, followed by the corresponding implementation module.

```

<sorting_ut.f90>≡
    <File header>

    module sorting_ut
    use unit_tests
    use sorting_uti

    <Standard module head>

    <Sorting: public test>

    contains

    <Sorting: test driver>

    end module sorting_ut

<sorting_uti.f90>≡
    <File header>

    module sorting_uti

    <Use kinds>

```

```

use sorting

<Standard module head>

## 6.6 Grids

*This is not really a combinatorics module but this directory is the closest I could find. Maybe this will be moved to a seperate directory or combined with related stuff.*

```

⟨grids.f90⟩≡
  ⟨File header⟩

  module grids

    ⟨Use kinds⟩
    ⟨Use mpi f08⟩

    ⟨Standard module head⟩

    ⟨Grids: public⟩

    ⟨Grids: types⟩

    interface
    ⟨Grids: sub interfaces⟩
    end interface

```

```

end module grids
⟨grids_sub.f90⟩≡
⟨File header⟩

submodule (grids) grids_s

use constants, only: zero, one, tiny_07
use io_units
use format_defs, only: FMT_16, FMT_12
use diagnostics
⟨Use mpi f08⟩

implicit none

⟨Grids: parameters⟩

contains

⟨Grids: procedures⟩

end submodule grids_s

```

Grids are used in many applications and a general implementation seems useful. The relevant properties implemented so far are

- Segments of the hypercube are represented by an integer array with size  $d$  corresponding to the dimension.
- There is a mapping from the indices to the location in the continuous memory block of values.
- Given a point in the hypercube, find the corresponding segment and the value of the grid therein.
- Update the grid sequentially to represent the maximum of a function over the unit hypercube.
- The grid can be saved to and recovered from disk.

The following might be implemented in the future

- Generate a random point in the hypercube by interpreting the grid as probability distribution.  
*This would most likely be solved by using projections and the `selector_t`, which would make a move of this module higher up in the dependency tree necessary.*
- Update the grid sequentially to represent the *minimum* of a function over the unit hypercube.

```

⟨Grids: public⟩≡
public :: grid_t

```

```

<Grids: types>≡
  type :: grid_t
  private
  real(default), dimension(:), allocatable :: values
  integer, dimension(:), allocatable :: points
  contains
  <Grids: grid: TBP>
  end type grid_t

```

### 6.6.1 Initializer and finalizer

For initialization, we expect the number of points for each dimension as an array or the the number of dimensions as a scalar whereby the default number of points is used then for each dimension.

```

<Grids: grid: TBP>≡
  generic :: init => init_base, init_simple
  procedure :: init_base => grid_init_base
  procedure :: init_simple => grid_init_simple

<Grids: sub interfaces>≡
  pure module subroutine grid_init_base (grid, points)
  class(grid_t), intent(inout) :: grid
  integer, dimension(:), intent(in) :: points
  end subroutine grid_init_base

<Grids: procedures>≡
  pure module subroutine grid_init_base (grid, points)
  class(grid_t), intent(inout) :: grid
  integer, dimension(:), intent(in) :: points
  allocate (grid%points (size (points)))
  allocate (grid%values (product (points)))
  grid%points = points
  grid%values = zero
  end subroutine grid_init_base

<Grids: sub interfaces>+≡

      deallocate (grid%values)  
    end if  
    if (allocated (grid%points)) then  
      deallocate (grid%points)  
    end if  
  end subroutine grid_final
```

## 6.6.2 Segment finding and memory mapping

The `indices` array is expected to go from 1 to  $d$  whereby the entries for the different dims are from 1 to  $n_{\text{points}}(\text{dim})$ .

We get the value of the grid either from given `indices` or from a point `x` in the hypercube. In the latter case, we have to find the segment first.

```
<Grids: grid: TBP>+≡  
  generic :: get_value => get_value_from_x, get_value_from_indices  
  procedure :: get_value_from_x => grid_get_value_from_x  
  procedure :: get_value_from_indices => grid_get_value_from_indices
```

```

<Grids: sub interfaces>+≡
  module function grid_get_value_from_indices (grid, indices)
    real(default) :: grid_get_value_from_indices
    class(grid_t), intent(in) :: grid
    integer, dimension(:), intent(in) :: indices
  end function grid_get_value_from_indices

<Grids: procedures>+≡
  module function grid_get_value_from_indices (grid, indices)
    real(default) :: grid_get_value_from_indices
    class(grid_t), intent(in) :: grid
    integer, dimension(:), intent(in) :: indices
    grid_get_value_from_indices = grid%values(grid%get_index(indices))
  end function grid_get_value_from_indices

<Grids: sub interfaces>+≡
  module function grid_get_value_from_x (grid, x)
    real(default) :: grid_get_value_from_x
    class(grid_t), intent(in) :: grid
    real(default), dimension(:), intent(in) :: x
  end function grid_get_value_from_x

<Grids: procedures>+≡
  module function grid_get_value_from_x (grid, x)
    real(default) :: grid_get_value_from_x
    class(grid_t), intent(in) :: grid
    real(default), dimension(:), intent(in) :: x
    grid_get_value_from_x = grid_get_value_from_indices &
      (grid, grid_get_segment (grid, x))
  end function grid_get_value_from_x

The segment is the part of the grid that contains the point x and is identified
by a tuple of indices. This is just a brute force search, for fine grids one could
also implement a binary search for  $\mathcal{O}(\log N)$  behavior instead of  $\mathcal{O}(N)$ .

<Grids: grid: TBP>+≡
  procedure :: get_segment => grid_get_segment

<Grids: sub interfaces>+≡
  module function grid_get_segment (grid, x, unit) result (segment)
    class(grid_t), intent(in) :: grid
    real(default), dimension(:), intent(in) :: x
    integer, intent(in), optional :: unit
    integer, dimension(1:size (x)) :: segment
  end function grid_get_segment

<Grids: procedures>+≡
  module function grid_get_segment (grid, x, unit) result (segment)
    class(grid_t), intent(in) :: grid
    real(default), dimension(:), intent(in) :: x
    integer, intent(in), optional :: unit
    integer, dimension(1:size (x)) :: segment
    integer :: dim, i
    real(default) :: segment_width
    segment = 0
    do dim = 1, size (grid%points)

```

```

segment_width = one / grid%points (dim)
SEARCH: do i = 1, grid%points (dim)
  if (x (dim) <= i * segment_width + tiny_07) then
    segment (dim) = i
  exit SEARCH
end if
end do SEARCH
if (segment (dim) == 0) then
  do i = 1, size(x)
    write (msg_buffer, "(A," // DEFAULT_OUTPUT_PRECISION // ")") &
      "x[i] = ", x(i)
    call msg_message ()
  end do
  call msg_error ("grid_get_segment: Did not find x in [0,1]^d", &
    unit=unit)
end if
end do
end function grid_get_segment

```

This is a simple storage mapping function but more sophisticated ideas like hashing could be implemented.

$$\begin{aligned}
 \text{index} = & \text{indices}(1) + \\
 & \text{indices}(2) * \text{size}(1) + \\
 & \text{indices}(3) * \text{size}(1) * \text{size}(2) + \dots
 \end{aligned} \tag{6.1}$$

```

<Grids: grid: TBP>+≡
  procedure :: get_index => grid_get_index

<Grids: sub interfaces>+≡
  pure module function grid_get_index (grid, indices) result (grid_index)
    integer :: grid_index

        multiplier = multiplier * grid%points (dim_innerloop)
      end do
      grid_index = grid_index + (indices(dim_outerloop) - 1) * multiplier
    end do
  end function grid_get_index

```

### 6.6.3 Grid manipulations

Given a point in the hypercube  $\mathbf{x}$  and its value  $y$ , we update the grids, such that the stepwise function  $f$  defined by the grid is  $f(x_i) \geq y_i \forall \{x_i, y_i\}$ .

```
<Grids: grid: TBP>+≡
  procedure :: update_maxima => grid_update_maxima
```

```
<Grids: sub interfaces>+≡
  module subroutine grid_update_maxima (grid, x, y)
    class(grid_t), intent(inout) :: grid
    real(default), dimension(:), intent(in) :: x
    real(default), intent(in) :: y
  end subroutine grid_update_maxima
```

```
<Grids: procedures>+≡
  module subroutine grid_update_maxima (grid, x, y)
    class(grid_t), intent(inout) :: grid
    real(default), dimension(:), intent(in) :: x
    real(default), intent(in) :: y
    integer, dimension(1:size(x)) :: indices
    indices = grid%get_segment (x)
    if (grid%get_value (indices) < y) then
      grid%values (grid%get_index (indices)) = y
    end if
  end subroutine grid_update_maxima
```

More general cases have to be thought through when they are needed. *This is inefficient and non-general.*

```
<Grids: grid: TBP>+≡
  procedure :: get_maximum_in_3d => grid_get_maximum_in_3d
```

```

## Chapter 7

# Text handling

WHIZARD has to handle complex structures in input (and output) data. Doing this in a generic and transparent way requires a generic lexer and parser. The necessary modules are implemented here:

**ifiles** Implementation of line-oriented internal files in a more flexible way (linked lists of variable-length strings) than the Fortran builtin features.

**lexers** Read text and transform it into a token stream.

**syntax\_rules** Define the rules for interpreting tokens, to be used by the WHIZARD parser.

**parser** Categorize tokens (keyword, string, number etc.) and use a set of syntax rules to transform the input into a parse tree.

**xml** Read and parse XML text, separate from the WHIZARD parser.

Figure 7.1: Module dependencies in `src/parsing`.

## 7.1 Internal files

The internal files introduced here (`ifile`) are a replacement for the built-in internal files, which are fixed-size arrays of fixed-length character strings. The `ifile` type is a doubly-linked list of variable-length character strings with line numbers.

```
<ifiles.f90>≡  
  <File header>  
  
  module ifiles  
  
    <Use strings>  
  
    <Standard module head>  
  
    <Ifiles: public>  
  
    <Ifiles: types>  
  
    <Ifiles: interfaces>  
  
    interface  
      <Ifiles: sub interfaces>  
    end interface  
  
  end module ifiles  
  
<ifiles_sub.f90>≡  
  <File header>  
  
  submodule (ifiles) ifiles_s  
  
    use system_defs, only: EOF  
    use io_units  
  
    implicit none  
  
    contains  
  
    <Ifiles: procedures>  
  
  end submodule ifiles_s
```

### 7.1.1 The line type

The line entry type is for internal use, it is the list entry to be collected in an `ifile` object.

```
<Ifiles: types>≡  
  type :: line_entry_t  
  private  
  type(line_entry_t), pointer :: previous => null ()  
  type(line_entry_t), pointer :: next => null ()
```

```

type(string_t) :: string
integer :: index
end type line_entry_t

```

Create a new list entry, given a varying string as input. The line number and pointers are not set, these make sense only within an ifile.

```

<Ifiles: procedures>≡
  subroutine line_entry_create (line, string)
    type(line_entry_t), pointer :: line
    type(string_t), intent(in) :: string
    allocate (line)
    line%string = string
  end subroutine line_entry_create

```

Destroy a single list entry: Since the pointer components should not be deallocated explicitly, just deallocate the object itself.

```

<Ifiles: procedures>+≡
  subroutine line_entry_destroy (line)
    type(line_entry_t), pointer :: line
    deallocate (line)
  end subroutine line_entry_destroy

```

### 7.1.2 The ifile type

The internal file is a linked list of line entries.

```

<Ifiles: public>≡
  public :: ifile_t

<Ifiles: types>+≡
  type :: ifile_t
  private
  type(line_entry_t), pointer :: first => null ()
  type(line_entry_t), pointer :: last => null ()
  integer :: n_lines = 0
  contains
  <Ifiles: ifile: TBP>
  end type ifile_t

```

We need no explicit initializer, but a routine which recursively deallocates the contents may be appropriate. After this, existing line pointers may become undefined, so they should be nullified before the file is destroyed.

```

<Ifiles: public>+≡
  public :: ifile_clear

<Ifiles: sub interfaces>≡
  module subroutine ifile_clear (ifile)
    class(ifile_t), intent(inout) :: ifile
  end subroutine ifile_clear

```

```

<Ifiles: procedures>+=
  module subroutine ifile_clear (ifile)
    class(ifile_t), intent(inout) :: ifile
    type(line_entry_t), pointer :: current
    do while (associated (ifile%first))
      current => ifile%first
      ifile%first => current%next
      call line_entry_destroy (current)
    end do
    nullify (ifile%last)
    ifile%n_lines = 0
  end subroutine ifile_clear

```

The finalizer is just an alias for the above.

```

<Ifiles: public>+=
  public :: ifile_final

<Ifiles: ifile: TBP>=
  procedure :: final => ifile_clear

<Ifiles: interfaces>=
  interface ifile_final
    module procedure ifile_clear
  end interface

```

### 7.1.3 I/O on ifiles

Fill an ifile from an ordinary external file, i.e., I/O unit. If the ifile is not empty, the old contents will be destroyed. We can read a fixed-length character string, an ISO varying string, an ordinary internal file (character-string array), or from an external unit. In the latter case, lines are appended until EOF is reached. Finally, there is a variant which reads from another ifile, effectively copying it.

```

<Ifiles: public>+=

call ifile_append_from_string (ifile, current%string)
current => current%next
end do
end subroutine ifile_append_from_ifile

```

Write the ifile contents to an external unit

```

<Ifiles: public>+≡
public :: ifile_write

<Ifiles: sub interfaces>+≡
module subroutine ifile_write (ifile, unit, iostat)
type(ifile_t), intent(in) :: ifile
integer, intent(in), optional :: unit
integer, intent(out), optional :: iostat
end subroutine ifile_write

<Ifiles: procedures>+≡

```

```

module subroutine ifile_write (ifile, unit, iostat)
  type(ifile_t), intent(in) :: ifile
  integer, intent(in), optional :: unit
  integer, intent(out), optional :: iostat
  integer :: u
  type(line_entry_t), pointer :: current
  u = given_output_unit (unit); if (u < 0) return
  current => ifile%first
  do while (associated (current))
    call put_line (u, current%string, iostat)
    current => current%next
  end do
end subroutine ifile_write

```

Convert the ifile to an array of strings, which is allocated by this function:

```

<Ifiles: public>+≡
  public :: ifile_to_string_array

<Ifiles: sub interfaces>+≡
  module subroutine ifile_to_string_array (ifile, string)
    type(ifile_t), intent(in) :: ifile
    type(string_t), dimension(:), intent(inout), allocatable :: string
  end subroutine ifile_to_string_array

<Ifiles: procedures>+≡
  module subroutine ifile_to_string_array (ifile, string)
    type(ifile_t), intent(in) :: ifile
    type(string_t), dimension(:), intent(inout), allocatable :: string
    type(line_entry_t), pointer :: current
    integer :: i
    allocate (string (ifile_get_length (ifile)))
    current => ifile%first
    do i = 1, ifile_get_length (ifile)
      string(i) = current%string
      current => current%next
    end do
  end subroutine ifile_to_string_array

```

#### 7.1.4 Ifile tools

```

<Ifiles: public>+≡
  public :: ifile_get_length

<Ifiles: sub interfaces>+≡
  module function ifile_get_length (ifile) result (length)
    integer :: length
    type(ifile_t), intent(in) :: ifile
  end function ifile_get_length

<Ifiles: procedures>+≡
  module function ifile_get_length (ifile) result (length)
    integer :: length
    type(ifile_t), intent(in) :: ifile
    length = ifile%n_lines

```

```
end function ifile_get_length
```

### 7.1.5 Line pointers

Instead of the implicit pointer used in ordinary file access, we define explicit pointers, so there can be more than one at a time.

```
<Ifiles: public>+≡
  public :: line_p

<Ifiles: types>+≡
  type :: line_p
  private
  type(line_entry_t), pointer :: p => null ()
end type line_p
```

Assign a file pointer to the first or last line in an ifile:

```
<Ifiles: public>+≡
  public :: line_init

<Ifiles: sub interfaces>+≡
  module subroutine line_init (line, ifile, back)
    type(line_p), intent(inout) :: line
    type(ifile_t), intent(in) :: ifile
    logical, intent(in), optional :: back
  end subroutine line_init

<Ifiles: procedures>+≡
  module subroutine line_init (line, ifile, back)
    type(line_p), intent(inout) :: line
    type(ifile_t), intent(in) :: ifile
    logical, intent(in), optional :: back
    if (present (back)) then
      if (back) then
        line%p => ifile%last
      else
        line%p => ifile%first
      end if
    else
      line%p => ifile%first
    end if
  end subroutine line_init
```

Remove the pointer association:

```
<Ifiles: public>+≡
  public :: line_final

<Ifiles: sub interfaces>+≡
  module subroutine line_final (line)
    type(line_p), intent(inout) :: line
  end subroutine line_final
```

*<Ifiles: procedures>+≡*

```
module subroutine line_final (line)
  type(line_p), intent(inout) :: line
  nullify (line%p)
end subroutine line_final
```

Go one step forward

*<Ifiles: public>+≡*

```
public :: line_advance
```

*<Ifiles: sub interfaces>+≡*

```
module subroutine line_advance (line)
  type(line_p), intent(inout) :: line
end subroutine line_advance
```

*<Ifiles: procedures>+≡*

```
module subroutine line_advance (line)
  type(line_p), intent(inout) :: line
  if (associated (line%p)) line%p => line%p%next
end subroutine line_advance
```

Go one step backward

*<Ifiles: public>+≡*

```
public :: line_backspace
```

*<Ifiles: sub interfaces>+≡*

```
module subroutine line_backspace (line)
  type(line_p), intent(inout) :: line
end subroutine line_backspace
```

*<Ifiles: procedures>+≡*

```
module subroutine line_backspace (line)
  type(line_p), intent(inout) :: line
  if (associated (line%p)) line%p => line%p%previous
end subroutine line_backspace
```

Check whether we are accessing a valid line

*<Ifiles: public>+≡*

```
public :: line_is_associated
```

*<Ifiles: sub interfaces>+≡*

```
module function line_is_associated (line) result (ok)
  logical :: ok
  type(line_p), intent(in) :: line
end function line_is_associated
```

*<Ifiles: procedures>+≡*

```
module function line_is_associated (line) result (ok)
  logical :: ok
  type(line_p), intent(in) :: line
  ok = associated (line%p)
end function line_is_associated
```

### 7.1.6 Access lines via pointers

We do not need the ifile as an argument to these functions, because the `line` type will point to an existing ifile.

```
<Ifiles: public>+≡
  public :: line_get_string

<Ifiles: sub interfaces>+≡
  module function line_get_string (line) result (string)
    type(string_t) :: string
    type(line_p), intent(in) :: line
  end function line_get_string

<Ifiles: procedures>+≡
  module function line_get_string (line) result (string)
    type(string_t) :: string
    type(line_p), intent(in) :: line
    if (associated (line%p)) then
      string = line%p%string
    else
      string = ""
    end if
  end function line_get_string
```

Variant where the line pointer is advanced after reading.

```
<Ifiles: public>+≡
  public :: line_get_string_advance

<Ifiles: sub interfaces>+≡
  module function line_get_string_advance (line) result (string)
    type(string_t) :: string
    type(line_p), intent(inout) :: line
  end function line_get_string_advance

<Ifiles: procedures>+≡
  module function line_get_string_advance (line) result (string)
    type(string_t) :: string
    type(line_p), intent(inout) :: line
    if (associated (line%p)) then
      string = line%p%string
      call line_advance (line)
    else
      string = ""
    end if
  end function line_get_string_advance

<Ifiles: public>+≡
  public :: line_get_index

<Ifiles: sub interfaces>+≡
  module function line_get_index (line) result (index)
    integer :: index
    type(line_p), intent(in) :: line
  end function line_get_index
```

```

<Ifiles: procedures>+=
  module function line_get_index (line) result (index)
    integer :: index
    type(line_p), intent(in) :: line
    if (associated (line%p)) then
      index = line%p%index
    else
      index = 0
    end if
  end function line_get_index

<Ifiles: public>+=
  public :: line_get_length

<Ifiles: sub interfaces>+=
  module function line_get_length (line) result (length)
    integer :: length
    type(line_p), intent(in) :: line
  end function line_get_length

<Ifiles: procedures>+=
  module function line_get_length (line) result (length)
    integer :: length
    type(line_p), intent(in) :: line
    if (associated (line%p)) then
      length = len (line%p%string)
    else
      length = 0
    end if
  end function line_get_length

```

## 7.2 Lexer

The lexer purpose is to read from a line-separated character input stream (usually a file) and properly chop the stream into lexemes (tokens). [The parser will transform lexemes into meaningful tokens, to be stored in a parse tree, therefore we do not use the term 'token' here.] The input is read line-by-line, but interpreted free-form, except for quotes and the comment syntax. (Fortran 2003 would allow us to use a stream type for reading.)

In an object-oriented approach, we can dynamically create and destroy lexers, including the lexer setup.

The main lexer function is to return a lexeme according to the basic lexer rules (quotes, comments, whitespace, special classes). There is also a routine to write back a lexeme to the input stream (but only once).

For the rules, we separate the possible characters into classes. Whitespace usually consists of blank, tab, and line-feed, where any number of consecutive whitespace is equivalent to one. Quoted strings are enclosed by a pair of quote characters, possibly multiline. Comments are similar to quotes, but interpreted as whitespace. Numbers are identified (not distinguishing real and integer) but not interpreted. Other character classes make up identifiers.

```

end submodule lexers_s

```

### 7.2.1 Input streams

For flexible input, we define a generic stream type that refers to either an external file, an external unit which is already open, a string, an `ifile` object (internal file, i.e., string list), or a line pointer to an `ifile` object. The stream type actually follows the idea of a formatted external file, which is line-oriented. Thus, the stream reader always returns a whole record (input line).

Note that only in the string version, the stream contents are stored inside the stream object. In the `ifile` version, the stream contains only the line pointer, while in the external-file case, the line pointer is implicitly created by the runtime library.

```

<Lexer: public>≡
  public :: stream_t

<Lexer: types>≡
  type :: stream_t
  type(string_t), pointer :: filename => null ()
  integer, pointer :: unit => null ()
  type(string_t), pointer :: string => null ()
  type(ifile_t), pointer :: ifile => null ()
  type(line_p), pointer :: line => null ()
  integer :: record = 0
  logical :: eof = .false.
  contains
  <Lexer: stream: TBP>
  end type stream_t

```

The initializers refer to the specific version. The stream should be undefined before calling this.

```

<Lexer: public>+≡
  public :: stream_init

<Lexer: stream: TBP>≡
  generic :: init => &
  stream_init_filename, &
  stream_init_unit, &
  stream_init_string, &
  stream_init_ifile, &
  stream_init_line

```

```

procedure, private :: stream_init_filename

class(stream_t), intent(out) :: stream
type(line_p), intent(in) :: line
allocate (stream%line)
stream%line = line
end subroutine stream_init_line

```

The finalizer restores the initial state. If an external file was opened, it is closed.

```

<Lexer: public>+≡
  public :: stream_final

<Lexer: stream: TBP>+≡
  procedure :: final => stream_final

<Lexer: sub interfaces>+≡
  module subroutine stream_final (stream)
  class(stream_t), intent(inout) :: stream
  end subroutine stream_final

<Lexer: procedures>+≡
  module subroutine stream_final (stream)
  class(stream_t), intent(inout) :: stream
  if (associated (stream%filename)) then
    close (stream%unit)
    deallocate (stream%unit)
    deallocate (stream%filename)
  else if (associated (stream%unit)) then
    deallocate (stream%unit)
  else if (associated (stream%string)) then
    deallocate (stream%string)
  else if (associated (stream%ifile)) then
    call line_final (stream%line)
    deallocate (stream%line)
    deallocate (stream%ifile)
  else if (associated (stream%line)) then
    call line_final (stream%line)
    deallocate (stream%line)
  end if
end subroutine stream_final

```

```

end if
end subroutine stream_final

```

This returns the next record from the input stream. Depending on the stream type, the stream pointers are modified: Reading from external unit, the external file is advanced (implicitly). Reading from string, the string is replaced by an empty string. Reading from ifile, the line pointer is advanced. Note that the `iostat` argument is mandatory.

*<Lexer: public>+≡*

```

<Lexer: procedures>+≡
module function stream_get_source_info_string (stream) result (string)
type(string_t) :: string
type(stream_t), intent(in) :: stream
character(20) :: buffer
if (associated (stream%filename)) then
string = "File '" // stream%filename // "' (unit = "
write (buffer, "(IO)") stream%unit
string = string // trim (buffer) // ")"
else if (associated (stream%unit)) then
write (buffer, "(IO)") stream%unit
string = "Unit " // trim (buffer)
else if (associated (stream%string)) then
string = "Input string"
else if (associated (stream%ifile) .or. associated (stream%line)) then
string = "Internal file"
else
string = ""
end if
end function stream_get_source_info_string

```

Return the index of the record just read as a message string.

```

<Lexer: public>+≡
public :: stream_get_record_info_string

<Lexer: sub interfaces>+≡
module function stream_get_record_info_string (stream) result (string)
type(string_t) :: string
type(stream_t), intent(in) :: stream
end function stream_get_record_info_string

<Lexer: procedures>+≡
module function stream_get_record_info_string (stream) result (string)
type(string_t) :: string
type(stream_t), intent(in) :: stream
character(20) :: buffer
string = stream_get_source_info_string (stream)

```

```

if (string /= "") string = string // ", "
write (buffer, "(IO)") stream%record
string = string // "line " // trim (buffer)
end function stream_get_record_info_string

```

### 7.2.2 Keyword list

The lexer should be capable of identifying a token as a known keyword. To this end, we store a list of keywords:

```

<Lexer: public>+≡
  public :: keyword_list_t

<Lexer: types>+≡
  type :: keyword_entry_t
  private
  type(string_t) :: string
  type(keyword_entry_t), pointer :: next => null ()
  end type keyword_entry_t

  type :: keyword_list_t
  private
  type(keyword_entry_t), pointer :: first => null ()
  type(keyword_entry_t), pointer :: last => null ()
  end type keyword_list_t

```

Add a new string to the keyword list, unless it is already there:

```

<Lexer: public>+≡
  public :: keyword_list_add

<Lexer: sub interfaces>+≡
  module subroutine keyword_list_add (keylist, string)
    type(keyword_list_t), intent(inout) :: keylist
    type(string_t), intent(in) :: string
  end subroutine keyword_list_add

<Lexer: procedures>+≡
  module subroutine keyword_list_add (keylist, string)
    type(keyword_list_t), intent(inout) :: keylist
    type(string_t), intent(in) :: string
    type(keyword_entry_t), pointer :: k_entry_new
    if (.not. keyword_list_contains (keylist, string)) then
      allocate (k_entry_new)
      k_entry_new%string = string
      if (associated (keylist%first)) then
        keylist%last%next => k_entry_new
      else
        keylist%first => k_entry_new
      end if
      keylist%last => k_entry_new
    end if
  end subroutine keyword_list_add

```

Return true if a string is a keyword.

```
<Lexer: public>+≡
    public :: keyword_list_contains

<Lexer: sub interfaces>+≡
    module function keyword_list_contains (keylist, string) result (found)
        type(keyword_list_t), intent(in) :: keylist
        type(string_t), intent(in) :: string
        logical :: found
    end function keyword_list_contains

<Lexer: procedures>+≡
    module function keyword_list_contains (keylist, string) result (found)
        type(keyword_list_t), intent(in) :: keylist
        type(string_t), intent(in) :: string
        logical :: found
        found = .false.
        call check_rec (keylist%first)
        contains
        recursive subroutine check_rec (k_entry)
            type(keyword_entry_t), pointer :: k_entry
            if (associated (k_entry)) then
                if (k_entry%string /= string) then
                    call check_rec (k_entry%next)
                else
                    found = .true.
                end if
            end if
        end subroutine check_rec
    end function keyword_list_contains
```

Write the keyword list

```
<Lexer: public>+≡
    public :: keyword_list_write

<Lexer: interfaces>+≡
    interface keyword_list_write
        module procedure keyword_list_write_unit
    end interface

<Lexer: sub interfaces>+≡
    module subroutine keyword_list_write_unit (keylist, unit)
        type(keyword_list_t), intent(in) :: keylist
        integer, intent(in) :: unit
    end subroutine keyword_list_write_unit

<Lexer: procedures>+≡
    module subroutine keyword_list_write_unit (keylist, unit)
        type(keyword_list_t), intent(in) :: keylist
        integer, intent(in) :: unit
        write (unit, "(A)") "Keyword list:"
        if (associated (keylist%first)) then
            call keyword_write_rec (keylist%first)
            write (unit, *)
        else
            write (unit, "(1x,A)") "[empty]"
        end if
    end subroutine keyword_list_write_unit
```

```

end if
contains
recursive subroutine keyword_write_rec (k_entry)
type(keyword_entry_t), intent(in), pointer :: k_entry
if (associated (k_entry)) then
write (unit, "(1x,A)", advance="no") char (k_entry%string)
call keyword_write_rec (k_entry%next)
end if
end subroutine keyword_write_rec
end subroutine keyword_list_write_unit

```

Clear the keyword list

```

<Lexer: public>+≡
public :: keyword_list_final

<Lexer: sub interfaces>+≡
module subroutine keyword_list_final (keylist)
type(keyword_list_t), intent(inout) :: keylist
end subroutine keyword_list_final

<Lexer: procedures>+≡
module subroutine keyword_list_final (keylist)
type(keyword_list_t), intent(inout) :: keylist
call keyword_destroy_rec (keylist%first)
nullify (keylist%last)
contains
recursive subroutine keyword_destroy_rec (k_entry)
type(keyword_entry_t), pointer :: k_entry
if (associated (k_entry)) then
call keyword_destroy_rec (k_entry%next)
deallocate (k_entry)
end if
end subroutine keyword_destroy_rec
end subroutine keyword_list_final

```

### 7.2.3 Lexeme templates

This type is handled like a rudimentary regular expression. It determines the lexer behavior when matching a string. The actual objects made from this type and the corresponding matching routines are listed below.

```

<Lexer: types>+≡
type :: template_t
!!! !!! Compiler bug in ifort 20/21/22: no structure constants for
!!! !!! types with private components in submodules possible
!!! private
integer :: type
character(256) :: charset1, charset2
integer :: len1, len2
end type template_t

```

These are the types that valid lexemes can have:

```

<Lexer: public>+≡
public :: T_KEYWORD, T_IDENTIFIER, T_QUOTED, T_NUMERIC

```

```

<Lexer: parameters>+=
  integer, parameter :: T_KEYWORD = 1
  integer, parameter :: T_IDENTIFIER = 2, T_QUOTED = 3, T_NUMERIC = 4

```

These are special types:

```

<Lexer: parameters>+=
  integer, parameter :: EMPTY = 0, WHITESPACE = 10
  integer, parameter :: NO_MATCH = 11, IO_ERROR = 12, OVERFLOW = 13
  integer, parameter :: UNMATCHED_QUOTE = 14

```

In addition, we have EOF which is a negative integer, normally  $-1$ . Printout for debugging:

```

<Lexer: procedures>+=
  subroutine lexeme_type_write (type, unit)
    integer, intent(in) :: type
    integer, intent(in) :: unit
    select case (type)
    case (EMPTY);      write(unit,"(A)",advance="no") " EMPTY      "
    case (WHITESPACE); write(unit,"(A)",advance="no") " WHITESPACE "
    case (T_IDENTIFIER);write(unit,"(A)",advance="no") " IDENTIFIER "
    case (T_QUOTED);   write(unit,"(A)",advance="no") " QUOTED     "
    case (T_NUMERIC);  write(unit,"(A)",advance="no") " NUMERIC    "
    case (IO_ERROR);   write(unit,"(A)",advance="no") " IO_ERROR   "
    case (OVERFLOW);   write(unit,"(A)",advance="no") " OVERFLOW   "
    case (UNMATCHED_QUOTE); write(unit,"(A)",advance="no") " UNMATCHEDQ "
    case (NO_MATCH);   write(unit,"(A)",advance="no") " NO_MATCH   "
    case (EOF);        write(unit,"(A)",advance="no") " EOF        "
    case default;      write(unit,"(A)",advance="no") " [illegal]  "
    end select
  end subroutine lexeme_type_write

  subroutine template_write (tt, unit)
    type(template_t), intent(in) :: tt
    integer, intent(in) :: unit
    call lexeme_type_write (tt%type, unit)
    write (unit, "(A)", advance="no") "' ' // tt%charset1(1:tt%len1) // '"
    write (unit, "(A)", advance="no") "' ' // tt%charset2(1:tt%len2) // '"
  end subroutine template_write

```

The matching functions all return the number of matched characters in the provided string. If this number is zero, the match has failed.

The `template` functions are declared `pure` because they appear in `forall` loops below.

A template for whitespace:

```

<Lexer: procedures>+=
  pure function template_whitespace (chars) result (tt)
    character(*), intent(in) :: chars
    type(template_t) :: tt
    tt = template_t (WHITESPACE, chars, "", len (chars), 0)
  end function template_whitespace

```

Just match the string against the character set.

```

<Lexer: procedures>+=

```

```

subroutine match_whitespace (tt, s, n)
type(template_t), intent(in) :: tt
character(*), intent(in) :: s
integer, intent(out) :: n
n = verify (s, tt%charset1(1:tt%len1)) - 1
if (n < 0) n = len (s)
end subroutine match_whitespace

```

A template for normal identifiers. To match, a lexeme should have a first character in class `chars1` and an arbitrary number of further characters in class `chars2`. If the latter is empty, we are looking for a single-character lexeme.

```

<Lexer: procedures>+≡
pure function template_identifier (chars1, chars2) result (tt)
character(*), intent(in) :: chars1, chars2
type(template_t) :: tt
tt = template_t (T_IDENTIFIER, chars1, chars2, len(chars1), len(chars2))
end function template_identifier

```

Here, the first letter must match, the others may or may not.

```

<Lexer: procedures>+≡
subroutine match_identifier (tt, s, n)
type(template_t), intent(in) :: tt
character(*), intent(in) :: s
integer, intent(out) :: n
if (verify (s(1:1), tt%charset1(1:tt%len1)) == 0) then
n = verify (s(2:), tt%charset2(1:tt%len2))
if (n == 0) n = len (s)
else
n = 0
end if
end subroutine match_identifier

```

A template for quoted strings. The same template applies for comments. The first character set indicates the left quote (could be a sequence of several characters), the second one the matching right quote.

```

<Lexer: procedures>+≡
pure function template_quoted (chars1, chars2) result (tt)
character(*), intent(in) :: chars1, chars2
type(template_t) :: tt
tt = template_t (T_QUOTED, chars1, chars2, len (chars1), len (chars2))
end function template_quoted

```

Here, the beginning of the string must exactly match the first character set, then we look for the second one. If found, return. If there is a first quote but no second one, return a negative number, indicating this error condition.

```

<Lexer: procedures>+≡
subroutine match_quoted (tt, s, n, range)
type(template_t), intent(in) :: tt
character(*), intent(in) :: s
integer, intent(out) :: n
integer, dimension(2), intent(out) :: range

```

```

character(tt%len1) :: ch1
character(tt%len2) :: ch2
integer :: i
ch1 = tt%charset1
if (s(1:tt%len1) == ch1) then
ch2 = tt%charset2
do i = tt%len1 + 1, len (s) - tt%len2 + 1
if (s(i:i+tt%len2-1) == ch2) then
n = i + tt%len2 - 1
range(1) = tt%len1 + 1
range(2) = i - 1
return
end if
end do
n = -1
range = 0
else
n = 0
range = 0
end if
end subroutine match_quoted

```

A template for real numbers. The first character set is the set of allowed exponent letters. In accordance with the other functions we return the lexeme as a string but do not read it.

```

<Lexer: procedures>+≡
pure function template_numeric (chars) result (tt)
character(*), intent(in) :: chars
type(template_t) :: tt
tt = template_t (T_NUMERIC, chars, "", len (chars), 0)
end function template_numeric

```

A numeric lexeme may be real or integer. We purposely do not allow for a preceding sign. If the number is followed by an exponent, this is included, otherwise the rest is ignored.

There is a possible pitfall with this behavior: while the string `1e3` will be interpreted as a single number, the analogous string `1a3` will be split into the number 1 and an identifier `a3`. There is no easy way around such an ambiguity. We should make sure that the syntax does not contain identifiers like `a3` or `e3`.

```

<Lexer: procedures>+≡
subroutine match_numeric (tt, s, n)
type(template_t), intent(in) :: tt
character(*), intent(in) :: s
integer, intent(out) :: n
integer :: i, n0
character(10), parameter :: digits = "0123456789"
character(2), parameter :: signs = "-+"
n = verify (s, digits) - 1
if (n < 0) then
n = 0
return
else if (s(n+1:n+1) == ".") then

```

```

i = verify (s(n+2:), digits) - 1
if (i < 0) then
n = len (s)
return
else if (i > 0 .or. n > 0) then
n = n + 1 + i
end if
end if
n0 = n
if (n > 0) then
if (verify (s(n+1:n+1), tt%charset1(1:tt%len1)) == 0) then
n = n + 1
if (verify (s(n+1:n+1), signs) == 0) n = n + 1
i = verify (s(n+1:), digits) - 1
if (i < 0) then
n = len (s)
else if (i == 0) then
n = n0
else
n = n + i
end if
end if
end if
end subroutine match_numeric

```

The generic matching routine. With Fortran 2003 we would define separate types and use a SELECT TYPE instead.

*(Lexer: procedures)*+≡

```

subroutine match_template (tt, s, n, range)
type(template_t), intent(in) :: tt
character(*), intent(in) :: s
integer, intent(out) :: n
integer, dimension(2), intent(out) :: range
select case (tt%type)
case (WHITESPACE)
call match_whitespace (tt, s, n)
range = 0
case (T_IDENTIFIER)
call match_identifier (tt, s, n)
range(1) = 1
range(2) = len_trim (s)
case (T_QUOTED)
call match_quoted (tt, s, n, range)
case (T_NUMERIC)
call match_numeric (tt, s, n)
range(1) = 1
range(2) = len_trim (s)
case default
call msg_bug ("Invalid lexeme template encountered")
end select
end subroutine match_template

```

Match against an array of templates. Return the index of the first template

that matches together with the number of characters matched and the range of the relevant substring. If all fails, these numbers are zero.

```

<Lexer: procedures>+≡
  subroutine match (tt, s, n, range, ii)
    type(template_t), dimension(:), intent(in) :: tt
    character(*), intent(in) :: s
    integer, intent(out) :: n
    integer, dimension(2), intent(out) :: range
    integer, intent(out) :: ii
    integer :: i
    do i = 1, size (tt)
      call match_template (tt(i), s, n, range)
      if (n /= 0) then
        ii = i
        return
      end if
    end do
    n = 0
    ii = 0
  end subroutine match

```

#### 7.2.4 The lexer setup

This object contains information about character classes. As said above, one class consists of quoting chars (matching left and right), another one of comment chars (similar), a class of whitespace, and several classes of characters that make up identifiers. When creating the lexer setup, the character classes are transformed into lexeme templates which are to be matched in a certain predefined order against the input stream.

BLANK should always be taken as whitespace, some things may depend on this. TAB is also fixed by convention, but may in principle be modified. Newline (DOS!) and linefeed are also defined as whitespace. The lexer setup, containing the list of lexeme templates. No defaults yet. The type with index zero will be assigned to the NO\_MATCH lexeme.

The keyword list is not stored, just a pointer to it. We anticipate that the keyword list is part of the syntax table, and the lexer needs not alter it. Furthermore, the lexer is typically finished before the syntax table is.

```

<Lexer: parameters>+≡
  integer, parameter :: CASE_KEEP = 0, CASE_UP = 1, CASE_DOWN = 2

```

```

<Lexer: types>+≡
  type :: lexer_setup_t
  private
  type(template_t), dimension(:), allocatable :: tt
  integer, dimension(:), allocatable :: type
  integer :: keyword_case = CASE_KEEP
  type(keyword_list_t), pointer :: keyword_list => null ()
  end type lexer_setup_t

```

Fill the lexer setup object. Some things are hardcoded here (whitespace, alphanumeric identifiers), some are free: comment chars (but these must be single, and comments must be terminated by line-feed), quote chars and matches (must be single), characters to be read as one-character lexeme, special classes (characters of one class that should be glued together as identifiers).

*<Lexer: procedures>+≡*

```

subroutine lexer_setup_init (setup, &
comment_chars, quote_chars, quote_match, &
single_chars, special_class, &
keyword_list, upper_case_keywords)
type(lexer_setup_t), intent(inout) :: setup
character(*), intent(in) :: comment_chars
character(*), intent(in) :: quote_chars, quote_match
character(*), intent(in) :: single_chars
character(*), dimension(:), intent(in) :: special_class
type(keyword_list_t), pointer :: keyword_list
logical, intent(in), optional :: upper_case_keywords
integer :: n, i
if (present (upper_case_keywords)) then
if (upper_case_keywords) then
setup%keyword_case = CASE_UP
else
setup%keyword_case = CASE_DOWN
end if
else
setup%keyword_case = CASE_KEEP
end if
n = 1 + len (comment_chars) + len (quote_chars) + 1 &
+ len (single_chars) + size (special_class) + 1
allocate (setup%tt(n))
allocate (setup%type(0:n))
n = 0
setup%type(n) = NO_MATCH
n = n + 1
setup%tt(n) = template_whitespace (WHITESPACE_CHARS)
setup%type(n) = EMPTY
forall (i = 1:len(comment_chars))
setup%tt(n+i) = template_quoted (comment_chars(i:i), LF)
setup%type(n+i) = EMPTY
end forall
n = n + len (comment_chars)
forall (i = 1:len(quote_chars))
setup%tt(n+i) = template_quoted (quote_chars(i:i), quote_match(i:i))
setup%type(n+i) = T_QUOTED
end forall
n = n + len (quote_chars)
setup%tt(n+1) = template_numeric ("EeDd")
setup%type(n+1) = T_NUMERIC
n = n + 1
forall (i = 1:len (single_chars))
setup%tt(n+i) = template_identifier (single_chars(i:i), "")
setup%type(n+i) = T_IDENTIFIER
end forall

```

```

n = n + len (single_chars)
forall (i = 1:size (special_class))
  setup%tt(n+i) = template_identifier &
    (trim (special_class(i)), trim (special_class(i)))
  setup%type(n+i) = T_IDENTIFIER
end forall
n = n + size (special_class)
setup%tt(n+1) = template_identifier &
  (LCLETTERS//UCLETTERS, LCLETTERS//DIGIT_CHARS//"_"/UCLETTERS)
setup%type(n+1) = T_IDENTIFIER
n = n + 1
if (n /= size (setup%tt)) &
  call msg_bug ("Size mismatch in lexer setup")
setup%keyword_list => keyword_list
end subroutine lexer_setup_init

```

The destructor is needed only if the object is not itself part of an allocatable array

```

<Lexer: procedures>+≡
  subroutine lexer_setup_final (setup)
    type(lexer_setup_t), intent(inout) :: setup
    deallocate (setup%tt, setup%type)
    setup%keyword_list => null ()
  end subroutine lexer_setup_final

```

For debugging: Write the lexer setup

```

<Lexer: procedures>+≡
  subroutine lexer_setup_write (setup, unit)
    type(lexer_setup_t), intent(in) :: setup
    integer, intent(in) :: unit
    integer :: i
    write (unit, "(A)") "Lexer setup:"
    if (allocated (setup%tt)) then
      do i = 1, size (setup%tt)
        call template_write (setup%tt(i), unit)
        write (unit, '(A)', advance = "no") " -> "
        call lexeme_type_write (setup%type(i), unit)
        write (unit, *)
      end do
    else
      write (unit, *) "[empty]"
    end if
    if (associated (setup%keyword_list)) then
      call keyword_list_write (setup%keyword_list, unit)
    end if
  end subroutine lexer_setup_write

```

### 7.2.5 The lexeme type

An object of this type is returned by the lexer. Apart from the lexeme string, it gives information about the relevant substring (first and last character index)

and the lexeme type. Interpreting the string is up to the parser.

```

<Lexer: public>+≡
    public :: lexeme_t

<Lexer: types>+≡
    type :: lexeme_t
    private
    integer :: type = EMPTY
    type(string_t) :: s
    integer :: b = 0, e = 0
    end type lexeme_t

```

Debugging aid:

```

<Lexer: public>+≡
    public :: lexeme_write

<Lexer: sub interfaces>+≡
    module subroutine lexeme_write (t, unit)
        type(lexeme_t), intent(in) :: t
        integer, intent(in) :: unit
    end subroutine lexeme_write

<Lexer: procedures>+≡
    module subroutine lexeme_write (t, unit)
        type(lexeme_t), intent(in) :: t
        integer, intent(in) :: unit
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        select case (t%type)
        case (T_KEYWORD)
            write (u, *) "KEYWORD:      '" // char (t%s) // "'"
        case (T_IDENTIFIER)
            write (u, *) "IDENTIFIER:  '" // char (t%s) // "'"
        case (T_QUOTED)
            write (u, *) "QUOTED:      '" // char (t%s) // "'"
        case (T_NUMERIC)
            write (u, *) "NUMERIC:      '" // char (t%s) // "'"
        case (UNMATCHED_QUOTE)
            write (u, *) "Unmatched quote: "// char (t%s)
        case (OVERFLOW); write (u, *) "Overflow: "// char (t%s)
        case (EMPTY);    write (u, *) "Empty lexeme"
        case (NO_MATCH); write (u, *) "No match"
        case (IO_ERROR); write (u, *) "IO error"
        case (EOF);      write (u, *) "EOF"
        case default
            write (u, *) "Error"
        end select
    end subroutine lexeme_write

```

Store string and type in a lexeme. The range determines the beginning and end of the relevant part of the string. Check for a keyword.

```

<Lexer: procedures>+≡
    subroutine lexeme_set (t, keyword_list, s, range, type, keyword_case)
        type(lexeme_t), intent(out) :: t

```

```

type(keyword_list_t), pointer :: keyword_list
type(string_t), intent(in) :: s
type(string_t) :: keyword
integer, dimension(2), intent(in) :: range
integer, intent(in) :: type
integer, intent(in), optional :: keyword_case
t%type = type
if (present (keyword_case)) then
select case (keyword_case)
case (CASE_KEEP); keyword = s
case (CASE_UP); keyword = upper_case (s)
case (CASE_DOWN); keyword = lower_case (s)

### 7.2.6 The lexer object

We store the current lexeme and the current line. The line buffer is set each time a new line is read from file. The working buffer has one character more, to hold any trailing blank. Pointers to line and column are for debugging, they will be used to make up readable error messages for the parser.

```

<Lexer: public>+≡
  public :: lexer_t

<Lexer: types>+≡
  type :: lexer_t
  private
  type(lexer_setup_t) :: setup
  type(stream_t), pointer :: stream => null ()

  module subroutine lexer_final (lexer)
    class(lexer_t), intent(inout) :: lexer
  end subroutine lexer_final

<Lexer: procedures>+≡
  module subroutine lexer_final (lexer)
    class(lexer_t), intent(inout) :: lexer
    call lexer%clear ()
    call lexer_setup_final (lexer%setup)
  end subroutine lexer_final

```

## 7.2.7 The lexer routine

For lexing we need to associate an input stream to the lexer.

```

<Lexer: public>+≡
  public :: lexer_assign_stream

<Lexer: lexer: TBP>+≡
  procedure :: assign_stream => lexer_assign_stream

<Lexer: sub interfaces>+≡
  module subroutine lexer_assign_stream (lexer, stream)
    class(lexer_t), intent(inout) :: lexer
    type(stream_t), intent(in), target :: stream
  end subroutine lexer_assign_stream

<Lexer: procedures>+≡
  module subroutine lexer_assign_stream (lexer, stream)
    class(lexer_t), intent(inout) :: lexer
    type(stream_t), intent(in), target :: stream
    lexer%stream => stream
  end subroutine lexer_assign_stream

```

The lexer. The lexer function takes the lexer and returns the currently stored lexeme. If there is none, it is read from buffer, matching against the lexeme templates in the lexer setup. Empty lexemes, i.e., comments and whitespace, are discarded and the buffer is read again until we have found a nonempty lexeme (which may also be EOF or an error condition).

The initial state of the lexer contains an empty lexeme, so reading from buffer is forced. The empty state is restored after returning the lexeme. A nonempty lexeme is present in the lexer only if `lex_back` has been executed before.

The workspace is the `lexer%buffer`, treated as a sort of input stream. We chop off lexemes from the beginning, adjusting the buffer to the left. Whenever the buffer is empty, or we are matching against an open quote which has not terminated, we read a new line and append it to the right. This may result in special conditions, which for simplicity are also returned as lexemes: I/O error, buffer overflow, end of file. If the latter happens during reading a quoted string, we return an unmatched-quote lexeme. Obviously, the special-condition lexemes have to be caught by the parser.

Note that reading further lines is only necessary when reading a quoted string. Otherwise, the line-feed that ends each line is interpreted as whitespace which terminates a preceding lexeme, so there are no other valid multiline lexemes.

To enable meaningful error messages, we also keep track of the line number of the last line read, and the beginning and the end of the current lexeme with respect to this line.

The lexer is implemented as a function that returns the next lexeme (i.e., token). It uses the `lexer` setup and modifies the buffers and pointers stored within the lexer, a side effect. The lexer reads from an input stream object, which also is modified by this reading, e.g., a line pointer is advanced.

```

(Lexer: public)+≡
  public :: lex

(Lexer: sub interfaces)+≡
  module subroutine lex (lexeme, lexer)
    type(lexeme_t), intent(out) :: lexeme
    type(lexer_t), intent(inout) :: lexer
  end subroutine lex

(Lexer: procedures)+≡
  module subroutine lex (lexeme, lexer)
    type(lexeme_t), intent(out) :: lexeme
    type(lexer_t), intent(inout) :: lexer
    integer :: iostat1, iostat2
    integer :: pos
    integer, dimension(2) :: range
    integer :: template_index, type
    if (.not. associated (lexer%stream)) &
      call msg_bug ("Lexer called without assigned stream")
    GET_LEXEME: do while (lexeme_get_type (lexer%lexeme) == EMPTY)
      if (len (lexer%buffer) /= 0) then
        iostat1 = 0
      else
        call lexer_read_line (lexer, iostat1)
      end if
      select case (iostat1)
        case (0)
          MATCH_BUFFER: do
            call match (lexer%setup%tt, char (lexer%buffer), &
              pos, range, template_index)
            if (pos >= 0) then
              type = lexer%setup%type(template_index)
              exit MATCH_BUFFER
            else

```

```

pos = 0
call lexer_read_line (lexer, iostat2)
select case (iostat2)
case (EOF); type = UNMATCHED_QUOTE; exit MATCH_BUFFER
case (1);   type = IO_ERROR;       exit MATCH_BUFFER
case (2);   type = OVERFLOW;       exit MATCH_BUFFER
end select
end if
end do MATCH_BUFFER
case (EOF); type = EOF
case (1);   type = IO_ERROR
case (2);   type = OVERFLOW
end select
call lexeme_set (lexer%lexeme, lexer%setup%keyword_list, &
extract (lexer%buffer, finish=pos), range, type, &

lexer%buffer = remove (lexer%buffer, finish=pos)
lexer%previous_column = lexer%current_column
lexer%current_column = lexer%current_column + pos
end do GET_LEXEME
lexeme = lexer%lexeme
call lexeme_clear (lexer%lexeme)
end subroutine lex

```

Read a line and append it to the input buffer. If the input buffer overflows, return `iostat=2`. Otherwise, `iostat=1` indicates an I/O error, and `iostat=-1` the EOF.

The input stream may either be an external unit or a `ifile` object. In the latter case, a line is read and the line pointer is advanced.

Note that inserting LF between input lines is the Unix convention. Since we are doing this explicitly when gluing lines together, we can pattern-match against LF without having to worry about the system.

```

<Lexer: procedures>+≡
subroutine lexer_read_line (lexer, iostat)
type(lexer_t), intent(inout) :: lexer
integer, intent(out) :: iostat
type(string_t) :: current_line
current_line = lexer%current_line
call stream_get_record (lexer%stream, lexer%current_line, iostat)
if (iostat == 0) then
lexer%lines_read = lexer%lines_read + 1
lexer%previous_line2 = lexer%previous_line1
lexer%previous_line1 = current_line
lexer%buffer = lexer%buffer // lexer%current_line // LF
lexer%previous_column = 0
lexer%current_column = 0
end if
end subroutine lexer_read_line

```

Once in a while we have read one lexeme to many, which can be pushed back into the input stream. Do not do this more than once.

```

<Lexer: public>+≡

```

```

    public :: lexer_put_back
<Lexer: sub interfaces>+≡
    module subroutine lexer_put_back (lexer, lexeme)
        type(lexer_t), intent(inout) :: lexer
        type(lexeme_t), intent(in) :: lexeme
        end subroutine lexer_put_back
<Lexer: procedures>+≡
    module subroutine lexer_put_back (lexer, lexeme)
        type(lexer_t), intent(inout) :: lexer
        type(lexeme_t), intent(in) :: lexeme
        if (lexeme_get_type (lexer%lexeme) == EMPTY) then
            lexer%lexeme = lexeme
        else
            call msg_bug (" Lexer: lex_back fails; probably called twice")
        end if
    end subroutine lexer_put_back

```

## 7.2.8 Diagnostics

For debugging: print just the setup

```

<Lexer: public>+≡
    public :: lexer_write_setup
<Lexer: sub interfaces>+≡
    module subroutine lexer_write_setup (lexer, unit)
        type(lexer_t), intent(in) :: lexer
        integer, intent(in), optional :: unit
        end subroutine lexer_write_setup
<Lexer: procedures>+≡
    module subroutine lexer_write_setup (lexer, unit)
        type(lexer_t), intent(in) :: lexer
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        call lexer_setup_write (lexer%setup, u)
    end subroutine lexer_write_setup

```

This is useful for error printing: show the current line with index and a pointer to the current column within the line.

```

<Lexer: public>+≡
    public :: lexer_show_location
<Lexer: sub interfaces>+≡
    module subroutine lexer_show_location (lexer)
        type(lexer_t), intent(in) :: lexer
        end subroutine lexer_show_location
<Lexer: procedures>+≡
    module subroutine lexer_show_location (lexer)
        type(lexer_t), intent(in) :: lexer
        type(string_t) :: loc_str
        if (associated (lexer%parent)) then

```

```

call lexer_show_source (lexer%parent)
call msg_message ("[includes]")
else
call msg_message ()
end if
if (associated (lexer%stream)) then
call msg_message &
(char (stream_get_record_info_string (lexer%stream)) // ":")
end if
if (lexer%lines_read >= 4) call msg_result ("[...]")
if (lexer%lines_read >= 3) call msg_result (char (lexer%previous_line2))
if (lexer%lines_read >= 2) call msg_result (char (lexer%previous_line1))
if (lexer%lines_read >= 1) then
call msg_result (char (lexer%current_line))
loc_str = repeat (" ", lexer%previous_column)
loc_str = loc_str // "^"
if (lexer%current_column > lexer%previous_column) then
loc_str = loc_str &
// repeat ("-", max (lexer%current_column &
- lexer%previous_column - 1, 0)) &
// "~"
end if
call msg_result (char (loc_str))
end if
end subroutine lexer_show_location

```

This just prints the current stream source.

*<Lexer: procedures>+≡*

```

recursive subroutine lexer_show_source (lexer)
type(lexer_t), intent(in) :: lexer
if (associated (lexer%parent)) then
call lexer_show_source (lexer%parent)
call msg_message ("[includes]")
else
call msg_message ()
end if
if (associated (lexer%stream)) then
call msg_message &
(char (stream_get_source_info_string (lexer%stream)) // ":")
end if
end subroutine lexer_show_source

```

## 7.2.9 Unit tests

```

```
  contains
```

```
    <Syntax: procedures>
```

```
end submodule syntax_rules_s
```

### 7.3.1 Syntax rules

Syntax rules are used by the parser. They determine how to translate the stream of lexemes as returned by the lexer into the parse tree node. A rule may be terminal, i.e., replace a matching lexeme into a terminal node. The node will contain the lexeme interpreted as a recognized token:

- a keyword: unquoted fixed character string;
- a real number, to be determined at runtime;
- an integer, to be determined at runtime;
- a boolean value, to be determined at runtime;
- a quoted token (e.g., string), to be determined at runtime;
- an identifier (unquoted string that is not a recognized keyword), to be determined at runtime.

It may be nonterminal, i.e., contain a sequence of child rules. These are matched consecutively (and recursively) against the input stream; the resulting node will be a branch node.

- the file, i.e., the input stream as a whole;
- a sequence of syntax elements, where the last syntax element may be optional, or optional repetitive;

Sequences carry a flag that tells whether the last child is optional or may be repeated an arbitrary number of times, corresponding to the regexp modifiers `?`, `*`, and `+`.

We also need an alternative rule; this will be replaced by the node generated by one of its children that matches; thus, it does not create a node of its own.

- an alternative of syntax elements.

We also define special types of sequences as convenience macros:

- a list: a sequence where the elements are separated by a separator keyword (e.g., commas), the separators are thrown away when parsing the list;
- a group: a sequence of three tokens, where the first and third ones are left and right delimiters, the delimiters are thrown away;
- an argument list: a delimited list, containing both delimiters and separators.

It would be great to have a polymorphic type for this purpose, but until Fortran 2003 is out we have to emulate this.

Here are the syntax element codes:

```
<Syntax: public>≡  
public :: S_UNKNOWN  
public :: S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_QUOTED  
public :: S_IDENTIFIER, S_KEYWORD  
public :: S_SEQUENCE, S_LIST, S_GROUP, S_ARGS  
public :: S_ALTERNATIVE  
public :: S_IGNORE
```

```

<Syntax: parameters>≡
  integer, parameter :: &
  S_UNKNOWN = 0, &
  S_LOGICAL = 1, S_INTEGER = 2, S_REAL = 3, S_COMPLEX = 4, &
  S_QUOTED = 5, S_IDENTIFIER = 6, S_KEYWORD = 7, &
  S_SEQUENCE = 8, S_LIST = 9, S_GROUP = 10, S_ARGS = 11, &
  S_ALTERNATIVE = 12, &
  S_IGNORE = 99

```

We need arrays of rule pointers, therefore this construct.

```

<Syntax: types>≡
  type :: rule_p
  private
  type(syntax_rule_t), pointer :: p => null ()
  end type rule_p

```

Return the association status of the rule pointer:

```

<Syntax: procedures>≡
  elemental function rule_is_associated (rp) result (ok)
  logical :: ok
  type (rule_p), intent(in) :: rp
  ok = associated (rp%p)
  end function rule_is_associated

```

The rule type is one of the types listed above, represented by an integer code. The keyword, for a non-keyword rule, is an identifier used for the printed syntax table. The array of children is needed for nonterminal rules. In that case, there is a modifier for the last element (blank, "?", "\*", or "+"), mirrored in the flags `opt` and `rep`. Then, we have the character constants used as separators and delimiters for this rule. Finally, the `used` flag can be set to indicate that this rule is the child of another rule.

```

<Syntax: types>+≡
  public :: syntax_rule_t

<Syntax: types>+≡
  type :: syntax_rule_t
  private
  integer :: type = S_UNKNOWN
  logical :: used = .false.
  type(string_t) :: keyword
  type(string_t) :: separator
  type(string_t), dimension(2) :: delimiter
  type(rule_p), dimension(:), allocatable :: child
  character(1) :: modifier = ""
  logical :: opt = .false., rep = .false.
  contains
  <Syntax: syntax rule: TBP>
  end type syntax_rule_t

```

Initializer: Set type and key for a rule, but do not (yet) allocate anything.  
 Finalizer: not needed (no pointer components).

```

<Syntax: procedures>+≡

```

```

subroutine syntax_rule_init (rule, key, type)
type(syntax_rule_t), intent(inout) :: rule
type(string_t), intent(in) :: key
integer, intent(in) :: type
rule%keyword = key
rule%type = type
select case (rule%type)
case (S_GROUP)
call syntax_rule_set_delimiter (rule)
case (S_LIST)
call syntax_rule_set_separator (rule)
case (S_ARGS)
call syntax_rule_set_delimiter (rule)
call syntax_rule_set_separator (rule)
end select
end subroutine syntax_rule_init

```

These characters will not be enclosed in quotes when writing syntax rules:

```

<Syntax: sub parameters>≡
character(*), parameter :: &
UNQUOTED = "(),|_"/LCLETTERS/UCLETTERS/DIGIT_CHARS

```

### 7.3.2 Accessing rules

This is the API for syntax rules:

```

<Syntax: public>+≡
public :: syntax_rule_get_type

<Syntax: sub interfaces>≡
module function syntax_rule_get_type (rule) result (type)
integer :: type
type(syntax_rule_t), intent(in) :: rule
end function syntax_rule_get_type

<Syntax: procedures>+≡
module function syntax_rule_get_type (rule) result (type)
integer :: type
type(syntax_rule_t), intent(in) :: rule
type = rule%type
end function syntax_rule_get_type

<Syntax: public>+≡
public :: syntax_rule_get_key

<Syntax: sub interfaces>+≡
module function syntax_rule_get_key (rule) result (key)
class(syntax_rule_t), intent(in) :: rule
type(string_t) :: key
end function syntax_rule_get_key

<Syntax: syntax rule: TBP>≡
procedure :: get_key => syntax_rule_get_key

```

```

<Syntax: procedures>+≡
  module function syntax_rule_get_key (rule) result (key)
    class(syntax_rule_t), intent(in) :: rule
    type(string_t) :: key
    key = rule%keyword
  end function syntax_rule_get_key

<Syntax: public>+≡
  public :: syntax_rule_get_separator
  public :: syntax_rule_get_delimiter

<Syntax: sub interfaces>+≡
  module function syntax_rule_get_separator (rule) result (separator)
    type(string_t) :: separator
    type(syntax_rule_t), intent(in) :: rule
  end function syntax_rule_get_separator
  module function syntax_rule_get_delimiter (rule) result (delimiter)
    type(string_t), dimension(2) :: delimiter
    type(syntax_rule_t), intent(in) :: rule
  end function syntax_rule_get_delimiter

<Syntax: procedures>+≡
  module function syntax_rule_get_separator (rule) result (separator)
    type(string_t) :: separator
    type(syntax_rule_t), intent(in) :: rule
    separator = rule%separator
  end function syntax_rule_get_separator

  module function syntax_rule_get_delimiter (rule) result (delimiter)
    type(string_t), dimension(2) :: delimiter
    type(syntax_rule_t), intent(in) :: rule
    delimiter = rule%delimiter
  end function syntax_rule_get_delimiter

```

Accessing child rules. If we use `syntax_rule_get_n_sub` for determining loop bounds, we do not need a check in the second routine.

```

<Syntax: public>+≡
  public :: syntax_rule_get_n_sub
  public :: syntax_rule_get_sub_ptr

<Syntax: sub interfaces>+≡
  module function syntax_rule_get_sub_ptr (rule, i) result (sub)
    type(syntax_rule_t), pointer :: sub
    type(syntax_rule_t), intent(in), target :: rule
    integer, intent(in) :: i
  end function syntax_rule_get_sub_ptr
  module function syntax_rule_get_n_sub (rule) result (n)
    integer :: n
    type(syntax_rule_t), intent(in) :: rule
  end function syntax_rule_get_n_sub

<Syntax: procedures>+≡
  module function syntax_rule_get_n_sub (rule) result (n)
    integer :: n
    type(syntax_rule_t), intent(in) :: rule

```

```

if (allocated (rule%child)) then
n = size (rule%child)
else
n = 0
end if
end function syntax_rule_get_n_sub

module function syntax_rule_get_sub_ptr (rule, i) result (sub)
type(syntax_rule_t), pointer :: sub
type(syntax_rule_t), intent(in), target :: rule
integer, intent(in) :: i
sub => rule%child(i)%p
end function syntax_rule_get_sub_ptr

subroutine syntax_rule_set_sub (rule, i, sub)
type(syntax_rule_t), intent(inout) :: rule
integer, intent(in) :: i
type(syntax_rule_t), intent(in), target :: sub
rule%child(i)%p => sub
end subroutine syntax_rule_set_sub

```

Return the modifier flags:

```

<Syntax: public>+≡
public :: syntax_rule_last_optional
public :: syntax_rule_last_repetitive

<Syntax: sub interfaces>+≡
module function syntax_rule_last_optional (rule) result (opt)
logical :: opt
type(syntax_rule_t), intent(in) :: rule
end function syntax_rule_last_optional
module function syntax_rule_last_repetitive (rule) result (rep)
logical :: rep
type(syntax_rule_t), intent(in) :: rule
end function syntax_rule_last_repetitive

<Syntax: procedures>+≡
module function syntax_rule_last_optional (rule) result (opt)
logical :: opt
type(syntax_rule_t), intent(in) :: rule
opt = rule%opt
end function syntax_rule_last_optional
module function syntax_rule_last_repetitive (rule) result (rep)
logical :: rep
type(syntax_rule_t), intent(in) :: rule
rep = rule%rep
end function syntax_rule_last_repetitive

```

Return true if the rule is atomic, i.e., logical, real, keyword etc.

```

<Syntax: public>+≡
public :: syntax_rule_is_atomic

<Syntax: sub interfaces>+≡
module function syntax_rule_is_atomic (rule) result (atomic)

```

```

logical :: atomic
type(syntax_rule_t), intent(in) :: rule
end function syntax_rule_is_atomic

<Syntax: procedures>+≡
module function syntax_rule_is_atomic (rule) result (atomic)
logical :: atomic
type(syntax_rule_t), intent(in) :: rule
select case (rule%type)
case (S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_IDENTIFIER, &
S_KEYWORD, S_QUOTED)
atomic = .true.
case default
atomic = .false.
end select
end function syntax_rule_is_atomic

```

### 7.3.3 I/O

Write an account of the rule. Setting **short** true will suppress the node type. Setting **key\_only** true will suppress the definition. Setting **advance** false will suppress the trailing newline.

```

<Syntax: public>+≡
public :: syntax_rule_write

<Syntax: syntax rule: TBP>+≡
procedure :: write => syntax_rule_write

<Syntax: sub interfaces>+≡
module subroutine syntax_rule_write (rule, unit, short, key_only, advance)
class(syntax_rule_t), intent(in) :: rule
integer, intent(in), optional :: unit
logical, intent(in), optional :: short, key_only, advance
end subroutine syntax_rule_write

end if
case default
string = "<" // rule%keyword // ">"
end select
end function wkey

```

### 7.3.4 Completing syntax rules

Set the separator and delimiter entries, using defaults:

```
<Syntax: procedures>+≡
  subroutine syntax_rule_set_separator (rule, separator)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in), optional :: separator
    if (present (separator)) then
      rule%separator = separator
    else
      rule%separator = ","
    end if
  end subroutine syntax_rule_set_separator

  subroutine syntax_rule_set_delimiter (rule, delimiter)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), dimension(2), intent(in), optional :: delimiter
    if (present (delimiter)) then
      rule%delimiter = delimiter
    else
      rule%delimiter(1) = "("
      rule%delimiter(2) = ")"
    end if
  end subroutine syntax_rule_set_delimiter
```

Set the modifier entry and corresponding flags:

```
<Syntax: procedures>+≡
  function is_modifier (string) result (ok)
    logical :: ok
    type(string_t), intent(in) :: string
    select case (char (string))
      case (" ", "?", "*", "+"); ok = .true.
      case default; ok = .false.
    end select
  end function is_modifier

  subroutine syntax_rule_set_modifier (rule, modifier)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: modifier
    rule%modifier = char (modifier)
    select case (rule%modifier)
      case (" ")
      case ("?"); rule%opt = .true.
      case ("*"); rule%opt = .true.; rule%rep = .true.
      case ("+"); rule%rep = .true.
      case default
        call msg_bug (" Syntax: sequence modifier '" // rule%modifier &
          // "' is not one of '+' '*' '?'")
    end select
  end subroutine syntax_rule_set_modifier
```

Check a finalized rule for completeness

```

<Syntax: procedures>+≡
  subroutine syntax_rule_check (rule)
    type(syntax_rule_t), intent(in) :: rule
    if (rule%keyword == "") call msg_bug ("Rule key not set")
    select case (rule%type)
    case (S_UNKNOWN); call bug (" Undefined rule")
    case (S_IGNORE, S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, &
    S_IDENTIFIER, S_KEYWORD)
    case (S_QUOTED)
    if (rule%delimiter(1) == "" .or. rule%delimiter(2) == "") &
    call bug (" Missing quote character(s)")
    case (S_SEQUENCE)
    case (S_GROUP)
    if (rule%delimiter(1) == "" .or. rule%delimiter(2) == "") &
    call bug (" Missing delimiter(s)")
    case (S_LIST)
    if (rule%separator == "") call bug (" Missing separator")
    case (S_ARGS)
    if (rule%delimiter(1) == "" .or. rule%delimiter(2) == "") &
    call bug (" Missing delimiter(s)")
    if (rule%separator == "") call bug (" Missing separator")
    case (S_ALTERNATIVE)
    case default
    call bug (" Undefined syntax code")
    end select
    select case (rule%type)
    case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
    if (allocated (rule%child)) then
    if (.not.all (rule_is_associated (rule%child))) &
    call bug (" Child rules not all associated")
    else
    call bug (" Parent rule without children")
    end if
    case default
    if (allocated (rule%child)) call bug (" Non-parent rule with children")
    end select
    contains
    subroutine bug (string)
    character(*), intent(in) :: string
    call msg_bug (" Syntax table: Rule " // char (rule%keyword) // ": " &
    // string)
    end subroutine bug
  end subroutine syntax_rule_check

```

### 7.3.5 Syntax tables

A syntax table contains the tree of syntax rules and, for direct parser access, the list of valid keywords.

## Types

The syntax contains an array of rules and a list of keywords. The array is actually used as a tree, where the top rule is the first array element, and the other rules are recursively pointed to by this first rule. (No rule should be used twice or be unused.) The keyword list is derived from the rule tree.

Objects of this type need the target attribute if they are associated with a lexer. The keyword list will be pointed to by this lexer.

```
<Syntax: public>+≡
  public :: syntax_t

<Syntax: types>+≡
  type :: syntax_t
  private
  type(syntax_rule_t), dimension(:), allocatable :: rule
  type(keyword_list_t) :: keyword_list
  end type syntax_t
```

## Constructor/destructor

Initialize and finalize syntax tables

```
<Syntax: public>+≡
  public :: syntax_init
  public :: syntax_final
```

There are two ways to create a syntax: hard-coded from rules or dynamically from file.

```
<Syntax: interfaces>≡
  interface syntax_init
  module procedure syntax_init_from_ifile
  end interface
```

The syntax definition is read from an ifile object which contains the syntax definitions in textual form, one rule per line. This interface allows for determining the number of rules beforehand.

To parse the rule definitions, we make up a temporary lexer. Obviously, we cannot use a generic parser yet, so we have to hardcode the parsing process.

```
<Syntax: sub interfaces>+≡
  module subroutine syntax_init_from_ifile (syntax, ifile)
  type(syntax_t), intent(out), target :: syntax
  type(ifile_t), intent(in) :: ifile
  end subroutine syntax_init_from_ifile

<Syntax: procedures>+≡
  module subroutine syntax_init_from_ifile (syntax, ifile)
  type(syntax_t), intent(out), target :: syntax
  type(ifile_t), intent(in) :: ifile
  type(lexer_t) :: lexer
  type(line_p) :: line
  type(string_t) :: string
  integer :: n_token
  integer :: i
```

```

call lexer_init (lexer, &
comment_chars = "", &
quote_chars = "<'\"", &
quote_match = ">'\"", &
single_chars = "?*+=|=", &
special_class = ["."], &
keyword_list = null ())
allocate (syntax%rule (ifile_get_length (ifile)))
call line_init (line, ifile)
do i = 1, size (syntax%rule)
string = line_get_string_advance (line)
call set_rule_type_and_key (syntax%rule(i), string, lexer)
end do
call line_init (line, ifile)
do i = 1, size (syntax%rule)
string = line_get_string_advance (line)
select case (syntax%rule(i)%type)
case (S_QUOTED, S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
n_token = get_n_token (string, lexer)
call set_rule_contents &
(syntax%rule(i), syntax, n_token, string, lexer)
end select
end do
call line_final (line)
call lexer_final (lexer)
call syntax_make_keyword_list (syntax)
if (.not. all (syntax%rule%used)) then
do i = 1, size (syntax%rule)
if (.not. syntax%rule(i)%used) then
call syntax_rule_write (syntax%rule(i), 6)
end if
end do
call msg_bug (" Syntax table: unused rules")
end if
end subroutine syntax_init_from_ifile

```

For a given rule defined in the input, the first task is to determine its type and key. With these, we can initialize the rule in the table, postponing the association of children.

*<Syntax: procedures>+≡*

```

subroutine set_rule_type_and_key (rule, string, lexer)
type(syntax_rule_t), intent(inout) :: rule
type(string_t), intent(in) :: string
type(lexer_t), intent(inout) :: lexer
type(stream_t), target :: stream
type(lexeme_t) :: lexeme
type(string_t) :: key
character(2) :: type
call lexer_clear (lexer)
call stream_init (stream, string)
call lexer_assign_stream (lexer, stream)
call lex (lexeme, lexer)
type = lexeme_get_string (lexeme)

```

```

call lex (lexeme, lexer)
key = lexeme_get_contents (lexeme)
call stream_final (stream)
if (trim (key) /= "") then
select case (type)
case ("IG"); call syntax_rule_init (rule, key, S_IGNORE)
case ("LO"); call syntax_rule_init (rule, key, S_LOGICAL)
case ("IN"); call syntax_rule_init (rule, key, S_INTEGER)
case ("RE"); call syntax_rule_init (rule, key, S_REAL)
case ("CO"); call syntax_rule_init (rule, key, S_COMPLEX)
case ("ID"); call syntax_rule_init (rule, key, S_IDENTIFIER)
case ("KE"); call syntax_rule_init (rule, key, S_KEYWORD)
case ("QU"); call syntax_rule_init (rule, key, S_QUOTED)
case ("SE"); call syntax_rule_init (rule, key, S_SEQUENCE)
case ("GR"); call syntax_rule_init (rule, key, S_GROUP)
case ("LI"); call syntax_rule_init (rule, key, S_LIST)
case ("AR"); call syntax_rule_init (rule, key, S_ARGS)
case ("AL"); call syntax_rule_init (rule, key, S_ALTERNATIVE)
case default
call lexer_show_location (lexer)
call msg_bug (" Syntax definition: unknown type '" // type // "'")
end select
else
print *, char (string)
call msg_bug (" Syntax definition: empty rule key")
end if
end subroutine set_rule_type_and_key

```

This function returns the number of tokens in an input line.

```

<Syntax: procedures>+≡
function get_n_token (string, lexer) result (n)
integer :: n
type(string_t), intent(in) :: string
type(lexer_t), intent(inout) :: lexer
type(stream_t), target :: stream
type(lexeme_t) :: lexeme
integer :: i
call lexer_clear (lexer)
call stream_init (stream, string)
call lexer_assign_stream (lexer, stream)
i = 0
do
call lex (lexeme, lexer)
if (lexeme_is_break (lexeme)) exit
i = i + 1
end do
n = i
call stream_final (stream)
end function get_n_token

```

Assign the pointer to the rule associated with a given key (assumes that the rule array is allocated)

```

<Syntax: public>+≡

```

```

    public :: syntax_get_rule_ptr
<Syntax: sub interfaces>+≡
    module function syntax_get_rule_ptr (syntax, key) result (rule)
        type(syntax_rule_t), pointer :: rule
        type(syntax_t), intent(in), target :: syntax
        type(string_t), intent(in) :: key
        end function syntax_get_rule_ptr
<Syntax: procedures>+≡
    module function syntax_get_rule_ptr (syntax, key) result (rule)
        type(syntax_rule_t), pointer :: rule
        type(syntax_t), intent(in), target :: syntax
        type(string_t), intent(in) :: key
        integer :: i
        do i = 1, size (syntax%rule)
            if (syntax%rule(i)%keyword == key) then
                rule => syntax%rule(i)
            end if
        end do
        call msg_bug (" Syntax table: Rule " // char (key) // " not found")
    end function syntax_get_rule_ptr

```

This subroutine extracts the rule contents for an input line. There are three tasks: (1) determine the number of children, depending on the rule type; (2) find and set the separator and delimiter strings, if required; (3) scan the child rules, find them in the syntax table and associate the parent rule with them.

```

<Syntax: procedures>+≡
    subroutine set_rule_contents (rule, syntax, n_token, string, lexer)
        type(syntax_rule_t), intent(inout) :: rule
        type(syntax_t), intent(in), target :: syntax

```

This routine completes the syntax table object. We assume that the rule array is set up. We associate the top rule with the first entry in the rule array and build up the keyword list.

The keyword list includes delimiters and separators. Filling it can only be done after all rules are set. We scan the rule tree. For each keyword that we find, we try to add it to the keyword list; the pointer to the last element is carried along with the recursive scanning. Before appending a keyword, we check whether it is already in the list.

```

<Syntax: procedures>+≡
subroutine syntax_make_keyword_list (syntax)
type(syntax_t), intent(inout), target :: syntax
type(syntax_rule_t), pointer :: rule
rule => syntax%rule(1)
call rule_scan_rec (rule, syntax%keyword_list)
contains
recursive subroutine rule_scan_rec (rule, keyword_list)

```

```

type(syntax_rule_t), pointer :: rule

        type(syntax_t), intent(in), target :: syntax
        keyword_list => syntax%keyword_list
    end function syntax_get_keyword_list_ptr

```

### 7.3.7 I/O

Write a readable representation of the syntax table

```

<Syntax: public>+≡
    public :: syntax_write

<Syntax: sub interfaces>+≡
    module subroutine syntax_write (syntax, unit)
        type(syntax_t), intent(in) :: syntax
        integer, intent(in), optional :: unit
    end subroutine syntax_write

<Syntax: procedures>+≡
    module subroutine syntax_write (syntax, unit)
        type(syntax_t), intent(in) :: syntax
        integer, intent(in), optional :: unit
        integer :: u
        integer :: i
        u = given_output_unit (unit); if (u < 0) return

```

```

write (u, "(A)") "Syntax table:"
if (allocated (syntax%rule)) then
do i = 1, size (syntax%rule)
call syntax_rule_write (syntax%rule(i), u)
end do
else
write (u, "(1x,A)") "[not allocated]"
end if
call keyword_list_write (syntax%keyword_list, u)
end subroutine syntax_write

```

## 7.4 The parser

On a small scale, the parser interprets the string tokens returned by the lexer; they are interpreted as numbers, keywords and such and stored as a typed object. On a large scale, a text is read, parsed, and a syntax rule set is applied such that the tokens are stored as a parse tree. Syntax errors are spotted in this process, so the resulting parse tree is syntactically correct by definition.

```
<parser.f90>≡  
  <File header>  
  
  module parser  
  
    <Use kinds>  
    <Use strings>  
    use lexers  
    use syntax_rules  
  
    <Standard module head>  
  
    <Parser: public>  
  
    <Parser: types>  
  
    <Parser: interfaces>  
  
    interface  
      <Parser: sub interfaces>  
    end interface  
  
  end module parser  
<parser_sub.f90>≡  
  <File header>  
  
  submodule (parser) parser_s  
  
    use io_units  
    use diagnostics  
    use md5  
    use system_defs, only: DIGIT_CHARS  
    use format_defs, only: FMT_19  
  
    implicit none  
  
    contains  
  
    <Parser: procedures>  
  
  end submodule parser_s
```

### 7.4.1 The token type

Tokens are elements of the parsed input that carry a value: logical, integer, real, quoted string, (unquoted) identifier, or known keyword. Note that non-keyword tokens also have an abstract key attached to them.

This is an obvious candidate for polymorphism.

```
<Parser: types>≡
  type :: token_t
  private
  integer :: type = S_UNKNOWN
  logical, pointer :: lval => null ()
  integer, pointer :: ival => null ()
  real(default), pointer :: rval => null ()
  complex(default), pointer :: cval => null ()
  type(string_t), pointer :: sval => null ()
  type(string_t), pointer :: kval => null ()
  type(string_t), dimension(:), pointer :: quote => null ()
end type token_t
```

Create a token from the lexeme returned by the lexer: Allocate storage and try to interpret the lexeme according to the type that is requested by the parser. For a keyword token, match the lexeme against the requested key. If successful, set the token type, value, and key. Otherwise, set the type to S\_UNKNOWN.

```
<Parser: procedures>≡
  subroutine token_init (token, lexeme, requested_type, key)
    type(token_t), intent(out) :: token
    type(lexeme_t), intent(in) :: lexeme
    integer, intent(in) :: requested_type
    type(string_t), intent(in) :: key

end subroutine token_mismatch

```

### 7.4.3 The parse tree: nodes

The parser will generate a parse tree from the input stream. Each node in this parse tree points to the syntax rule that was applied. (Since syntax rules are stored in a pointer-type array within the syntax table, they qualify as targets.) A leaf node contains a token. A branch node has subnodes. The subnodes are stored as a list, so each node also has a `next` pointer.

```

(Parser: public)≡
  public :: parse_node_t

(Parser: types)+≡
  type :: parse_node_t
  private
  type(syntax_rule_t), pointer :: rule => null ()
  type(token_t) :: token
  integer :: n_sub = 0
  type(parse_node_t), pointer :: sub_first => null ()
  type(parse_node_t), pointer :: sub_last => null ()
  type(parse_node_t), pointer :: next => null ()
  contains
  (Parser: parse node: TBP)
  end type parse_node_t

```

Container for parse node pointers, useful for creating pointer arrays:

```

(Parser: public)+≡
  public :: parse_node_p

(Parser: types)+≡
  type :: parse_node_p
  type(parse_node_t), pointer :: ptr => null ()
  end type parse_node_p

```

Output. The first version writes a node together with its sub-node tree, organized by indentation.

```

(Parser: parse node: TBP)≡
  procedure :: write => parse_node_write_rec

(Parser: public)+≡
  public :: parse_node_write_rec

(Parser: sub interfaces)+≡
  recursive module subroutine parse_node_write_rec (node, unit, short, depth)
  class(parse_node_t), intent(in), target :: node
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: short

```

```

integer, intent(in), optional :: depth
end subroutine parse_node_write_rec

(Parser: procedures)+≡
recursive module subroutine parse_node_write_rec (node, unit, short, depth)
class(parse_node_t), intent(in), target :: node
integer, intent(in), optional :: unit
logical, intent(in), optional :: short
integer, intent(in), optional :: depth
integer :: u, d
type(parse_node_t), pointer :: current
u = given_output_unit (unit); if (u < 0) return
d = 0; if (present (depth)) d = depth
call parse_node_write (node, u, short=short)
current => node%sub_first
do while (associated (current))
write (u, "(A)", advance = "no") repeat ("| ", d)
call parse_node_write_rec (current, unit, short, d+1)
current => current%next
end do
end subroutine parse_node_write_rec

```

This does the actual output for a single node, without recursion.

```

(Parser: public)+≡
public :: parse_node_write

short=.true., key_only=.true., advance=.false.)
current => current%next

```

```

end do
write (u, *)
else
write (u, *)
end if
else
write (u, *) "[empty]"
end if
end subroutine parse_node_write

```

Finalize the token and recursively finalize and deallocate all sub-nodes.

```

<Parser: public>+≡
    public :: parse_node_final

<Parser: sub interfaces>+≡
    recursive module subroutine parse_node_final (node, recursive)
    type(parse_node_t), intent(inout) :: node
    logical, intent(in), optional :: recursive
    end subroutine parse_node_final

<Parser: procedures>+≡
    recursive module subroutine parse_node_final (node, recursive)
    type(parse_node_t), intent(inout) :: node
    type(parse_node_t), pointer :: current
    logical, intent(in), optional :: recursive
    logical :: rec
    rec = .true.; if (present (recursive)) rec = recursive
    call token_final (node%token)
    if (rec) then
    do while (associated (node%sub_first))
    current => node%sub_first
    node%sub_first => node%sub_first%next
    call parse_node_final (current)
    deallocate (current)
    end do
    end if
    end subroutine parse_node_final

```

#### 7.4.4 Filling nodes

The constructors allocate and initialize the node. There are two possible initializers (in a later version, should correspond to different type extensions).

First, leaf (terminal) nodes. The token constructor does the actual work, looking at the requested type and key for the given rule and matching against the lexeme contents. If it fails, the token will keep the type `S_UNKNOWN` and remain empty. Otherwise, we have a valid node which contains the new token.

If the lexeme argument is absent, the token is left empty.

```

<Parser: procedures>+≡
    subroutine parse_node_create_leaf (node, rule, lexeme)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    type(lexeme_t), intent(in) :: lexeme

```

```

allocate (node)
node%rule => rule
call token_init (node%token, lexeme, &
syntax_rule_get_type (rule), syntax_rule_get_key (rule))
if (.not. token_is_valid (node%token)) deallocate (node)
end subroutine parse_node_create_leaf

```

This version allows us to manually create a leaf node that holds a keyword.

```

(Parser: public)+≡
  public :: parse_node_create_key

(Parser: sub interfaces)+≡
  module subroutine parse_node_create_key (node, rule)
    type(parse_node_t), intent(out) :: node
    type(syntax_rule_t), intent(in), target :: rule
  end subroutine parse_node_create_key

(Parser: procedures)+≡
  module subroutine parse_node_create_key (node, rule)
    type(parse_node_t), intent(out) :: node
    type(syntax_rule_t), intent(in), target :: rule
    node%rule => rule
    call token_init_key (node%token, syntax_rule_get_key (rule))
  end subroutine parse_node_create_key

```

This version allows us to manually create a leaf node that holds a fixed value. Only one of the optional values should be provided.

```

(Parser: public)+≡
  public :: parse_node_create_value

(Parser: sub interfaces)+≡
  module subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
    type(parse_node_t), intent(out) :: node
    type(syntax_rule_t), intent(in), target :: rule
    integer, intent(in), optional :: ival
    real(default), intent(in), optional :: rval
    complex(default), intent(in), optional :: cval
    type(string_t), intent(in), optional :: sval
    logical, intent(in), optional :: lval
  end subroutine parse_node_create_value

(Parser: procedures)+≡
  module subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
    type(parse_node_t), intent(out) :: node
    type(syntax_rule_t), intent(in), target :: rule
    integer, intent(in), optional :: ival
    real(default), intent(in), optional :: rval
    complex(default), intent(in), optional :: cval
    type(string_t), intent(in), optional :: sval
    logical, intent(in), optional :: lval
    node%rule => rule
    call parse_node_set_value (node, ival, rval, cval, sval, lval)
  end subroutine parse_node_create_value

```

Directly set the value without changing anything else.

```

(Parser: public)+≡
  public :: parse_node_set_value

(Parser: sub interfaces)+≡
  module subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
    type(parse_node_t), intent(inout) :: node
    integer, intent(in), optional :: ival
    real(default), intent(in), optional :: rval
    complex(default), intent(in), optional :: cval
    type(string_t), intent(in), optional :: sval
    logical, intent(in), optional :: lval
  end subroutine parse_node_set_value

(Parser: procedures)+≡
  module subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
    type(parse_node_t), intent(inout) :: node
    integer, intent(in), optional :: ival
    real(default), intent(in), optional :: rval
    complex(default), intent(in), optional :: cval
    type(string_t), intent(in), optional :: sval
    logical, intent(in), optional :: lval
    if (present (ival)) then
      node%token = ival
    else if (present (rval)) then
      node%token = rval
    else if (present (cval)) then
      node%token = cval
    else if (present (lval)) then
      node%token = lval
    else if (present (sval)) then
      node%token = sval
    end if
  end subroutine parse_node_set_value

```

Second, branch nodes. We first assign the rule:

```

(Parser: public)+≡
  public :: parse_node_create_branch

(Parser: sub interfaces)+≡
  module subroutine parse_node_create_branch (node, rule)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
  end subroutine parse_node_create_branch

(Parser: procedures)+≡
  module subroutine parse_node_create_branch (node, rule)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    allocate (node)
    node%rule => rule
  end subroutine parse_node_create_branch

```

Copy a node. This is a shallow copy. Note that we have to nullify the `next` pointer if we don't want to inherit the context of the original node.

```

(Parser: parse node: TBP)+≡
  procedure :: copy => parse_node_copy

(Parser: sub interfaces)+≡
  module subroutine parse_node_copy (node, copy)
    class(parse_node_t), intent(in) :: node
    type(parse_node_t), pointer, intent(out) :: copy
  end subroutine parse_node_copy

(Parser: procedures)+≡
  module subroutine parse_node_copy (node, copy)
    class(parse_node_t), intent(in) :: node
    type(parse_node_t), pointer, intent(out) :: copy
    allocate (copy)
    select type (node)
    type is (parse_node_t)
    copy = node
    end select
    copy%next => null ()
  end subroutine parse_node_copy

```

Append a sub-node. The sub-node must exist and be a valid target, otherwise nothing is done.

```

(Parser: public)+≡
  public :: parse_node_append_sub

(Parser: parse node: TBP)+≡
  procedure :: append_sub => parse_node_append_sub

(Parser: sub interfaces)+≡
  module subroutine parse_node_append_sub (node, sub)
    class(parse_node_t), intent(inout) :: node
    type(parse_node_t), pointer :: sub
  end subroutine parse_node_append_sub

(Parser: procedures)+≡
  module subroutine parse_node_append_sub (node, sub)
    class(parse_node_t), intent(inout) :: node
    type(parse_node_t), pointer :: sub
    if (associated (sub)) then
    if (associated (node%sub_last)) then
    node%sub_last%next => sub
    else
    node%sub_first => sub
    end if
    node%sub_last => sub
    end if
  end subroutine parse_node_append_sub

```

For easy access, once the list is complete we count the number of sub-nodes. If there are no subnodes, the whole node is deleted.

```

(Parser: public)+≡
  public :: parse_node_freeze_branch

```

```

<Parser: sub interfaces>+≡
  module subroutine parse_node_freeze_branch (node)
    type(parse_node_t), pointer :: node
    end subroutine parse_node_freeze_branch

<Parser: procedures>+≡
  module subroutine parse_node_freeze_branch (node)
    type(parse_node_t), pointer :: node
    type(parse_node_t), pointer :: current
    node%n_sub = 0
    current => node%sub_first
    do while (associated (current))
      node%n_sub = node%n_sub + 1
      current => current%next
    end do
    if (node%n_sub == 0) deallocate (node)
  end subroutine parse_node_freeze_branch

```

Replace the syntax rule. This makes sense only if the parse node adheres to the syntax of the new rule.

```

<Parser: public>+≡
  public :: parse_node_replace_rule

<Parser: sub interfaces>+≡
  module subroutine parse_node_replace_rule (node, rule)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    end subroutine parse_node_replace_rule

<Parser: procedures>+≡
  module subroutine parse_node_replace_rule (node, rule)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    node%rule => rule
  end subroutine parse_node_replace_rule

```

Replace the last subnode by the target node. Since the subnodes are stored as a linked list, we can do this only if we copy the subnodes. Furthermore, the target node must also be copied, and the `next` pointer of the copy is nullified. This ensures that we cannot modify the originals at the subnode level.

All copies are shallow copies. This implies that further modifications at the sub-subnode level will affect the original nodes and must therefore be forbidden.

Use with care, this invites to memory mismanagement. The copy nodes can be deallocated, but not finalized, since its subnodes are the same objects as the subnodes of the target node.

```

<Parser: public>+≡
  public :: parse_node_replace_last_sub

<Parser: sub interfaces>+≡
  module subroutine parse_node_replace_last_sub (node, pn_target)
    type(parse_node_t), intent(inout), target :: node
    type(parse_node_t), intent(in), target :: pn_target
    end subroutine parse_node_replace_last_sub

```

```

<Parser: procedures>+≡
module subroutine parse_node_replace_last_sub (node, pn_target)
  type(parse_node_t), intent(inout), target :: node
  type(parse_node_t), intent(in), target :: pn_target
  type(parse_node_t), pointer :: current, current_copy, previous
  integer :: i
  select case (node%n_sub)
  case (1)
    allocate (current_copy)
    current_copy = pn_target
    node%sub_first => current_copy
  case (2:)
    current => node%sub_first
    allocate (current_copy)
    current_copy = current
    node%sub_first => current_copy
    previous => current_copy
    do i = 1, node%n_sub - 2
      current => current%next
      allocate (current_copy)
      current_copy = current
      previous%next => current_copy
      previous => current_copy
    end do
    allocate (current_copy)
    current_copy = pn_target
    previous%next => current_copy
  case default
    call parse_node_write (node)
    call msg_bug ("replace_last_sub' called for non-branch parse node")
  end select
  current_copy%next => null ()
  node%sub_last => current_copy
end subroutine parse_node_replace_last_sub

```

#### 7.4.5 Accessing nodes

Return the node contents. Check if pointers are associated. No check when accessing a sub-node; assume that `parse_node_n_sub` is always used for the upper bound.

The token extractor returns a pointer.

```

<Parser: public>+≡
public :: parse_node_get_rule_ptr
public :: parse_node_get_n_sub
public :: parse_node_get_sub_ptr
public :: parse_node_get_next_ptr
public :: parse_node_get_last_sub_ptr

<Parser: parse node: TBP>+≡
procedure :: get_rule_ptr => parse_node_get_rule_ptr
procedure :: get_n_sub => parse_node_get_n_sub
procedure :: get_sub_ptr => parse_node_get_sub_ptr
procedure :: get_next_ptr => parse_node_get_next_ptr

```

```

<Parser: sub interfaces>+≡
module function parse_node_get_rule_ptr (node) result (rule)
class(parse_node_t), intent(in) :: node
type(syntax_rule_t), pointer :: rule
end function parse_node_get_rule_ptr
module function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
type(parse_node_t), pointer :: sub
type(parse_node_t), intent(in), target :: node
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
end function parse_node_get_last_sub_ptr
module function parse_node_get_n_sub (node) result (n)
class(parse_node_t), intent(in) :: node
integer :: n
end function parse_node_get_n_sub
module function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
class(parse_node_t), intent(in), target :: node
type(parse_node_t), pointer :: sub
integer, intent(in), optional :: n

logical, intent(in), optional :: required
end function parse_node_get_sub_ptr
module function parse_node_get_next_ptr (sub, n, tag, required) result (next)
class(parse_node_t), intent(in), target :: sub
type(parse_node_t), pointer :: next
integer, intent(in), optional :: n
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
end function parse_node_get_next_ptr

<Parser: procedures>+≡
module function parse_node_get_rule_ptr (node) result (rule)
class(parse_node_t), intent(in) :: node
type(syntax_rule_t), pointer :: rule
if (associated (node%rule)) then
rule => node%rule
else
rule => null ()
call parse_node_undefined (node, "rule")
end if
end function parse_node_get_rule_ptr

module function parse_node_get_n_sub (node) result (n)
class(parse_node_t), intent(in) :: node
integer :: n
n = node%n_sub
end function parse_node_get_n_sub

module function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
class(parse_node_t), intent(in), target :: node
type(parse_node_t), pointer :: sub
integer, intent(in), optional :: n
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
integer :: i

```

```

sub => node%sub_first
if (present (n)) then
do i = 2, n
if (associated (sub)) then
sub => sub%next
else
return
end if
end do
end if
call parse_node_check (sub, tag, required)
end function parse_node_get_sub_ptr

module function parse_node_get_next_ptr (sub, n, tag, required) result (next)
class(parse_node_t), intent(in), target :: sub
type(parse_node_t), pointer :: next
integer, intent(in), optional :: n
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
integer :: i
next => sub%next
if (present (n)) then
do i = 2, n
if (associated (next)) then
next => next%next
else
exit
end if
end do
end if
call parse_node_check (next, tag, required)
end function parse_node_get_next_ptr

module function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
type(parse_node_t), pointer :: sub
type(parse_node_t), intent(in), target :: node
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
sub => node%sub_last
call parse_node_check (sub, tag, required)
end function parse_node_get_last_sub_ptr

<Parser: procedures>+≡
subroutine parse_node_undefined (node, obj)
type(parse_node_t), intent(in) :: node
character(*), intent(in) :: obj
call parse_node_write (node, 6)
call msg_bug (" Parse-tree node: " // obj // " requested, but undefined")
end subroutine parse_node_undefined

```

Check if a parse node has a particular tag, and if it is associated:

```

<Parser: public>+≡
public :: parse_node_check

```

```

<Parser: sub interfaces>+≡
  module subroutine parse_node_check (node, tag, required)
    type(parse_node_t), pointer :: node
    character(*), intent(in), optional :: tag
    logical, intent(in), optional :: required
  end subroutine parse_node_check

<Parser: procedures>+≡
  module subroutine parse_node_check (node, tag, required)
    type(parse_node_t), pointer :: node
    character(*), intent(in), optional :: tag
    logical, intent(in), optional :: required
    if (associated (node)) then
      if (present (tag)) then
        if (parse_node_get_rule_key (node) /= tag) &
          call parse_node_mismatch (tag, node)
      end if
    else
      if (present (required)) then
        if (required) &
          call msg_bug (" Missing node, expected <" // tag // ">")
      end if
    end if
  end subroutine parse_node_check

```

This is called by a parse-tree scanner if the expected and the actual nodes do not match

```

<Parser: public>+≡
  public :: parse_node_mismatch

<Parser: sub interfaces>+≡
  module subroutine parse_node_mismatch (string, parse_node)
    character(*), intent(in) :: string
    type(parse_node_t), intent(in) :: parse_node
  end subroutine parse_node_mismatch

<Parser: procedures>+≡
  module subroutine parse_node_mismatch (string, parse_node)
    character(*), intent(in) :: string
    type(parse_node_t), intent(in) :: parse_node
    call parse_node_write (parse_node)
    call msg_bug (" Syntax mismatch, expected <" // string // ">.")
  end subroutine parse_node_mismatch

```

The following functions are wrappers for extracting the token contents.

```

<Parser: public>+≡
  public :: parse_node_get_logical
  public :: parse_node_get_integer
  public :: parse_node_get_real

call parse_node_write_rec (pn, unit=u)
rewind (u)
md5sum_pn = md5sum (u)
close (u)
end function parse_node_get_md5sum

```

### 7.4.6 The parse tree

The parse tree is a tree of nodes, where leaf nodes hold a valid token, while branch nodes point to a list of sub-nodes.

```

<Parser: public>+≡
  public :: parse_tree_t

<Parser: types>+≡
  type :: parse_tree_t
private
  type(parse_node_t), pointer :: root_node => null ()
contains
  <Parser: parse tree: TBP>
  end type parse_tree_t

```

The parser. Its arguments are the parse tree (which should be empty initially), the lexer (which should be already set up), the syntax table (which should be valid), and the input stream. The input stream is completely parsed, using the lexer setup and the syntax rules as given, and the parse tree is built accordingly.

If `check_eof` is absent or true, the parser will complain about trailing garbage. Otherwise, it will ignore it.

By default, the input stream is matched against the top rule in the specified syntax. If `key` is given, it is matched against the rule with the specified key instead.

Failure at the top level means that no rule could match at all; in this case the error message will show the top rule.

```

<Parser: public>+≡
  public :: parse_tree_init

<Parser: parse tree: TBP>≡
  procedure :: parse => parse_tree_init

<Parser: sub interfaces>+≡
  module subroutine parse_tree_init &
    (parse_tree, syntax, lexer, key, check_eof)
  class(parse_tree_t), intent(inout) :: parse_tree
  type(lexer_t), intent(inout) :: lexer
  type(syntax_t), intent(in), target :: syntax
  type(string_t), intent(in), optional :: key
  logical, intent(in), optional :: check_eof
  end subroutine parse_tree_init

```

```

<Parser: procedures>+≡
module subroutine parse_tree_init &
  (parse_tree, syntax, lexer, key, check_eof)
class(parse_tree_t), intent(inout) :: parse_tree

  end if
end if

```

```

    ok = .false.
  end if
end subroutine parse_args

```

The IGNORE syntax reads one lexeme and discards it if it is numeric, logical or string/identifier (but not a keyword). This is a successful match. Otherwise, the match fails. The node pointer is returned disassociated in any case.

```

<Parser: internal subroutines of parse_tree_init>+≡
  subroutine parse_ignore (node, ok)
  type(parse_node_t), pointer :: node
  logical, intent(out) :: ok
  call lex (lexeme, lexer)
  select case (lexeme_get_type (lexeme))
  case (T_NUMERIC, T_IDENTIFIER, T_QUOTED)
    ok = .true.
  case default
    ok = .false.
  end select
  node => null ()
end subroutine parse_ignore

```

If the match fails and we cannot step back:

```

<Parser: internal subroutines of parse_tree_init>+≡
  subroutine parse_error (rule, lexeme)
  type(syntax_rule_t), intent(in) :: rule
  type(lexeme_t), intent(in) :: lexeme
  character(80) :: buffer
  integer :: u, iostat
  call lexer_show_location (lexer)
  u = free_unit ()
  open (u, status = "scratch")
  write (u, "(A)", advance="no") "Expected syntax:"
  call syntax_rule_write (rule, u)
  write (u, "(A)", advance="no") "Found token:"
  call lexeme_write (lexeme, u)
  rewind (u)
  do
    read (u, "(A)", iostat=iostat) buffer
    if (iostat /= 0) exit
    call msg_message (trim (buffer))
  end do
  call msg_fatal (" Syntax error " &
    // "(at or before the location indicated above)")
  end subroutine parse_error

```

The finalizer recursively deallocates all nodes and their contents. For each node, `parse_node_final` is called on the sub-nodes, which in turn deallocates the token or sub-node array contained within each of them. At the end, only the top node remains to be deallocated.

```

<Parser: public>+≡
  public :: parse_tree_final

<Parser: parse tree: TBP>+≡
  procedure :: final => parse_tree_final

```

```

<Parser: sub interfaces>+≡
  module subroutine parse_tree_final (parse_tree)
    class(parse_tree_t), intent(inout) :: parse_tree
    end subroutine parse_tree_final

```

```

<Parser: procedures>+≡
  module subroutine parse_tree_final (parse_tree)
    class(parse_tree_t), intent(inout) :: parse_tree
    if (associated (parse_tree%root_node)) then
      call parse_node_final (parse_tree%root_node)
      deallocate (parse_tree%root_node)
    end if
  end subroutine parse_tree_final

```

Print the parse tree. Print one token per line, indented according to the depth of the node.

The **verbose** version includes type identifiers for the nodes.

```

<Parser: public>+≡
  public :: parse_tree_write

```

```

<Parser: parse tree: TBP>+≡
  procedure :: write => parse_tree_write

```

```

<Parser: sub interfaces>+≡
  module subroutine parse_tree_write (parse_tree, unit, verbose)
    class(parse_tree_t), intent(in) :: parse_tree
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    end subroutine parse_tree_write

```

```

<Parser: procedures>+≡
  module subroutine parse_tree_write (parse_tree, unit, verbose)
    class(parse_tree_t), intent(in) :: parse_tree
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    logical :: short
    u = given_output_unit (unit); if (u < 0) return
    short = .true.; if (present (verbose)) short = .not. verbose
    write (u, "(A)") "Parse tree:"
    if (associated (parse_tree%root_node)) then
      call parse_node_write_rec (parse_tree%root_node, unit, short, 1)
    else
      write (u, *) "[empty]"
    end if
  end subroutine parse_tree_write

```

This is a generic error that can be issued if the parse tree does not meet the expectations of the parser. This most certainly indicates a bug.

```

<Parser: public>+≡
  public :: parse_tree_bug

```

```

<Parser: sub interfaces>+≡
  module subroutine parse_tree_bug (node, keys)
    type(parse_node_t), intent(in) :: node

```

```

type(parse_node_t), intent(in) :: node
character(*), intent(in) :: keys
call parse_node_write (node)
call msg_bug (" Inconsistency in parse tree: expected " // keys)
end subroutine parse_tree_bug

```

### 7.4.7 Access the parser

For scanning the parse tree we give access to the top node, as a node pointer. Of course, there should be no write access.

```

<Parser: parse tree: TBP>+≡
procedure :: get_root_ptr => parse_tree_get_root_ptr

<Parser: sub interfaces>+≡
module function parse_tree_get_root_ptr (parse_tree) result (node)
class(parse_tree_t), intent(in) :: parse_tree
type(parse_node_t), pointer :: node
end function parse_tree_get_root_ptr

<Parser: procedures>+≡
module function parse_tree_get_root_ptr (parse_tree) result (node)
class(parse_tree_t), intent(in) :: parse_tree
type(parse_node_t), pointer :: node
node => parse_tree%root_node
end function parse_tree_get_root_ptr

```

### 7.4.8 Tools

This operation traverses the parse tree and simplifies any occurrences of a set of syntax rules. If such a parse node has only one sub-node, it is replaced by that subnode. (This makes sense only of the rules to eliminate have no meaningful token.)

```

<Parser: public>+≡
public :: parse_tree_reduce

<Parser: sub interfaces>+≡
module subroutine parse_tree_reduce (parse_tree, rule_key)
type(parse_tree_t), intent(inout) :: parse_tree
type(string_t), dimension(:), intent(in) :: rule_key
end subroutine parse_tree_reduce

## 7.5 XML Parser

The XML parser is actually independent from the previous modules of `lexer` and `parser`. However, for a generic I/O interface we make use of the `stream_t` facility.

We need the XML parser for reading and writing LHEF data files. Only a subset of XML is actually relevant. The parser is of the “pull” type, i.e., the program steers the reading of XML data in a context-sensitive manner.

```
<xml.f90>≡
  <File header>

  module xml

    <Use strings>
    use lexers

    <Standard module head>

    <XML: public>

    <XML: types>

    interface
    <XML: sub interfaces>
    end interface

  end module xml

<xml_sub.f90>≡
  <File header>

  submodule (xml) xml_s

    use io_units
    use system_defs, only: BLANK, TAB
    use diagnostics
    use ifiles

    implicit none

    contains

    <XML: procedures>

  end submodule xml_s
```

### 7.5.1 Cached Stream

The `stream` type as defined in the `lexer` module is versatile regarding the choice of input channel, but it does not allow reading a section more than once. Here, we define an extension where we can return a string to the stream, which is

stored in a cache variable, and presented to the caller for the next read.

```
<XML: public>≡
  public :: cstream_t

<XML: types>≡
  type, extends (stream_t) :: cstream_t
  logical :: cache_is_empty = .true.
  type(string_t) :: cache
  contains
  <XML: cstream: TBP>
  end type cstream_t
```

The initializers are simply inherited.

Finalizer: also inherited, in essence:

```
<XML: cstream: TBP>≡
  procedure :: final => cstream_final

<XML: sub interfaces>≡
  module subroutine cstream_final (stream)
    class(cstream_t), intent(inout) :: stream
  end subroutine cstream_final

<XML: procedures>≡
  module subroutine cstream_final (stream)
    class(cstream_t), intent(inout) :: stream
    stream%cache_is_empty = .true.
    call stream%stream_t%final ()
  end subroutine cstream_final
```

Get record: now, if there is a cache string, return this instead of the record from the stream.

```
<XML: cstream: TBP>+≡
  procedure :: get_record => cstream_get_record

<XML: sub interfaces>+≡
  module subroutine cstream_get_record (cstream, string, iostat)
    class(cstream_t), intent(inout) :: cstream
    type(string_t), intent(out) :: string
    integer, intent(out) :: iostat
  end subroutine cstream_get_record

<XML: procedures>+≡
  module subroutine cstream_get_record (cstream, string, iostat)
    class(cstream_t), intent(inout) :: cstream
    type(string_t), intent(out) :: string
    integer, intent(out) :: iostat

    end if
  end subroutine cstream_revert_record

```

## 7.5.2 Attributes

A tag attribute has a name and a value; both are strings. When the attribute is defined, the known flag indicates this.

```

<XML: types>+≡
  type :: attribute_t
  type(string_t) :: name
  type(string_t) :: value
  logical :: known = .false.
  contains
  <XML: attribute: TBP>
  end type attribute_t

```

Output in standard format, non-advancing. (If the value is unknown, we indicate this by a question mark, which is non-standard.)

```

<XML: attribute: TBP>≡
  procedure :: write => attribute_write

<XML: sub interfaces>+≡
  module subroutine attribute_write (object, unit)
    class(attribute_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine attribute_write

<XML: procedures>+≡
  module subroutine attribute_write (object, unit)
    class(attribute_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(A,'=')", advance = "no") char (object%name)

```

```

if (object%known) then
write (u, "(A,A,A)", advance = "no")  "'", char (object%value), '''
else
write (u, "('?')", advance = "no")
end if
end subroutine attribute_write

```

This is a genuine constructor. The value is optional.

```

<XML: public>+≡
public :: xml_attribute

<XML: sub interfaces>+≡
module function xml_attribute (name, value) result (attribute)
type(string_t), intent(in) :: name
type(string_t), intent(in), optional :: value

    if (attribute%known) then
      value = attribute%value
    else
      value = "?"
    end if
  end function attribute_get_value

```

### 7.5.3 The Tag Type

The basic entity is the internal representation of an XML tag. The tag has a name, a well-defined set of attributes which may be mandatory or optional, and a flag that determines whether there is content or not. The content itself is not stored in the data structure.

```

<XML: public>+≡
  public :: xml_tag_t

<XML: types>+≡
  type :: xml_tag_t
  type(string_t) :: name
  type(attribute_t), dimension(:), allocatable :: attribute
  logical :: has_content = .false.
  contains
    <XML: tag: TBP>
  end type xml_tag_t

```

Initialization. There are different versions, depending on content.

```

<XML: tag: TBP>≡
  generic :: init => init_no_attributes
  procedure :: init_no_attributes => xml_tag_init_no_attributes

<XML: sub interfaces>+≡
  module subroutine xml_tag_init_no_attributes (tag, name, has_content)
    class(xml_tag_t), intent(out) :: tag
    type(string_t), intent(in) :: name
    logical, intent(in), optional :: has_content
  end subroutine xml_tag_init_no_attributes

<XML: procedures>+≡
  module subroutine xml_tag_init_no_attributes (tag, name, has_content)
    class(xml_tag_t), intent(out) :: tag
    type(string_t), intent(in) :: name
    logical, intent(in), optional :: has_content
    tag%name = name

```

```

allocate (tag%attribute (0))
if (present (has_content)) tag%has_content = has_content
end subroutine xml_tag_init_no_attributes

```

This version sets attributes.

```

<XML: tag: TBP>+≡
  generic :: init => init_with_attributes
  procedure :: init_with_attributes => xml_tag_init_with_attributes

<XML: sub interfaces>+≡
  module subroutine xml_tag_init_with_attributes (tag, name, attribute, has_content)
    class(xml_tag_t), intent(out) :: tag
    type(string_t), intent(in) :: name
    type(attribute_t), dimension(:), intent(in) :: attribute
    logical, intent(in), optional :: has_content
  end subroutine xml_tag_init_with_attributes

<XML: procedures>+≡
  module subroutine xml_tag_init_with_attributes (tag, name, attribute, has_content)
    class(xml_tag_t), intent(out) :: tag
    type(string_t), intent(in) :: name
    type(attribute_t), dimension(:), intent(in) :: attribute
    logical, intent(in), optional :: has_content
    tag%name = name
    allocate (tag%attribute (size (attribute)))
    tag%attribute = attribute
    if (present (has_content)) tag%has_content = has_content
  end subroutine xml_tag_init_with_attributes

```

Set an attribute value explicitly.

```

<XML: tag: TBP>+≡
  procedure :: set_attribute => xml_tag_set_attribute

<XML: sub interfaces>+≡
  module subroutine xml_tag_set_attribute (tag, i, value)
    class(xml_tag_t), intent(inout) :: tag
    integer, intent(in) :: i
    type(string_t), intent(in) :: value
  end subroutine xml_tag_set_attribute

<XML: procedures>+≡
  module subroutine xml_tag_set_attribute (tag, i, value)
    class(xml_tag_t), intent(inout) :: tag
    integer, intent(in) :: i
    type(string_t), intent(in) :: value
    call tag%attribute(i)%set_value (value)
  end subroutine xml_tag_set_attribute

```

Get an attribute value.

```

<XML: tag: TBP>+≡
  procedure :: get_attribute => xml_tag_get_attribute

```

```

<XML: sub interfaces>+≡
  module function xml_tag_get_attribute (tag, i) result (value)
    class(xml_tag_t), intent(in) :: tag
    integer, intent(in) :: i
    type(string_t) :: value
  end function xml_tag_get_attribute

<XML: procedures>+≡

    end do
    if (tag%has_content) then
      write (u, "('>')", advance = "no")
    else
      write (u, "(' />')", advance = "no")
    end if
  end subroutine xml_tag_write

```

If there is content, we should write the context next (arbitrary format), the write the corresponding closing tag. Again, non-advancing.

```

<XML: tag: TBP>+≡
  procedure :: close => xml_tag_close

<XML: sub interfaces>+≡
  module subroutine xml_tag_close (tag, unit)
    class(xml_tag_t), intent(in) :: tag
    integer, intent(in), optional :: unit
  end subroutine xml_tag_close

```

```

<XML: procedures>+≡
  module subroutine xml_tag_close (tag, unit)
    class(xml_tag_t), intent(in) :: tag
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "('</',A,'>')", advance = "no") char (tag%name)
  end subroutine xml_tag_close

```

Given content as a single string, we can write tag, content, and closing at once

```

<XML: tag: TBP>+≡
  generic :: write => write_with_content
  procedure :: write_with_content => xml_tag_write_with_content

<XML: sub interfaces>+≡
  module subroutine xml_tag_write_with_content (tag, content, unit)
    class(xml_tag_t), intent(in) :: tag
    type(string_t), intent(in) :: content
    integer, intent(in), optional :: unit
  end subroutine xml_tag_write_with_content

    type(string_t), intent(in) :: content
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    call tag%write (u)
    write (u, "(A)", advance = "no") char (content)
    call tag%close (u)
  end subroutine xml_tag_write_with_content

```

Input from stream. We know what we are looking for, so we check if the name matches, then fill attributes. We report an error if (a) an I/O error occurs, (b) we reach EOF before encountering the tag, (c) if the tag is incomplete.

Trailing text after reading a tag is put back to the input stream.

We assume that the tag is not broken across records, and that there is only one tag within the record. This is more restricted than standard XML.

```

close (u_tmp)
call cstream%final ()

write (u, "(A)")
write (u, "(A)") "* Test output end: xml_2"

end subroutine xml_2

```

### 7.5.8 Optional Tag

Write and read a tag with single-line content.

```

<XML: execute tests>+≡
  call test (xml_3, "xml_3", &
    "content", &
    u, results)

<XML: test declarations>+≡
  public :: xml_3

<XML: tests>+≡
  subroutine xml_3 (u)
    integer, intent(in) :: u
    type(xml_tag_t), allocatable :: tag
    integer :: u_tmp
    type(cstream_t) :: cstream

```

```

logical :: success, closing
type(string_t) :: content

write (u, "(A)")  "* Test output: xml_3"
write (u, "(A)")  "* Purpose: handle tag with content"
write (u, "(A)")

write (u, "(A)")  "* Tag without content"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag)
call tag%init (var_str ("tagname"))
call tag%write (u_tmp)
write (u_tmp, *)
deallocate (tag)

call show (u_tmp, u)

write (u, *)
write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag)
call tag%init (var_str ("tagname"))
call tag%read (cstream, success)
call tag%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
write (u, "(A,L1)")  "content = ", tag%has_content
write (u, *)
deallocate (tag)
close (u_tmp)
call cstream%final ()

write (u, "(A)")  "* Tag with content"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag)
call tag%init (var_str ("tagname"), has_content = .true.)
call tag%write (var_str ("Content text"), u_tmp)
write (u_tmp, *)
deallocate (tag)

call show (u_tmp, u)

write (u, *)
write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag)

```

```

call tag%init (var_str ("tagname"))
call tag%read (cstream, success)
call tag%read_content (cstream, content, closing)
call tag%write (u)
write (u, "(A)", advance = "no") char (content)
call tag%close (u)
write (u, *)
write (u, "(A,L1)") "success = ", success
write (u, "(A,L1)") "content = ", tag%has_content
write (u, "(A,L1)") "closing = ", closing
deallocate (tag)
close (u_tmp)
call cstream%final ()

write (u, *)
write (u, "(A)")  "* Tag with multiline content"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag)
call tag%init (var_str ("tagname"), has_content = .true.)
call tag%write (u_tmp)
write (u_tmp, *)
write (u_tmp, "(A)") "Line 1"
write (u_tmp, "(A)") "Line 2"
call tag%close (u_tmp)

call show (u_tmp, u)

write (u, *)
write (u, "(A)") "Result from read:"
call cstream%init (u_tmp)
allocate (tag)
call tag%init (var_str ("tagname"))
call tag%read (cstream, success)
call tag%write (u)
write (u, *)
do
call tag%read_content (cstream, content, closing)
if (closing) exit
write (u, "(A)") char (content)
end do
call tag%close (u)
write (u, *)
write (u, "(A,L1)") "success = ", success
write (u, "(A,L1)") "content = ", tag%has_content
deallocate (tag)
close (u_tmp)
call cstream%final ()

```

```

write (u, "(A)")
write (u, "(A)")  "* Test output end: xml_3"

end subroutine xml_3

```

### 7.5.9 Basic Tag I/O

Write a tag and read it again, using a temporary file.

```

<XML: execute tests>+≡
  call test (xml_4, "xml_4", &
    "attributes", &
    u, results)

<XML: test declarations>+≡
  public :: xml_4

<XML: tests>+≡
  subroutine xml_4 (u)
    integer, intent(in) :: u
    type(xml_tag_t), allocatable :: tag
    integer :: u_tmp
    type(cstream_t) :: cstream
    logical :: success

    write (u, "(A)")  "* Test output: xml_4"
    write (u, "(A)")  "* Purpose: handle tag with attributes"
    write (u, "(A)")

    write (u, "(A)")  "* Tag with one mandatory and one optional attribute,"
    write (u, "(A)")  "* unknown attribute ignored"
    write (u, *)

    u_tmp = free_unit ()
    open (u_tmp, status = "scratch", action = "readwrite")

    allocate (tag)
    call tag%init (var_str ("tagname"), &
      [xml_attribute (var_str ("a1"), var_str ("foo")), &
      xml_attribute (var_str ("a3"), var_str ("gee"))])
    call tag%write (u_tmp)
    deallocate (tag)

    call show (u_tmp, u)

    write (u, *)
    write (u, "(A)")  "Result from read:"
    call cstream%init (u_tmp)
    allocate (tag)
    call tag%init (var_str ("tagname"), &
      [xml_attribute (var_str ("a1")), &
      xml_attribute (var_str ("a2"), var_str ("bar"))])
    call tag%read (cstream, success)
    call tag%write (u)

```

```
write (u, *)
deallocate (tag)
close (u_tmp)
call cstream%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: xml_4"

end subroutine xml_4
```

## Chapter 8

# Random-Number Generator

These modules implement abstract types and tools for random-number generation.

**rng\_base** Abstract random-number generator and factory

**selectors** Selection depending on weights and random numbers

Implementation of the RNG abstract types:

**Module rng\_tao:** Interface to the TAO random number generator which the VAMP package provides. Note that VAMP explicitly requests this generator.

**Module rng\_stream:** Implementation of RNGstream proposed by L'Ecuyer. The RNGStream provides access to different streams and/or substream of random numbers.

Figure 8.1: Module dependencies in `src/rng`.

## 8.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

```
<rng_base.f90>≡  
  <File header>  
  
  module rng_base  
  
    <Use kinds>  
    use kinds, only: i16  
  
    <Standard module head>  
  
    <RNG base: public>  
  
    <RNG base: types>  
  
    <RNG base: interfaces>  
  
    interface  
      <RNG base: sub interfaces>  
    end interface  
  
  end module rng_base  
<rng_base_sub.f90>≡  
  <File header>  
  
  submodule (rng_base) rng_base_s  
  
    use constants, only: TWOPI  
  
    implicit none  
  
    contains  
  
    <RNG base: procedures>  
  
  end submodule rng_base_s
```

### 8.1.1 Generator type

The `rng` object is actually the state of the random-number generator. The methods `initialize/reset` and `call` the generator for this state.

```
<RNG base: public>≡  
  public :: rng_t
```

```

<RNG base: types>≡
  type, abstract :: rng_t
  contains
    <RNG base: rng: TBP>
  end type rng_t

```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The behavior without seed is not defined, however.

```

<RNG base: rng: TBP>≡
  procedure (rng_init), deferred :: init

<RNG base: interfaces>≡
  abstract interface
    subroutine rng_init (rng, seed)
    import
    class(rng_t), intent(out) :: rng
    integer, intent(in), optional :: seed
  end subroutine rng_init
end interface

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

<RNG base: rng: TBP>+≡
  procedure (rng_final), deferred :: final

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_final (rng)
    import
    class(rng_t), intent(inout) :: rng
  end subroutine rng_final
end interface

```

Output. We should, at least, identify the generator.

```

<RNG base: rng: TBP>+≡
  procedure (rng_write), deferred :: write

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_write (rng, unit, indent)
    import
    class(rng_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
  end subroutine rng_write
end interface

```

These routines generate a single and an array of uniformly distributed default-precision random numbers, respectively.

```

<RNG base: rng: TBP>+≡
  generic :: generate => generate_single, generate_array
  procedure (rng_generate_single), deferred :: generate_single
  procedure (rng_generate_array), deferred :: generate_array

```

```

<RNG base: interfaces>+=
  abstract interface
    subroutine rng_generate_single (rng, x)
    import
    class(rng_t), intent(inout) :: rng
    real(default), intent(out) :: x
    end subroutine rng_generate_single
  end interface

  abstract interface
    subroutine rng_generate_array (rng, x)
    import
    class(rng_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    end subroutine rng_generate_array
  end interface

```

These routines generate a single and an array of Gaussian (normal) distributed default-precision random numbers, respectively. Mean is 0 and  $\sigma = 1$ . Note that  $z = \mu + \sigma x$  then distributes with mean  $\mu$  and variance  $\sigma^2$ .

The algorithm uses twice as much uniformly distributed random numbers, taken from the PDG review.

```

<RNG base: rng: TBP>+=
  generic :: generate_gaussian => &
    rng_generate_gaussian_single, rng_generate_gaussian_array
  procedure, private :: rng_generate_gaussian_single
  procedure, private :: rng_generate_gaussian_array

<RNG base: sub interfaces>=
  module subroutine rng_generate_gaussian_single (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), intent(out) :: x
    end subroutine rng_generate_gaussian_single
  module subroutine rng_generate_gaussian_array (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    end subroutine rng_generate_gaussian_array

<RNG base: procedures>=
  module subroutine rng_generate_gaussian_single (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), intent(out) :: x
    real(default), dimension(2) :: u
    call rng%generate (u)
    x = sin (twopi * u(1)) * sqrt (- 2 * log (u(2)))
    end subroutine rng_generate_gaussian_single

  module subroutine rng_generate_gaussian_array (rng, x)
    class(rng_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    integer :: i
    do i = 1, size (x)
    call rng%generate_gaussian (x(i))
    end do

```

```
end subroutine rng_generate_gaussian_array
```

### 8.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

```
<RNG base: public>+≡
  public :: rng_factory_t

<RNG base: types>+≡
  type, abstract :: rng_factory_t
  contains
  <RNG base: rng factory: TBP>
  end type rng_factory_t
```

Output. Should be short, just report the seed and current state of the factory.

```
<RNG base: rng factory: TBP>≡
  procedure (rng_factory_write), deferred :: write

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_write (object, unit)
    import
    class(rng_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine rng_factory_write
  end interface
```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

```
<RNG base: rng factory: TBP>+≡
  procedure (rng_factory_init), deferred :: init

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_init (factory, seed)
    import
    class(rng_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    end subroutine rng_factory_init
  end interface
```

Spawn a new generator.

```
<RNG base: rng factory: TBP>+≡
  procedure (rng_factory_make), deferred :: make
```

```

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_make (factory, rng)
  import
    class(rng_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
  end subroutine rng_factory_make
end interface

```

### 8.1.3 Unit tests

Test module, followed by the corresponding implementation module.

```

<rng_base_ut.f90>≡
  <File header>

  module rng_base_ut
    use unit_tests
    use rng_base_utl

    <Standard module head>

    <RNG base: public test>

    <RNG base: public test auxiliary>

    contains

    <RNG base: test driver>

  end module rng_base_ut

<rng_base_uti.f90>≡
  <File header>

  module rng_base_uti

    <Use kinds>
    use kinds, only: i16
    use format_utils, only: write_indent
    use io_units

    use rng_base

    <Standard module head>

    <RNG base: public test auxiliary>

    <RNG base: test declarations>

    <RNG base: test types>

    contains

```

*<RNG base: tests>*

*<RNG base: test auxiliary>*

```
end module rng_base_util
```

API: driver for the unit tests below.

*<RNG base: public test>*≡

```
public :: rng_base_test
```

*<RNG base: test driver>*≡

```
subroutine rng_base_test (u, results)
```

```
integer, intent(in) :: u
```

```
type(test_results_t), intent(inout) :: results
```

*<RNG base: execute tests>*

```
end subroutine rng_base_test
```

## Test generator

The test 'mock' random generator generates a repeating series with the numbers 0.1, 0.3, 0.5, 0.7, 0.9. It has an integer stored as state. The integer must be one of 1, 3, 5, 7, 9.

*<RNG base: public test auxiliary>*≡

```
public :: rng_test_t
```

*<RNG base: test types>*≡

```
type, extends (rng_t) :: rng_test_t
```

```
integer :: state = 1
```

```
contains
```

```
procedure :: write => rng_test_write
```

```
procedure :: init => rng_test_init
```

```
procedure :: final => rng_test_final
```

```
procedure :: generate_single => rng_test_generate_single
```

```
procedure :: generate_array => rng_test_generate_array
```

```
end type rng_test_t
```

Output. The state is a single number, so print it.

*<RNG base: test auxiliary>*≡

```
subroutine rng_test_write (rng, unit, indent)
```

```
class(rng_test_t), intent(in) :: rng
```

```
integer, intent(in), optional :: unit, indent
```

```
integer :: u, ind
```

```
u = given_output_unit (unit)
```

```
ind = 0; if (present (indent)) ind = indent
```

```
call write_indent (u, ind)
```

```
write (u, "(A,I0,A)") "Random-number generator: &
```

```
&test (state = ", rng%state, ")"
```

```
end subroutine rng_test_write
```

The default seed is 1.

*<RNG base: test auxiliary>*+≡

```
subroutine rng_test_init (rng, seed)
```

```

class(rng_test_t), intent(out) :: rng
integer, intent(in), optional :: seed
if (present (seed)) rng%state = seed
end subroutine rng_test_init

```

Nothing to finalize:

```

<RNG base: test auxiliary>+≡
subroutine rng_test_final (rng)
class(rng_test_t), intent(inout) :: rng
end subroutine rng_test_final

```

Generate a single number and advance the state.

```

<RNG base: test auxiliary>+≡
subroutine rng_test_generate_single (rng, x)
class(rng_test_t), intent(inout) :: rng
real(default), intent(out) :: x
x = rng%state / 10._default
rng%state = mod (rng%state + 2, 10)
end subroutine rng_test_generate_single

```

The array generator calls the single-item generator multiple times.

```

<RNG base: test auxiliary>+≡
subroutine rng_test_generate_array (rng, x)
class(rng_test_t), intent(inout) :: rng
real(default), dimension(:), intent(out) :: x
integer :: i
do i = 1, size (x)
call rng%generate (x(i))
end do
end subroutine rng_test_generate_array

```

## Test Factory

This factory makes `rng_test_t` generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

```

<RNG base: public test auxiliary>+≡
public :: rng_test_factory_t

<RNG base: test types>+≡
type, extends (rng_factory_t) :: rng_test_factory_t
integer :: seed = 1
contains
<RNG base: rng test factory: TBP>
end type rng_test_factory_t

```

Output.

```

<RNG base: rng test factory: TBP>≡
procedure :: write => rng_test_factory_write

```

```

<RNG base: test auxiliary>+≡
  subroutine rng_test_factory_write (object, unit)
    class(rng_test_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A,I0,A)") "RNG factory: test (" , object%seed, ")"
  end subroutine rng_test_factory_write

```

Initialize, translating the given seed.

```

<RNG base: rng test factory: TBP>+≡
  procedure :: init => rng_test_factory_init

<RNG base: test auxiliary>+≡
  subroutine rng_test_factory_init (factory, seed)
    class(rng_test_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    if (present (seed)) factory%seed = mod (seed * 2 + 1, 10)
  end subroutine rng_test_factory_init

```

```

<RNG base: rng test factory: TBP>+≡
  procedure :: make => rng_test_factory_make

<RNG base: test auxiliary>+≡
  subroutine rng_test_factory_make (factory, rng)

  end submodule selectors_s
```

### 8.2.1 Selector type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

```
<Selectors: public>≡
  public :: selector_t

<Selectors: types>≡
  type :: selector_t
  integer :: offset = 0
  integer, dimension(:), allocatable :: map
  real(default), dimension(:), allocatable :: weight
  real(default), dimension(:), allocatable :: acc
  contains
```

```

    <Selectors: selector: TBP>
end type selector_t

```

Display contents.

```

<Selectors: selector: TBP>≡
  procedure :: write => selector_write

<Selectors: sub interfaces>≡
  module subroutine selector_write (object, unit, testflag)
    class(selector_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
  end subroutine selector_write

<Selectors: procedures>≡
  module subroutine selector_write (object, unit, testflag)
    class(selector_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    integer :: u, i
    logical :: truncate
    u = given_output_unit (unit)
    truncate = .false.; if (present (testflag)) truncate = testflag
    write (u, "(1x,A)") "Selector: i, weight, acc. weight"
    if (allocated (object%weight)) then
      do i = 1, size (object%weight)
        if (truncate) then
          write (u, "(3x,I0,2(1x," // FMT_14 // ")") &
            object%map(i), object%weight(i), object%acc(i)
        else
          write (u, "(3x,I0,2(1x," // FMT_19 // ")") &

write (u, "(A)")  "* Test output end: selectors_2"

end subroutine selectors_2

```

### 8.3 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

```

<rng_tao.f90>≡
  <File header>

  module rng_tao

    <Use kinds>
    use tao_random_numbers !NODEP!

    use rng_base

    <Standard module head>

```

```

    <RNG tao: public>

    <RNG tao: types>

    interface
    <RNG tao: sub interfaces>
    end interface

    contains

    <RNG tao: main procedures>

    end module rng_tao
<rng_tao_sub.f90>≡
    <File header>

    submodule (rng_tao) rng_tao_s

    use io_units
    use format_utils, only: write_indent

    implicit none

    contains

    <RNG tao: procedures>

    end submodule rng_tao_s

```

### 8.3.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

```

<RNG tao: public>≡
    public :: rng_tao_t
<RNG tao: types>≡
    type, extends (rng_t) :: rng_tao_t
    integer :: seed = 0
    integer :: n_calls = 0
    type(tao_random_state) :: state
    contains
    <RNG tao: rng tao: TBP>
    end type rng_tao_t

```

Output: Display seed and number of calls.

```

<RNG tao: rng tao: TBP>≡
    procedure :: write => rng_tao_write

```

```

<RNG tao: sub interfaces>≡
  module subroutine rng_tao_write (rng, unit, indent)
    class(rng_tao_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
  end subroutine rng_tao_write

```

```

<RNG tao: procedures>≡
  module subroutine rng_tao_write (rng, unit, indent)
    class(rng_tao_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A)") "TAO random-number generator:"
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "seed = ", rng%seed
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "calls = ", rng%n_calls
  end subroutine rng_tao_write

```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

```

<RNG tao: rng tao: TBP>+≡
  procedure :: init => rng_tao_init

<RNG tao: sub interfaces>+≡
  module subroutine rng_tao_init (rng, seed)
    class(rng_tao_t), intent(out) :: rng
    integer, intent(in), optional :: seed
  end subroutine rng_tao_init

<RNG tao: procedures>+≡
  module subroutine rng_tao_init (rng, seed)
    class(rng_tao_t), intent(out) :: rng
    integer, intent(in), optional :: seed
    if (present (seed)) rng%seed = seed
    call tao_random_create (rng%state, rng%seed)
  end subroutine rng_tao_init

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

<RNG tao: rng tao: TBP>+≡
  procedure :: final => rng_tao_final

<RNG tao: sub interfaces>+≡
  module subroutine rng_tao_final (rng)
    class(rng_tao_t), intent(inout) :: rng
  end subroutine rng_tao_final

<RNG tao: procedures>+≡
  module subroutine rng_tao_final (rng)
    class(rng_tao_t), intent(inout) :: rng
    call tao_random_destroy (rng%state)

```

```
end subroutine rng_tao_final
```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

```
<RNG tao: rng tao: TBP>+≡
  procedure :: generate_single => rng_tao_generate_single
  procedure :: generate_array => rng_tao_generate_array

<RNG tao: sub interfaces>+≡
  module subroutine rng_tao_generate_single (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), intent(out) :: x
  end subroutine rng_tao_generate_single
  module subroutine rng_tao_generate_array (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
  end subroutine rng_tao_generate_array

<RNG tao: procedures>+≡
  module subroutine rng_tao_generate_single (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), intent(out) :: x
    real(default) :: r
    call tao_random_number (rng%state, r)
    x = r
    rng%n_calls = rng%n_calls + 1
  end subroutine rng_tao_generate_single

  module subroutine rng_tao_generate_array (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    real(default) :: r
    integer :: i
    do i = 1, size (x)
      call tao_random_number (rng%state, r)
      x(i) = r
    end do
    rng%n_calls = rng%n_calls + size (x)
  end subroutine rng_tao_generate_array
```

## Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \quad (8.1)$$

where  $s_0$  is the seed (a 16-bit integer) given to the factory object, and  $i$  is the index in the generated sequence of generators, starting with zero.

```
<RNG tao: public>+≡
  public :: rng_tao_factory_t
```

```

<RNG tao: types>+≡
  type, extends (rng_factory_t) :: rng_tao_factory_t
  integer(i16) :: s = 0
  integer(i16) :: i = 0
  contains
  <RNG tao: rng tao factory: TBP>
  end type rng_tao_factory_t

```

Output.

```

<RNG tao: rng tao factory: TBP>≡
  procedure :: write => rng_tao_factory_write

<RNG tao: sub interfaces>+≡
  module subroutine rng_tao_factory_write (object, unit)
    class(rng_tao_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine rng_tao_factory_write

<RNG tao: procedures>+≡
  module subroutine rng_tao_factory_write (object, unit)
    class(rng_tao_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A,2(I0,A))") &
      "RNG factory: tao (" , object%s, ", ", object%i, ")"
  end subroutine rng_tao_factory_write

```

Initialize, translating the given seed.

```

<RNG tao: rng tao factory: TBP>+≡
  procedure :: init => rng_tao_factory_init

<RNG tao: sub interfaces>+≡
  module subroutine rng_tao_factory_init (factory, seed)
    class(rng_tao_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
  end subroutine rng_tao_factory_init

<RNG tao: procedures>+≡
  module subroutine rng_tao_factory_init (factory, seed)
    class(rng_tao_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    if (present (seed)) factory%s = seed
  end subroutine rng_tao_factory_init

```

Due to a bug of allocating polymorphic types with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<RNG tao: rng tao factory: TBP>+≡
  procedure :: make => rng_tao_factory_make

<RNG tao: main procedures>≡
  subroutine rng_tao_factory_make (factory, rng)
    class(rng_tao_factory_t), intent(inout) :: factory

```

```

class(rng_t), intent(out), allocatable :: rng
allocate (rng_tao_t :: rng)
select type (rng)
type is (rng_tao_t)
call rng%init (factory%s * 65536 + factory%i)
factory%i = int (factory%i + 1, kind = i16)
end select
end subroutine rng_tao_factory_make

```

### 8.3.2 Unit tests

## 8.4 RNG Stream

We implement the RNGstream proposed and implemented in C++, C and Java by L'Ecuyer et al. (L'Ecuyer, Pierre, Richard Simard, E. Jack Chen, and W. David Kelton. "An Object-Oriented Random-Number Package with Many Long Streams and Substreams." *Operations Research* 50, no. 6 (December 2002): 1073–1075. doi:10.1287/opre.50.6.1073.358.). RNGstream allows us to access multiple independent streams of random numbers.

```

⟨rng_stream.f90⟩≡
  ⟨File header⟩

```

```

module rng_stream

  <Use kinds>
  use kinds, only: i16
  use rng_base

  <Standard module head>

  <RNG stream: public>

  <RNG stream: types>

  interface
    <RNG stream: sub interfaces>
  end interface

  contains

  <RNG stream: main procedures>

end module rng_stream

<rng_stream_sub.f90>≡
<File header>

submodule (rng_stream) rng_stream_s

  use io_units
  use format_utils, only: write_indent
  use diagnostics

  implicit none

  <RNG stream: parameters>

  contains

  <RNG stream: procedures>

end submodule rng_stream_s

```

We store the current position in the stream of random numbers. Furthermore, we store the beginning of the (latest) substream and the initial starting point of the stream, which corresponds to the “seed”. The default seed is 1234.

```

<RNG stream: public>≡
  public :: rng_stream_t

<RNG stream: types>≡
  type, extends(rng_t) :: rng_stream_t
  private
  logical :: antithetic = .false.
  logical :: increased_precision = .false.
  real(default), dimension(3, 2) :: current_position = 1234._default
  real(default), dimension(3, 2) :: beginning_substream = 1234._default

```

```

real(default), dimension(3, 2) :: initial_stream = 1234._default
contains
  <RNG stream: rng stream: TBP>
end type rng_stream_t

```

Output. Display current position and the (sub-)stream positions.

```

<RNG stream: rng stream: TBP>≡

```

Generate a single real random number from the current state of (sub-)stream.

The machine representation of the result can lead to negative numbers. We add  $m_1$  or  $m_2$  to the respective number to ensure they are all positive and are still congruent to  $\text{mod } m_1$  or  $\text{mod } m_2$ .

The final formula  $x = y(3, 1) - y(3, 2) \pmod{m_1}$  can lead to negative random numbers. Instead of directly calculating the modulo, we check whether  $y(3, 1)$  is larger than  $y(3, 2)$ , or not. If  $x(3, 1) > y(3, 2)$ , then  $y(3, 1) - y(3, 2)$  is congruent to  $y(3, 1) - y(3, 2) \pmod{m_1}$ . If  $y(3, 1) < y(3, 2)$ , then  $y(3, 1) - y(3, 2) + m_1$  is congruent to  $y(3, 1) - y(3, 2) \pmod{m_1}$ .

Advance state of the current stream by  $n$  steps. We do not touch the beginning of the substream nor the initial stream. The purpose of the procedure is to reproduce the same random number (streams) among multiple workers without additional communication cost. E.g. worker 1 needs the first 5000 random numbers and the second one needs the next 5000 random numbers. In such a way we can exactly reproduce results (upon numerical noise) in single or parallel runs with the RngStream. The procedure must only be used with care! Misuse can lead to wrong results!

```

end do
end function matmat_mod

```

### 8.4.1 Factory

We utilize the streams proposed by L'Ecuyer where we use precalculated transition matrices to jump between different (sub-)streams.

The random generator has the period  $\rho$  and the transition function  $T : s_n \rightarrow s_{n+1}$  whereas  $s_n$  is the generator's state after  $n$  steps. Furthermore, it is  $T^\rho(s) = s$ . The stream of random number then is disjoint into streams and substreams. The length of the streams, which divide the overall stream, should be  $Z = 2^z$  and partition those streams again in  $V = 2^v$  substreams of length  $W = 2^w$ .

We store the seed and the initial stream, also, the beginning of the substream.

```

<RNG stream: public>+≡
  public :: rng_stream_factory_t

<RNG stream: types>+≡
  type, extends(rng_factory_t) :: rng_stream_factory_t
  real(default), dimension(3, 2) :: seed = 1234._default
  contains
  <RNG stream: rng stream factory: TBP>
  end type rng_stream_factory_t

```

Output.

```

<RNG stream: rng stream factory: TBP>≡
  procedure, public :: write => rng_stream_factory_write

<RNG stream: sub interfaces>+≡
  module subroutine rng_stream_factory_write (object, unit)
    class(rng_stream_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine rng_stream_factory_write

<RNG stream: procedures>+≡
  module subroutine rng_stream_factory_write (object, unit)
    class(rng_stream_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "RNG Stream factory"
    write (u, "(1x,A,6(F20.1,' ',1X),A)") "Next seed = [ "
    write (u, "(1x,3(F20.1,' ',1X))") object%seed(:, 1)
    write (u, "(1x,3(F20.1,' ',1X))") object%seed(:, 2)
    write (u, "(1x,A)") "]"
  end subroutine rng_stream_factory_write

```

Initialize. Default seed is 1234. We do not check whether the seed is valid, this is later done in `rng_stream_init`.

Additionally, we have to explicitly convert from `integer` to `real` because we are using floating-point arithmetic and not integer arithmetic due to a larger set of number in the representation of real numbers.

```

<RNG stream: rng stream factory: TBP>+≡
  procedure, public :: init => rng_stream_factory_init

```

```

<RNG stream: sub interfaces>+≡
  module subroutine rng_stream_factory_init (factory, seed)
    class(rng_stream_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
  end subroutine rng_stream_factory_init

```

```

<RNG stream: procedures>+≡
  module subroutine rng_stream_factory_init (factory, seed)
    class(rng_stream_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    real(default), dimension(3, 2) :: real_seed
    if (present (seed)) then
      factory%seed = real(seed, default)
    end if
  end subroutine rng_stream_factory_init

```

Allocate a new RNG and different stream states, accordingly. Due to a bug of allocating polymorphic types with submodules in gfortran 7/8/9 (and maybe together with MPI) this needs to be in the module, not the submodule.

```

<RNG stream: rng stream factory: TBP>+≡
  procedure, public :: make => rng_stream_factory_make

```

```

<RNG stream: main procedures>≡
  subroutine rng_stream_factory_make (factory, rng)
    class(rng_stream_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
    allocate (rng_stream_t :: rng)
    select type (rng)
    type is (rng_stream_t)
      call rng%init ()
      call rng%set_initial_stream (factory%seed)
    end select
    call factory%advance_seed ()
  end subroutine rng_stream_factory_make

```

Advance seed. Use the precalculated transistion matrices for the streams.

```

<RNG stream: parameters>+≡
  real(default), dimension(3, 3), parameter :: A1p127 = reshape (&
    [2427906178.0_default, 3580155704.0_default, 949770784.0_default, &

<Dispatch rng: variables>

interface
<Dispatch rng: sub interfaces>
end interface

end module dispatch_rng

(dispatch_rng_sub.f90)≡
<File header>

submodule (dispatch_rng) dispatch_rng_s

use diagnostics
use rng_tao
use rng_stream

implicit none

<Dispatch rng: parameters>

contains

<Dispatch rng: procedures>

end submodule dispatch_rng_s

```

Allocate a random-number generator factory according to the variable `$rng_method`, using the current seed in the global record. (If the variable does not exist, the lookup will return the value 0.) We take only the lower 15 bits of the seed, so the actual value fits into a positive 16-bit signed integer.

Since we want to guarantee that all random-number generators in a run are independent, we increment the global seed by one after creating the rng factory and return it to the caller. If the user wants to have identical sequences, he can always set the seed manually, before it is used.

```

<Dispatch rng: public>≡
  public :: dispatch_rng_factory

<Dispatch rng: sub interfaces>≡
  module subroutine dispatch_rng_factory &
    (rng_factory, var_list, next_rng_seed)
    class(rng_factory_t), allocatable, intent(inout) :: rng_factory
    type(var_list_t), intent(in) :: var_list
    integer, intent(out) :: next_rng_seed
  end subroutine dispatch_rng_factory

```

```

end subroutine dispatch_rng_factory

<Dispatch rng: procedures>≡
module subroutine dispatch_rng_factory &
(rng_factory, var_list, next_rng_seed)
class(rng_factory_t), allocatable, intent(inout) :: rng_factory
type(var_list_t), intent(in) :: var_list
integer, intent(out) :: next_rng_seed
type(var_list_t) :: local
type(string_t) :: rng_method
integer :: seed
character(30) :: buffer
integer(i16) :: s
rng_method = var_list%get_sval (var_str ("rng_method"))
seed = var_list%get_ival (var_str ("seed"))
s = int (mod (seed, 32768), i16)
select case (char (rng_method))
case ("tao")
allocate (rng_tao_factory_t :: rng_factory)
call msg_message ("RNG: Initializing TAO random-number generator")
next_rng_seed = seed + 1
case ("rng_stream")
allocate (rng_stream_factory_t :: rng_factory)
call msg_message ("RNG: Initializing RNG Stream random-number generator")
next_rng_seed = seed + 1
case default
if (associated (dispatch_rng_factory_fallback)) then
call dispatch_rng_factory_fallback &
(rng_factory, var_list, next_rng_seed)
end if
if (.not. allocated (rng_factory)) then
call msg_fatal ("Random-number generator '" &
// char (rng_method) // "' not implemented")
end if
end select
write (buffer, "(IO)") s
call msg_message ("RNG: Setting seed for random-number generator to " &
// trim (buffer))
call rng_factory%init (s)
end subroutine dispatch_rng_factory

```

This is a hook that allows us to inject further handlers for RNG factory objects, in particular a test RNG.

```

<Dispatch rng: public>+≡
public :: dispatch_rng_factory_fallback

<Dispatch rng: variables>≡
procedure (dispatch_rng_factory), pointer :: &
dispatch_rng_factory_fallback => null ()

```

If the RNG factory dispatcher has used up a seed, we should reset it in the variable list. Separate subroutine with optional argument for more flexibility.

```

<Dispatch rng: public>+≡
public :: update_rng_seed_in_var_list

```

```

<Dispatch rng: sub interfaces>+≡
  module subroutine update_rng_seed_in_var_list (var_list, next_rng_seed)
    type(var_list_t), intent(inout), optional :: var_list
    integer, intent(in) :: next_rng_seed
  end subroutine update_rng_seed_in_var_list

<Dispatch rng: procedures>+≡
  module subroutine update_rng_seed_in_var_list (var_list, next_rng_seed)
    type(var_list_t), intent(inout), optional :: var_list
    integer, intent(in) :: next_rng_seed
    if (present (var_list)) then
      call var_list%set_int (var_str ("seed"), next_rng_seed, is_known=.true.)
    end if
  end subroutine update_rng_seed_in_var_list

```

### 8.5.1 Unit tests

Test module, followed by the corresponding implementation module.

```

<dispatch_rng_ut.f90>≡
  <File header>

  module dispatch_rng_ut
    use unit_tests
    use dispatch_rng_utl

    <Standard module head>

    <Dispatch rng: public test>

    <Dispatch rng: public test auxiliary>

    contains

    <Dispatch rng: test driver>

  end module dispatch_rng_ut

<dispatch_rng_uti.f90>≡
  <File header>

  module dispatch_rng_uti

    <Use strings>
    use variables
    use diagnostics
    use rng_base
    use dispatch_rng

    <Standard module head>

    <Dispatch rng: public test auxiliary>

    <Dispatch rng: test declarations>

```

```

contains

  <Dispatch rng: tests>

  <Dispatch rng: test auxiliary>

  end module dispatch_rng_util

API: driver for the unit tests below.
<Dispatch rng: public test>≡
  public ::dispatch_rng_test

<Dispatch rng: test driver>≡
  subroutine dispatch_rng_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
    <Dispatch rng: execute tests>
  end subroutine dispatch_rng_test

```

### Select type: random number generator

This is an extra dispatcher that enables the test RNG. This procedure should be assigned to the `dispatch_rng_factory_fallback` hook before any tests are executed.

The test generator does not use the seed at all, but it does increment it to be consistent with the other implementations.

```

<Dispatch rng: public test auxiliary>≡
  public :: dispatch_rng_factory_test

<Dispatch rng: test auxiliary>≡
  subroutine dispatch_rng_factory_test (rng_factory, var_list, next_rng_seed)
    use rng_base
    use rng_base_ut, only: rng_test_factory_t
    class(rng_factory_t), allocatable, intent(inout) :: rng_factory
    type(var_list_t), intent(in) :: var_list
    integer, intent(out) :: next_rng_seed
    type(string_t) :: rng_method
    if (var_list%contains (var_str ("rng_method"))) then
      rng_method = var_list%get_sval (var_str ("rng_method"))
    else
      rng_method = "unit_test"
    end if
    next_rng_seed = &
      var_list%get_ival (var_str ("seed")) + 1
    select case (char (rng_method))
    case ("unit_test")
      allocate (rng_test_factory_t :: rng_factory)
      call msg_message ("RNG: Initializing Test random-number generator")
    end select
  end subroutine dispatch_rng_factory_test

```

This is the analog for the TAO RNG, for the unit tests we need a full generator.  
(The seed is to be zero or a small integer.)

```

<Dispatch rng: public test auxiliary>+≡
  public :: dispatch_rng_factory_tao

<Dispatch rng: test auxiliary>+≡
  subroutine dispatch_rng_factory_tao (rng_factory, var_list, next_rng_seed)
  use kinds, only: i16
  use rng_base
  use rng_tao, only: rng_tao_factory_t
  class(rng_factory_t), allocatable, intent(inout) :: rng_factory
  type(var_list_t), intent(in) :: var_list
  integer, intent(out) :: next_rng_seed
  type(string_t) :: rng_method
  integer(i16) :: s
  if (var_list%contains (var_str ("rng_method"))) then
    rng_method = var_list%get_sval (var_str ("rng_method"))
  else
    rng_method = "tao"
  end if
  s = var_list%get_ival (var_str ("seed"))
  select case (char (rng_method))
  case ("tao")
    allocate (rng_tao_factory_t :: rng_factory)
    call rng_factory%init (s)
  end select
  next_rng_seed = s + 1
  end subroutine dispatch_rng_factory_tao

```

Create RNG factories for different algorithms. Note that the seed is updated after each rng factory call.

```

<Dispatch rng: execute tests>≡

```

## Chapter 9

# Physics

Here we collect definitions and functions that we need for (particle) physics in general, to make them available for the more specific needs of WHIZARD.

**physics\_defs** Physical constants.

**c\_particles** A simple data type for particles which is C compatible.

**lorentz** Define three-vectors, four-vectors and Lorentz transformations and common operations for them.

**phs\_point** Collections of Lorentz vectors.

**sm\_physics** Here, running functions are stored for special kinematical setup like running coupling constants, Catani-Seymour dipoles, or Sudakov factors.

**sm\_qcd** Definitions and methods for dealing with the running QCD coupling.

**shower\_algorithms** Algorithms typically used in Parton Showers as well as in their matching to NLO computations, e.g. with the POWHEG method.

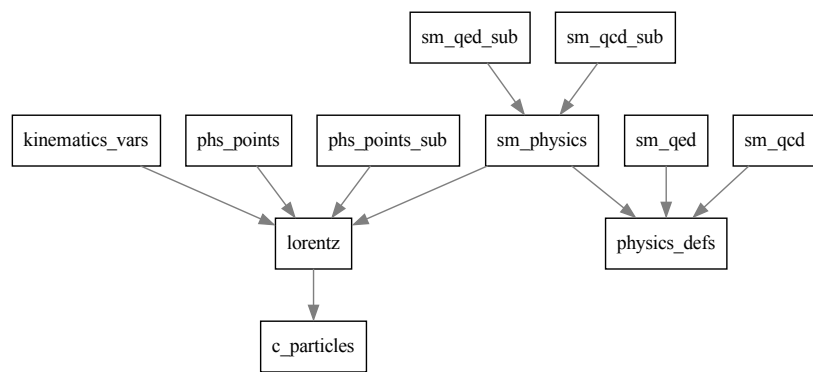

Figure 9.1: Module dependencies in `src/physics`.

## 9.1 Physics Constants

There is also the generic `constants` module. The constants listed here are more specific for particle physics.

```
(physics_defs.f90)≡  
  <File header>  
  
  module physics_defs  
  
    <Use kinds>  
    <Use strings>  
    use constants, only: one, two, three  
  
    <Standard module head>  
  
    <Physics defs: public parameters>  
  
    <Physics defs: public>  
  
    <Physics defs: interfaces>  
  
    interface  
    <Physics defs: sub interfaces>  
    end interface  
  
  end module physics_defs  
(physics_defs_sub.f90)≡  
  <File header>  
  
  submodule (physics_defs) physics_defs_s  
  
  implicit none  
  
  contains  
  
  <Physics defs: procedures>  
  
end submodule physics_defs_s
```

### 9.1.1 Units

Conversion from energy units to cross-section units.

```
<Physics defs: public parameters>≡  
  real(default), parameter, public :: &  
  conv = 0.38937966e12_default
```

Conversion from millimeter to nanoseconds for lifetimes.

```
<Physics defs: public parameters>+≡  
  real(default), parameter, public :: &  
  ns_per_mm = 1.e6_default / 299792458._default
```

Rescaling factor.

```
<Physics defs: public parameters>+=  
  real(default), parameter, public :: &  
  pb_per_fb = 1.e-3_default
```

String for the default energy and cross-section units.

```
<Physics defs: public parameters>+=  
  character(*), parameter, public :: &  
  energy_unit = "GeV"  
  character(*), parameter, public :: &  
  cross_section_unit = "fb"
```

### 9.1.2 SM and QCD constants

```
<Physics defs: public parameters>+=  
  real(default), parameter, public :: &  
  NC = three, &  
  CF = (NC**2 - one) / two / NC, &  
  CA = NC, &  
  TR = one / two
```

### 9.1.3 Parameter Reference values

These are used exclusively in the context of running QCD parameters. In other contexts, we rely on the uniform parameter set as provided by the model definition, modifiable by the user.

```
<Physics defs: public parameters>+=  
  real(default), public, parameter :: MZ_REF = 91.188_default  
  real(default), public, parameter :: ME_REF = 0.000510998928_default  
  real(default), public, parameter :: ALPHA_QCD_MZ_REF = 0.1178_default  
  real(default), public, parameter :: ALPHA_QED_ME_REF = 0.0072973525693_default  
  real(default), public, parameter :: LAMBDA_QCD_REF = 200.e-3_default
```

### 9.1.4 Particle codes

Let us define a few particle codes independent of the model.

We need an UNDEFINED value:

```
<Physics defs: public parameters>+=  
  integer, parameter, public :: UNDEFINED = 0
```

SM fermions:

```
<Physics defs: public parameters>+=  
  integer, parameter, public :: DOWN_Q = 1  
  integer, parameter, public :: UP_Q = 2  
  integer, parameter, public :: STRANGE_Q = 3  
  integer, parameter, public :: CHARM_Q = 4  
  integer, parameter, public :: BOTTOM_Q = 5  
  integer, parameter, public :: TOP_Q = 6  
  integer, parameter, public :: ELECTRON = 11  
  integer, parameter, public :: ELECTRON_NEUTRINO = 12  
  integer, parameter, public :: MUON = 13
```

```

integer, parameter, public :: MUON_NEUTRINO = 14
integer, parameter, public :: TAU = 15
integer, parameter, public :: TAU_NEUTRINO = 16

```

Gauge bosons:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: GLUON = 21
integer, parameter, public :: PHOTON = 22
integer, parameter, public :: PHOTON_OFFSHELL = -2002
integer, parameter, public :: PHOTON_ONSHELL = 2002
integer, parameter, public :: Z_BOSON = 23
integer, parameter, public :: W_BOSON = 24

```

Light mesons:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: PION = 111
integer, parameter, public :: PIPLUS = 211
integer, parameter, public :: PIMINUS = - PIPLUS

```

Di-Quarks:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: UD0 = 2101
integer, parameter, public :: UD1 = 2103
integer, parameter, public :: UU1 = 2203

```

Mesons:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: KOL = 130
integer, parameter, public :: KOS = 310
integer, parameter, public :: KO = 311
integer, parameter, public :: KPLUS = 321
integer, parameter, public :: DPLUS = 411
integer, parameter, public :: D0 = 421
integer, parameter, public :: B0 = 511
integer, parameter, public :: BPLUS = 521

```

Light baryons:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: PROTON = 2212
integer, parameter, public :: NEUTRON = 2112
integer, parameter, public :: DELTAPLUSPLUS = 2224
integer, parameter, public :: DELTAPLUS = 2214
integer, parameter, public :: DELTA0 = 2114
integer, parameter, public :: DELTAMINUS = 1114

```

Strange baryons:

```

<Physics defs: public parameters>+≡
integer, parameter, public :: SIGMAPLUS = 3222
integer, parameter, public :: SIGMA0 = 3212
integer, parameter, public :: SIGMAMINUS = 3112

```

Charmed baryons:

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: SIGMACPLUSPLUS = 4222  
integer, parameter, public :: SIGMACPLUS = 4212  
integer, parameter, public :: SIGMACO = 4112
```

Bottom baryons:

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: SIGMABO = 5212  
integer, parameter, public :: SIGMABPLUS = 5222
```

81-100 are reserved for internal codes. Hadron and beam remnants:

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: BEAM_REMNANT = 9999  
integer, parameter, public :: HADRON_REMNANT = 90  
integer, parameter, public :: HADRON_REMNANT_SINGLET = 91  
integer, parameter, public :: HADRON_REMNANT_TRIPLET = 92  
integer, parameter, public :: HADRON_REMNANT_OCTET = 93
```

Further particle codes for internal use:

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: INTERNAL = 94  
integer, parameter, public :: INVALID = 97  
  
integer, parameter, public :: COMPOSITE = 99
```

### 9.1.5 Spin codes

Somewhat redundant, but for better readability we define named constants for spin types. If the mass is nonzero, this is equal to the number of degrees of freedom.

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: UNKNOWN = 0  
integer, parameter, public :: SCALAR = 1, SPINOR = 2, VECTOR = 3, &  
VECTORSPINOR = 4, TENSOR = 5
```

Isospin types and charge types are counted in an analogous way, where charge type 1 is charge 0, 2 is charge 1/3, and so on. Zero always means unknown. Note that charge and isospin types have an explicit sign.

Color types are defined as the dimension of the representation.

### 9.1.6 NLO status codes

Used to specify whether a `term_instance_t` of a `process_instance_t` is associated with a Born, real-subtracted, virtual-subtracted or subtraction-dummy matrix element.

```
(Physics defs: public parameters)+≡  
integer, parameter, public :: BORN = 0  
integer, parameter, public :: NLO_REAL = 1
```

```

integer, parameter, public :: NLO_VIRTUAL = 2
integer, parameter, public :: NLO_MISMATCH = 3
integer, parameter, public :: NLO_DGLAP = 4
integer, parameter, public :: NLO_SUBTRACTION = 5
integer, parameter, public :: NLO_FULL = 6
integer, parameter, public :: GKS = 7
integer, parameter, public :: COMPONENT_UNDEFINED = 99

```

NLO\_FULL is not strictly a component status code but having it is convenient. We define the number of additional subtractions for beam-involved NLO calculations. Each subtraction refers to a rescaling of one of two beams. Obviously, this approach is not flexible enough to support setups with just a single beam described by a structure function.

```

<Physics defs: public parameters>+=
  integer, parameter, public :: n_beams_rescaled = 2

```

Orders of the electron PDFs.

```

<Physics defs: public parameters>+=
  integer, parameter, public :: EPDF_LL = 0
  integer, parameter, public :: EPDF_NLL = 1

```

```

<Physics defs: public>=
  public :: component_status

```

```

<Physics defs: interfaces>=
  interface component_status
    module procedure component_status_of_string
    module procedure component_status_to_string
  end interface

```

```

<Physics defs: sub interfaces>=
  elemental module function component_status_of_string (string) result (i)
    integer :: i
    type(string_t), intent(in) :: string
  end function component_status_of_string
  elemental module function component_status_to_string (i) result (string)
    type(string_t) :: string
    integer, intent(in) :: i
  end function component_status_to_string

```

```

<Physics defs: procedures>=
  elemental module function component_status_of_string (string) result (i)
    integer :: i
    type(string_t), intent(in) :: string
    select case (char(string))
    case ("born")
      i = BORN
    case ("real")
      i = NLO_REAL
    case ("virtual")
      i = NLO_VIRTUAL
    case ("mismatch")
      i = NLO_MISMATCH
    case ("dglap")

```

```

i = NLO_DGLAP
case ("subtraction")
i = NLO_SUBTRACTION
case ("full")
i = NLO_FULL
case ("GKS")
i = GKS
case default
i = COMPONENT_UNDEFINED
end select
end function component_status_of_string

elemental module function component_status_to_string (i) result (string)
type(string_t) :: string
integer, intent(in) :: i
select case (i)
case (BORN)
string = "born"
case (NLO_REAL)
string = "real"
case (NLO_VIRTUAL)
string = "virtual"
case (NLO_MISMATCH)
string = "mismatch"
case (NLO_DGLAP)
string = "dglap"
case (NLO_SUBTRACTION)
string = "subtraction"
case (NLO_FULL)
string = "full"
case (GKS)
string = "GKS"
case default
string = "undefined"
end select
end function component_status_to_string

<Physics defs: public>+≡
public :: is_nlo_component

<Physics defs: sub interfaces>+≡
elemental module function is_nlo_component (comp) result (is_nlo)
logical :: is_nlo
integer, intent(in) :: comp
end function is_nlo_component

<Physics defs: procedures>+≡
elemental module function is_nlo_component (comp) result (is_nlo)
logical :: is_nlo
integer, intent(in) :: comp
select case (comp)
case (BORN : GKS)
is_nlo = .true.
case default
is_nlo = .false.

```

```

end select
end function is_nlo_component

<Physics defs: public>+≡
  public :: is_subtraction_component

<Physics defs: sub interfaces>+≡
  module function is_subtraction_component (emitter, nlo_type) result (is_subtraction)
    logical :: is_subtraction
    integer, intent(in) :: emitter, nlo_type
  end function is_subtraction_component

<Physics defs: procedures>+≡
  module function is_subtraction_component (emitter, nlo_type) result (is_subtraction)
    logical :: is_subtraction
    integer, intent(in) :: emitter, nlo_type
    is_subtraction = nlo_type == NLO_REAL .and. emitter < 0
  end function is_subtraction_component

```

### 9.1.7 Threshold

Some commonly used variables for the threshold computation

```

<Physics defs: public parameters>+≡
  integer, parameter, public :: THR_POS_WP = 3
  integer, parameter, public :: THR_POS_WM = 4
  integer, parameter, public :: THR_POS_B = 5
  integer, parameter, public :: THR_POS_BBAR = 6
  integer, parameter, public :: THR_POS_GLUON = 7

  integer, parameter, public :: THR_EMITTER_OFFSET = 4

  integer, parameter, public :: NO_FACTORIZATION = 0
  integer, parameter, public :: FACTORIZATION_THRESHOLD = 1

  integer, dimension(2), parameter, public :: ass_quark = [5, 6]
  integer, dimension(2), parameter, public :: ass_boson = [3, 4]

  integer, parameter, public :: PROC_MODE_UNDEFINED = 0
  integer, parameter, public :: PROC_MODE_TT = 1
  integer, parameter, public :: PROC_MODE_WBWB = 2

<Physics defs: public>+≡
  public :: thr_leg

<Physics defs: sub interfaces>+≡
  module function thr_leg (emitter) result (leg)
    integer :: leg
    integer, intent(in) :: emitter
  end function thr_leg

```

```

(Physics defs: procedures) +=
  module function thr_leg (emitter) result (leg)
    integer :: leg
    integer, intent(in) :: emitter
    leg = emitter - THR_EMITTER_OFFSET
  end function thr_leg

```

## 9.2 C-compatible Particle Type

For easy communication with C code, we introduce a simple C-compatible type for particles. The components are either default C integers or default C doubles.

The `c_prt` type is transparent, and its contents should be regarded as part of the interface.

```
<c_particles.f90>≡
  <File header>

  module c_particles

    use, intrinsic :: iso_c_binding !NODEP!

    <Standard module head>

    <C Particles: public>

    <C Particles: types>

    interface
      <C Particles: sub interfaces>
    end interface

  end module c_particles

<c_particles_sub.f90>≡
  <File header>

  submodule (c_particles) c_particles_s

    use io_units
    use format_defs, only: FMT_14, FMT_19

    implicit none

    contains

    <C Particles: procedures>

  end submodule c_particles_s

<C Particles: public>≡
  public :: c_prt_t

<C Particles: types>≡
  type, bind(C) :: c_prt_t
  integer(c_int) :: type = 0
  integer(c_int) :: pdg = 0
  integer(c_int) :: polarized = 0
  integer(c_int) :: h = 0
  real(c_double) :: pe = 0
  real(c_double) :: px = 0
  real(c_double) :: py = 0
  real(c_double) :: pz = 0
```

```

real(c_double) :: p2 = 0
end type c_prt_t

```

This is for debugging only, there is no C binding. It is a simplified version of `prt_write`.

```

<C Particles: public>+≡
  public :: c_prt_write

<C Particles: sub interfaces>≡
  module subroutine c_prt_write (prt, unit)
    type(c_prt_t), intent(in) :: prt
    integer, intent(in), optional :: unit
  end subroutine c_prt_write

<C Particles: procedures>≡
  module subroutine c_prt_write (prt, unit)
    type(c_prt_t), intent(in) :: prt
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(1x,A)", advance="no") "prt("
    write (u, "(I0,':')", advance="no") prt%type
    if (prt%polarized /= 0) then
      write (u, "(I0,'/',I0,'|')", advance="no") prt%pdg, prt%h
    else
      write (u, "(I0,'|')", advance="no") prt%pdg
    end if
    write (u, "(" // FMT_14 // ",','," // FMT_14 // ",','," // &
      FMT_14 // ",','," // FMT_14 // ")", advance="no") &
      prt%pe, prt%px, prt%py, prt%pz
    write (u, "( '|'," // FMT_19 // ")", advance="no") prt%p2
    write (u, "(A)" " ")
  end subroutine c_prt_write

```

## 9.3 Lorentz algebra

Define Lorentz vectors, three-vectors, boosts, and some functions to manipulate them.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

```
<lorentz.f90>≡  
  <File header>  
  
  module lorentz  
  
    <Use kinds with double>  
    use constants, only: zero, one  
    use c_particles  
  
    <Standard module head>  
  
    <Lorentz: public>  
  
    <Lorentz: public operators>  
  
    <Lorentz: public functions>  
  
    <Lorentz: types>  
  
    <Lorentz: parameters>  
  
    <Lorentz: interfaces>  
  
    interface  
      <Lorentz: sub interfaces>  
    end interface  
  
  end module lorentz  
<lorentz_sub.f90>≡  
  <File header>  
  
  submodule (lorentz) lorentz_s  
  
    use constants, only: pi, twopi, degree, two, tiny_07, eps0  
    use numeric_utils  
    use io_units  
    use format_defs, only: FMT_11, FMT_13, FMT_15, FMT_19  
    use format_utils, only: pac_fmt  
    use diagnostics  
  
    implicit none  
  
    contains  
  
    <Lorentz: procedures>  
  
  end submodule lorentz_s
```

### 9.3.1 Three-vectors

First of all, let us introduce three-vectors in a trivial way. The functions and overloaded elementary operations clearly are too much overhead, but we like to keep the interface for three-vectors and four-vectors exactly parallel. By the way, we might attach a label to a vector by extending the type definition later.

```
<Lorentz: public>≡
  public :: vector3_t

<Lorentz: types>≡
  type :: vector3_t
  real(default), dimension(3) :: p
  end type vector3_t
```

Output a vector

```
<Lorentz: public>+≡
  public :: vector3_write

<Lorentz: sub interfaces>≡
  module subroutine vector3_write (p, unit, testflag)
    type(vector3_t), intent(in) :: p
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
  end subroutine vector3_write

<Lorentz: procedures>≡
  module subroutine vector3_write (p, unit, testflag)
    type(vector3_t), intent(in) :: p
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    character(len=7) :: fmt
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    call pac_fmt (fmt, FMT_19, FMT_15, testflag)
    write(u, "(1x,A,3(1x," // fmt // "))" ) 'P = ', p%p
  end subroutine vector3_write
```

This is a three-vector with zero components

```
<Lorentz: public>+≡
  public :: vector3_null

<Lorentz: parameters>≡
  type(vector3_t), parameter :: vector3_null = &
    vector3_t ([ zero, zero, zero ])
```

Canonical three-vector:

```
<Lorentz: public>+≡
  public :: vector3_canonical
```

```

<Lorentz: sub interfaces>+≡
  elemental module function vector3_canonical (k) result (p)
    type(vector3_t) :: p
    integer, intent(in) :: k
  end function vector3_canonical

```

```

<Lorentz: procedures>+≡
  elemental module function vector3_canonical (k) result (p)
    type(vector3_t) :: p
    integer, intent(in) :: k
    p = vector3_null
    p%p(k) = 1
  end function vector3_canonical

```

A moving particle ( $k$ -axis, or arbitrary axis). Note that the function for the generic momentum cannot be elemental.

```

<Lorentz: public>+≡
  public :: vector3_moving

<Lorentz: interfaces>≡
  interface vector3_moving
    module procedure vector3_moving_canonical
    module procedure vector3_moving_generic
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function vector3_moving_canonical (p, k) result(q)
    type(vector3_t) :: q
    real(default), intent(in) :: p
    integer, intent(in) :: k
  end function vector3_moving_canonical
  pure module function vector3_moving_generic (p) result(q)
    real(default), dimension(3), intent(in) :: p
    type(vector3_t) :: q
  end function vector3_moving_generic

<Lorentz: procedures>+≡
  elemental module function vector3_moving_canonical (p, k) result(q)
    type(vector3_t) :: q
    real(default), intent(in) :: p
    integer, intent(in) :: k
    q = vector3_null
    q%p(k) = p
  end function vector3_moving_canonical
  pure module function vector3_moving_generic (p) result(q)
    real(default), dimension(3), intent(in) :: p
    type(vector3_t) :: q
    q%p = p
  end function vector3_moving_generic

```

Equality and inequality

```

<Lorentz: public operators>≡
  public :: operator(==), operator(/=)

```

```

<Lorentz: interfaces>+≡
  interface operator(==)
  module procedure vector3_eq
  end interface
  interface operator(/=)
  module procedure vector3_neq
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function vector3_eq (p, q) result (r)
  logical :: r
  type(vector3_t), intent(in) :: p,q
  end function vector3_eq
  elemental module function vector3_neq (p, q) result (r)
  logical :: r
  type(vector3_t), intent(in) :: p,q
  end function vector3_neq

<Lorentz: procedures>+≡
  elemental module function vector3_eq (p, q) result (r)
  logical :: r
  type(vector3_t), intent(in) :: p,q
  r = all (abs (p%p - q%p) < eps0)
  end function vector3_eq
  elemental module function vector3_neq (p, q) result (r)
  logical :: r
  type(vector3_t), intent(in) :: p,q
  r = any (abs(p%p - q%p) > eps0)
  end function vector3_neq

```

Define addition and subtraction

```

<Lorentz: public operators>+≡
  public :: operator(+), operator(-)

<Lorentz: interfaces>+≡
  interface operator(+)
  module procedure add_vector3
  end interface
  interface operator(-)
  module procedure sub_vector3
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function add_vector3 (p, q) result (r)
  type(vector3_t) :: r
  type(vector3_t), intent(in) :: p,q
  end function add_vector3
  elemental module function sub_vector3 (p, q) result (r)
  type(vector3_t) :: r
  type(vector3_t), intent(in) :: p,q
  end function sub_vector3

<Lorentz: procedures>+≡
  elemental module function add_vector3 (p, q) result (r)
  type(vector3_t) :: r
  type(vector3_t), intent(in) :: p,q

```

```

r%p = p%p + q%p
end function add_vector3
elemental module function sub_vector3 (p, q) result (r)
type(vector3_t) :: r
type(vector3_t), intent(in) :: p,q
r%p = p%p - q%p
end function sub_vector3

```

The multiplication sign is overloaded with scalar multiplication; similarly division:

```

(Lorentz: public operators)+≡
public :: operator(*), operator(/)

(Lorentz: interfaces)+≡
interface operator(*)
module procedure prod_integer_vector3, prod_vector3_integer
module procedure prod_real_vector3, prod_vector3_real
end interface
interface operator(/)
module procedure div_vector3_real, div_vector3_integer
end interface

(Lorentz: sub interfaces)+≡
elemental module function prod_real_vector3 (s, p) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
end function prod_real_vector3
elemental module function prod_vector3_real (p, s) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
end function prod_vector3_real
elemental module function div_vector3_real (p, s) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
end function div_vector3_real
elemental module function prod_integer_vector3 (s, p) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
end function prod_integer_vector3
elemental module function prod_vector3_integer (p, s) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
end function prod_vector3_integer
elemental module function div_vector3_integer (p, s) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
end function div_vector3_integer

(Lorentz: procedures)+≡

```

```

elemental module function prod_real_vector3 (s, p) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = s * p%p
end function prod_real_vector3
elemental module function prod_vector3_real (p, s) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = s * p%p
end function prod_vector3_real
elemental module function div_vector3_real (p, s) result (q)
type(vector3_t) :: q
real(default), intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = p%p/s
end function div_vector3_real
elemental module function prod_integer_vector3 (s, p) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = s * p%p
end function prod_integer_vector3
elemental module function prod_vector3_integer (p, s) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = s * p%p
end function prod_vector3_integer
elemental module function div_vector3_integer (p, s) result (q)
type(vector3_t) :: q
integer, intent(in) :: s
type(vector3_t), intent(in) :: p
q%p = p%p/s
end function div_vector3_integer

```

The multiplication sign can also indicate scalar products:

```

(Lorentz: interfaces)+≡
  interface operator(*)
  module procedure prod_vector3
  end interface

(Lorentz: sub interfaces)+≡
  elemental module function prod_vector3 (p, q) result (s)
  real(default) :: s
  type(vector3_t), intent(in) :: p,q
  end function prod_vector3

(Lorentz: procedures)+≡
  elemental module function prod_vector3 (p, q) result (s)
  real(default) :: s
  type(vector3_t), intent(in) :: p,q
  s = dot_product (p%p, q%p)
  end function prod_vector3

```

```

<Lorentz: public functions>≡
  public :: cross_product

<Lorentz: interfaces>+≡
  interface cross_product
  module procedure vector3_cross_product
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function vector3_cross_product (p, q) result (r)
  type(vector3_t) :: r
  type(vector3_t), intent(in) :: p,q
  end function vector3_cross_product

<Lorentz: procedures>+≡
  elemental module function vector3_cross_product (p, q) result (r)
  type(vector3_t) :: r
  type(vector3_t), intent(in) :: p,q
  integer :: i
  do i=1,3
  r%p(i) = dot_product (p%p, matmul(epsilon_three(i, :, :), q%p))
  end do
  end function vector3_cross_product

```

Exponentiation is defined only for integer powers. Odd powers mean take the square root; so `p**1` is the length of `p`.

```

<Lorentz: public operators>+≡
  public :: operator(**)

<Lorentz: interfaces>+≡
  interface operator(**)
  module procedure power_vector3
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function power_vector3 (p, e) result (s)
  real(default) :: s
  type(vector3_t), intent(in) :: p
  integer, intent(in) :: e
  end function power_vector3

<Lorentz: procedures>+≡
  elemental module function power_vector3 (p, e) result (s)
  real(default) :: s
  type(vector3_t), intent(in) :: p
  integer, intent(in) :: e
  s = dot_product (p%p, p%p)
  if (e/=2) then
  if (mod(e,2)==0) then
  s = s**(e/2)
  else
  s = sqrt(s)**e
  end if
  end if
  end function power_vector3

```

Finally, we need a negation.

```

<Lorentz: interfaces>+≡
  interface operator(-)
  module procedure negate_vector3
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function negate_vector3 (p) result (q)
  type(vector3_t) :: q
  type(vector3_t), intent(in) :: p
  end function negate_vector3

<Lorentz: procedures>+≡
  elemental module function negate_vector3 (p) result (q)
  type(vector3_t) :: q
  type(vector3_t), intent(in) :: p
  integer :: i
  do i = 1, 3
  if (abs (p%p(i)) < eps0) then
  q%p(i) = 0
  else
  q%p(i) = -p%p(i)
  end if
  end do
  end function negate_vector3

```

The sum function can be useful:

```

<Lorentz: public functions>+≡
  public :: sum

<Lorentz: interfaces>+≡
  interface sum
  module procedure sum_vector3
  end interface

<Lorentz: public>+≡
  public :: vector3_set_component

<Lorentz: sub interfaces>+≡
  module subroutine vector3_set_component (p, i, value)
  type(vector3_t), intent(inout) :: p
  integer, intent(in) :: i
  real(default), intent(in) :: value
  end subroutine vector3_set_component

<Lorentz: procedures>+≡
  module subroutine vector3_set_component (p, i, value)
  type(vector3_t), intent(inout) :: p
  integer, intent(in) :: i
  real(default), intent(in) :: value
  p%p(i) = value
  end subroutine vector3_set_component

```

```

<Lorentz: sub interfaces>+≡
  pure module function sum_vector3 (p) result (q)
    type(vector3_t) :: q
    type(vector3_t), dimension(:), intent(in) :: p
  end function sum_vector3

```

```

<Lorentz: procedures>+≡
  pure module function sum_vector3 (p) result (q)
    type(vector3_t) :: q
    type(vector3_t), dimension(:), intent(in) :: p
    integer :: i
    do i=1, 3
      q%p(i) = sum (p%p(i))
    end do
  end function sum_vector3

```

Any component:

```

<Lorentz: public>+≡
  public :: vector3_get_component

<Lorentz: sub interfaces>+≡
  elemental module function vector3_get_component (p, k) result (c)
    type(vector3_t), intent(in) :: p
    integer, intent(in) :: k
    real(default) :: c
  end function vector3_get_component

<Lorentz: procedures>+≡
  elemental module function vector3_get_component (p, k) result (c)
    type(vector3_t), intent(in) :: p
    integer, intent(in) :: k
    real(default) :: c
    c = p%p(k)
  end function vector3_get_component

```

Extract all components. This is not elemental.

```

<Lorentz: public>+≡
  public :: vector3_get_components

<Lorentz: sub interfaces>+≡
  pure module function vector3_get_components (p) result (a)
    type(vector3_t), intent(in) :: p
    real(default), dimension(3) :: a
  end function vector3_get_components

<Lorentz: procedures>+≡
  pure module function vector3_get_components (p) result (a)
    type(vector3_t), intent(in) :: p
    real(default), dimension(3) :: a
    a = p%p
  end function vector3_get_components

```

This function returns the direction of a three-vector, i.e., a normalized three-vector. If the vector is null, we return a null vector.

```

<Lorentz: public functions>+≡
  public :: direction

```

```

<Lorentz: interfaces>+≡
  interface direction
  module procedure vector3_get_direction
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function vector3_get_direction (p) result (q)
  type(vector3_t) :: q
  type(vector3_t), intent(in) :: p
  end function vector3_get_direction

<Lorentz: procedures>+≡
  elemental module function vector3_get_direction (p) result (q)
  type(vector3_t) :: q
  type(vector3_t), intent(in) :: p
  real(default) :: pp
  pp = p**1
  if (pp > eps0) then
    q%p = p%p / pp
  else
    q%p = 0
  end if
  end function vector3_get_direction

```

### 9.3.2 Four-vectors

In four-vectors the zero-component needs special treatment, therefore we do not use the standard operations. Sure, we pay for the extra layer of abstraction by losing efficiency; so we have to assume that the time-critical applications do not involve four-vector operations.

```

<Lorentz: public>+≡
  public :: vector4_t

<Lorentz: types>+≡
  type :: vector4_t
  real(default), dimension(0:3) :: p = &
    [zero, zero, zero, zero]
  contains
  <Lorentz: vector4: TBP>
  end type vector4_t

```

Output a vector

```

<Lorentz: public>+≡
  public :: vector4_write

<Lorentz: vector4: TBP>≡
  procedure :: write => vector4_write

<Lorentz: sub interfaces>+≡
  module subroutine vector4_write &
    (p, unit, show_mass, testflag, compressed, ultra)
  class(vector4_t), intent(in) :: p
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: show_mass, testflag, compressed, ultra
  end subroutine vector4_write

```

*<Lorentz: procedures>+≡*

```

module subroutine vector4_write &
  (p, unit, show_mass, testflag, compressed, ultra)
class(vector4_t), intent(in) :: p
integer, intent(in), optional :: unit
logical, intent(in), optional :: show_mass, testflag, compressed, ultra
logical :: comp, sm, tf, extreme
integer :: u
character(len=7) :: fmt
real(default) :: m
comp = .false.; if (present (compressed)) comp = compressed
sm = .false.; if (present (show_mass)) sm = show_mass
tf = .false.; if (present (testflag)) tf = testflag
extreme = .false.; if (present (ultra)) extreme = ultra
if (extreme) then
call pac_fmt (fmt, FMT_19, FMT_11, testflag)
else
call pac_fmt (fmt, FMT_19, FMT_13, testflag)
end if
u = given_output_unit (unit); if (u < 0) return
if (comp) then
write (u, "(4(F12.3,1X))", advance="no") p%p(0:3)
else
write (u, "(1x,A,1x," // fmt // ")") 'E = ', p%p(0)
write (u, "(1x,A,3(1x," // fmt // ")") 'P = ', p%p(1:)
if (sm) then
m = p**1
if (tf) call pacify (m, tolerance = 1E-6_default)
write (u, "(1x,A,1x," // fmt // ")") 'M = ', m
end if
end if
end if
end subroutine vector4_write

```

## Binary I/O

*<Lorentz: public>+≡*

```

public :: vector4_write_raw
public :: vector4_read_raw

```

*<Lorentz: sub interfaces>+≡*

```

module subroutine vector4_write_raw (p, u)
type(vector4_t), intent(in) :: p
integer, intent(in) :: u
end subroutine vector4_write_raw
module subroutine vector4_read_raw (p, u, iostat)
type(vector4_t), intent(out) :: p
integer, intent(in) :: u
integer, intent(out), optional :: iostat
end subroutine vector4_read_raw

```

*<Lorentz: procedures>+≡*

```

module subroutine vector4_write_raw (p, u)
type(vector4_t), intent(in) :: p
integer, intent(in) :: u
write (u) p%p
end subroutine vector4_write_raw

```

```

module subroutine vector4_read_raw (p, u, iostat)
  type(vector4_t), intent(out) :: p
  integer, intent(in) :: u
  integer, intent(out), optional :: iostat
  read (u, iostat=iostat) p%p
end subroutine vector4_read_raw

```

This is a four-vector with zero components

```

<Lorentz: public>+≡
  public :: vector4_null

<Lorentz: parameters>+≡
  type(vector4_t), parameter :: vector4_null = &
  vector4_t ([ zero, zero, zero, zero ])

```

Canonical four-vector:

```

<Lorentz: public>+≡
  public :: vector4_canonical

<Lorentz: sub interfaces>+≡
  elemental module function vector4_canonical (k) result (p)
    type(vector4_t) :: p
    integer, intent(in) :: k
  end function vector4_canonical

<Lorentz: procedures>+≡
  elemental module function vector4_canonical (k) result (p)
    type(vector4_t) :: p
    integer, intent(in) :: k
    p = vector4_null
    p%p(k) = 1
  end function vector4_canonical

```

A particle at rest:

```

<Lorentz: public>+≡
  public :: vector4_at_rest

<Lorentz: sub interfaces>+≡
  elemental module function vector4_at_rest (m) result (p)
    type(vector4_t) :: p
    real(default), intent(in) :: m
  end function vector4_at_rest

<Lorentz: procedures>+≡
  elemental module function vector4_at_rest (m) result (p)
    type(vector4_t) :: p
    real(default), intent(in) :: m
    p = vector4_t ([ m, zero, zero, zero ])
  end function vector4_at_rest

```

A moving particle ( $k$ -axis, or arbitrary axis)

```

<Lorentz: public>+≡
  public :: vector4_moving

```

```

<Lorentz: interfaces>+=
  interface vector4_moving
  module procedure vector4_moving_canonical
  module procedure vector4_moving_generic
  end interface

<Lorentz: sub interfaces>+=
  elemental module function vector4_moving_canonical (E, p, k) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E, p
  integer, intent(in) :: k
  end function vector4_moving_canonical
  elemental module function vector4_moving_generic (E, p) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E
  type(vector3_t), intent(in) :: p
  end function vector4_moving_generic

<Lorentz: procedures>+=
  elemental module function vector4_moving_canonical (E, p, k) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E, p
  integer, intent(in) :: k
  q = vector4_at_rest(E)
  q%p(k) = p
  end function vector4_moving_canonical
  elemental module function vector4_moving_generic (E, p) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E
  type(vector3_t), intent(in) :: p
  q%p(0) = E
  q%p(1:) = p%p
  end function vector4_moving_generic

```

Equality and inequality

```

<Lorentz: interfaces>+=
  interface operator(==)
  module procedure vector4_eq
  end interface
  interface operator(/=)
  module procedure vector4_neq
  end interface

<Lorentz: sub interfaces>+=
  elemental module function vector4_eq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  end function vector4_eq
  elemental module function vector4_neq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  end function vector4_neq

<Lorentz: procedures>+=
  elemental module function vector4_eq (p, q) result (r)
  logical :: r

```

```

type(vector4_t), intent(in) :: p,q
r = all (abs (p%p - q%p) < eps0)
end function vector4_eq
elemental module function vector4_neq (p, q) result (r)
logical :: r
type(vector4_t), intent(in) :: p,q
r = any (abs (p%p - q%p) > eps0)
end function vector4_neq

```

Addition and subtraction:

```

<Lorentz: interfaces>+≡
  interface operator(+)
  module procedure add_vector4
  end interface
  interface operator(-)
  module procedure sub_vector4
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function add_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  end function add_vector4
  elemental module function sub_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  end function sub_vector4

<Lorentz: procedures>+≡
  elemental module function add_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  r%p = p%p + q%p
  end function add_vector4
  elemental module function sub_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  r%p = p%p - q%p
  end function sub_vector4

```

We also need scalar multiplication and division:

```

<Lorentz: interfaces>+≡
  interface operator(*)
  module procedure prod_real_vector4, prod_vector4_real
  module procedure prod_integer_vector4, prod_vector4_integer
  end interface
  interface operator(/)
  module procedure div_vector4_real
  module procedure div_vector4_integer
  end interface

<Lorentz: sub interfaces>+≡
  elemental module function prod_real_vector4 (s, p) result (q)
  type(vector4_t) :: q

```

```

real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
end function prod_real_vector4
elemental module function prod_vector4_real (p, s) result (q)
type(vector4_t) :: q
real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
end function prod_vector4_real
elemental module function div_vector4_real (p, s) result (q)
type(vector4_t) :: q
real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
end function div_vector4_real
elemental module function prod_integer_vector4 (s, p) result (q)
type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
end function prod_integer_vector4
elemental module function prod_vector4_integer (p, s) result (q)
type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
end function prod_vector4_integer
elemental module function div_vector4_integer (p, s) result (q)
type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
end function div_vector4_integer

```

*(Lorentz: procedures)* +=

```

elemental module function prod_real_vector4 (s, p) result (q)
type(vector4_t) :: q
real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = s * p%p
end function prod_real_vector4
elemental module function prod_vector4_real (p, s) result (q)
type(vector4_t) :: q
real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = s * p%p
end function prod_vector4_real
elemental module function div_vector4_real (p, s) result (q)
type(vector4_t) :: q
real(default), intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = p%p/s
end function div_vector4_real
elemental module function prod_integer_vector4 (s, p) result (q)
type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = s * p%p
end function prod_integer_vector4
elemental module function prod_vector4_integer (p, s) result (q)

```

```

type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = s * p%p
end function prod_vector4_integer
elemental module function div_vector4_integer (p, s) result (q)
type(vector4_t) :: q
integer, intent(in) :: s
type(vector4_t), intent(in) :: p
q%p = p%p/s
end function div_vector4_integer

```

Scalar products and squares in the Minkowski sense:

```

(Lorentz: interfaces)+≡
  interface operator(*)
  module procedure prod_vector4
  end interface
  interface operator(**)
  module procedure power_vector4
  end interface

(Lorentz: sub interfaces)+≡
  elemental module function prod_vector4 (p, q) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p,q
  end function prod_vector4

(Lorentz: procedures)+≡
  elemental module function prod_vector4 (p, q) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p,q
  s = p%p(0)*q%p(0) - dot_product(p%p(1:), q%p(1:))
  end function prod_vector4

```

The power operation for four-vectors is signed, i.e.,  $p^{**1}$  is positive for timelike and negative for spacelike vectors. Note that  $(p^{**1})^{**2}$  is not necessarily equal to  $p^{**2}$ .

```

(Lorentz: sub interfaces)+≡
  elemental module function power_vector4 (p, e) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p
  integer, intent(in) :: e
  end function power_vector4

(Lorentz: procedures)+≡
  elemental module function power_vector4 (p, e) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p
  integer, intent(in) :: e
  s = p * p
  if (e /= 2) then
  if (mod(e, 2) == 0) then
  s = s**(e / 2)
  else if (s >= 0) then

```

```

s = sqrt(s)**e
else
s = -(sqrt(abs(s))**e)
end if
end if
end function power_vector4

```

Finally, we introduce a negation

```

<Lorentz: interfaces>+=
  interface operator(-)
    module procedure negate_vector4
  end interface

<Lorentz: sub interfaces>+=
  elemental module function negate_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), intent(in) :: p
  end function negate_vector4

<Lorentz: procedures>+=
  elemental module function negate_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), intent(in) :: p
    integer :: i
    do i = 0, 3
      if (abs (p%p(i)) < eps0) then
        q%p(i) = 0
      else
        q%p(i) = -p%p(i)
      end if
    end do
  end function negate_vector4

```

The sum function can be useful:

```

<Lorentz: interfaces>+=
  interface sum
    module procedure sum_vector4, sum_vector4_mask
  end interface

<Lorentz: sub interfaces>+=
  pure module function sum_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), dimension(:), intent(in) :: p
  end function sum_vector4
  pure module function sum_vector4_mask (p, mask) result (q)
    type(vector4_t) :: q
    type(vector4_t), dimension(:), intent(in) :: p
    logical, dimension(:), intent(in) :: mask
  end function sum_vector4_mask

<Lorentz: procedures>+=
  pure module function sum_vector4 (p) result (q)
    type(vector4_t) :: q
    type(vector4_t), dimension(:), intent(in) :: p
    integer :: i

```

```

do i = 0, 3
  q%p(i) = sum (p%p(i))
end do
end function sum_vector4

pure module function sum_vector4_mask (p, mask) result (q)
  type(vector4_t) :: q
  type(vector4_t), dimension(:), intent(in) :: p
  logical, dimension(:), intent(in) :: mask
  integer :: i
  do i = 0, 3
    q%p(i) = sum (p%p(i), mask=mask)
  end do
end function sum_vector4_mask

```

### 9.3.3 Conversions

Manually set a component of the four-vector:

```

<Lorentz: public>+≡
  public :: vector4_set_component

<Lorentz: sub interfaces>+≡
  module subroutine vector4_set_component (p, k, c)
    type(vector4_t), intent(inout) :: p
    integer, intent(in) :: k
    real(default), intent(in) :: c
  end subroutine vector4_set_component

<Lorentz: procedures>+≡
  module subroutine vector4_set_component (p, k, c)
    type(vector4_t), intent(inout) :: p
    integer, intent(in) :: k
    real(default), intent(in) :: c
    p%p(k) = c
  end subroutine vector4_set_component

```

Any component:

```

<Lorentz: public>+≡
  public :: vector4_get_component

<Lorentz: sub interfaces>+≡
  elemental module function vector4_get_component (p, k) result (c)
    real(default) :: c
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: k
  end function vector4_get_component

<Lorentz: procedures>+≡

a = L%L
end function lorentz_transformation_get_components

```

### 9.3.8 Functions of Lorentz transformations

For the inverse, we make use of the fact that  $\Lambda^{\mu\nu}\Lambda_{\mu\rho} = \delta_{\rho}^{\nu}$ . So, lowering the indices and transposing is sufficient.

```

<Lorentz: public functions>+≡
public :: inverse

<Lorentz: interfaces>+≡
interface inverse
module procedure lorentz_transformation_inverse
end interface

<Lorentz: sub interfaces>+≡
elemental module function lorentz_transformation_inverse (L) result (IL)
type(lorentz_transformation_t) :: IL
type(lorentz_transformation_t), intent(in) :: L
end function lorentz_transformation_inverse

```

```

<Lorentz: procedures>+≡
  elemental module function lorentz_transformation_inverse (L) result (IL)
    type(lorentz_transformation_t) :: IL
    type(lorentz_transformation_t), intent(in) :: L
    IL%L(0,0) = L%L(0,0)
    IL%L(0,1:) = -L%L(1:,0)
    IL%L(1:,0) = -L%L(0,1:)
    IL%L(1:,1:) = transpose(L%L(1:,1:))
  end function lorentz_transformation_inverse

```

### 9.3.9 Invariants

These are used below. The first array index is varying fastest in FORTRAN; therefore the extra minus in the odd-rank tensor epsilon.

```

<Lorentz: parameters>+≡
  integer, dimension(3,3), parameter :: delta_three = &
    & reshape( source = [ 1,0,0, 0,1,0, 0,0,1 ], &
    &          shape = [3,3] )
  integer, dimension(3,3,3), parameter :: epsilon_three = &
    & reshape( source = [ 0, 0,0, 0,0,-1, 0,1,0, &
    &                      0, 0,1, 0,0, 0, -1,0,0, &
    &                      0,-1,0, 1,0, 0, 0,0,0 ],&
    &          shape = [3,3,3] )

```

This could be of some use:

```

<Lorentz: public>+≡
  public :: identity

<Lorentz: parameters>+≡
  type(lorentz_transformation_t), parameter :: &
    & identity = &
    & lorentz_transformation_t ( &
    & reshape( source = [ one, zero, zero, zero, &
    &                      zero, one, zero, zero, &
    &                      zero, zero, one, zero, &
    &                      zero, zero, zero, one ],&
    &          shape = [4,4] ) )

<Lorentz: public>+≡
  public :: space_reflection

<Lorentz: parameters>+≡
  type(lorentz_transformation_t), parameter :: &
    & space_reflection = &
    & lorentz_transformation_t ( &
    & reshape( source = [ one, zero, zero, zero, &
    &                      zero,-one, zero, zero, &
    &                      zero, zero,-one, zero, &
    &                      zero, zero, zero,-one ],&
    &          shape = [4,4] ) )

```

Builds a unit vector orthogonal to the input vector in the xy-plane.

end function create_two_particle_decay

```

This function creates a phase-space point for a  $1 \rightarrow 3$  decay in the decaying particle's rest frame. There are three rest frames for this system, corresponding to  $s$ -,  $t$ -, and  $u$ -channel momentum exchange, also referred to as Gottfried-Jackson frames. Below, we choose the momentum with index 1 to be aligned along the  $z$ -axis. We then have

$$\begin{aligned}
s_1 &= (p_1 + p_2)^2, \\
s_2 &= (p_2 + p_3)^2, \\
s_3 &= (p_1 + p_3)^2, \\
s_1 + s_2 + s_3 &= s + m_1^2 + m_2^2 + m_3^2.
\end{aligned}$$

From these we can construct

$$\begin{aligned}
E_1^{R23} &= \frac{s - s_2 - m_1^2}{2\sqrt{s_2}} & P_1^{R23} &= \frac{\lambda^{1/2}(s, s_2, m_1^2)}{2\sqrt{s_2}}, \\
E_2^{R23} &= \frac{s_2 + m_2^2 - m_3^2}{2\sqrt{s_2}} & P_2^{R23} &= \frac{\lambda^{1/2}(s_2, m_2^2, m_3^2)}{2\sqrt{s_2}}, \\
E_3^{R23} &= \frac{s_2 + m_3^2 - m_2^2}{2\sqrt{s_2}} & P_3^{R23} &= P_2^{R23},
\end{aligned}$$

where  $R23$  denotes the Gottfried-Jackson frame of our choice. Finally, the scattering angle  $\theta_{12}^{R23}$  between momentum 1 and 2 can be determined to be

$$\cos \theta_{12}^{R23} = \frac{(s - s_2 - m_1^2)(s_2 + m_2^2 - m_3^2) + 2s_2(m_1^2 + m_2^2 - s_1)}{\lambda^{1/2}(s, s_2, m_1^2)\lambda^{1/2}(s_2, m_2^2, m_3^2)}$$

### 9.3.10 Boosts

We build Lorentz transformations from boosts and rotations. In both cases we can supply a three-vector which defines the axis and (hyperbolic) angle. For a boost, this is the vector  $\vec{\beta} = \vec{p}/E$ , such that a particle at rest with mass  $m$  is boosted to a particle with three-vector  $\vec{p}$ . Here, we have

$$\beta = \tanh \chi = p/E, \quad \gamma = \cosh \chi = E/m, \quad \beta\gamma = \sinh \chi = p/m \quad (9.1)$$

```

<Lorentz: public functions>+=
public :: boost

<Lorentz: interfaces>+=
interface boost
module procedure boost_from_rest_frame
module procedure boost_from_rest_frame_vector3
module procedure boost_generic
module procedure boost_canonical
end interface

```

In the first form, the argument is some four-momentum, the space part of which determines a direction, and the associated mass (which is not checked against the four-momentum). The boost vector  $\gamma\vec{\beta}$  is then given by  $\vec{p}/m$ . This boosts from the rest frame of a particle to the current frame. To be explicit, if  $\vec{p}$  is the momentum of a particle and  $m$  its mass,  $L(\vec{p}/m)$  is the transformation that turns  $(m; \vec{0})$  into  $(E; \vec{p})$ . Conversely, the inverse transformation boosts a vector *into* the rest frame of a particle, in particular  $(E; \vec{p})$  into  $(m; \vec{0})$ .

### 9.3.12 Composite Lorentz transformations

This function returns the transformation that, given a pair of vectors  $p_{1,2}$ , (a) boosts from the rest frame of the c.m. system (with invariant mass  $m$ ) into the lab frame where  $p_i$  are defined, and (b) turns the given axis (or the canonical vectors  $\pm e_k$ ) in the rest frame into the directions of  $p_{1,2}$  in the lab frame. Note that the energy components are not used; for a consistent result one should have  $(p_1 + p_2)^2 = m^2$ .

```

### 9.3.14 Special Lorentz transformations

These routines have their application in the generation and extraction of angles in the phase-space sampling routine. Since this part of the program is time-critical, we calculate the composition of transformations directly instead of multiplying rotations and boosts.

This Lorentz transformation is the composition of a rotation by  $\phi$  around the 3 axis, a rotation by  $\theta$  around the 2 axis, and a boost along the 3 axis:

$$L = B_3(\beta\gamma) R_2(\theta) R_3(\phi) \quad (9.2)$$

Instead of the angles we provide sine and cosine.

```

<Lorentz: public functions>+≡
  public :: LT_compose_r3_r2_b3

<Lorentz: sub interfaces>+≡
  elemental module function LT_compose_r3_r2_b3 &
    (cp, sp, ct, st, beta_gamma) result (L)
  type(lorentz_transformation_t) :: L
  real(default), intent(in) :: cp, sp, ct, st, beta_gamma
  end function LT_compose_r3_r2_b3

<Lorentz: procedures>+≡
  elemental module function LT_compose_r3_r2_b3 &
    (cp, sp, ct, st, beta_gamma) result (L)
  type(lorentz_transformation_t) :: L
  real(default), intent(in) :: cp, sp, ct, st, beta_gamma
  real(default) :: gamma
  if (abs(beta_gamma) < eps0) then
    L%L(0,0) = 1
    L%L(1:,0) = 0
    L%L(0,1:) = 0
    L%L(1,1:) = [ ct*cp, -ct*sp, st ]
    L%L(2,1:) = [      sp,      cp, zero ]
    L%L(3,1:) = [ -st*cp, st*sp, ct ]
  else
    gamma = sqrt(1 + beta_gamma**2)
    L%L(0,0) = gamma
    L%L(1,0) = 0

```

```

L%L(2,0) = 0
L%L(3,0) = beta_gamma
L%L(0,1:) = beta_gamma * [ -st*cp, st*sp, ct ]
L%L(1,1:) = [ ct*cp, -ct*sp, st ]
L%L(2,1:) = [ sp, cp, zero ]
L%L(3,1:) = gamma * [ -st*cp, st*sp, ct ]
end if
end function LT_compose_r3_r2_b3

```

Different ordering:

$$L = B_3(\beta\gamma) R_3(\phi) R_2(\theta) \quad (9.3)$$

```

(Lorentz: public functions)+≡

      L%L(3,1:) = gamma * [ -st, zero, ct ]
    end if
  end function LT_compose_r2_r3_b3

```

This function returns the previous Lorentz transformation applied to an arbitrary four-momentum and extracts the space part of the result:

$$\vec{n} = [B_3(\beta\gamma) R_2(\theta) R_3(\phi) p]_{\text{space part}} \quad (9.4)$$

The second variant applies if there is no rotation

```

This subroutine is for the purpose of numerical checks and comparisons. The idea is to set a number to zero if it is numerically equivalent with zero. The equivalence is established by comparing with a `tolerance` argument. We implement this for vectors and transformations.

```

This computes the quantities

$$\langle ij \rangle = \sqrt{|S_{ij}|} e^{i\phi_{ij}}, [ij] = \sqrt{|S_{ij}|} e^{\mathcal{B}\tilde{\phi}_{ij}},$$

with  $S_{ij} = (p_i + p_j)^2$ . The phase space factor  $\phi_{ij}$  is determined by

$$\cos \phi_{ij} = \frac{p_i^1 p_j^+ - p_j^1 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}, \sin \phi_{ij} = \frac{p_i^2 p_j^+ - p_j^2 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}.$$

After  $\langle ij \rangle$  has been computed according to these formulae,  $[ij]$  can be obtained by using the relation  $S_{ij} = \langle ij \rangle [ji]$  and taking into account that  $[ij] = -[ji]$ . Thus, a minus-sign has to be applied.

print *, 'using calculation for massive visible particles.'

!!! Allowed transverse 2-momenta for each invisible particle incloses
!!! an elliptical region on the px, py plane.
!!! To satisfy kinematic constraints, the two elliptical regions must
!!! overlap. MT2 is therefore given by the minimum initial decay mass
!!! in each branch (mt2_b) which gives overlapping ellipses
!!! We therefore increase the initial decay mass in each branch (mt2_b)
!!! until the ellipses overlap - the "balanced configuration".
!!! In the balanced configuration, the two quadratic equations
!!! can be combined into one quartic equation.
!!! We search for the point at which the two ellipses are tangent,
!!! using the Sturm sequence method and bisection

!!! When the smaller ellipse is already inside the larger ellipse, this
!!! is called an "unbalanced configuration", and mt2 is easy to calculate.

```

## 9.5 Special Physics functions

Here, we declare functions that are specific for the Standard Model, including QCD: fixed and running  $\alpha_s$ , Catani-Seymour dipole terms, loop functions, etc.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

```
<sm_physics.f90>≡  
  <File header>  
  
  module sm_physics  
  
    <Use kinds with double>  
    use constants  
    use physics_defs  
    use lorentz  
  
    <Standard module head>  
  
    <SM physics: public>  
  
    <SM physics: parameters>  
  
    interface  
    <SM physics: sub interfaces>  
    end interface  
  
  end module sm_physics  
<sm_physics_sub.f90>≡  
  <File header>  
  
  submodule (sm_physics) sm_physics_s  
  
    use io_units  
    use numeric_utils  
    use diagnostics  
    use permutations, only: factorial  
  
    implicit none  
  
    contains  
  
    <SM physics: procedures>  
  
  end submodule sm_physics_s
```

### 9.5.1 Constants for Quantum Field Theory calculations

For loop calculations in quantum field theories, one needs the numerical values of the Riemann zeta function:

$$\begin{aligned}\zeta(2) &= 1.64493406684822643647241516665\dots \\ \zeta(3) &= 1.20205690315959428539973816151\dots \\ \zeta(4) &= 1.08232323371113819151600369654\dots \\ \zeta(5) &= 1.03692775514336992633136548646\dots\end{aligned}$$

```
<SM physics: public>≡
  public :: zeta2, zeta3, zeta4, zeta5

<SM physics: parameters>≡
  real(default), parameter :: &
  zeta2 = 1.64493406684822643647241516665_default, &
  zeta3 = 1.20205690315959428539973816151_default, &
  zeta4 = 1.08232323371113819151600369654_default, &
  zeta5 = 1.03692775514336992633136548646_default
```

The Euler-Mascheroni constant is

$$\gamma_E =$$

```
<SM physics: public>+≡
  public :: eulerc

<SM physics: parameters>+≡
  real(default), parameter :: &
  eulerc = 0.5772156649015328606065120900824024310422_default
```

### 9.5.2 Running $\alpha_s$

Then we define the coefficients of the beta function of QCD (as a reference cf. the Particle Data Group), where  $n_f$  is the number of active flavors in two different schemes:

$$\beta_0 = 11 - \frac{2}{3}n_f \quad (9.5)$$

$$\beta_1 = 51 - \frac{19}{3}n_f \quad (9.6)$$

$$\beta_2 = 2857 - \frac{5033}{9}n_f + \frac{325}{27}n_f^2 \quad (9.7)$$

$$b_0 = \frac{1}{12\pi} (11C_A - 2n_f) \quad (9.8)$$

$$b_1 = \frac{1}{24\pi^2} (17C_A^2 - 5C_A n_f - 3C_F n_f) \quad (9.9)$$

$$b_2 = \frac{1}{(4\pi)^3} \left( \frac{2857}{54} C_A^3 - \frac{1415}{54} C_A^2 n_f - \frac{205}{18} C_A C_F n_f + C_F^2 n_f + \frac{79}{54} C_A n_f^{**2} + \frac{11}{9} C_F n_f^{**2} \right) \quad (9.10)$$

The functions `sumQ2q` and `sumQ4q` provide the sum of the squared and quartic electric charges of a number `nf` of active quark flavors.

```

### 9.5.3 Catani-Seymour Parameters

These are fundamental constants of the Catani-Seymour dipole formalism. Since the corresponding parameters for the gluon case depend on the number of flavors which is treated as an argument, there we do have functions and not parameters.

$$\gamma_q = \gamma_{\bar{q}} = \frac{3}{2}C_F \quad \gamma_g = \frac{11}{6}C_A - \frac{2}{3}T_R N_f \quad (9.11)$$

$$K_q = K_{\bar{q}} = \left(\frac{7}{2} - \frac{\pi^2}{6}\right) C_F \quad K_g = \left(\frac{67}{18} - \frac{\pi^2}{6}\right) C_A - \frac{10}{9}T_R N_f \quad (9.12)$$

*<SM physics: parameters>+≡*

#### 9.5.4 Mathematical Functions

The dilogarithm. This simplified version is bound to double precision, and restricted to argument values less or equal to unity, so we do not need complex algebra. The wrapper converts it to default precision (which is, of course, a no-op if double=default).

The routine calculates the dilogarithm through mapping on the area where there is a quickly convergent series (adapted from an F77 routine by Hans Kuijf, 1988): Map  $x$  such that  $x$  is not in the neighbourhood of 1. Note that  $|z| = -\ln(1-x)$  is always smaller than 1.10, but  $\frac{1 \cdot 10^{19}}{19!} \text{Bernoulli}_{19} = 2.7 \times 10^{-15}$ .

  end function run_bb

```

### 9.5.7 Functions for Catani-Seymour dipoles

For the automated Catani-Seymour dipole subtraction, we need the following functions.

```

<SM physics: public>+≡
  public :: ff_dipole

<SM physics: sub interfaces>+≡
  pure module subroutine ff_dipole (v_ijk, y_ijk, p_ij, pp_k, p_i, p_j, p_k)
    type(vector4_t), intent(in) :: p_i, p_j, p_k
    type(vector4_t), intent(out) :: p_ij, pp_k
    real(default), intent(out) :: y_ijk
    real(default), intent(out) :: v_ijk
  end subroutine ff_dipole

<SM physics: procedures>+≡
  pure module subroutine ff_dipole (v_ijk, y_ijk, p_ij, pp_k, p_i, p_j, p_k)
    type(vector4_t), intent(in) :: p_i, p_j, p_k
    type(vector4_t), intent(out) :: p_ij, pp_k
    real(default), intent(out) :: y_ijk

```

```

real(default) :: z_i
real(default), intent(out) :: v_ijk
z_i = (p_i*p_k) / ((p_k*p_j) + (p_k*p_i))
y_ijk = (p_i*p_j) / ((p_i*p_j) + (p_i*p_k) + (p_j*p_k))
p_ij = p_i + p_j - y_ijk/(1.0_default - y_ijk) * p_k
pp_k = (1.0/(1.0_default - y_ijk)) * p_k
!!! We don't multiply by alpha_s right here:
v_ijk = 8.0_default * PI * CF * &
(2.0 / (1.0 - z_i*(1.0 - y_ijk)) - (1.0 + z_i))
end subroutine ff_dipole

```

*<SM physics: public>+≡*

end subroutine ii_dipole

```

### 9.5.8 Distributions for integrated dipoles and such

Note that the following formulae are only meaningful for  $0 \leq x \leq 1$ .

The Dirac delta distribution, modified for Monte-Carlo sampling, centered at  $x = 1 - \frac{\epsilon}{2}$ :

```

<SM physics: public>+≡
public :: delta

<SM physics: sub interfaces>+≡
elemental module function delta (x,eps) result (z)
real(default), intent(in) :: x, eps
real(default) :: z
end function delta

<SM physics: procedures>+≡
elemental module function delta (x,eps) result (z)
real(default), intent(in) :: x, eps
real(default) :: z
if (x > one - eps) then
z = one / eps
else
z = 0
end if
end function delta

```

The  $+$ -distribution,  $P_+(x) = \left(\frac{1}{1-x}\right)_+$ , for the regularization of soft-collinear singularities. The constant part for the Monte-Carlo sampling is the integral over the splitting function divided by the weight for the WHIZARD numerical integration over the interval.

```

<SM physics: public>+≡
public :: plus_distr

<SM physics: sub interfaces>+≡
elemental module function plus_distr (x,eps) result (plusd)
real(default), intent(in) :: x, eps
real(default) :: plusd
end function plus_distr

```

```

⟨SM physics: procedures⟩+≡
  elemental module function plus_distr (x,eps) result (plusd)
    real(default), intent(in) :: x, eps
    real(default) :: plusd
    if (x > one - eps) then
      plusd = log(eps) / eps
    else
      plusd = one / (one - x)
    end if
  end function plus_distr

```

The splitting function in  $D = 4$  dimensions, regularized as +-distributions if necessary:

$$P^{qq}(x) = P^{\bar{q}\bar{q}}(x) = C_F \cdot \left( \frac{1+x^2}{1-x} \right)_+ \quad (9.15)$$

$$P^{qg}(x) = P^{\bar{q}g}(x) = C_F \cdot \frac{1+(1-x)^2}{x} \quad (9.16)$$

$$P^{gq}(x) = P^{g\bar{q}}(x) = T_R \cdot [x^2 + (1-x)^2] \quad (9.17)$$

$$\begin{aligned}
P^{gg}(x) = 2C_A \left[ \left( \frac{1}{1-x} \right)_+ + \frac{1-x}{x} - 1 + x(1-x) \right] \\
+ \delta(1-x) \left( \frac{11}{6}C_A - \frac{2}{3}N_f T_R \right)
\end{aligned} \quad (9.18)$$

Since the number of flavors summed over in the gluon splitting function might depend on the physics case under consideration, it is implemented as an input variable.

```

⟨SM physics: public⟩+≡
  public :: pqq

⟨SM physics: sub interfaces⟩+≡
  elemental module function pqq (x,eps) result (pqqx)
    real(default), intent(in) :: x, eps
    real(default) :: pqqx
  end function pqq

⟨SM physics: procedures⟩+≡
  elemental module function pqq (x,eps) result (pqqx)
    real(default), intent(in) :: x, eps
    real(default) :: pqqx
    if (x > (1.0_default - eps)) then
      pqqx = (eps - one) / two + two * log(eps) / eps - &
        three * (eps - one) / eps / two
    else
      pqqx = (one + x**2) / (one - x)
    end if
    pqqx = CF * pqqx
  end function pqq

⟨SM physics: public⟩+≡
  public :: pgq

```

```

⟨SM physics: sub interfaces⟩+≡
  elemental module function pgq (x) result (pgqx)
    real(default), intent(in) :: x
    real(default) :: pgqx
  end function pgq

⟨SM physics: procedures⟩+≡
  elemental module function pgq (x) result (pgqx)
    real(default), intent(in) :: x
    real(default) :: pgqx
    pgqx = TR * (x**2 + (one - x)**2)
  end function pgq

⟨SM physics: public⟩+≡
  public :: pgq

⟨SM physics: sub interfaces⟩+≡
  elemental module function pqg (x) result (pqgx)
    real(default), intent(in) :: x
    real(default) :: pqgx
  end function pqg

⟨SM physics: procedures⟩+≡
  elemental module function pqg (x) result (pqgx)
    real(default), intent(in) :: x
    real(default) :: pqgx
    pqgx = CF * (one + (one - x)**2) / x
  end function pqg

⟨SM physics: public⟩+≡
  public :: pqg

⟨SM physics: sub interfaces⟩+≡
  elemental module function pgg (x, nf, eps) result (pggx)
    real(default), intent(in) :: x, nf, eps
    real(default) :: pggx
  end function pgg

⟨SM physics: procedures⟩+≡
  elemental module function pgg (x, nf, eps) result (pggx)
    real(default), intent(in) :: x, nf, eps
    real(default) :: pggx
    pggx = two * CA * ( plus_distr (x, eps) + (one-x)/x - one + &
      x*(one-x)) + delta (x, eps) * gamma_g(nf)
  end function pgg

```

For the  $qq$  and  $gg$  cases, there exist “regularized” versions of the splitting functions:

$$P_{\text{reg}}^{qq}(x) = -C_F \cdot (1 + x) \quad (9.19)$$

$$P_{\text{reg}}^{gg}(x) = 2C_A \left[ \frac{1-x}{x} - 1 + x(1-x) \right] \quad (9.20)$$

```

⟨SM physics: public⟩+≡
  public :: pqq_reg

```

```

⟨SM physics: sub interfaces⟩+≡
  elemental module function pqq_reg (x) result (pqgregx)
    real(default), intent(in) :: x
    real(default) :: pqgregx
  end function pqq_reg

⟨SM physics: procedures⟩+≡
  elemental module function pqq_reg (x) result (pqgregx)
    real(default), intent(in) :: x
    real(default) :: pqgregx
    pqgregx = - CF * (one + x)
  end function pqq_reg

⟨SM physics: public⟩+≡
  public :: pgg_reg

⟨SM physics: sub interfaces⟩+≡
  elemental module function pgg_reg (x) result (pggregx)
    real(default), intent(in) :: x
    real(default) :: pggregx
  end function pgg_reg

⟨SM physics: procedures⟩+≡
  elemental module function pgg_reg (x) result (pggregx)
    real(default), intent(in) :: x
    real(default) :: pggregx
    pggregx = two * CA * ((one - x)/x - one + x*(one - x))
  end function pgg_reg

```

Here, we collect the expressions needed for integrated Catani-Seymour dipoles, and the so-called flavor kernels. We always distinguish between the “ordinary” Catani-Seymour version, and the one including a phase-space slicing parameter,  $\alpha$ .

The standard flavor kernels  $\overline{K}^{ab}$  are:

$$\overline{K}^{qg}(x) = \overline{K}^{\bar{q}g}(x) = P^{qg}(x) \log((1-x)/x) + CF \times x \quad (9.21)$$

$$\overline{K}^{gq}(x) = \overline{K}^{g\bar{q}}(x) = P^{gq}(x) \log((1-x)/x) + TR \times 2x(1-x) \quad (9.22)$$

$$\begin{aligned} \overline{K}^{qq} = C_F \left[ \left( \frac{2}{1-x} \log \frac{1-x}{x} \right)_+ - (1+x) \log((1-x)/x) + (1-x) \right] \\ - (5 - \pi^2) \cdot C_F \cdot \delta(1-x) \end{aligned} \quad (9.23)$$

$$\begin{aligned} \overline{K}^{gg} = 2C_A \left[ \left( \frac{1}{1-x} \log \frac{1-x}{x} \right)_+ + \left( \frac{1-x}{x} - 1 + x(1-x) \right) \log((1-x)/x) \right] \\ - \delta(1-x) \left[ \left( \frac{50}{9} - \pi^2 \right) C_A - \frac{16}{9} T_R N_f \right] \end{aligned} \quad (9.24)$$

```

```

This is a logarithmic +-distribution,  $\left(\frac{\log((1-x)/x)}{1-x}\right)_+$ . For the sampling, we need the integral over this function over the incomplete sampling interval  $[0, 1 - \epsilon]$ , which is  $\log^2(x) + 2Li_2(x) - \frac{\pi^2}{3}$ . As this function is negative definite for  $\epsilon > 0.1816$ , we take a hard upper limit for that sampling parameter, irrespective of the fact what the user chooses.

### 9.5.9 Splitting Functions

Analogue to the regularized distributions of the last subsection, we give here the unregularized splitting functions, relevant for the parton shower algorithm. We can use this unregularized version since there will be a cut-off  $\epsilon$  that ensures that  $\{z, 1-z\} > \epsilon(t)$ . This cut-off separates resolvable from unresolvable emissions.

$p_{xxx}$  are the kernels that are summed over helicity:

```

⟨SM physics: public⟩+≡
  public :: p_qqg
  public :: p_gqq
  public :: p_ggg

q → qq

⟨SM physics: sub interfaces⟩+≡
  elemental module function p_qqg (z) result (P)

```

```

    real(default), intent(in) :: z
    real(default) :: P
    end function p_qqg
<SM physics: procedures>+≡
    elemental module function p_qqg (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = CF * (one + z**2) / (one - z)
    end function p_qqg

g → q $\bar{q}$ 
<SM physics: sub interfaces>+≡
    elemental module function p_gqq (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    end function p_gqq
<SM physics: procedures>+≡
    elemental module function p_gqq (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = TR * (z**2 + (one - z)**2)
    end function p_gqq

g → gg
<SM physics: sub interfaces>+≡
    elemental module function p_ggg (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    end function p_ggg
<SM physics: procedures>+≡
    elemental module function p_ggg (z) result (P)
    real(default), intent(in) :: z
    real(default) :: P
    P = NC * ((one - z) / z + z / (one - z) + z * (one - z))
    end function p_ggg

Analytically integrated splitting kernels:
<SM physics: public>+≡
    public :: integral_over_p_qqg
    public :: integral_over_p_gqq
    public :: integral_over_p_ggg
<SM physics: sub interfaces>+≡
    pure module function integral_over_p_qqg (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax
    real(default) :: integral
    end function integral_over_p_qqg
    pure module function integral_over_p_gqq (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax
    real(default) :: integral
    end function integral_over_p_gqq
    pure module function integral_over_p_ggg (zmin, zmax) result (integral)
    real(default), intent(in) :: zmin, zmax

```

```

real(default) :: integral
end function integral_over_p_ggg

<SM physics: procedures>+≡
pure module function integral_over_p_qqg (zmin, zmax) result (integral)
real(default), intent(in) :: zmin, zmax
real(default) :: integral
integral = (two / three) * (- zmax**2 + zmin**2 - &
two * (zmax - zmin) + four * log((one - zmin) / (one - zmax)))
end function integral_over_p_qqg

pure module function integral_over_p_gqq (zmin, zmax) result (integral)
real(default), intent(in) :: zmin, zmax
real(default) :: integral
integral = 0.5_default * ((two / three) * &
(zmax**3 - zmin**3) - (zmax**2 - zmin**2) + (zmax - zmin))
end function integral_over_p_gqq

pure module function integral_over_p_ggg (zmin, zmax) result (integral)
real(default), intent(in) :: zmin, zmax
real(default) :: integral
integral = three * ((log(zmax) - two * zmax - &
log(one - zmax) + zmax**2 / two - zmax**3 / three) - &
(log(zmin) - zmin - zmin - log(one - zmin) + zmin**2 &
/ two - zmin**3 / three) )
end function integral_over_p_ggg

```

We can also use (massless) helicity dependent splitting functions:

```

<SM physics: public>+≡
public :: p_qqg_pol

 $q_a \rightarrow q_b g_c$ , the helicity of the quark is not changed by gluon emission and the
gluon is preferably polarized in the branching plane ( $l_c = 1$ ):

<SM physics: sub interfaces>+≡
elemental module function p_qqg_pol (z, l_a, l_b, l_c) result (P)
real(default), intent(in) :: z
integer, intent(in) :: l_a, l_b, l_c
real(default) :: P
end function p_qqg_pol

<SM physics: procedures>+≡
elemental module function p_qqg_pol (z, l_a, l_b, l_c) result (P)
real(default), intent(in) :: z
integer, intent(in) :: l_a, l_b, l_c
real(default) :: P
if (l_a /= l_b) then
P = zero
return
end if
if (l_c == -1) then
P = one - z
else
P = (one + z)**2 / (one - z)
end if
P = P * CF

```

```
end function p_qqg_pol
```

### Mellin transforms of splitting functions

As Mellin transforms necessarily live in the complex plane, all functions are defined as complex functions: Splitting function  $P_{qq}(N)$ :

```
<SM physics: public>+≡
  public :: pqqm

<SM physics: sub interfaces>+≡
  module function pqqm (n, c_f) result (pqq_m)
    integer, intent(in) :: n
    real(default), intent(in) :: c_f
    complex(default) :: pqq_m
  end function pqqm

<SM physics: procedures>+≡
  module function pqqm (n, c_f) result (pqq_m)
    integer, intent(in) :: n
    real(default), intent(in) :: c_f
    complex(default) :: pqq_m
    pqq_m = three - four * (eulerc + &
      psic(cmplx(N+1,zero,kind=default))) + two/N/(N+1)
  end function pqqm
```

### 9.5.10 Top width

In order to produce sensible results, the widths have to be recomputed for each parameter and order. We start with the LO-expression for the top width given by the decay  $t \rightarrow W^+, b$ , cf. doi:10.1016/0550-3213(91)90530-B:

The analytic formula given there is

$$\Gamma = \frac{G_F m_t^2}{16\sqrt{2}\pi} \left[ \mathcal{F}_0(\varepsilon, \xi^{-1/2}) - \frac{2\alpha_s}{3\pi} \mathcal{F}_1(\varepsilon, \xi^{-1/2}) \right],$$

with

$$\begin{aligned} \mathcal{F}_0 &= \frac{\sqrt{\lambda}}{2} f_0, \\ f_0 &= 4 \left[ (1 - \varepsilon^2)^2 + w^2(1 + \varepsilon^2) - 2w^4 \right], \\ \lambda &= 1 + w^4 + \varepsilon^4 - 2(w^2 + \varepsilon^2 + w^2\varepsilon^2). \end{aligned}$$

Defining

$$u_q = \frac{1 + \varepsilon^2 - w^2 - \lambda^{1/2}}{1 + \varepsilon^2 - w^2 + \lambda^{1/2}}$$

and

$$u_w = \frac{1 - \varepsilon^2 + w^2 - \lambda^{1/2}}{1 - \varepsilon^2 + w^2 + \lambda^{1/2}}$$

the factor  $\mathcal{F}_1$  can be expressed as

$$\begin{aligned}\mathcal{F}_1 = & \frac{1}{2}f_0(1 + \varepsilon^2 - w^2) \left[ \pi^2 + 2Li_2(u_w) - 2Li_2(1 - u_w) - 4Li_2(u_q) \right. \\ & - 4Li_2(u_q u_w) + \log\left(\frac{1 - u_q}{w^2}\right) \log(1 - u_q) - \log^2(1 - u_q u_w) \\ & + \frac{1}{4} \log^2\left(\frac{w^2}{u_w}\right) - \log(u_w) \log\left[\frac{(1 - u_q u_w)^2}{1 - u_q}\right] - 2 \log(u_q) \log[(1 - u_q)(1 - u_q u_w)] \left. \right] \\ & - \sqrt{\lambda} f_0 (2 \log(w) + 3 \log(\varepsilon) - 2 \log \lambda) \\ & + 4(1 - \varepsilon^2) [(1 - \varepsilon^2)^2 + w^2(1 + \varepsilon^2) - 4w^4] \log(u_w) \\ & [(3 - \varepsilon^2 + 11\varepsilon^4 - \varepsilon^6) + w^2(6 - 12\varepsilon^2 + 2\varepsilon^4) - w^4(21 + 5\varepsilon^2) + 12w^6] \log(u_q) \\ & 6\sqrt{\lambda}(1 - \varepsilon^2)(1 + \varepsilon^2 - w^2) \log(\varepsilon) + \sqrt{\lambda} [-5 + 22\varepsilon^2 - 5\varepsilon^4 - 9w^2(1 + \varepsilon^2) + 6w^4] .\end{aligned}$$

## 9.6 QCD Coupling

We provide various distinct implementations of the QCD coupling. In this module, we define an abstract data type and three implementations: fixed, running with  $\alpha_s(M_Z)$  as input, and running with  $\Lambda_{\text{QCD}}$  as input. We use the functions defined above in the module `sm_physics` but provide a common interface. Later modules may define additional implementations.

```
<sm_qcd.f90>≡  
  <File header>  
  
  module sm_qcd  
  
    <Use kinds>  
    use physics_defs  
  
    <Standard module head>  
  
    <SM qcd: public>  
  
    <SM qcd: types>  
  
    <SM qcd: interfaces>  
  
    interface  
      <SM qcd: sub interfaces>  
    end interface  
  
  end module sm_qcd  
<sm_qcd_sub.f90>≡  
  <File header>  
  
  submodule (sm_qcd) sm_qcd_s  
  
    use io_units  
    use format_defs, only: FMT_12  
    use numeric_utils  
    use diagnostics  
    use md5  
    use sm_physics  
  
    implicit none  
  
    contains  
  
    <SM qcd: procedures>  
  
  end submodule sm_qcd_s
```

### 9.6.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

```
<SM qcd: public>≡
```

```

    public :: alpha_qcd_t
  <SM qcd: types>≡
    type, abstract :: alpha_qcd_t
    contains
    <SM qcd: alpha qcd: TBP>
  end type alpha_qcd_t

```

There must be an output routine.

```

  <SM qcd: alpha qcd: TBP>≡
    procedure (alpha_qcd_write), deferred :: write

  <SM qcd: interfaces>≡
    abstract interface
    subroutine alpha_qcd_write (object, unit)
    import
    class(alpha_qcd_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine alpha_qcd_write
  end interface

```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

```

  <SM qcd: alpha qcd: TBP>+≡
    procedure (alpha_qcd_get), deferred :: get

  <SM qcd: interfaces>+≡
    abstract interface
    function alpha_qcd_get (alpha_qcd, scale) result (alpha)
    import
    class(alpha_qcd_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    end function alpha_qcd_get
  end interface

```

## 9.6.2 Fixed Coupling

In this version, the  $\alpha_s$  value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. By default, this is the value at  $M_Z$ .

```

  <SM qcd: public>+≡
    public :: alpha_qcd_fixed_t

  <SM qcd: types>+≡
    type, extends (alpha_qcd_t) :: alpha_qcd_fixed_t
    real(default) :: val = ALPHA_QCD_MZ_REF
    contains
    <SM qcd: alpha qcd fixed: TBP>
  end type alpha_qcd_fixed_t

```

Output.

```

⟨SM qcd: alpha qcd fixed: TBP⟩≡
  procedure :: write => alpha_qcd_fixed_write

⟨SM qcd: sub interfaces⟩≡
  module subroutine alpha_qcd_fixed_write (object, unit)
    class(alpha_qcd_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine alpha_qcd_fixed_write

⟨SM qcd: procedures⟩≡
  module subroutine alpha_qcd_fixed_write (object, unit)
    class(alpha_qcd_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(3x,A)") "QCD parameters (fixed coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "alpha = ", object%val
  end subroutine alpha_qcd_fixed_write

```

Calculation: the scale is ignored in this case.

```

⟨SM qcd: alpha qcd fixed: TBP⟩+≡
  procedure :: get => alpha_qcd_fixed_get

⟨SM qcd: sub interfaces⟩+≡
  module function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
  end function alpha_qcd_fixed_get

⟨SM qcd: procedures⟩+≡
  module function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = alpha_qcd%val
  end function alpha_qcd_fixed_get

```

### 9.6.3 Running Coupling

In this version, the  $\alpha_s$  value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default:  $M_Z$ ), the value of  $\alpha_s$  at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

```

⟨SM qcd: public⟩+≡
  public :: alpha_qcd_from_scale_t

⟨SM qcd: types⟩+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_from_scale_t
  real(default) :: mu_ref = MZ_REF
  real(default) :: ref = ALPHA_QCD_MZ_REF
  integer :: order = 0
  integer :: nf = 5

```

```
contains
<SM qcd: alpha qcd from scale: TBP>
end type alpha_qcd_from_scale_t
```

Output.

```
<SM qcd: alpha qcd from scale: TBP>≡
  procedure :: write => alpha_qcd_from_scale_write
<SM qcd: sub interfaces>+≡
  module subroutine alpha_qcd_from_scale_write (object, unit)
    class(alpha_qcd_from_scale_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine alpha_qcd_from_scale_write
<SM qcd: procedures>+≡
  module subroutine alpha_qcd_from_scale_write (object, unit)
    class(alpha_qcd_from_scale_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(3x,A)") "QCD parameters (running coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "Scale mu = ", object%mu_ref
    write (u, "(5x,A," // FMT_12 // ")") "alpha(mu) = ", object%ref
    write (u, "(5x,A,I0)") "LL order = ", object%order
    write (u, "(5x,A,I0)") "N(flv) = ", object%nf
    end subroutine alpha_qcd_from_scale_write
```

Calculation: here, we call the function for running  $\alpha_s$  that was defined in `sm_physics` above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the  $Z$  boson mass.

```
<SM qcd: alpha qcd from scale: TBP>+≡
  procedure :: get => alpha_qcd_from_scale_get
<SM qcd: sub interfaces>+≡
  module function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    end function alpha_qcd_from_scale_get
<SM qcd: procedures>+≡
  module function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = running_as (scale, alpha_qcd%ref, alpha_qcd%mu_ref, &
      alpha_qcd%order, real (alpha_qcd%nf, kind=default))
    end function alpha_qcd_from_scale_get
```

#### 9.6.4 Running Coupling, determined by $\Lambda_{\text{QCD}}$

In this version, the inputs are the value  $\Lambda_{\text{QCD}}$  and the order of the approximation.

```

⟨SM qcd: public⟩+≡
  public :: alpha_qcd_from_lambda_t

⟨SM qcd: types⟩+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_from_lambda_t
  real(default) :: lambda = LAMBDA_QCD_REF
  integer :: order = 0
  integer :: nf = 5
  contains
  ⟨SM qcd: alpha qcd from lambda: TBP⟩
  end type alpha_qcd_from_lambda_t

```

Output.

```

⟨SM qcd: alpha qcd from lambda: TBP⟩≡
  procedure :: write => alpha_qcd_from_lambda_write

⟨SM qcd: sub interfaces⟩+≡
  module subroutine alpha_qcd_from_lambda_write (object, unit)
    class(alpha_qcd_from_lambda_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine alpha_qcd_from_lambda_write

⟨SM qcd: procedures⟩+≡
  module subroutine alpha_qcd_from_lambda_write (object, unit)
    class(alpha_qcd_from_lambda_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(3x,A)") "QCD parameters (Lambda_QCD as input):"
    write (u, "(5x,A," // FMT_12 // ")") "Lambda_QCD = ", object%lambda
    write (u, "(5x,A,I0)") "LL order = ", object%order
    write (u, "(5x,A,I0)") "N(flv) = ", object%nf
    end subroutine alpha_qcd_from_lambda_write

```

Calculation: here, we call the second function for running  $\alpha_s$  that was defined in `sm_physics` above. The  $\Lambda$  value should be the one that is appropriate for the chosen number of effective flavors. Again, thresholds are not incorporated.

```

⟨SM qcd: alpha qcd from lambda: TBP⟩+≡
  procedure :: get => alpha_qcd_from_lambda_get

⟨SM qcd: sub interfaces⟩+≡
  module function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    end function alpha_qcd_from_lambda_get

⟨SM qcd: procedures⟩+≡
  module function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = running_as_lam (real (alpha_qcd%nf, kind=default), scale, &
      alpha_qcd%lambda, alpha_qcd%order)
    end function alpha_qcd_from_lambda_get

```

### 9.6.5 QCD Wrapper type

We could get along with a polymorphic QCD type, but a monomorphic wrapper type with a polymorphic component is easier to handle and probably safer (w.r.t. compiler bugs). However, we keep the object transparent, so we can set the type-specific parameters directly (by a `dispatch` routine).

```

⟨SM qcd: public⟩+≡
  public :: qcd_t

⟨SM qcd: types⟩+≡
  type :: qcd_t
  class(alpha_qcd_t), allocatable :: alpha
  character(32) :: md5sum = ""
  integer :: n_f = -1
  contains
  ⟨SM qcd: qcd: TBP⟩
  end type qcd_t

```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

```

⟨SM qcd: qcd: TBP⟩≡
  procedure :: write => qcd_write

⟨SM qcd: sub interfaces⟩+≡
  module subroutine qcd_write (qcd, unit, show_md5sum)
    class(qcd_t), intent(in) :: qcd
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_md5sum
  end subroutine qcd_write

⟨SM qcd: procedures⟩+≡
  module subroutine qcd_write (qcd, unit, show_md5sum)
    class(qcd_t), intent(in) :: qcd
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_md5sum
    logical :: show_md5
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    show_md5 = .true.; if (present (show_md5sum)) show_md5 = show_md5sum
    if (allocated (qcd%alpha)) then
      call qcd%alpha%write (u)
    else
      write (u, "(3x,A)") "QCD parameters (coupling undefined)"
    end if
    if (show_md5 .and. qcd%md5sum /= "") &
      write (u, "(5x,A,A,A)") "md5sum = '", qcd%md5sum, "'"
  end subroutine qcd_write

```

Compute an MD5 sum for the `alpha_s` setup. This is done by writing them to a temporary file, using a standard format.

```

⟨SM qcd: qcd: TBP⟩+≡
  procedure :: compute_alphas_md5sum => qcd_compute_alphas_md5sum

```

```

<SM qcd: sub interfaces>+≡
  module subroutine qcd_compute_alphas_md5sum (qcd)
    class(qcd_t), intent(inout) :: qcd
    integer :: unit
    end subroutine qcd_compute_alphas_md5sum

```

```

<SM qcd: procedures>+≡
  module subroutine qcd_compute_alphas_md5sum (qcd)
    class(qcd_t), intent(inout) :: qcd
    integer :: unit
    if (allocated (qcd%alpha)) then
      unit = free_unit ()
      open (unit, status="scratch", action="readwrite")
      call qcd%alpha%write (unit)
      rewind (unit)
      qcd%md5sum = md5sum (unit)
      close (unit)
    end if
    end subroutine qcd_compute_alphas_md5sum

```

Retrieve the MD5 sum of the qcd setup.

```

<SM qcd: qcd: TBP>+≡
  procedure :: get_md5sum => qcd_get_md5sum

<SM qcd: sub interfaces>+≡
  module function qcd_get_md5sum (qcd) result (md5sum)
    character(32) :: md5sum
    class(qcd_t), intent(inout) :: qcd
    end function qcd_get_md5sum

<SM qcd: procedures>+≡
  module function qcd_get_md5sum (qcd) result (md5sum)
    character(32) :: md5sum
    class(qcd_t), intent(inout) :: qcd
    md5sum = qcd%md5sum
    end function qcd_get_md5sum

```

### 9.6.6 Unit tests

Test module, followed by the corresponding implementation module.

```

## 9.7 QED Coupling

On the surface similar to the QCD coupling module but much simpler. Only a fixed QED coupling  $\alpha_{\text{em}}$  is allowed. Can be extended later if we want to enable a running of  $\alpha_{\text{em}}$  as well.

```
<sm_qed.f90>≡  
  <File header>  
  
  module sm_qed  
  
    <Use kinds>  
    use physics_defs  
  
    <Standard module head>  
  
    <SM qed: public>  
  
    <SM qed: types>  
  
    <SM qed: interfaces>  
  
    interface  
    <SM qed: sub interfaces>  
    end interface  
  
  end module sm_qed  
<sm_qed_sub.f90>≡  
  <File header>  
  
  submodule (sm_qed) sm_qed_s  
  
    use io_units  
    use format_defs, only: FMT_12  
    use md5  
    use sm_physics  
  
    implicit none  
  
    contains  
  
    <SM qed: procedures>  
  
  end submodule sm_qed_s
```

### 9.7.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

```
<SM qed: public>≡  
  public :: alpha_qed_t  
  
<SM qed: types>≡  
  type, abstract :: alpha_qed_t
```

```

contains
  <SM qed: alpha qed: TBP>
end type alpha_qed_t

```

There must be an output routine.

```

<SM qed: alpha qed: TBP>≡
  procedure (alpha_qed_write), deferred :: write

<SM qed: interfaces>≡
  abstract interface
    subroutine alpha_qed_write (object, unit)
    import
    class(alpha_qed_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine alpha_qed_write
end interface

```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

```

<SM qed: alpha qed: TBP>+≡
  procedure (alpha_qed_get), deferred :: get

<SM qed: interfaces>+≡
  abstract interface
    function alpha_qed_get (alpha_qed, scale) result (alpha)
    import
    class(alpha_qed_t), intent(in) :: alpha_qed
    real(default), intent(in) :: scale
    real(default) :: alpha
  end function alpha_qed_get
end interface

```

### 9.7.2 Fixed Coupling

In this version, the  $\alpha$  value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. The default depends on the electroweak scheme chosen in the model.

```

<SM qed: public>+≡
  public :: alpha_qed_fixed_t

<SM qed: types>+≡
  type, extends (alpha_qed_t) :: alpha_qed_fixed_t
  real(default) :: val = ALPHA_QED_ME_REF
  contains
    <SM qed: alpha qed fixed: TBP>
  end type alpha_qed_fixed_t

```

Output.

```

<SM qed: alpha qed fixed: TBP>≡
  procedure :: write => alpha_qed_fixed_write

```

```

⟨SM qed: sub interfaces⟩≡
  module subroutine alpha_qed_fixed_write (object, unit)
    class(alpha_qed_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine alpha_qed_fixed_write

⟨SM qed: procedures⟩≡
  module subroutine alpha_qed_fixed_write (object, unit)
    class(alpha_qed_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(3x,A)") "QED parameters (fixed coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "alpha = ", object%val
  end subroutine alpha_qed_fixed_write

```

Calculation: the scale is ignored in this case.

```

⟨SM qed: alpha qed fixed: TBP⟩+≡
  procedure :: get => alpha_qed_fixed_get

⟨SM qed: sub interfaces⟩+≡
  module function alpha_qed_fixed_get (alpha_qed, scale) result (alpha)
    class(alpha_qed_fixed_t), intent(in) :: alpha_qed
    real(default), intent(in) :: scale
    real(default) :: alpha
  end function alpha_qed_fixed_get

⟨SM qed: procedures⟩+≡
  module function alpha_qed_fixed_get (alpha_qed, scale) result (alpha)
    class(alpha_qed_fixed_t), intent(in) :: alpha_qed
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = alpha_qed%val
  end function alpha_qed_fixed_get

```

### 9.7.3 Running Coupling

In this version, the  $\alpha$  value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default:  $M_Z$ ), the value of  $\alpha$  at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

```

⟨SM qed: public⟩+≡
  public :: alpha_qed_from_scale_t

⟨SM qed: types⟩+≡
  type, extends (alpha_qed_t) :: alpha_qed_from_scale_t
  real(default) :: mu_ref = ME_REF
  real(default) :: ref = ALPHA_QED_ME_REF
  integer :: order = 0
  integer :: nf = 5
  integer :: nlep = 1
  logical :: analytic = .true.
  contains

```

```

<SM qed: alpha qed from scale: TBP>
end type alpha_qed_from_scale_t

```

Output.

```

<SM qed: alpha qed from scale: TBP>≡
  procedure :: write => alpha_qed_from_scale_write
<SM qed: sub interfaces>+≡
  module subroutine alpha_qed_from_scale_write (object, unit)
    class(alpha_qed_from_scale_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine alpha_qed_from_scale_write
<SM qed: procedures>+≡
  module subroutine alpha_qed_from_scale_write (object, unit)
    class(alpha_qed_from_scale_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(3x,A)") "QED parameters (running coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "Scale mu = ", object%mu_ref
    write (u, "(5x,A," // FMT_12 // ")") "alpha(mu) = ", object%ref
    write (u, "(5x,A,I0)") "LL order = ", object%order
    write (u, "(5x,A,I0)") "N(flv) = ", object%nf
    write (u, "(5x,A,I0)") "N(lep) = ", object%nlep
    write (u, "(5x,A,L1)") "analytic = ", object%analytic
    end subroutine alpha_qed_from_scale_write

```

Calculation: here, we call the function for running  $\alpha_s$  that was defined in `sm_physics` above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the  $Z$  boson mass.

```

<SM qed: alpha qed from scale: TBP>+≡
  procedure :: get => alpha_qed_from_scale_get
<SM qed: sub interfaces>+≡
  module function alpha_qed_from_scale_get (alpha_qed, scale) result (alpha)
    class(alpha_qed_from_scale_t), intent(in) :: alpha_qed
    real(default), intent(in) :: scale
    real(default) :: alpha
    end function alpha_qed_from_scale_get
<SM qed: procedures>+≡
  module function alpha_qed_from_scale_get (alpha_qed, scale) result (alpha)
    class(alpha_qed_from_scale_t), intent(in) :: alpha_qed
    real(default), intent(in) :: scale
    real(default) :: alpha
    if (alpha_qed%analytic) then
      alpha = running_alpha (scale, alpha_qed%ref, alpha_qed%mu_ref, &
        alpha_qed%order, alpha_qed%nf, alpha_qed%nlep)
    else
      alpha = running_alpha_num (scale, alpha_qed%ref, alpha_qed%mu_ref, &
        alpha_qed%order, alpha_qed%nf, alpha_qed%nlep)
    end if
    end function alpha_qed_from_scale_get

```

### 9.7.4 QED type

This module is similar to `qcd_t`, defining the type `qed_t`. It stores the `alpha_qed_t` type which is either constant or a running  $\alpha$  with different options.

```

<SM qed: public>+≡
  public :: qed_t

<SM qed: types>+≡
  type :: qed_t
  class(alpha_qed_t), allocatable :: alpha
  character(32) :: md5sum = ""
  integer :: n_f = -1
  integer :: n_lep = -1
  contains
  <SM qed: qed: TBP>
  end type qed_t

```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

```

<SM qed: qed: TBP>≡
  procedure :: write => qed_write

<SM qed: sub interfaces>+≡
  module subroutine qed_write (qed, unit, show_md5sum)
    class(qed_t), intent(in) :: qed
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_md5sum
  end subroutine qed_write

<SM qed: procedures>+≡
  module subroutine qed_write (qed, unit, show_md5sum)
    class(qed_t), intent(in) :: qed
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_md5sum
    logical :: show_md5
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    show_md5 = .true.; if (present (show_md5sum)) show_md5 = show_md5sum
    if (allocated (qed%alpha)) then
      call qed%alpha%write (u)
    else
      write (u, "(3x,A)") "QED parameters (coupling undefined)"
    end if
    if (show_md5 .and. qed%md5sum /= "") &
      write (u, "(5x,A,A,A)") "md5sum = '", qed%md5sum, "'"
  end subroutine qed_write

```

Compute an MD5 sum for the `alpha` setup. This is done by writing them to a temporary file, using a standard format.

```

<SM qed: qed: TBP>+≡
  procedure :: compute_alpha_md5sum => qed_compute_alpha_md5sum

<SM qed: sub interfaces>+≡
  module subroutine qed_compute_alpha_md5sum (qed)
    class(qed_t), intent(inout) :: qed

```

```

integer :: unit
end subroutine qed_compute_alpha_md5sum

⟨SM qed: procedures⟩+≡
module subroutine qed_compute_alpha_md5sum (qed)
class(qed_t), intent(inout) :: qed
integer :: unit
if (allocated (qed%alpha)) then
unit = free_unit ()
open (unit, status="scratch", action="readwrite")
call qed%alpha%write (unit)
rewind (unit)
qed%md5sum = md5sum (unit)
close (unit)
end if
end subroutine qed_compute_alpha_md5sum

```

Retrieve the MD5 sum of the qed setup.

```

⟨SM qed: qed: TBP⟩+≡
procedure :: get_md5sum => qed_get_md5sum

⟨SM qed: sub interfaces⟩+≡
module function qed_get_md5sum (qed) result (md5sum)
character(32) :: md5sum
class(qed_t), intent(inout) :: qed
end function qed_get_md5sum

⟨SM qed: procedures⟩+≡
module function qed_get_md5sum (qed) result (md5sum)
character(32) :: md5sum
class(qed_t), intent(inout) :: qed
md5sum = qed%md5sum
end function qed_get_md5sum

```

### 9.7.5 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨sm_qed_ut.f90⟩≡
⟨File header⟩

```

## 9.8 Shower algorithms

```

⟨shower_algorithms.f90⟩≡
  ⟨File header⟩

  module shower_algorithms

    ⟨Use kinds⟩

    ⟨Standard module head⟩

    ⟨Shower algorithms: public⟩

    ⟨Shower algorithms: interfaces⟩

    interface
      ⟨Shower algorithms: sub interfaces⟩
    end interface

  end module shower_algorithms

⟨shower_algorithms_sub.f90⟩≡
  ⟨File header⟩

  submodule (shower_algorithms) shower_algorithms_s

    use diagnostics
    use constants

    implicit none

    contains

    ⟨Shower algorithms: procedures⟩

    ⟨Shower algorithms: tests⟩

  end submodule shower_algorithms_s

```

We want to generate emission variables  $\mathbf{x} \in \mathbb{R}^d$  proportional to

$$f(x) \Delta(f, h(x)) \quad \text{with} \quad (9.32)$$

$$\Delta(f, H) = \exp \left\{ - \int d^d x' f(x') \Theta(h(x') - H) \right\} \quad (9.33)$$

The `true_function`  $f$  is however too complicated and we are only able to generate  $\mathbf{x}$  according to the `overestimator`  $F$ . This algorithm is described in Appendix B of 0709.2092 and is proven e.g. in 1211.7204 and hep-ph/0606275. Intuitively speaking, we overestimate the emission probability and can therefore set `scale_max = scale` if the emission is rejected.

```

⟨Shower algorithms: sub interfaces⟩≡

## Chapter 10

# QED Parton Distribution Functions

We start with a module that gives access to the ISR structure function:

`electron_pdfs`

### 10.1 Electron PDFs

This module contains the formulae for the numerical evaluation of different incarnations of the QED initial-state radiation (ISR) structure functions (a.k.a. electron PDFs).

```
<electron_pdfs.f90>≡  
  <File header>  
  
  module electron_pdfs  
  
    <Use kinds>  
    <electron_pdfs use>  
  
    <Standard module head>  
  
    <Electron PDFs: public>  
  
    <Electron PDFs: parameters>  
  
    <Electron PDFs: types>  
  
    interface  
      <Electron PDFs: sub interfaces>  
    end interface  
  
    contains  
  
    <Electron PDFs: main procedures>  
  
  end module electron_pdfs
```

## No internal dependencies

Figure 10.1: Module dependencies in `src/qed_pdf`.

```

<electron pdfs use>≡
  use io_units
  use sm_qed

<electron_pdfs_sub.f90>≡
  <File header>

  submodule (electron_pdfs) electron_pdfs_s

    <Use strings>
    <electron pdfs use>
    use diagnostics
    use constants
    use format_defs, only: FMT_12
    use numeric_utils
    use physics_defs
    use sm_physics

    implicit none

    contains

    <Electron PDFs: procedures>

  end submodule electron_pdfs_s

```

### 10.1.1 The physics for electron beam PDFs (structure functions)

The ISR structure function is in the most crude approximation (LLA without  $\alpha$  corrections, i.e.  $\epsilon^0$ )

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (10.1)$$

where  $m$  is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of  $\epsilon$  results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit  $m^2 \ll s$  are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \quad (10.2)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \quad (10.3)$$

so the integration over the propagator  $1/(t - m^2)$  yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \quad (10.4)$$

The structure function has three parameters:  $\alpha$ ,  $m_{\text{in}}$  of the incoming particle and  $s$ , the hard scale. Internally, we store the exponent  $\epsilon$  which is the relevant parameter. (In conventional notation,  $\epsilon = \beta/2$ .) As defaults, we take the actual values of  $\alpha$  (which is probably  $\alpha(s)$ ), the actual mass  $m_{\text{in}}$  and the squared total c.m. energy  $s$ .

Including  $\epsilon$ ,  $\epsilon^2$ , and  $\epsilon^3$  corrections, the successive approximation of the ISR structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad (10.5)$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \quad (10.6)$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left( \frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \quad (10.7)$$

$$\begin{aligned} f_3(x) = g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) & - \frac{\epsilon^2}{8} \left( \frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \\ & - \frac{\epsilon^3}{48} \left( (1+x) [6 \text{Li}_2(x) + 12 \ln^2(1-x) - 3\pi^2] + 6(x+5) \ln(1-x) \right. \\ & \quad \left. + \frac{1}{1-x} \left[ \frac{3}{2}(1+8x+3x^2) \ln x + 12(1+x^2) \ln x \ln(1-x) \right. \right. \\ & \quad \left. \left. - \frac{1}{2}(1+7x^2) \ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \right) \end{aligned} \quad (10.8)$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \quad (10.9)$$

are given by

$$g_0(\epsilon) = 1 \quad (10.10)$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \quad (10.11)$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \quad (10.12)$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 + \frac{27 - 24\pi^2 + 128\zeta(3)}{384}\epsilon^3, \quad (10.13)$$

where, numerically

$$\zeta(3) = 1.20205690315959428539973816151\dots \quad (10.14)$$

Although one could calculate the function  $g(\epsilon)$  exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx f_i(x) = 1 \quad \text{for all } i. \quad (10.15)$$

Effectively, the  $O(\epsilon)$  correction reduces the low- $x$  tail of the structure function by 50% while increasing the coefficient of the singularity by  $O(\epsilon)$ . Relative to this, the  $O(\epsilon^2)$  correction slightly enhances  $x > \frac{1}{2}$  compared to  $x < \frac{1}{2}$ . At  $x = 0$ ,  $f_2(x)$  introduces a logarithmic singularity which should be cut off at  $x_0 = O(e^{-1/\epsilon})$ : for lower  $x$  the perturbative series breaks down. The  $f_3$  correction is slightly positive for low  $x$  values and negative near  $x = 1$ , where the  $\text{Li}_2$  piece slightly softens the singularity at  $x = 1$ .

Instead of the definition for  $\epsilon$  given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left( \ln \frac{s}{m^2} - 1 \right) \quad (10.16)$$

### 10.1.2 Implementation

The basic type for lepton beam (QED) structure functions:

```

<Electron PDFs: public>≡
  public :: qed_pdf_t
<Electron PDFs: types>≡
  type :: qed_pdf_t
  private
  integer :: flv = 0

## Chapter 11

# Quantum Field Theory Concepts

The objects and methods defined here implement concepts and data for the underlying quantum field theory that we use for computing matrix elements and processes.

**model\_data** Fields and coupling parameters, operators as vertex structures, for a specific model.

**model\_testbed** Provide hooks to deal with a **model\_data** extension without referencing it explicitly.

**helicities** Types and methods for spin density matrices.

**colors** Dealing with colored particles, using the color-flow representation.

**flavors** PDG codes and particle properties, depends on the model.

**quantum\_numbers** Quantum numbers and density matrices for entangled particle systems.

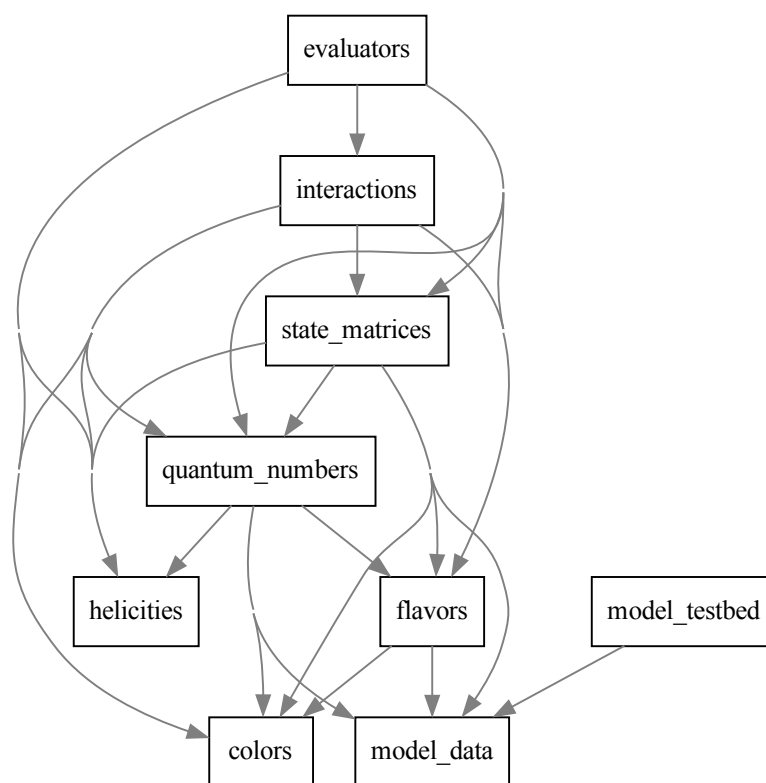

Figure 11.1: Module dependencies in `src/qft`.

## 11.1 Model Data

These data represent a specific Lagrangian in numeric terms. That is, we have the fields with their quantum numbers, the masses, widths and couplings as numerical values, and the vertices as arrays of fields.

We do not store the relations between coupling parameters. They should be represented by expressions for evaluation, implemented as Sindarin objects in a distinct data structure. Neither do we need the algebraic structure of vertices. The field content of vertices is required for the sole purpose of setting up phase space.

```

### 11.1.1 Physics Parameters

Couplings, masses, and widths are physics parameters. Each parameter has a unique name (used, essentially, for diagnostics output and debugging) and a value. The value may be a real or a complex number, so we provide two implementations of an abstract type.

```
<Model data: public>≡
  public :: modelpar_data_t

<Model data: types>≡
  type, abstract :: modelpar_data_t
  private
  type(string_t) :: name
  contains
  <Model data: par data: TBP>
  end type modelpar_data_t

  type, extends (modelpar_data_t) :: modelpar_real_t
  private
  real(default) :: value
  end type modelpar_real_t

  type, extends (modelpar_data_t) :: modelpar_complex_t
  private
  complex(default) :: value
  end type modelpar_complex_t
```

Output for diagnostics. Non-advancing.

```
<Model data: par data: TBP>≡
  procedure :: write => par_write

<Model data: sub interfaces>≡
  module subroutine par_write (par, unit)
    class(modelpar_data_t), intent(in) :: par
    integer, intent(in), optional :: unit
  end subroutine

<Model data: procedures>≡
  module subroutine par_write (par, unit)
    class(modelpar_data_t), intent(in) :: par
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A,1x,A)", advance="no") char (par%name), "= "
    select type (par)
    type is (modelpar_real_t)
    write (u, "(" // FMT_19 // ")", advance="no") par%value
    type is (modelpar_complex_t)
    write (u, "(" // FMT_19 // ",1x,'+',1x," // FMT_19 // ",1x,'I')", &
    advance="no") par%value
    end select
```

```
end subroutine par_write
```

Pretty-printed on separate line, with fixed line length

*<Model data: par data: TBP>+≡*

```
procedure :: show => par_show
```

*<Model data: sub interfaces>+≡*

```
module subroutine par_show (par, l, u)
  class(modelpar_data_t), intent(in) :: par
  integer, intent(in) :: l, u
end subroutine par_show
```

*<Model data: procedures>+≡*

```
module subroutine par_show (par, l, u)
  class(modelpar_data_t), intent(in) :: par
  integer, intent(in) :: l, u
  character(len=1) :: buffer
  buffer = par%name
  select type (par)
    type is (modelpar_real_t)
      write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")") buffer, par%value
    type is (modelpar_complex_t)
      write (u, "(4x,A,1x,'=',1x," // FMT_19 // ",1x,'+',1x," &
// FMT_19 // ",1x,'I')") buffer, par%value
  end select
end subroutine par_show
```

Initialize with name and value. The type depends on the argument type. If the type does not match, the value is converted following Fortran rules.

*<Model data: par data: TBP>+≡*

```
generic :: init => modelpar_data_init_real, modelpar_data_init_complex
procedure, private :: modelpar_data_init_real
procedure, private :: modelpar_data_init_complex
```

*<Model data: sub interfaces>+≡*

```
module subroutine modelpar_data_init_real (par, name, value)
  class(modelpar_data_t), intent(out) :: par
  type(string_t), intent(in) :: name
  real(default), intent(in) :: value
end subroutine modelpar_data_init_real
module subroutine modelpar_data_init_complex (par, name, value)
  class(modelpar_data_t), intent(out) :: par
  type(string_t), intent(in) :: name
  complex(default), intent(in) :: value
end subroutine modelpar_data_init_complex
```

*<Model data: procedures>+≡*

```
module subroutine modelpar_data_init_real (par, name, value)
  class(modelpar_data_t), intent(out) :: par
  type(string_t), intent(in) :: name
  real(default), intent(in) :: value
  par%name = name
  par = value
end subroutine modelpar_data_init_real
```

```

module subroutine modelpar_data_init_complex (par, name, value)
class(modelpar_data_t), intent(out) :: par
type(string_t), intent(in) :: name
complex(default), intent(in) :: value
par%name = name
par = value
end subroutine modelpar_data_init_complex

```

Modify the value. We assume that the parameter has been initialized. The type (real or complex) must not be changed, and the name is also fixed.

```

⟨Model data: par data: TBP⟩+≡

```

### 11.1.2 Field Data

The field-data type holds all information that pertains to a particular field (or particle) within a particular model. Information such as spin type, particle code etc. is stored within the object itself, while mass and width are associated to parameters, otherwise assumed zero.

```

<Model data: public>+≡

### 11.1.3 Vertex data

The vertex object contains an array of particle-data pointers, for which we need a separate type. (We could use the flavor type defined in another module.)

The program does not (yet?) make use of vertex definitions, so they are not stored here.

*<Model data: types>+≡*

```

type :: field_data_p

end subroutine vertex_iterator_get_next_match

```

#### 11.1.4 Vertex lookup table

The vertex lookup table is a hash table: given two particle codes, we check which codes are allowed for the third one.

The size of the hash table should be large enough that collisions are rare. We first select a size based on the number of vertices (multiplied by six because all permutations count), with some margin, and then choose the smallest integer power of two larger than this.

```

<Model data: parameters>≡
integer, parameter :: VERTEX_TABLE_SCALE_FACTOR = 60

<Model data: procedures>+≡
function vertex_table_size (n_vtx) result (n)
integer(i32) :: n
integer, intent(in) :: n_vtx
integer :: i, s
s = VERTEX_TABLE_SCALE_FACTOR * n_vtx
n = 1

```

```

do i = 1, 31
n = ishft (n, 1)
s = ishft (s,-1)
if (s == 0) exit
end do
end function vertex_table_size

```

The specific hash function takes two particle codes (arbitrary integers) and returns a 32-bit integer. It makes use of the universal function `hash` which operates on a byte array.

```

<Model data: procedures>+≡
function hash2 (pdg1, pdg2)
integer(i32) :: hash2
integer, intent(in) :: pdg1, pdg2
integer(i8), dimension(1) :: mold
hash2 = hash (transfer ([pdg1, pdg2], mold))
end function hash2

```

Each entry in the vertex table stores the two particle codes and an array of possibilities for the third code.

```

<Model data: types>+≡
type :: vertex_table_entry_t
private
integer :: pdg1 = 0, pdg2 = 0
integer :: n = 0
integer, dimension(:), allocatable :: pdg3
end type vertex_table_entry_t

```

The vertex table:

```

<Model data: types>+≡
type :: vertex_table_t
type(vertex_table_entry_t), dimension(:), allocatable :: entry
integer :: n_collisions = 0
integer(i32) :: mask
contains
<Model data: vertex table: TBP>
end type vertex_table_t

```

Output.

```

<Model data: vertex table: TBP>≡
procedure :: write => vertex_table_write

<Model data: sub interfaces>+≡
module subroutine vertex_table_write (vt, unit)
class(vertex_table_t), intent(in) :: vt
integer, intent(in), optional :: unit
end subroutine vertex_table_write

<Model data: procedures>+≡
module subroutine vertex_table_write (vt, unit)
class(vertex_table_t), intent(in) :: vt
integer, intent(in), optional :: unit

```

```

integer :: u, i
character(9) :: size_pdg3
u = given_output_unit (unit)
write (u, "(A)") "vertex hash table:"
write (u, "(A,I7)") " size = ", size (vt%entry)
write (u, "(A,I7)") " used = ", count (vt%entry%n /= 0)
write (u, "(A,I7)") " coll = ", vt%n_collisions
do i = lbound (vt%entry, 1), ubound (vt%entry, 1)
if (vt%entry(i)%n /= 0) then
write (size_pdg3, "(I7)") size (vt%entry(i)%pdg3)
write (u, "(A,1x,I7,1x,A,2(1x,I7),A," // &
size_pdg3 // "(1x,I7))") &
" ", i, ":", vt%entry(i)%pdg1, &
vt%entry(i)%pdg2, "->", vt%entry(i)%pdg3
end if
end do
end subroutine vertex_table_write

```

Initializing the vertex table: This is done in two passes. First, we scan all permutations for all vertices and count the number of entries in each bucket of the hashtable. Then, the buckets are allocated accordingly and filled.

Collision resolution is done by just incrementing the hash value until an empty bucket is found. The vertex table size is fixed, since we know from the beginning the number of entries.

```

### 11.1.5 Model Data Record

This type collects the model data as defined above.

We deliberately implement the parameter arrays as pointer arrays. We thus avoid keeping track of TARGET attributes.

The `scheme` identifier provides meta information. It doesn't give the client code an extra parameter, but it tells something about the interpretation of the parameters. If the scheme ID is left as default (zero), it is ignored.

```
<Model data: public>+≡
```

```
public :: model_data_t
```

```
<Model data: types>+≡
```

```
type :: model_data_t
private
type(string_t) :: name
integer :: scheme = 0
type(modelpar_real_t), dimension(:), pointer :: par_real => null ()
type(modelpar_complex_t), dimension(:), pointer :: par_complex => null ()
```

```

type(field_data_t), dimension(:), allocatable :: field
type(vertex_t), dimension(:), allocatable :: vtx
type(vertex_table_t) :: vt
contains
<Model data: model data: TBP>
end type model_data_t

```

Finalizer, deallocate pointer arrays.

```

<Model data: model data: TBP>≡
  procedure :: final => model_data_final

<Model data: sub interfaces>+≡
  module subroutine model_data_final (model)
    class(model_data_t), intent(inout) :: model
  end subroutine model_data_final

end subroutine model_data_init_sm_test

```

## 11.2 Model Testbed

The standard way of defining a model uses concrete variables and expressions to interpret the model file. Some of this is not available at the point of use. This is no problem for the WHIZARD program as a whole, but unit tests are kept local to their respective module and don't access all definitions.

Instead, we introduce a separate module that provides hooks, one for initializing a model and one for finalizing a model. The main program can assign real routines to the hooks (procedure pointers of abstract type) before unit tests are called. The unit tests can call the abstract routines without knowing about their implementation.

```
<model_testbed.f90>≡  
  <File header>  
  
  module model_testbed  
  
    <Use strings>  
    use model_data  
    use var_base  
  
    <Standard module head>  
  
    <Model testbed: public>  
  
    <Model testbed: variables>  
  
    <Model testbed: interfaces>  
  
  end module model_testbed
```

### 11.2.1 Abstract Model Handlers

Both routines take a polymorphic model (data) target, which is not allocated/deallocated inside the subroutine. The model constructor `prepare_model` requires the model name as input. It can, optionally, return a link to the variable list of the model.

```
<Model testbed: public>≡  
  public :: prepare_model  
  public :: cleanup_model  
  
<Model testbed: variables>≡  
  procedure (prepare_model_proc), pointer :: prepare_model => null ()  
  procedure (cleanup_model_proc), pointer :: cleanup_model => null ()  
  
<Model testbed: interfaces>≡  
  abstract interface  
    subroutine prepare_model_proc (model, name, vars)  
    import  
    class(model_data_t), intent(inout), pointer :: model  
    type(string_t), intent(in) :: name  
    class(vars_t), pointer, intent(out), optional :: vars  
  end subroutine prepare_model_proc  
  end interface
```

```
abstract interface
  subroutine cleanup_model_proc (model)
  import
  class(model_data_t), intent(inout), target :: model
  end subroutine cleanup_model_proc
end interface
```

## 11.3 Helicities

This module defines types and tools for dealing with helicity information.

```
<helicities.f90>≡  
  <File header>  
  
  module helicities  
  
    <Standard module head>  
  
    <Helicities: public>  
  
    <Helicities: types>  
  
    <Helicities: interfaces>  
  
    interface  
      <Helicities: sub interfaces>  
    end interface  
  
  end module helicities  
<helicities_sub.f90>≡  
  <File header>  
  
  submodule (helicities) helicities_s  
  
    use io_units  
  
    implicit none  
  
    contains  
  
    <Helicities: procedures>  
  
  end submodule helicities_s
```

### 11.3.1 Helicity types

Helicities may be defined or undefined, corresponding to a polarized or unpolarized state. Each helicity is actually a pair of helicities, corresponding to an entry in the spin density matrix. Obviously, diagonal entries are distinguished.

```
<Helicities: public>≡  
  public :: helicity_t  
<Helicities: types>≡  
  type :: helicity_t  
  private  
  logical :: defined = .false.  
  integer :: h1, h2  
  contains  
  <Helicities: helicity: TBP>  
  end type helicity_t
```

Constructor functions, for convenience:

```

<Helicities: public>+≡
  public :: helicity

<Helicities: interfaces>≡
  interface helicity
  module procedure helicity0, helicity1, helicity2
  end interface helicity

<Helicities: sub interfaces>≡
  pure module function helicity0 () result (hel)
  type(helicity_t) :: hel
  end function helicity0
  elemental module function helicity1 (h) result (hel)
  type(helicity_t) :: hel
  integer, intent(in) :: h
  end function helicity1
  elemental module function helicity2 (h2, h1) result (hel)
  type(helicity_t) :: hel
  integer, intent(in) :: h1, h2
  end function helicity2

<Helicities: procedures>≡
  pure module function helicity0 () result (hel)
  type(helicity_t) :: hel
  end function helicity0

  elemental module function helicity1 (h) result (hel)
  type(helicity_t) :: hel
  integer, intent(in) :: h
  call hel%init (h)
  end function helicity1

  elemental module function helicity2 (h2, h1) result (hel)
  type(helicity_t) :: hel
  integer, intent(in) :: h1, h2
  call hel%init (h2, h1)
  end function helicity2

```

Initializers.

Note: conceptually, the argument to initializers should be INTENT(OUT). However, Interp. F08/0033 prohibited this. The reason is that, in principle, the call could result in the execution of an impure finalizer for a type extension of `hel` (ugh).

```

<Helicities: helicity: TBP>≡
  generic :: init => helicity_init_empty, helicity_init_same, helicity_init_different
  procedure, private :: helicity_init_empty
  procedure, private :: helicity_init_same
  procedure, private :: helicity_init_different

<Helicities: sub interfaces>+≡
  elemental module subroutine helicity_init_empty (hel)
  class(helicity_t), intent(inout) :: hel

```

```

end subroutine helicity_init_empty
elemental module subroutine helicity_init_same (hel, h)
class(helicity_t), intent(inout) :: hel
integer, intent(in) :: h
end subroutine helicity_init_same
elemental module subroutine helicity_init_different (hel, h2, h1)
class(helicity_t), intent(inout) :: hel
integer, intent(in) :: h1, h2
end subroutine helicity_init_different

<Helicities: procedures>+≡
elemental module subroutine helicity_init_empty (hel)
class(helicity_t), intent(inout) :: hel
hel%defined = .false.
end subroutine helicity_init_empty

elemental module subroutine helicity_init_same (hel, h)
class(helicity_t), intent(inout) :: hel
integer, intent(in) :: h
hel%defined = .true.
hel%h1 = h
hel%h2 = h
end subroutine helicity_init_same

elemental module subroutine helicity_init_different (hel, h2, h1)
class(helicity_t), intent(inout) :: hel
integer, intent(in) :: h1, h2
hel%defined = .true.
hel%h2 = h2
hel%h1 = h1
end subroutine helicity_init_different

```

Undefine:

```

<Helicities: helicity: TBP>+≡
procedure :: undefine => helicity_undefine

<Helicities: sub interfaces>+≡
elemental module subroutine helicity_undefine (hel)
class(helicity_t), intent(inout) :: hel
end subroutine helicity_undefine

<Helicities: procedures>+≡
elemental module subroutine helicity_undefine (hel)
class(helicity_t), intent(inout) :: hel
hel%defined = .false.
end subroutine helicity_undefine

```

Diagonalize by removing the second entry (use with care!)

```

<Helicities: helicity: TBP>+≡
procedure :: diagonalize => helicity_diagonalize

<Helicities: sub interfaces>+≡
elemental module subroutine helicity_diagonalize (hel)
class(helicity_t), intent(inout) :: hel
end subroutine helicity_diagonalize

```

```

<Helicities: procedures>+≡
  elemental module subroutine helicity_diagonalize (hel)
    class(helicity_t), intent(inout) :: hel
    hel%h2 = hel%h1
  end subroutine helicity_diagonalize

```

Flip helicity indices by sign.

```

<Helicities: helicity: TBP>+≡
  procedure :: flip => helicity_flip

```

```

<Helicities: sub interfaces>+≡
  elemental module subroutine helicity_flip (hel)
    class(helicity_t), intent(inout) :: hel
  end subroutine helicity_flip

```

```

<Helicities: procedures>+≡
  elemental module subroutine helicity_flip (hel)
    class(helicity_t), intent(inout) :: hel
    hel%h1 = - hel%h1
    hel%h2 = - hel%h2
  end subroutine helicity_flip

```

```

<Helicities: helicity: TBP>+≡
  procedure :: get_indices => helicity_get_indices

```

```

<Helicities: sub interfaces>+≡
  module subroutine helicity_get_indices (hel, h1, h2)
    class(helicity_t), intent(in) :: hel
    integer, intent(out) :: h1, h2
  end subroutine helicity_get_indices

```

```

<Helicities: procedures>+≡
  module subroutine helicity_get_indices (hel, h1, h2)
    class(helicity_t), intent(in) :: hel
    integer, intent(out) :: h1, h2
    h1 = hel%h1; h2 = hel%h2
  end subroutine helicity_get_indices

```

Output (no linebreak). No output if undefined.

```

<Helicities: helicity: TBP>+≡
  procedure :: write => helicity_write

```

```

<Helicities: sub interfaces>+≡
  module subroutine helicity_write (hel, unit)
    class(helicity_t), intent(in) :: hel
    integer, intent(in), optional :: unit
  end subroutine helicity_write

```

```

<Helicities: procedures>+≡
  module subroutine helicity_write (hel, unit)
    class(helicity_t), intent(in) :: hel
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    if (hel%defined) then

```

```

write (u, "(A)", advance="no") "h("
write (u, "(I0)", advance="no") hel%h1
if (hel%h1 /= hel%h2) then
write (u, "(A)", advance="no") "|"
write (u, "(I0)", advance="no") hel%h2
end if
write (u, "(A)", advance="no") ")"
end if
end subroutine helicity_write

```

Binary I/O. Write contents only if defined.

*<Helicities: helicity: TBP>+≡*

```

procedure :: write_raw => helicity_write_raw
procedure :: read_raw => helicity_read_raw

```

*<Helicities: sub interfaces>+≡*

```

module subroutine helicity_write_raw (hel, u)
class(helicity_t), intent(in) :: hel
integer, intent(in) :: u
end subroutine helicity_write_raw
module subroutine helicity_read_raw (hel, u, iostat)
class(helicity_t), intent(out) :: hel
integer, intent(in) :: u
integer, intent(out), optional :: iostat
end subroutine helicity_read_raw

```

*<Helicities: procedures>+≡*

```

module subroutine helicity_write_raw (hel, u)
class(helicity_t), intent(in) :: hel
integer, intent(in) :: u
write (u) hel%defined
if (hel%defined) then
write (u) hel%h1, hel%h2
end if
end subroutine helicity_write_raw

module subroutine helicity_read_raw (hel, u, iostat)
class(helicity_t), intent(out) :: hel
integer, intent(in) :: u
integer, intent(out), optional :: iostat
read (u, iostat=iostat) hel%defined
if (hel%defined) then
read (u, iostat=iostat) hel%h1, hel%h2
end if
end subroutine helicity_read_raw

```

### 11.3.2 Predicates

Check if the helicity is defined:

*<Helicities: helicity: TBP>+≡*

```

procedure :: is_defined => helicity_is_defined

```

```

<Helicities: sub interfaces>+≡
  elemental module function helicity_is_defined (hel) result (defined)
  logical :: defined
  class(helicity_t), intent(in) :: hel
  end function helicity_is_defined

```

```

<Helicities: procedures>+≡
  elemental module function helicity_is_defined (hel) result (defined)
  logical :: defined
  class(helicity_t), intent(in) :: hel
  defined = hel%defined
  end function helicity_is_defined

```

Return true if the two helicities are equal or the particle is unpolarized:

```

<Helicities: helicity: TBP>+≡
  procedure :: is_diagonal => helicity_is_diagonal

<Helicities: sub interfaces>+≡
  elemental module function helicity_is_diagonal (hel) result (diagonal)
  logical :: diagonal
  class(helicity_t), intent(in) :: hel
  end function helicity_is_diagonal

<Helicities: procedures>+≡
  elemental module function helicity_is_diagonal (hel) result (diagonal)
  logical :: diagonal
  class(helicity_t), intent(in) :: hel
  if (hel%defined) then
    diagonal = hel%h1 == hel%h2
  else
    diagonal = .true.
  end if
  end function helicity_is_diagonal

```

### 11.3.3 Accessing contents

This returns a two-element array and thus cannot be elemental. The result is unpredictable if the helicity is undefined.

```

<Helicities: helicity: TBP>+≡
  procedure :: to_pair => helicity_to_pair

<Helicities: sub interfaces>+≡
  pure module function helicity_to_pair (hel) result (h)
  integer, dimension(2) :: h
  class(helicity_t), intent(in) :: hel
  end function helicity_to_pair

<Helicities: procedures>+≡
  pure module function helicity_to_pair (hel) result (h)
  integer, dimension(2) :: h
  class(helicity_t), intent(in) :: hel
  h(1) = hel%h2
  h(2) = hel%h1
  end function helicity_to_pair

```

### 11.3.4 Comparisons

When comparing helicities, if either one is undefined, they are considered to match. In other words, an unpolarized particle matches any polarization. In the `dmatch` variant, it matches only diagonal helicity.

```

<Helicities: helicity: TBP>+≡
  generic :: operator(.match.) => helicity_match
  generic :: operator(.dmatch.) => helicity_match_diagonal
  generic :: operator(==) => helicity_eq
  generic :: operator(/=) => helicity_neq
  procedure, private :: helicity_match
  procedure, private :: helicity_match_diagonal
  procedure, private :: helicity_eq
  procedure, private :: helicity_neq

<Helicities: sub interfaces>+≡
  elemental module function helicity_match (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
  end function helicity_match
  elemental module function helicity_match_diagonal (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
  end function helicity_match_diagonal

<Helicities: procedures>+≡
  elemental module function helicity_match (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else
      eq = .true.
    end if
  end function helicity_match

  elemental module function helicity_match_diagonal (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else if (hel1%defined) then
      eq = hel1%h1 == hel1%h2
    else if (hel2%defined) then
      eq = hel2%h1 == hel2%h2
    else
      eq = .true.
    end if
  end function helicity_match_diagonal

<Helicities: sub interfaces>+≡
  elemental module function helicity_eq (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
  end function helicity_eq

```

```

<Helicities: procedures>+≡
  elemental module function helicity_eq (hel1, hel2) result (eq)
    logical :: eq
    class(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else if (.not. hel1%defined .and. .not. hel2%defined) then
      eq = .true.
    else
      eq = .false.
    end if
  end function helicity_eq

<Helicities: sub interfaces>+≡
  elemental module function helicity_neq (hel1, hel2) result (neq)
    logical :: neq
    class(helicity_t), intent(in) :: hel1, hel2
  end function helicity_neq

<Helicities: procedures>+≡
  elemental module function helicity_neq (hel1, hel2) result (neq)
    logical :: neq
    class(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      neq = (hel1%h1 /= hel2%h1) .or. (hel1%h2 /= hel2%h2)
    else if (.not. hel1%defined .and. .not. hel2%defined) then
      neq = .false.
    else
      neq = .true.
    end if
  end function helicity_neq

```

### 11.3.5 Tools

Merge two helicity objects by taking the first entry from the first and the second entry from the second argument. Makes sense only if the input helicities were defined and diagonal. The handling of ghost flags is not well-defined; one should verify beforehand that they match.

```

<Helicities: helicity: TBP>+≡
  generic :: operator(.merge.) => merge_helicities
  procedure, private :: merge_helicities

<Helicities: sub interfaces>+≡
  elemental module function merge_helicities (hel1, hel2) result (hel)
    type(helicity_t) :: hel
    class(helicity_t), intent(in) :: hel1, hel2
  end function merge_helicities

<Helicities: procedures>+≡
  elemental module function merge_helicities (hel1, hel2) result (hel)
    type(helicity_t) :: hel
    class(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then

```

```
call hel%init (hel2%h1, hel1%h1)
else if (hel1%defined) then
call hel%init (hel1%h2, hel1%h1)
else if (hel2%defined) then
call hel%init (hel2%h2, hel2%h1)
end if
end function merge_helicities
```

## 11.4 Colors

This module defines a type and tools for dealing with color information.

Each particle can have zero or more (in practice, usually not more than two) color indices. Color indices are positive; flow direction can be determined from the particle nature.

While parton shower matrix elements are diagonal in color, some special applications (e.g., subtractions for NLO matrix elements) require non-diagonal color matrices.

```
<colors.f90>≡  
  <File header>  
  
  module colors  
  
    <Use kinds>  
    <Use strings>  
  
    <Standard module head>  
  
    <Colors: public>  
  
    <Colors: types>  
  
    <Colors: interfaces>  
  
    interface  
      <Colors: sub interfaces>  
    end interface  
  
  end module colors  
<colors_sub.f90>≡  
  <File header>  
  
  submodule (colors) colors_s  
  
    use io_units  
    use diagnostics  
  
    implicit none  
  
    contains  
  
    <Colors: procedures>  
  
  end submodule colors_s
```

### 11.4.1 The color type

A particle may have an arbitrary number of color indices (in practice, from zero to two, but more are possible). This object acts as a container. (The current implementation has a fixed array of length two.)

The fact that color comes as an array prohibits elemental procedures in some places. (May add interfaces and multi versions where necessary.)

The color may be undefined.

NOTE: Due to a compiler bug in nagfor 5.2, we do not use allocatable but fixed-size arrays with dimension 2. Only nonzero entries count. This may be more efficient anyway, but gives up some flexibility. However, the squaring algorithm currently works only for singlets, (anti)triplets and octets anyway, so two components are enough.

This type has to be generalized (abstract type and specific implementations) when trying to pursue generalized color flows or Monte Carlo over continuous color.

```

<Colors: public>≡
  public :: color_t

<Colors: types>≡
  type :: color_t
  private
  logical :: defined = .false.
  integer, dimension(2) :: c1 = 0, c2 = 0
  logical :: ghost = .false.
  contains
  <Colors: color: TBP>
  end type color_t

<Colors: types>+≡
  type :: entry_t
  integer, dimension(:), allocatable :: map
  type(color_t), dimension(:), allocatable :: col
  type(entry_t), pointer :: next => null ()
  logical :: nlo_event = .false.
  end type entry_t
  type :: list_t
  integer :: n = 0
  type(entry_t), pointer :: first => null ()
  type(entry_t), pointer :: last => null ()
  end type list_t

```

Initializers:

```

<Colors: color: TBP>≡
  generic :: init => &
  color_init_trivial, color_init_trivial_ghost, &

end subroutine color_init_trivial_ghost

This defines color from an arbitrary length color array, suitable for any representation. We may have two color arrays (non-diagonal matrix elements). This cannot be elemental. The third version assigns an array of colors, using a two-dimensional array as input.

<Colors: sub interfaces>+≡
pure module subroutine color_init_array (col, c1)
class(color_t), intent(inout) :: col

call color_init_array (col, [col_in])
case default
call color_init_array (col, [col_in, -acl_in])
end select
end select
end subroutine color_init_col_acl

```

This version is used for the external interface. We convert a fixed-size array of colors (for each particle) to the internal form by packing only the nonzero entries.

Some of these procedures produce an array, so they can't be all type-bound. We implement them as ordinary procedures.

```

<Colors: public>+≡
public :: color_init_from_array

<Colors: interfaces>≡
interface color_init_from_array
module procedure color_init_from_array1

```

### 11.4.2 Predicates

Return the definition status. A color state may be defined but trivial.

```

<Colors: color: TBP>+≡
  procedure :: is_defined => color_is_defined
  procedure :: is_nonzero => color_is_nonzero

<Colors: sub interfaces>+≡
  elemental module function color_is_defined (col) result (defined)
  logical :: defined
  class(color_t), intent(in) :: col
  end function color_is_defined
  elemental module function color_is_nonzero (col) result (flag)
  logical :: flag
  class(color_t), intent(in) :: col
  end function color_is_nonzero

<Colors: procedures>+≡
  elemental module function color_is_defined (col) result (defined)
  logical :: defined
  class(color_t), intent(in) :: col
  defined = col%defined
  end function color_is_defined

  elemental module function color_is_nonzero (col) result (flag)
  logical :: flag
  class(color_t), intent(in) :: col
  flag = col%defined &
    .and. .not. col%ghost &
    .and. any (col%c1 /= 0 .or. col%c2 /= 0)
  end function color_is_nonzero

```

Diagonal color objects have only one array allocated:

```

<Colors: color: TBP>+≡
  procedure :: is_diagonal => color_is_diagonal

<Colors: sub interfaces>+≡
  elemental module function color_is_diagonal (col) result (diagonal)
  logical :: diagonal

```

```

class(color_t), intent(in) :: col
end function color_is_diagonal

<Colors: procedures>+≡
elemental module function color_is_diagonal (col) result (diagonal)
logical :: diagonal
class(color_t), intent(in) :: col
if (col%defined) then
diagonal = all (col%c1 == col%c2)
else
diagonal = .true.
end if
end function color_is_diagonal

```

Return the ghost flag

```

<Colors: color: TBP>+≡
procedure :: is_ghost => color_is_ghost

<Colors: sub interfaces>+≡
elemental module function color_is_ghost (col) result (ghost)
logical :: ghost
class(color_t), intent(in) :: col
end function color_is_ghost

<Colors: procedures>+≡
elemental module function color_is_ghost (col) result (ghost)
logical :: ghost
class(color_t), intent(in) :: col
ghost = col%ghost
end function color_is_ghost

```

The ghost parity: true if the color-ghost flag is set. Again, no TBP since this is an array.

```

<Colors: procedures>+≡
pure function color_ghost_parity (col) result (parity)
type(color_t), dimension(:), intent(in) :: col
logical :: parity
parity = mod (count (col%ghost), 2) == 1
end function color_ghost_parity

```

Determine the color representation, given a color object. We allow only singlet (1), (anti)triplet ( $\pm 3$ ), and octet states (8). A color ghost must not have color assigned, but the color type is 8. For non-diagonal color, representations must match. If the color type is undefined, return 0. If it is invalid or unsupported, return  $-1$ .

Assumption: nonzero entries precede nonzero ones.

```

<Colors: color: TBP>+≡
procedure :: get_type => color_get_type

<Colors: sub interfaces>+≡
elemental module function color_get_type (col) result (ctype)
class(color_t), intent(in) :: col
integer :: ctype
end function color_get_type

```

```

<Colors: procedures>+≡
  elemental module function color_get_type (col) result (ctype)
    class(color_t), intent(in) :: col
    integer :: ctype
    if (col%defined) then
      ctype = -1
    if (col%ghost) then
      if (all (col%c1 == 0 .and. col%c2 == 0)) then
        ctype = 8
      end if
    else
      if (all ((col%c1 == 0 .and. col%c2 == 0) &
        & .or. (col%c1 > 0 .and. col%c2 > 0) &
        & .or. (col%c1 < 0 .and. col%c2 < 0))) then
        if (all (col%c1 == 0)) then
          ctype = 1
        else if ((col%c1(1) > 0 .and. col%c1(2) == 0)) then
          ctype = 3
        else if ((col%c1(1) < 0 .and. col%c1(2) == 0)) then
          ctype = -3
        else if ((col%c1(1) > 0 .and. col%c1(2) < 0) &
          .or. (col%c1(1) < 0 .and. col%c1(2) > 0)) then
          ctype = 8
        end if
      end if
    else
      ctype = 0
    end if
  end function color_get_type

```

### 11.4.3 Accessing contents

Return the number of color indices. We assume that it is identical for both arrays.

```

<Colors: color: TBP>+≡
  procedure, private :: get_number_of_indices => color_get_number_of_indices

<Colors: sub interfaces>+≡
  elemental module function color_get_number_of_indices (col) result (n)
    integer :: n
    class(color_t), intent(in) :: col
  end function color_get_number_of_indices

<Colors: procedures>+≡
  elemental module function color_get_number_of_indices (col) result (n)
    integer :: n
    class(color_t), intent(in) :: col
    if (col%defined .and. .not. col%ghost) then
      n = count (col%c1 /= 0)
    else
      n = 0
    end if

```

```
end function color_get_number_of_indices
```

Return the (first) color/anticolor entry (assuming that color is diagonal). The result is a positive color index.

*<Colors: color: TBP>+≡*

```
procedure :: get_col => color_get_col
procedure :: get_acl => color_get_acl

    end if
    end do SCAN1
    allocate (c_index (n))
    c_index = c_tmp(1:n)
  end subroutine extract_color_line_indices

```

Given a color array, pairwise contract the color lines in all possible ways and return the resulting array of arrays. The input color array must be diagonal, and each color should occur exactly twice, once as color and once as anticolor.

Gluon entries with equal color and anticolor are explicitly excluded.

This algorithm is generic, but for long arrays it is neither efficient, nor does it avoid duplicates. It is intended for small arrays, in particular for the state matrix of a structure-function pair.

The algorithm works directly on the contents of the color objects, it thus depends on the implementation.

```

end if
end function merge_colors

```

Merge up to two (diagonal!) color objects. The result inherits the unmatched color lines of the input colors. If one of the input colors is undefined, the output is undefined as well. It must be in a supported color representation.

A color-ghost object should not actually occur in real-particle events, but for completeness we define its behavior. For simplicity, it is identified as a color-octet with zero color/anticolor. It can only couple to a triplet or antitriplet. A fusion of triplet with matching antitriplet will yield a singlet, not a ghost, however.

If the fusion fails, the result is undefined.

```

```

We have a pair of color index arrays which corresponds to a squared matrix element. We want to determine the number of color loops in this square matrix element. So we first copy the colors (stored in a single color array with a pair of color lists in each entry) to a temporary where the color indices are shifted by some offset. We then recursively follow each loop, starting at the first color that has the offset, resetting the first color index to the loop index and each further index to zero as we go. We check that (a) each color index occurs twice within the left (right) color array, (b) the loops are closed, so we always come back to a line which has the loop index.

In order for the algorithm to work we have to conjugate the colors of initial state particles (one for decays, two for scatterings) into their corresponding anticolors of outgoing particles.

### 11.4.7 The Madgraph color model

This section describes the method for matrix element and color flow calculation within Madgraph.

For each Feynman diagram, the colorless amplitude for a specified helicity and momentum configuration (in- and out- combined) is computed:

$$A_d(p, h) \quad (11.1)$$

Inserting color, the squared matrix element for definite helicity and momentum is

$$M^2(p, h) = \sum_{dd'} A_d(p, h) C_{dd'} A_{d'}^*(p, h) \quad (11.2)$$

where  $C_{dd'}$  describes the color interference of the two diagrams  $A_d$  and  $A_{d'}$ , which is independent of momentum and helicity and can be calculated for each Feynman diagram pair by reducing it to the corresponding color graph. Obviously, one could combine all diagrams with identical color structure, such that the index  $d$  runs only over different color graphs. For colorless diagrams all elements of  $C_{dd'}$  are equal to unity.

The hermitian matrix  $C_{dd'}$  is diagonalized once and for all, such that it can be written in the form

$$C_{dd'} = \sum_{\lambda} c_d^{\lambda} \lambda c_{d'}^{\lambda*}, \quad (11.3)$$

where the eigenvectors  $c_d$  are normalized,

$$\sum_d |c_d^\lambda|^2 = 1, \quad (11.4)$$

and the  $\lambda$  values are the corresponding eigenvalues. In the colorless case, this means  $c_d = 1/\sqrt{N_d}$  for all diagrams ( $N_d$  = number of diagrams), and  $\lambda = N_d$  is the only nonzero eigenvalue.

Consequently, the squared matrix element for definite helicity and momentum can also be written as

$$M^2(p, h) = \sum_\lambda A_\lambda(p, h) \lambda A_\lambda(p, h)^* \quad (11.5)$$

with

$$A_\lambda(p, h) = \sum_d c_d^\lambda A_d(p, h). \quad (11.6)$$

For generic spin density matrices, this is easily generalized to

$$M^2(p, h, h') = \sum_\lambda A_\lambda(p, h) \lambda A_\lambda(p, h')^* \quad (11.7)$$

To determine the color flow probabilities of a given momentum-helicity configuration, the color flow amplitudes are calculated as

$$a_f(p, h) = \sum_d \beta_d^f A_d(p, h), \quad (11.8)$$

where the coefficients  $\beta_d^f$  describe the amplitude for a given Feynman diagram (or color graph)  $d$  to correspond to a definite color flow  $f$ . They are computed from  $C_{dd'}$  by transforming this matrix into the color flow basis and neglecting all off-diagonal elements. Again, these coefficients do not depend on momentum or helicity and can therefore be calculated in advance. This gives the color flow transition matrix

$$F^f(p, h, h') = a_f(p, h) a_f^*(p, h') \quad (11.9)$$

which is assumed diagonal in color flow space and is separate from the color-summed transition matrix  $M^2$ . They are, however, equivalent (up to a factor) to leading order in  $1/N_c$ , and using the color flow transition matrix is appropriate for matching to hadronization.

Note that the color flow transition matrix is not normalized at this stage. To make use of it, we have to fold it with the in-state density matrix to get a pseudo density matrix

$$\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} F^f(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (11.10)$$

which gets a meaning only after contracted with projections on the outgoing helicity states  $k_{\text{out}}$ , given as linear combinations of helicity states with the unitary coefficient matrix  $c(k_{\text{out}}, h_{\text{out}})$ . Then the probability of finding color flow  $f$  when the helicity state  $k_{\text{out}}$  is measured is given by

$$P^f(p, k_{\text{out}}) = Q^f(p, k_{\text{out}}) / \sum_f Q^f(p, k_{\text{out}}) \quad (11.11)$$

where

$$Q^f(p, k_{\text{out}}) = \sum_{h_{\text{out}} h'_{\text{out}}} c(k_{\text{out}}, h_{\text{out}}) \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) c^*(k_{\text{out}}, h'_{\text{out}}) \quad (11.12)$$

However, if we can assume that the out-state helicity basis is the canonical one, we can throw away the off diagonal elements in the color flow density matrix and normalize the ones on the diagonal to obtain

$$P^f(p, h_{\text{out}}) = \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) / \sum_f \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) \quad (11.13)$$

Finally, the color-summed out-state density matrix is computed by the scattering formula

$$\rho_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} M^2(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (11.14)$$

$$= \sum_{h_{\text{in}} h'_{\text{in}} \lambda} A_\lambda(p, h) \lambda A_\lambda(p, h')^* \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}), \quad (11.15)$$

The trace of  $\rho_{\text{out}}$  is the squared matrix element, summed over all internal degrees of freedom. To get the squared matrix element for a definite helicity  $k_{\text{out}}$  and color flow  $f$ , one has to project the density matrix onto the given helicity state and multiply with  $P^f(p, k_{\text{out}})$ .

For diagonal helicities the out-state density reduces to

$$\rho_{\text{out}}(p, h_{\text{out}}) = \sum_{h_{\text{in}} \lambda} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (11.16)$$

Since no basis transformation is involved, we can use the normalized color flow probability  $P^f(p, h_{\text{out}})$  and express the result as

$$\rho_{\text{out}}^f(p, h_{\text{out}}) = \rho_{\text{out}}(p, h_{\text{out}}) P^f(p, h_{\text{out}}) \quad (11.17)$$

$$= \sum_{h_{\text{in}} \lambda} \frac{|a^f(p, h)|^2}{\sum_f |a^f(p, h)|^2} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (11.18)$$

From these considerations, the following calculation strategy can be derived:

- Before the first event is generated, the color interference matrix  $C_{dd'}$  is computed and diagonalized, so the eigenvectors  $c_d^\lambda$ , eigenvalues  $\lambda$  and color flow coefficients  $\beta_d^f$  are obtained. In practice, these calculations are done when the matrix element code is generated, and the results are hardcoded in the matrix element subroutine as **DATA** statements.
- For each event, one loops over helicities once and stores the matrices  $A_\lambda(p, h)$  and  $a^f(p, h)$ . The allowed color flows, helicity combinations and eigenvalues are each labeled by integer indices, so one has to store complex matrices of dimension  $N_\lambda \times N_h$  and  $N_f \times N_h$ , respectively.
- The further strategy depends on the requested information.

1. If colorless diagonal helicity amplitudes are required, the eigenvalues  $A_\lambda(p, h)$  are squared, summed with weight  $\lambda$ , and the result contracted with the in-state probability vector  $\rho_{\text{in}}(p, h_{\text{in}})$ . The result is a probability vector  $\rho_{\text{out}}(p, h_{\text{out}})$ .
2. For colored diagonal helicity amplitudes, the color coefficients  $a^f(p, h)$  are also squared and used as weights to obtain the color-flow probability vector  $\rho_{\text{out}}^f(p, h_{\text{out}})$ .
3. For colorless non-diagonal helicity amplitudes, we contract the tensor product of  $A_\lambda(p, h)$  with  $A_\lambda(p, h')$ , weighted with  $\lambda$ , with the correlated in-state density matrix, to obtain a correlated out-state density matrix.
4. In the general (colored, non-diagonal) case, we do the same as in the colorless case, but return the un-normalized color flow density matrix  $\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}})$  in addition. When the relevant helicity basis is known, the latter can be used by the caller program to determine flow probabilities. (In reality, we assume the canonical basis and reduce the correlated out-state density to its diagonal immediately.)

## 11.5 Flavors: Particle properties

This module contains a type for holding the flavor code, and all functions that depend on the model, i.e., that determine particle properties.

The PDG code is packed in a special `flavor` type. (This prohibits meaningless operations, and it allows for a different implementation, e.g., some non-PDG scheme internally, if appropriate at some point.)

There are lots of further particle properties that depend on the model. Implementing a flyweight pattern, the associated field data object is to be stored in a central area, the `flavor` object just receives a pointer to this, so all queries can be delegated.

```

### 11.5.1 The flavor type

The flavor type is an integer representing the PDG code, or undefined (zero). Negative codes represent ant flavors. They should be used only for particles which do have a distinct antiparticle.

The `hard_process` flag can be set for particles that are participating in the hard interaction.

The `radiated` flag can be set for particles that are the result of a beam-structure interaction (hadron beam remnant, ISR photon, etc.), not of the hard interaction itself.

Further properties of the given flavor can be retrieved via the particle-data pointer, if it is associated.

```
<Flavors: public>≡
  public :: flavor_t

<Flavors: types>≡
  type :: flavor_t
  private
  integer :: f = UNDEFINED
  logical :: hard_process = .false.
  logical :: radiated = .false.
  type(field_data_t), pointer :: field_data => null ()
  contains
  <Flavors: flavor: TBP>
  end type flavor_t
```

Initializer form. If the model is assigned, the procedure is impure, therefore we have to define a separate array version.

Note: The pure elemental subroutines can't have an intent(out) CLASS argument (because of the potential for an impure finalizer in a type extension), so we stick to intent(inout) and (re)set all components explicitly.

```

            logical, intent(in), optional :: hard
            if (present (hard)) then
                flv%hard_process = hard
            else
                flv%hard_process = .true.
            end if
            end subroutine flavor_tag_hard_process

```

Undefine the flavor state:

```

    <Flavors: flavor: TBP>+≡
        procedure :: undefine => flavor_undefine

    <Flavors: sub interfaces>+≡
        elemental module subroutine flavor_undefine (flv)
            class(flavor_t), intent(inout) :: flv
            end subroutine flavor_undefine

    <Flavors: procedures>+≡
        elemental module subroutine flavor_undefine (flv)
            class(flavor_t), intent(inout) :: flv
            flv%f = UNDEFINED
            flv%field_data => null ()
            end subroutine flavor_undefine

```

Output: dense, no linebreak

A hard-process tag is only shown if debugging is on.

```

    <Flavors: flavor: TBP>+≡

read (u, iostat=iostat) flv%hard_process
end subroutine flavor_read_raw

```

## Assignment

Default assignment of flavor objects is possible, but cannot be used in pure procedures, because a pointer assignment is involved.

Assign the particle pointer separately. This cannot be elemental, so we define a scalar and an array version explicitly. We refer to an array of flavors, not an array of models.

```

<Flavors: flavor: TBP> +=
  procedure :: set_model => flavor_set_model_single

<Flavors: sub interfaces> +=
  impure elemental module subroutine flavor_set_model_single (flv, model)
  class(flavor_t), intent(inout) :: flv
  class(model_data_t), intent(in), target :: model
  end subroutine flavor_set_model_single

<Flavors: procedures> +=
  impure elemental module subroutine flavor_set_model_single (flv, model)
  class(flavor_t), intent(inout) :: flv
  class(model_data_t), intent(in), target :: model
  if (flv%f /= UNDEFINED) &
  flv%field_data => model%get_field_ptr (flv%f)
  end subroutine flavor_set_model_single

```

## Predicates

Return the definition status. By definition, the flavor object is defined if the flavor PDG code is nonzero.

```

<Flavors: flavor: TBP> +=
  procedure :: is_defined => flavor_is_defined

```

```

<Flavors: sub interfaces>+≡
  elemental module function flavor_is_defined (flv) result (defined)
  class(flavor_t), intent(in) :: flv
  logical :: defined
  end function flavor_is_defined

```

```

<Flavors: procedures>+≡
  elemental module function flavor_is_defined (flv) result (defined)
  class(flavor_t), intent(in) :: flv
  logical :: defined
  defined = flv%f /= UNDEFINED
  end function flavor_is_defined

```

Check for valid flavor (including undefined). This is distinct from the `is_defined` status. Invalid flavor is actually a specific PDG code.

```

<Flavors: flavor: TBP>+≡
  procedure :: is_valid => flavor_is_valid

<Flavors: sub interfaces>+≡
  elemental module function flavor_is_valid (flv) result (valid)
  class(flavor_t), intent(in) :: flv
  logical :: valid
  end function flavor_is_valid

<Flavors: procedures>+≡
  elemental module function flavor_is_valid (flv) result (valid)
  class(flavor_t), intent(in) :: flv
  logical :: valid
  valid = flv%f /= INVALID
  end function flavor_is_valid

```

Return true if the particle-data pointer is associated. (Debugging aid)

```

<Flavors: flavor: TBP>+≡
  procedure :: is_associated => flavor_is_associated

<Flavors: sub interfaces>+≡
  elemental module function flavor_is_associated (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  end function flavor_is_associated

<Flavors: procedures>+≡
  elemental module function flavor_is_associated (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  flag = associated (flv%field_data)
  end function flavor_is_associated

```

Check the `radiated` flag. A radiated particle has a definite PDG flavor status, but it is actually a pseudoparticle (a beam remnant) which may be subject to fragmentation.

```

<Flavors: flavor: TBP>+≡
  procedure :: is_radiated => flavor_is_radiated

```

```

<Flavors: sub interfaces>+≡
  elemental module function flavor_is_radiated (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  end function flavor_is_radiated

```

```

<Flavors: procedures>+≡
  elemental module function flavor_is_radiated (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  flag = flv%radiated
  end function flavor_is_radiated

```

Check the **hard\_process** flag. A particle is tagged with this flag if it participates in the hard interaction and is not a beam remnant.

```

<Flavors: flavor: TBP>+≡
  procedure :: is_hard_process => flavor_is_hard_process

```

```

<Flavors: sub interfaces>+≡
  elemental module function flavor_is_hard_process (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  end function flavor_is_hard_process

```

```

<Flavors: procedures>+≡
  elemental module function flavor_is_hard_process (flv) result (flag)
  class(flavor_t), intent(in) :: flv
  logical :: flag
  flag = flv%hard_process
  end function flavor_is_hard_process

```

## Accessing contents

With the exception of the PDG code, all particle property enquiries are delegated to the **field\_data** pointer. If this is unassigned, some access function will crash.

Return the flavor as an integer

```

<Flavors: flavor: TBP>+≡
  procedure :: get_pdg => flavor_get_pdg

```

```

<Flavors: sub interfaces>+≡
  elemental module function flavor_get_pdg (flv) result (f)
  integer :: f
  class(flavor_t), intent(in) :: flv
  end function flavor_get_pdg

```

```

<Flavors: procedures>+≡
  elemental module function flavor_get_pdg (flv) result (f)
  integer :: f
  class(flavor_t), intent(in) :: flv
  f = flv%f
  end function flavor_get_pdg

```

Return the flavor of the antiparticle

```
(Flavors: flavor: TBP)+≡  
  procedure :: get_pdg_anti => flavor_get_pdg_anti  
  
(Flavors: sub interfaces)+≡  
  elemental module function flavor_get_pdg_anti (flv) result (f)  
    integer :: f  
    class(flavor_t), intent(in) :: flv  
  end function flavor_get_pdg_anti  
  
(Flavors: procedures)+≡  
  elemental module function flavor_get_pdg_anti (flv) result (f)  
    integer :: f  
    class(flavor_t), intent(in) :: flv  
    if (associated (flv%field_data)) then  
      if (flv%field_data%has_antiparticle ()) then  
        f = -flv%f  
      else  
        f = flv%f  
      end if  
    else  
      f = 0  
    end if  
  end function flavor_get_pdg_anti
```

Absolute value:

```
(Flavors: flavor: TBP)+≡  
  procedure :: get_pdg_abs => flavor_get_pdg_abs  
  
(Flavors: sub interfaces)+≡  
  elemental module function flavor_get_pdg_abs (flv) result (f)

    else
      neq = .true.
    end if
  end function flavor_neq

```

## Tools

Merge two flavor indices. This works only if both are equal or either one is undefined, because we have no off-diagonal flavor entries. Otherwise, generate an invalid flavor.

We cannot use elemental procedures because of the pointer component.

```
<Flavors: public>+≡
  public :: operator(.merge.)

<Flavors: interfaces>≡
  interface operator(.merge.)
  module procedure merge_flavors0
  module procedure merge_flavors1
  end interface

<Flavors: sub interfaces>+≡
  module function merge_flavors0 (flv1, flv2) result (flv)
    type(flavor_t) :: flv
    type(flavor_t), intent(in) :: flv1, flv2
  end function merge_flavors0
  module function merge_flavors1 (flv1, flv2) result (flv)
    type(flavor_t), dimension(:), intent(in) :: flv1, flv2
    type(flavor_t), dimension(size(flv1)) :: flv
  end function merge_flavors1

<Flavors: procedures>+≡
  module function merge_flavors0 (flv1, flv2) result (flv)
    type(flavor_t) :: flv
    type(flavor_t), intent(in) :: flv1, flv2
    if (flavor_is_defined (flv1) .and. flavor_is_defined (flv2)) then
      if (flv1 == flv2) then
        flv = flv1
      else
        flv%f = INVALID
      end if
    else if (flavor_is_defined (flv1)) then
      flv = flv1
    else if (flavor_is_defined (flv2)) then
      flv = flv2
    end if
  end function merge_flavors0

  module function merge_flavors1 (flv1, flv2) result (flv)
    type(flavor_t), dimension(:), intent(in) :: flv1, flv2
    type(flavor_t), dimension(size(flv1)) :: flv
    integer :: i
    do i = 1, size (flv1)
      flv(i) = flv1(i) .merge. flv2(i)
    end do
  end function merge_flavors1
```

Generate consecutive color indices for a given flavor. The indices are counted starting with the stored value of *c*, so new indices are created each time this (impure) function is called. The counter can be reset by the optional argument

`c_seed` if desired. The optional flag `reverse` is used only for octets. If set, the color and anticolor entries of the octet particle are exchanged.

```

<Flavors: public>+≡
  public :: color_from_flavor

<Flavors: interfaces>+≡
  interface color_from_flavor
  module procedure color_from_flavor0
  module procedure color_from_flavor1
  end interface

    else
      call col%init ([c, -(c+1)]); c = c + 2
    end if
  end select
  end function color_from_flavor0

  module function color_from_flavor1 (flv, c_seed, reverse) result (col)
  type(flavor_t), dimension(:), intent(in) :: flv
  integer, intent(in), optional :: c_seed
  logical, intent(in), optional :: reverse
  type(color_t), dimension(size(flv)) :: col

```

```

integer :: i
col(1) = color_from_flavor0 (flv(1), c_seed, reverse)
do i = 2, size (flv)
col(i) = color_from_flavor0 (flv(i), reverse=reverse)
end do
end function color_from_flavor1

```

This procedure returns the flavor object for the antiparticle. The antiparticle code may either be the same code or its negative.

```

<Flavors: flavor: TBP>+=
  procedure :: anti => flavor_anti

<Flavors: sub interfaces>+=
  module function flavor_anti (flv) result (aflv)
  type(flavor_t) :: aflv
  class(flavor_t), intent(in) :: flv
  end function flavor_anti

<Flavors: procedures>+=
  module function flavor_anti (flv) result (aflv)
  type(flavor_t) :: aflv
  class(flavor_t), intent(in) :: flv
  if (flavor_has_antiparticle (flv)) then
aflv%f = - flv%f
  else
aflv%f = flv%f
  end if
aflv%field_data => flv%field_data
end function flavor_anti

```

## 11.6 Quantum numbers

This module collects helicity, color, and flavor in a single type and defines procedures

```
<quantum_numbers.f90>≡  
  <File header>  
  
  module quantum_numbers  
  
    use model_data  
    use helicities  
    use colors  
    use flavors  
  
    <Standard module head>  
  
    <Quantum numbers: public>  
  
    <Quantum numbers: types>  
  
    <Quantum numbers: interfaces>  
  
    interface  
    <Quantum numbers: sub interfaces>  
    end interface  
  
  end module quantum_numbers  
<quantum_numbers_sub.f90>≡  
  <File header>  
  
  submodule (quantum_numbers) quantum_numbers_s  
  
    use io_units  
  
    implicit none  
  
    contains  
  
    <Quantum numbers: procedures>  
  
  end submodule quantum_numbers_s
```

### 11.6.1 The quantum number type

```
<Quantum numbers: public>≡  
  public :: quantum_numbers_t  
  
<Quantum numbers: types>≡  
  type :: quantum_numbers_t  
  private  
  type(flavor_t) :: f  
  type(color_t) :: c
```

```

type(helicity_t) :: h
integer :: sub = 0
contains
  <Quantum numbers: quantum numbers: TBP>
end type quantum_numbers_t

```

Define quantum numbers: Initializer form. All arguments may be present or absent.

Some elemental initializers are impure because they set the `flv` component. This implies transfer of a pointer behind the scenes.

```

<Quantum numbers: quantum numbers: TBP>≡
  generic :: init => &

## 11.6.2 I/O

Write the quantum numbers in condensed form, enclosed by square brackets. Color is written only if nontrivial. For convenience, introduce also an array version.

If the `col_verbose` option is set, show the quantum number color also if it is zero, but defined. Otherwise, suppress zero color.

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_write

end subroutine quantum_numbers_assign

```

Two sets of quantum numbers are compatible if the individual quantum numbers are compatible, depending on the mask. Flavor has to match, regardless of the flavor mask.

If the color flag is set, color is compatible if the ghost property is identical. If the color flag is unset, color has to be identical. I.e., if the flag is set, the color amplitudes can interfere. If it is not set, they must be identical, and there must be no ghost. The latter property is used for expanding physical color flows.

Helicity is compatible if the mask is unset, otherwise it has to match. This determines if two amplitudes can be multiplied (no mask) or traced (mask).

```

<Quantum numbers: public>+≡

```

```

public :: quantum_numbers_are_compatible

<Quantum numbers: sub interfaces>+≡
elemental module function quantum_numbers_are_compatible &
(qn1, qn2, mask) result (flag)

  elemental module subroutine quantum_numbers_flip_helicity (qn)
  class(quantum_numbers_t), intent(inout) :: qn
  call qn%h%flip ()
  end subroutine quantum_numbers_flip_helicity

```

Merge two quantum number sets: for each entry, if both are defined, combine them to an off-diagonal entry (meaningful only if the input was diagonal). If either entry is undefined, take the defined one.

For flavor, off-diagonal entries are invalid, so both flavors must be equal, otherwise an invalid flavor is inserted.

```

<Quantum numbers: public>+≡
  public :: operator(.merge.)

<Quantum numbers: interfaces>+≡
  interface operator(.merge.)
  module procedure merge_quantum_numbers0
  module procedure merge_quantum_numbers1
  end interface

```

```

<Quantum numbers: sub interfaces>+≡

```

### 11.6.7 The quantum number mask

The quantum numbers mask is true for quantum numbers that should be ignored or summed over. The three mandatory entries correspond to flavor, color, and helicity, respectively.

There is an additional entry `cg`: If false, the color-ghosts property should be kept even if color is ignored. This is relevant only if `c` is set, otherwise it is always false.

The flag `hd` tells that only diagonal entries in helicity should be kept. If `h` is set, `hd` is irrelevant and will be kept `.false`.

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_mask_t

<Quantum numbers: types>+≡
  type :: quantum_numbers_mask_t
  private
  logical :: f = .false.
  logical :: c = .false.
  logical :: cg = .false.
  logical :: h = .false.
  logical :: hd = .false.
  integer :: sub = 0
  contains
  <Quantum numbers: quantum numbers mask: TBP>
  end type quantum_numbers_mask_t

```

Define a quantum number mask: Constructor form

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_mask

<Quantum numbers: sub interfaces>+≡
  elemental module function quantum_numbers_mask &
    (mask_f, mask_c, mask_h, mask_cg, mask_hd) result (mask)
  type(quantum_numbers_mask_t) :: mask
  logical, intent(in) :: mask_f, mask_c, mask_h

logical, intent(in), optional :: mask_cg
mask%c = mask_c
if (present (mask_cg)) then
if (mask%c) mask%cg = mask_cg
else
mask%cg = mask_c
end if
end subroutine quantum_numbers_mask_set_color

elemental module subroutine quantum_numbers_mask_set_helicity (mask, mask_h, mask_hd)
class(quantum_numbers_mask_t), intent(inout) :: mask
logical, intent(in) :: mask_h
logical, intent(in), optional :: mask_hd
mask%h = mask_h
if (present (mask_hd)) then
if (.not. mask%h) mask%hd = mask_hd
end if
end subroutine quantum_numbers_mask_set_helicity

elemental module subroutine quantum_numbers_mask_set_sub (mask, sub)
class(quantum_numbers_mask_t), intent(inout) :: mask
integer, intent(in) :: sub
mask%sub = sub
end subroutine quantum_numbers_mask_set_sub

```

The following routines assign part of a mask, depending on the flags given.

```

<Quantum numbers: quantum numbers mask: TBP>+≡
  procedure :: assign => quantum_numbers_mask_assign

<Quantum numbers: sub interfaces>+≡
  elemental module subroutine quantum_numbers_mask_assign &
    (mask, mask_in, flavor, color, helicity)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  class(quantum_numbers_mask_t), intent(in) :: mask_in
  logical, intent(in), optional :: flavor, color, helicity
  end subroutine quantum_numbers_mask_assign

<Quantum numbers: procedures>+≡
  elemental module subroutine quantum_numbers_mask_assign &
    (mask, mask_in, flavor, color, helicity)
  class(quantum_numbers_mask_t), intent(inout) :: mask
  class(quantum_numbers_mask_t), intent(in) :: mask_in
  logical, intent(in), optional :: flavor, color, helicity
  if (present (flavor)) then
  if (flavor) then
  mask%f = mask_in%f
  end if

```

```

end if
if (present (color)) then
  if (color) then
    mask%c = mask_in%c
    mask%cg = mask_in%cg
  end if
end if
if (present (helicity)) then
  if (helicity) then
    mask%h = mask_in%h
    mask%hd = mask_in%hd
  end if
end if
end subroutine quantum_numbers_mask_assign

```

### 11.6.9 Mask predicates

Return true if either one of the entries is set:

```

<Quantum numbers: public>+≡
  public :: any

<Quantum numbers: interfaces>+≡
  interface any
  module procedure quantum_numbers_mask_any
  end interface

<Quantum numbers: sub interfaces>+≡
  module function quantum_numbers_mask_any (mask) result (match)
  logical :: match
  type(quantum_numbers_mask_t), intent(in) :: mask
  end function quantum_numbers_mask_any

<Quantum numbers: procedures>+≡
  module function quantum_numbers_mask_any (mask) result (match)
  logical :: match
  type(quantum_numbers_mask_t), intent(in) :: mask
  match = mask%f .or. mask%c .or. mask%h .or. mask%hd
  end function quantum_numbers_mask_any

```

### 11.6.10 Operators

The OR operation is applied to all components.

```

<Quantum numbers: quantum numbers mask: TBP>+≡
  generic :: operator(.or.) => quantum_numbers_mask_or
  procedure, private :: quantum_numbers_mask_or

<Quantum numbers: sub interfaces>+≡
  elemental module function quantum_numbers_mask_or (mask1, mask2) result (mask)
  type(quantum_numbers_mask_t) :: mask
  class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
  end function quantum_numbers_mask_or

```

```

<Quantum numbers: procedures>+≡
elemental module function quantum_numbers_mask_or (mask1, mask2) result (mask)
type(quantum_numbers_mask_t) :: mask
class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
mask%f = mask1%f .or. mask2%f
mask%c = mask1%c .or. mask2%c
if (mask%c) mask%cg = mask1%cg .or. mask2%cg
mask%h = mask1%h .or. mask2%h
if (.not. mask%h) mask%hd = mask1%hd .or. mask2%hd
end function quantum_numbers_mask_or

```

### 11.6.11 Mask comparisons

Return true if the two masks are equivalent / differ:

```

<Quantum numbers: quantum numbers mask: TBP>+≡
generic :: operator(.eqv.) => quantum_numbers_mask_eqv
generic :: operator(.neqv.) => quantum_numbers_mask_neqv
procedure, private :: quantum_numbers_mask_eqv
procedure, private :: quantum_numbers_mask_neqv

<Quantum numbers: sub interfaces>+≡
elemental module function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
logical :: eqv
class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
end function quantum_numbers_mask_eqv
elemental module function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
logical :: neqv
class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
end function quantum_numbers_mask_neqv

<Quantum numbers: procedures>+≡
elemental module function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
logical :: eqv
class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
eqv = (mask1%f .eqv. mask2%f) .and. &
(mask1%c .eqv. mask2%c) .and. &
(mask1%cg .eqv. mask2%cg) .and. &
(mask1%h .eqv. mask2%h) .and. &
(mask1%hd .eqv. mask2%hd)
end function quantum_numbers_mask_eqv

elemental module function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
logical :: neqv
class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
neqv = (mask1%f .neqv. mask2%f) .or. &
(mask1%c .neqv. mask2%c) .or. &
(mask1%cg .neqv. mask2%cg) .or. &
(mask1%h .neqv. mask2%h) .or. &
(mask1%hd .neqv. mask2%hd)
end function quantum_numbers_mask_neqv

```

### 11.6.12 Apply a mask

Applying a mask to the quantum number object means undefining those entries where the mask is set. The others remain unaffected.

The `hd` mask has the special property that it “diagonalizes” helicity, i.e., the second helicity entry is dropped and the result is a diagonal helicity quantum number.

```
<Quantum numbers: quantum numbers: TBP>+≡
  procedure :: undefine => quantum_numbers_undefine
  procedure :: undefined => quantum_numbers_undefined0

<Quantum numbers: public>+≡
  public :: quantum_numbers_undefined

<Quantum numbers: interfaces>+≡
  interface quantum_numbers_undefined
  module procedure quantum_numbers_undefined0
  module procedure quantum_numbers_undefined1
  module procedure quantum_numbers_undefined11
  end interface

<Quantum numbers: sub interfaces>+≡
  elemental module subroutine quantum_numbers_undefine (qn, mask)
  class(quantum_numbers_t), intent(inout) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  end subroutine quantum_numbers_undefine
  module function quantum_numbers_undefined0 (qn, mask) result (qn_new)
  class(quantum_numbers_t), intent(in) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  type(quantum_numbers_t) :: qn_new
  end function quantum_numbers_undefined0
  module function quantum_numbers_undefined1 (qn, mask) result (qn_new)
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  type(quantum_numbers_t), dimension(size(qn)) :: qn_new
  end function quantum_numbers_undefined1
  module function quantum_numbers_undefined11 (qn, mask) result (qn_new)
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
  type(quantum_numbers_t), dimension(size(qn)) :: qn_new
  end function quantum_numbers_undefined11

<Quantum numbers: procedures>+≡
  elemental module subroutine quantum_numbers_undefine (qn, mask)
  class(quantum_numbers_t), intent(inout) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  if (mask%f) call qn%f%undefine ()
  if (mask%c) call qn%c%undefine (undefine_ghost = mask%cg)
  if (mask%h) then
    call qn%h%undefine ()
  else if (mask%hd) then
    if (.not. qn%h%is_diagonal ()) then
      call qn%h%diagonalize ()
    end if
  end if
```

```

if (mask%sub > 0) qn%sub = 0
end subroutine quantum_numbers_undefine

module function quantum_numbers_undefined0 (qn, mask) result (qn_new)
class(quantum_numbers_t), intent(in) :: qn
type(quantum_numbers_mask_t), intent(in) :: mask
type(quantum_numbers_t) :: qn_new
select type (qn)
type is (quantum_numbers_t); qn_new = qn
end select
call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined0

module function quantum_numbers_undefined1 (qn, mask) result (qn_new)
type(quantum_numbers_t), dimension(:), intent(in) :: qn
type(quantum_numbers_mask_t), intent(in) :: mask
type(quantum_numbers_t), dimension(size(qn)) :: qn_new
qn_new = qn
call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined1

module function quantum_numbers_undefined11 (qn, mask) result (qn_new)
type(quantum_numbers_t), dimension(:), intent(in) :: qn
type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
type(quantum_numbers_t), dimension(size(qn)) :: qn_new
qn_new = qn
call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined11

```

Return true if the input quantum number set has entries that would be removed by the applied mask, e.g., if polarization is defined but mask%h is set:

```

<Quantum numbers: quantum numbers: TBP>+≡
  procedure :: are_redundant => quantum_numbers_are_redundant

<Quantum numbers: sub interfaces>+≡
  elemental module function quantum_numbers_are_redundant (qn, mask) &
  result (redundant)
  logical :: redundant
  class(quantum_numbers_t), intent(in) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  end function quantum_numbers_are_redundant

<Quantum numbers: procedures>+≡
  elemental module function quantum_numbers_are_redundant (qn, mask) &
  result (redundant)
  logical :: redundant
  class(quantum_numbers_t), intent(in) :: qn
  type(quantum_numbers_mask_t), intent(in) :: mask
  redundant = .false.
  if (mask%f) then
    redundant = qn%f%is_defined ()
  end if
  if (mask%c) then
    redundant = qn%c%is_defined ()
  end if

```

```

if (mask%h) then
  redundant = qn%h%is_defined ()
else if (mask%hd) then
  redundant = .not. qn%h%is_diagonal ()
end if
if (mask%sub > 0) redundant = qn%sub >= mask%sub
end function quantum_numbers_are_redundant

```

Return true if the helicity flag is set or the diagonal-helicity flag is set.

```

<Quantum numbers: quantum numbers mask: TBP>+≡
  procedure :: diagonal_helicity => quantum_numbers_mask_diagonal_helicity

<Quantum numbers: sub interfaces>+≡
  elemental module function quantum_numbers_mask_diagonal_helicity (mask) &
  result (flag)
  logical :: flag
  class(quantum_numbers_mask_t), intent(in) :: mask
  end function quantum_numbers_mask_diagonal_helicity

<Quantum numbers: procedures>+≡
  elemental module function quantum_numbers_mask_diagonal_helicity (mask) &
  result (flag)
  logical :: flag
  class(quantum_numbers_mask_t), intent(in) :: mask
  flag = mask%h .or. mask%hd
  end function quantum_numbers_mask_diagonal_helicity

```

## Chapter 12

# Transition Matrices and Evaluation

The modules in this chapter implement transition matrices and calculations. The functionality is broken down in three modules

**state\_matrices** represent state and transition density matrices built from particle quantum numbers (helicity, color, flavor)

**interactions** extend state matrices with the record of particle momenta. They also distinguish in- and out-particles and store parent-child relations.

**evaluators** These objects extend interaction objects by the information how to calculate matrix elements from products and squares of other interactions. They implement the methods to actually compute those matrix elements.

## 12.1 State matrices

This module deals with the internal state of a particle system, i.e., with its density matrix in flavor, color, and helicity space.

```
<state_matrices.f90>≡  
  <File header>  
  
  module state_matrices  
  
    <Use kinds>  
    use model_data  
    use flavors  
    use colors  
    use helicities  
    use quantum_numbers  
  
    <Standard module head>  
  
    <State matrices: public>  
  
    <State matrices: parameters>  
  
    <State matrices: types>  
  
    <State matrices: interfaces>  
  
    interface  
    <State matrices: sub interfaces>  
    end interface  
  
  end module state_matrices  
<state_matrices_sub.f90>≡  
  <File header>  
  
  submodule (state_matrices) state_matrices_s  
  
    use constants, only: zero  
    use format_utils, only: pac_fmt  
    use format_defs, only: FMT_17, FMT_19  
    use io_units  
    use diagnostics  
    use sorting  
  
    implicit none  
  
    contains  
  
    <State matrices: procedures>  
  
  end submodule state_matrices_s
```

### 12.1.1 Nodes of the quantum state trie

A quantum state object represents an unnormalized density matrix, i.e., an array of possibilities for flavor, color, and helicity indices with associated complex values. Physically, the trace of this matrix is the summed squared matrix element for an interaction, and the matrix elements divided by this value correspond to the flavor-color-helicity density matrix. (Flavor and color are diagonal.)

We store density matrices as tries, that is, as trees where each branching represents the possible quantum numbers of a particle. The first branching is the first particle in the system. A leaf (the node corresponding to the last particle) contains the value of the matrix element.

Each node contains a flavor, color, and helicity entry. Note that each of those entries may be actually undefined, so we can also represent, e.g., unpolarized particles.

The value is meaningful only for leaves, which have no child nodes. There is a pointer to the parent node which allows for following the trie downwards from a leaf, it is null for a root node. The child nodes are implemented as a list, so there is a pointer to the first and last child, and each node also has a `next` pointer to the next sibling.

The root node does not correspond to a particle, only its children do. The quantum numbers of the root node are irrelevant and will not be set. However, we use a common type for the three classes (root, branch, leaf); they may easily be distinguished by the association status of parent and child.

#### Node type

The node is linked in all directions: the parent, the first and last in the list of children, and the previous and next sibling. This allows us for adding and removing nodes and whole branches anywhere in the trie. (Circular links are not allowed, however.). The node holds its associated set of quantum numbers. The integer index, which is set only for leaf nodes, is the index of the corresponding matrix element value within the state matrix.

Temporarily, matrix-element values may be stored within a leaf node. This is used during state-matrix factorization. When the state matrix is `frozen`, these values are transferred to the matrix-element array within the host state matrix.

*(State matrices: types)≡*

```
type :: node_t
private
type(quantum_numbers_t) :: qn
type(node_t), pointer :: parent => null ()
type(node_t), pointer :: child_first => null ()
type(node_t), pointer :: child_last => null ()
type(node_t), pointer :: next => null ()
type(node_t), pointer :: previous => null ()
integer :: me_index = 0
integer, dimension(:), allocatable :: me_count
complex(default) :: me = 0
end type node_t
```

## Operations on nodes

Recursively deallocate all children of the current node. This includes any values associated with the children.

```
<State matrices: procedures>≡
  pure recursive subroutine node_delete_offspring (node)
  type(node_t), pointer :: node
  type(node_t), pointer :: child
  child => node%child_first
  do while (associated (child))
  node%child_first => node%child_first%next
  call node_delete_offspring (child)
  deallocate (child)
  child => node%child_first
  end do
  node%child_last => null ()
  end subroutine node_delete_offspring
```

Remove a node including its offspring. Adjust the pointers of parent and siblings, if necessary.

```
<State matrices: procedures>+≡
  pure subroutine node_delete (node)
  type(node_t), pointer :: node
  call node_delete_offspring (node)
  if (associated (node%previous)) then
  node%previous%next => node%next
  else if (associated (node%parent)) then
  node%parent%child_first => node%next
  end if
  if (associated (node%next)) then
  node%next%previous => node%previous
  else if (associated (node%parent)) then
  node%parent%child_last => node%previous
  end if
  deallocate (node)
  end subroutine node_delete
```

Append a child node

```
<State matrices: procedures>+≡
  subroutine node_append_child (node, child)
  type(node_t), target, intent(inout) :: node
  type(node_t), pointer :: child
  allocate (child)
  if (associated (node%child_last)) then
  node%child_last%next => child
  child%previous => node%child_last
  else
  node%child_first => child
  end if
  node%child_last => child
  child%parent => node
  end subroutine node_append_child
```

## I/O

Output of a single node, no recursion. We print the quantum numbers in square brackets, then the value (if any).

```

<State matrices: procedures>+≡
  subroutine node_write (node, me_array, verbose, unit, col_verbose, testflag)
    type(node_t), intent(in) :: node
    complex(default), dimension(:), intent(in), optional :: me_array
    logical, intent(in), optional :: verbose, col_verbose, testflag
    integer, intent(in), optional :: unit
    logical :: verb
    integer :: u
    character(len=7) :: fmt
    call pac_fmt (fmt, FMT_19, FMT_17, testflag)
    verb = .false.; if (present (verbose)) verb = verbose
    u = given_output_unit (unit); if (u < 0) return
    call node%qn%write (u, col_verbose)
    if (node%me_index /= 0) then
      write (u, "(A,I0,A)", advance="no") " => ME(", node%me_index, ")"
      if (present (me_array)) then
        write (u, "(A)", advance="no") " = "
        write (u, "('(', " // fmt // ",','," // fmt // ",')')", &
          advance="no") pacify_complex (me_array(node%me_index))
      end if
    end if
    write (u, *)
    if (verb) then
      call ptr_write ("parent      ", node%parent)
      call ptr_write ("child_first", node%child_first)
      call ptr_write ("child_last ", node%child_last)
      call ptr_write ("next       ", node%next)
      call ptr_write ("previous   ", node%previous)
    end if
    contains
    subroutine ptr_write (label, node)
      character(*), intent(in) :: label
      type(node_t), pointer :: node
      if (associated (node)) then
        write (u, "(10x,A,1x,'->',1x)", advance="no") label
        call node%qn%write (u, col_verbose)
        write (u, *)
      end if
    end subroutine ptr_write
  end subroutine node_write

```

Recursive output of a node:

```

<State matrices: procedures>+≡
  recursive subroutine node_write_rec (node, me_array, verbose, &
    indent, unit, col_verbose, testflag)
    type(node_t), intent(in), target :: node
    complex(default), dimension(:), intent(in), optional :: me_array
    logical, intent(in), optional :: verbose, col_verbose, testflag
    integer, intent(in), optional :: indent
    integer, intent(in), optional :: unit

```

```

type(node_t), pointer :: current
logical :: verb
integer :: i, u
verb = .false.; if (present (verbose)) verb = verbose
i = 0; if (present (indent)) i = indent
u = given_output_unit (unit); if (u < 0) return
current => node%child_first
do while (associated (current))
write (u, "(A)", advance="no") repeat (" ", i)
call node_write (current, me_array, verbose = verb, &
unit = u, col_verbose = col_verbose, testflag = testflag)
call node_write_rec (current, me_array, verbose = verb, &
indent = i + 2, unit = u, col_verbose = col_verbose, testflag = testflag)
current => current%next
end do
end subroutine node_write_rec

```

Binary I/O. Matrix elements are written only for leaf nodes.

*(State matrices: procedures)*+≡

```

recursive subroutine node_write_raw_rec (node, u)
type(node_t), intent(in), target :: node
integer, intent(in) :: u
logical :: associated_child_first, associated_next

  call node_read_raw_rec (node%next, u, parent, iostat=iostat)
end if
end subroutine node_read_raw_rec

```

### 12.1.2 State matrix

#### Definition

The quantum state object is a container that keeps and hides the root node. For direct accessibility of values, they are stored in a separate array. The leaf nodes of the quantum-number tree point to those values, once the state matrix is finalized.

The norm component is redefined if a common factor is extracted from all nodes.

```

<State matrices: public>≡
  public :: state_matrix_t

<State matrices: types>+≡
  type :: state_matrix_t
  private
  type(node_t), pointer :: root => null ()
  integer :: depth = 0
  integer :: n_matrix_elements = 0
  logical :: leaf_nodes_store_values = .false.
  integer :: n_counters = 0
  complex(default), dimension(:), allocatable :: me
  real(default) :: norm = 1
  integer :: n_sub = -1
  contains
  <State matrices: state matrix: TBP>
  end type state_matrix_t

```

This initializer allocates the root node but does not fill anything. We declare whether values are stored within the nodes during state-matrix construction, and how many counters should be maintained (default: none).

```

<State matrices: state matrix: TBP>≡
  procedure :: init => state_matrix_init

<State matrices: sub interfaces>≡
  module subroutine state_matrix_init (state, store_values, n_counters)

```

```

class(state_matrix_t), intent(out) :: state
logical, intent(in), optional :: store_values
integer, intent(in), optional :: n_counters
end subroutine state_matrix_init

<State matrices: procedures>+≡
module subroutine state_matrix_init (state, store_values, n_counters)
class(state_matrix_t), intent(out) :: state
logical, intent(in), optional :: store_values
integer, intent(in), optional :: n_counters
allocate (state%root)
if (present (store_values)) &
state%leaf_nodes_store_values = store_values
if (present (n_counters)) state%n_counters = n_counters
end subroutine state_matrix_init

```

This recursively deletes all children of the root node, restoring the initial state. The matrix element array is not finalized, since it does not contain physical entries, just pointers.

```

<State matrices: state matrix: TBP>+≡
procedure :: final => state_matrix_final

<State matrices: sub interfaces>+≡
module subroutine state_matrix_final (state)
class(state_matrix_t), intent(inout) :: state
end subroutine state_matrix_final

<State matrices: procedures>+≡
module subroutine state_matrix_final (state)
class(state_matrix_t), intent(inout) :: state
if (allocated (state%me)) deallocate (state%me)
if (associated (state%root)) call node_delete (state%root)
state%depth = 0
state%n_matrix_elements = 0
end subroutine state_matrix_final

```

Output: Present the tree as a nested list with appropriate indentation.

```

<State matrices: state matrix: TBP>+≡
procedure :: write => state_matrix_write

<State matrices: sub interfaces>+≡
module subroutine state_matrix_write (state, unit, write_value_list, &
verbose, col_verbose, testflag)

## Properties of the quantum state

A state is defined if its root is allocated:

```

<State matrices: state matrix: TBP>+≡
procedure :: is_defined => state_matrix_is_defined

<State matrices: sub interfaces>+≡
elemental module function state_matrix_is_defined (state) result (defined)
logical :: defined
class(state_matrix_t), intent(in) :: state
end function state_matrix_is_defined

<State matrices: procedures>+≡
elemental module function state_matrix_is_defined (state) result (defined)
logical :: defined
class(state_matrix_t), intent(in) :: state
defined = associated (state%root)
end function state_matrix_is_defined

```

A state is empty if its depth is zero:

```

<State matrices: state matrix: TBP>+≡
procedure :: is_empty => state_matrix_is_empty

<State matrices: sub interfaces>+≡
elemental module function state_matrix_is_empty (state) result (flag)
logical :: flag

```

```

class(state_matrix_t), intent(in) :: state
end function state_matrix_is_empty

<State matrices: procedures>+≡
elemental module function state_matrix_is_empty (state) result (flag)
logical :: flag
class(state_matrix_t), intent(in) :: state
flag = state%depth == 0
end function state_matrix_is_empty

```

Return the number of matrix-element values.

```

<State matrices: state matrix: TBP>+≡

## Building the quantum state

The procedure generates a branch associated to the input array of quantum numbers. If the branch exists already, it is used.

Optionally, we set the matrix-element index, a value (which may be added to the previous one), and increment one of the possible counters. We may also return the matrix element index of the current node.

```

```

Remove irrelevant flavor/color/helicity labels and the corresponding branchings. The masks indicate which particles are affected; the masks length should coincide with the depth of the trie (without the root node). Recursively scan the whole tree, starting from the leaf nodes and working up to the root node. If a mask entry is set for the current tree level, scan the children there. For each child within that level make a new empty branch where the masked quan-

tum number is undefined. Then recursively combine all following children with matching quantum number into this new node and move on.

```

<State matrices: state matrix: TBP>+≡
  procedure :: collapse => state_matrix_collapse

<State matrices: sub interfaces>+≡
  module subroutine state_matrix_collapse (state, mask)

      call state%reduce (mask, red_state)
      call state%final ()
      state = red_state
    end if
  end subroutine state_matrix_collapse

```

Transform the given state matrix into a reduced state matrix where some quantum numbers are removed, as indicated by the mask. The procedure creates a new state matrix, so the old one can be deleted after this if it is no longer used.

It is said that the matrix element ordering is lost afterwards. We allow to keep the original matrix element index in the new state matrix. If the matrix element indices are kept, we do not freeze the state matrix. After reordering the matrix element indices by `state_matrix_reorder_me`, the state matrix can be frozen.

```

<State matrices: state matrix: TBP>+≡
  procedure :: reduce => state_matrix_reduce

Sets all matrix elements whose flavor structure is a duplicate of another flavor structure to zero. We need this for the real finite to ignore duplicate flavor structures while keeping the indices identical to the singular real component. When comparing the flavor structures, we take into account permutations of final- state particles. To do this properly, we keep only the non-hard flavors and the initial-state flavors, i.e. the first two hard flavors fixed.

  end if
end do
end subroutine state_matrix_set_duplicate_flv_zero

```

This subroutine sets up the matrix-element array. The leaf nodes acquire the index values that point to the appropriate matrix-element entry.

We recursively scan the trie. Once we arrive at a leaf node, the index is increased and associated to that node. Finally, we allocate the matrix-element array with the appropriate size.

If matrix element values are temporarily stored within the leaf nodes, we scan the state again and transfer them to the matrix-element array.

```

procedure :: set_matrix_element_single => &
state_matrix_set_matrix_element_single
procedure :: set_matrix_element_clone => &
state_matrix_set_matrix_element_clone
```

Set a value that corresponds to a quantum number array:

```
(State matrices: sub interfaces)+≡
module subroutine state_matrix_set_matrix_element_qn (state, qn, value)
class(state_matrix_t), intent(inout), target :: state
type(quantum_numbers_t), dimension(:), intent(in) :: qn
complex(default), intent(in) :: value
end subroutine state_matrix_set_matrix_element_qn

(State matrices: procedures)+≡
module subroutine state_matrix_set_matrix_element_qn (state, qn, value)
class(state_matrix_t), intent(inout), target :: state
type(quantum_numbers_t), dimension(:), intent(in) :: qn
complex(default), intent(in) :: value
type(state_iterator_t) :: it
if (.not. allocated (state%me)) then
allocate (state%me (size(qn)))
end if
call it%init (state)
call it%go_to_qn (qn)
call it%set_matrix_element (value)
end subroutine state_matrix_set_matrix_element_qn
```

Set all matrix elements to a single value

```
(State matrices: sub interfaces)+≡
module subroutine state_matrix_set_matrix_element_all (state, value)
class(state_matrix_t), intent(inout) :: state
complex(default), intent(in) :: value
end subroutine state_matrix_set_matrix_element_all

(State matrices: procedures)+≡
module subroutine state_matrix_set_matrix_element_all (state, value)
class(state_matrix_t), intent(inout) :: state
complex(default), intent(in) :: value
if (.not. allocated (state%me)) then
allocate (state%me (state%n_matrix_elements))
end if
state%me = value
```

```
end subroutine state_matrix_set_matrix_element_all
```

Set the matrix-element array directly.

*<State matrices: sub interfaces>+≡*

```
module subroutine state_matrix_set_matrix_element_array (state, value, range)
class(state_matrix_t), intent(inout) :: state
complex(default), intent(in), dimension(:) :: value
integer, intent(in), dimension(:), optional :: range
end subroutine state_matrix_set_matrix_element_array
```

*<State matrices: procedures>+≡*

```
module subroutine state_matrix_set_matrix_element_array (state, value, range)
class(state_matrix_t), intent(inout) :: state
complex(default), intent(in), dimension(:) :: value
integer, intent(in), dimension(:), optional :: range
if (present (range)) then
state%me(range) = value
else
if (.not. allocated (state%me)) &
allocate (state%me (size (value)))
state%me(:) = value
end if
end subroutine state_matrix_set_matrix_element_array
```

Set a matrix element at position i to value.

*<State matrices: sub interfaces>+≡*

```
pure module subroutine state_matrix_set_matrix_element_single (state, i, value)
class(state_matrix_t), intent(inout) :: state
integer, intent(in) :: i
complex(default), intent(in) :: value
end subroutine state_matrix_set_matrix_element_single
```

*<State matrices: procedures>+≡*

```
pure module subroutine state_matrix_set_matrix_element_single (state, i, value)
class(state_matrix_t), intent(inout) :: state
integer, intent(in) :: i
complex(default), intent(in) :: value
if (.not. allocated (state%me)) then
allocate (state%me (state%n_matrix_elements))
end if
state%me(i) = value
end subroutine state_matrix_set_matrix_element_single
```

Clone the matrix elements from another (matching) state matrix.

*<State matrices: sub interfaces>+≡*

```
module subroutine state_matrix_set_matrix_element_clone (state, state1)
class(state_matrix_t), intent(inout) :: state
type(state_matrix_t), intent(in) :: state1
end subroutine state_matrix_set_matrix_element_clone
```

*<State matrices: procedures>+≡*

```
module subroutine state_matrix_set_matrix_element_clone (state, state1)
class(state_matrix_t), intent(inout) :: state
type(state_matrix_t), intent(in) :: state1
```

```

if (.not. allocated (state1%me)) return
if (.not. allocated (state%me)) allocate (state%me (size (state1%me)))
state%me = state1%me
end subroutine state_matrix_set_matrix_element_clone

```

Add a value to a matrix element

```

<State matrices: state matrix: TBP>+≡
  procedure :: add_to_matrix_element => state_matrix_add_to_matrix_element

<State matrices: sub interfaces>+≡
  module subroutine state_matrix_add_to_matrix_element (state, qn, value, match_only_flavor)
    class(state_matrix_t), intent(inout), target :: state
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    complex(default), intent(in) :: value
    logical, intent(in), optional :: match_only_flavor
  end subroutine state_matrix_add_to_matrix_element

<State matrices: procedures>+≡
  module subroutine state_matrix_add_to_matrix_element (state, qn, value, match_only_flavor)
    class(state_matrix_t), intent(inout), target :: state
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    complex(default), intent(in) :: value
    logical, intent(in), optional :: match_only_flavor
    type(state_iterator_t) :: it
    call it%init (state)
    call it%go_to_qn (qn, match_only_flavor)
    if (it%is_valid ()) then
      call it%add_to_matrix_element (value)
    else
      call msg_fatal ("Cannot add to matrix element - it%node not allocated")
    end if
  end subroutine state_matrix_add_to_matrix_element

```

### 12.1.3 State iterators

Accessing the quantum state from outside is best done using a specialized iterator, i.e., a pointer to a particular branch of the quantum state trie. Technically, the iterator contains a pointer to a leaf node, but via parent pointers it allows to access the whole branch where the leaf is attached. For quick access, we also keep the branch depth (which is assumed to be universal for a quantum state).

```

<State matrices: public>+≡
  public :: state_iterator_t

<State matrices: types>+≡
  type :: state_iterator_t
  private
  integer :: depth = 0
  type(state_matrix_t), pointer :: state => null ()
  type(node_t), pointer :: node => null ()
  contains
  <State matrices: state iterator: TBP>
  end type state_iterator_t

```

The initializer: Point at the first branch. Note that this cannot be pure, thus not be elemental, because the iterator can be used to manipulate data in the state matrix.

```

<State matrices: state iterator: TBP>≡
  procedure :: init => state_iterator_init

<State matrices: sub interfaces>+≡
  module subroutine state_iterator_init (it, state)
    class(state_iterator_t), intent(out) :: it
    type(state_matrix_t), intent(in), target :: state
    end subroutine state_iterator_init

<State matrices: procedures>+≡
  module subroutine state_iterator_init (it, state)
    class(state_iterator_t), intent(out) :: it
    type(state_matrix_t), intent(in), target :: state
    it%state => state
    it%depth = state%depth
    if (state%is_defined ()) then
      it%node => state%root
      do while (associated (it%node%child_first))
        it%node => it%node%child_first
      end do
    else
      it%node => null ()
    end if
  end subroutine state_iterator_init

```

Go forward. Recursively programmed: if the next node does not exist, go back to the parent node and look at its successor (if present), etc.

There is a possible pitfall in the implementation: If the dummy pointer argument to the `find_next` routine is used directly, we still get the correct result for the iterator, but calling the recursion on `node%parent` means that we manipulate a parent pointer in the original state in addition to the iterator. Making a local copy of the pointer avoids this. Using pointer intent would be helpful, but we do not yet rely on this F2003 feature.

```

<State matrices: state iterator: TBP>+≡
  procedure :: advance => state_iterator_advance

<State matrices: sub interfaces>+≡
  module subroutine state_iterator_advance (it)
    class(state_iterator_t), intent(inout) :: it
    end subroutine state_iterator_advance

<State matrices: procedures>+≡
  module subroutine state_iterator_advance (it)
    class(state_iterator_t), intent(inout) :: it
    call find_next (it%node)
    contains
    recursive subroutine find_next (node_in)
      type(node_t), intent(in), target :: node_in
      type(node_t), pointer :: node
      node => node_in
      if (associated (node%next)) then
        node => node%next
      end if
    end subroutine find_next
  end subroutine state_iterator_advance

```

```

do while (associated (node%child_first))
node => node%child_first
end do
it%node => node
else if (associated (node%parent)) then
call find_next (node%parent)
else
it%node => null ()
end if
end subroutine find_next
end subroutine state_iterator_advance

```

If all has been scanned, the iterator is at an undefined state. Check for this:

```

<State matrices: state iterator: TBP>+≡
  procedure :: is_valid => state_iterator_is_valid

<State matrices: sub interfaces>+≡
  module function state_iterator_is_valid (it) result (defined)
  logical :: defined
  class(state_iterator_t), intent(in) :: it
  end function state_iterator_is_valid

<State matrices: procedures>+≡
  module function state_iterator_is_valid (it) result (defined)
  logical :: defined
  class(state_iterator_t), intent(in) :: it
  defined = associated (it%node)
  end function state_iterator_is_valid

```

Return the matrix-element index that corresponds to the current node

```

<State matrices: state iterator: TBP>+≡
  procedure :: get_me_index => state_iterator_get_me_index

<State matrices: sub interfaces>+≡
  module function state_iterator_get_me_index (it) result (n)
  integer :: n
  class(state_iterator_t), intent(in) :: it
  end function state_iterator_get_me_index

<State matrices: procedures>+≡
  module function state_iterator_get_me_index (it) result (n)
  integer :: n
  class(state_iterator_t), intent(in) :: it
  n = it%node%me_index
  end function state_iterator_get_me_index

```

Return the number of times this quantum-number state has been added (noting that it is physically inserted only the first time). Note that for each state, there is an array of counters.

```

<State matrices: state iterator: TBP>+≡
  procedure :: get_me_count => state_iterator_get_me_count

```

```

<State matrices: sub interfaces>+≡
  module function state_iterator_get_me_count (it) result (n)
    integer, dimension(:), allocatable :: n
    class(state_iterator_t), intent(in) :: it
  end function state_iterator_get_me_count

```

```

<State matrices: procedures>+≡
  module function state_iterator_get_me_count (it) result (n)
    integer, dimension(:), allocatable :: n
    class(state_iterator_t), intent(in) :: it
    if (allocated (it%node%me_count)) then
      allocate (n (size (it%node%me_count)))
      n = it%node%me_count
    else
      allocate (n (0))
    end if
  end function state_iterator_get_me_count

```

```

<State matrices: state iterator: TBP>+≡
  procedure :: get_depth => state_iterator_get_depth

```

```

<State matrices: sub interfaces>+≡
  pure module function state_iterator_get_depth (state_iterator) result (depth)
    integer :: depth
    class(state_iterator_t), intent(in) :: state_iterator
  end function state_iterator_get_depth

```

```

<State matrices: procedures>+≡
  pure module function state_iterator_get_depth (state_iterator) result (depth)
    integer :: depth
    class(state_iterator_t), intent(in) :: state_iterator
    depth = state_iterator%depth
  end function state_iterator_get_depth

```

Proceed to the state associated with the quantum numbers qn.

```

<State matrices: state iterator: TBP>+≡
  procedure :: go_to_qn => state_iterator_go_to_qn

```

```

<State matrices: sub interfaces>+≡
  module subroutine state_iterator_go_to_qn (it, qn, match_only_flavor)
    class(state_iterator_t), intent(inout) :: it
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    logical, intent(in), optional :: match_only_flavor
  end subroutine state_iterator_go_to_qn

```

```

<State matrices: procedures>+≡
  module subroutine state_iterator_go_to_qn (it, qn, match_only_flavor)
    class(state_iterator_t), intent(inout) :: it
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    logical, intent(in), optional :: match_only_flavor
    type(quantum_numbers_t), dimension(:), allocatable :: qn_hard, qn_tmp
    logical :: match_flg
    match_flg = .false.; if (present (match_only_flavor)) match_flg = .true.
    do while (it%is_valid ())
      if (match_flg) then
        qn_tmp = it%get_quantum_numbers ()

```

```

qn_hard = pack (qn_tmp, qn_tmp%are_hard_process ())
if (all (qn .fmatch. qn_hard)) then
return
else
call it%advance ()
end if
else
if (all (qn == it%get_quantum_numbers ())) then
return
else
call it%advance ()
end if
end if
end do
end subroutine state_iterator_go_to_qn

```

Use the iterator to retrieve quantum-number information:

```

<State matrices: state iterator: TBP>+≡
generic :: get_quantum_numbers => get_qn_multi, get_qn_slice, &
get_qn_range, get_qn_single
generic :: get_flavor => get_flv_multi, get_flv_slice, &
get_flv_range, get_flv_single
generic :: get_color => get_col_multi, get_col_slice, &
get_col_range, get_col_single
generic :: get_helicity => get_hel_multi, get_hel_slice, &
get_hel_range, get_hel_single

<State matrices: state iterator: TBP>+≡
procedure :: get_qn_multi => state_iterator_get_qn_multi
procedure :: get_qn_slice => state_iterator_get_qn_slice
procedure :: get_qn_range => state_iterator_get_qn_range
procedure :: get_qn_single => state_iterator_get_qn_single
procedure :: get_flv_multi => state_iterator_get_flv_multi
procedure :: get_flv_slice => state_iterator_get_flv_slice
procedure :: get_flv_range => state_iterator_get_flv_range
procedure :: get_flv_single => state_iterator_get_flv_single
procedure :: get_col_multi => state_iterator_get_col_multi
procedure :: get_col_slice => state_iterator_get_col_slice
procedure :: get_col_range => state_iterator_get_col_range
procedure :: get_col_single => state_iterator_get_col_single
procedure :: get_hel_multi => state_iterator_get_hel_multi
procedure :: get_hel_slice => state_iterator_get_hel_slice
procedure :: get_hel_range => state_iterator_get_hel_range
procedure :: get_hel_single => state_iterator_get_hel_single

```

These versions return the whole quantum number array

```

<State matrices: sub interfaces>+≡
module function state_iterator_get_qn_multi (it) result (qn)
class(state_iterator_t), intent(in) :: it
type(quantum_numbers_t), dimension(it%depth) :: qn
end function state_iterator_get_qn_multi
module function state_iterator_get_flv_multi (it) result (flv)
class(state_iterator_t), intent(in) :: it
type(flavor_t), dimension(it%depth) :: flv

```

```

end function state_iterator_get_flv_multi

end do
end do
end subroutine state_matrix_add_color_contractions

```

This procedure merges two state matrices of equal depth. For each quantum number (flavor, color, helicity), we take the entry from the first argument where defined, otherwise the second one. (If both are defined, we get an off-diagonal matrix.) The resulting trie combines the information of the input tries in all possible ways. Note that values are ignored, all values in the result are zero.

```

<State matrices: public>+≡

end subroutine merge_state_matrices

```

Multiply matrix elements from two state matrices. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

Note that the `dot_product` intrinsic function conjugates its first complex argument. This is intended for the c suffix case, but must be reverted for the plain-product case.

We provide analogous subroutines for just summing over state matrix entries. The `evaluate_sum` variant includes the state-matrix norm in the evaluation, the `evaluate_me_sum` takes into account just the matrix elements proper.

(State matrices: state matrix: TBP)+≡

```

procedure :: evaluate_product => state_matrix_evaluate_product

    end select
end subroutine outer_multiply_array
```

### 12.1.5 Factorization

In physical events, the state matrix is factorized into single-particle state matrices. This is essentially a measurement.

In a simulation, we select one particular branch of the state matrix with a probability that is determined by the matrix elements at the leaves. (This makes sense only if the state matrix represents a squared amplitude.) The selection is based on a (random) value  $x$  between 0 and one that is provided as the third argument.

For flavor and color, we select a unique value for each particle. For polarization, we have three options (modes). Option 1 is to drop helicity information altogether and sum over all diagonal helicities. Option 2 is to select a unique diagonal helicity in the same way as flavor and color. Option 3 is, for each

particle, to trace over all remaining helicities in order to obtain an array of independent single-particle helicity matrices.

Only branches that match the given quantum-number array `qn_in`, if present, are considered. For this array, color is ignored.

If the optional `correlated_state` is provided, it is assigned the correlated density matrix for the selected flavor-color branch, so multi-particle spin correlations remain available even if they are dropped in the single-particle density matrices. This should be done by the caller for the choice `FM_CORRELATED_HELICITY`, which otherwise is handled as `FM_IGNORE_HELICITY`.

The algorithm is as follows: First, we determine the normalization by summing over all diagonal matrix elements. In a second scan, we select one of the diagonal matrix elements by a cumulative comparison with the normalized random number. In the corresponding quantum number array, we undefine the helicity entries. Then, we scan the third time. For each branch that matches the selected quantum number array (i.e., definite flavor and color, arbitrary helicity), we determine its contribution to any of the single-particle state matrices. The matrix-element value is added if all other quantum numbers are diagonal, while the helicity of the chosen particle may be arbitrary; this helicity determines the branch in the single-particle state.

As a result, flavor and color quantum numbers are selected with the correct probability. Within this subset of states, each single-particle state matrix results from tracing over all other particles. Note that the single-particle state matrices are not normalized.

The flag `ok` is set to false if the matrix element sum is zero, so factorization is not possible. This can happen if an event did not pass cuts.

```

## Quantum-number matching

This feature allows us to check whether a given string of PDG values matches, in any ordering, any of the flavor combinations that the state matrix provides. We will also request the permutation of the successful match.

This type provides an account of the state's flavor content. We store all flavor combinations, as `pdg` values, in an array, assuming that the length is uniform.

We check only the entries selected by `mask_match`. Among those, only the entries selected by `mask_sort` are sorted and thus matched without respecting array element order. The entries that correspond to a true value in the associated `mask` are sorted. The mapping from the original state to the sorted state is given by the index array `map`.

```
<State matrices: public>+≡
  public :: state_flv_content_t

<State matrices: types>+≡
  type :: state_flv_content_t
  private
  integer, dimension(:,:), allocatable :: pdg
  integer, dimension(:,:), allocatable :: map
  logical, dimension(:), allocatable :: mask
```

```

```

Match a given flavor string against the flavor content. We sort the input string and check whether it matches any of the stored strings. If yes, return the mapping.

Only PDG entries under the preset mask are sorted before matching. The other entries must match exactly (i.e., without reordering). A zero entry matches anything. In any case, the length of the PDG string must be equal to the length  $d$  of the individual flavor-state entries.

Looks for flavor structures that only differ by a permutation of the masked flavors. The result is returned in form of a mask which is `.true.` at the positions of a duplicate flavor structure from the second encounter on. This routine implements the naive approach: We go through all flavor structures and compare each one with each preceding one. This works but is  $\mathcal{O}(n^2)$  in the number of flavor structures. Using a table to remember which flavor structure has already been encountered, it would be possible to find the duplicates in  $\mathcal{O}(n)$ .

```

## 12.2 Interactions

This module defines the `interaction_t` type. It is an extension of the `state_matrix_t` type.

The state matrix is a representation of a multi-particle density matrix. It implements all possible flavor, color, and quantum-number assignments of the entries in a generic density matrix, and it can hold a complex matrix element for each entry. (Note that this matrix can hold non-diagonal entries in color and helicity space.) The `interaction_t` object associates this with a list of momenta, such that the whole object represents a multi-particle state.

The `interaction_t` holds information about which particles are incoming, virtual (i.e., kept for the records), or outgoing. Each particle can be associated to a source within another interaction. This allows us to automatically fill those interaction momenta which have been computed or defined elsewhere. It also contains internal parent-child relations and flags for (virtual) particles which are to be treated as resonances.

A quantum-number mask array summarizes, for each particle within the interaction, the treatment of flavor, color, or helicity (expose or ignore). A list of locks states which particles are bound to have an identical quantum-number mask. This is useful when the mask is changed at one place.

```

Given an ordered list of quantum numbers (without any subtraction index) map this list to a state matrix, such that each list index corresponds to an index of a set of quantum numbers in the state matrix, hence, the matrix element.

The (unphysical) subtraction index is not a genuine quantum number and as such handled specially.

```

```

<Interactions: qn index map: TBP>
end type qn_index_map_t

```

Construct a mapping from interaction to an array of (sorted) quantum numbers.

We strip all non-elementary particles (like beam) from the quantum numbers which we retrieve from the interaction.

We consider helicity matrix elements only, when `qn_hel` is allocated. Else the helicity index is handled trivially as 1.

For the rescaling of the structure functions in the real subtraction and DGLAP components we need a mapping (initialized by `qn_index_map_init_sf`) from the real and born flavor structure indices to the structure function chain interaction matrix element with the correct initial state quantum numbers. This is stored in `sf_index_born` and `sf_index_real`. The array `index` is only needed for the initialisation of the Born and real index arrays and is therefore deallocated again.

### 12.2.1 External interaction links

Each particle in an interaction can have a link to a corresponding particle in another interaction. This allows to fetch the momenta of incoming or virtual particles from the interaction where they are defined. The link object consists of a pointer to the interaction and an index.

```
<Interactions: types>+≡  
  type :: external_link_t  
  private  
  type(interaction_t), pointer :: int => null ()  
  integer :: i  
  end type external_link_t
```

Set an external link.

```
<Interactions: sub interfaces>+≡  
  module subroutine external_link_set (link, int, i)  
    type(external_link_t), intent(out) :: link  
    type(interaction_t), target, intent(in) :: int  
    integer, intent(in) :: i  
  end subroutine external_link_set
```

```
<Interactions: procedures>+≡  
  module subroutine external_link_set (link, int, i)  
    type(external_link_t), intent(out) :: link  
    type(interaction_t), target, intent(in) :: int  
    integer, intent(in) :: i  
    if (i /= 0) then  
      link%int => int  
      link%i = i  
    end if  
  end subroutine external_link_set
```

Reassign an external link to a new interaction (which should be an image of the original target).

```
<Interactions: sub interfaces>+≡  
  module subroutine external_link_reassign (link, int_src, int_target)  
    type(external_link_t), intent(inout) :: link  
    type(interaction_t), intent(in) :: int_src  
    type(interaction_t), intent(in), target :: int_target  
  end subroutine external_link_reassign
```

```
<Interactions: procedures>+≡  
  module subroutine external_link_reassign (link, int_src, int_target)  
    type(external_link_t), intent(inout) :: link  
    type(interaction_t), intent(in) :: int_src  
    type(interaction_t), intent(in), target :: int_target  
    if (associated (link%int)) then  
      if (link%int%tag == int_src%tag) link%int => int_target  
    end if  
  end subroutine external_link_reassign
```

Return true if the link is set

```
<Interactions: sub interfaces>+≡
```

```

module function external_link_is_set (link) result (flag)
logical :: flag
type(external_link_t), intent(in) :: link
end function external_link_is_set

```

*<Interactions: procedures>+≡*

```

module function external_link_is_set (link) result (flag)
logical :: flag
type(external_link_t), intent(in) :: link
flag = associated (link%int)
end function external_link_is_set

```

Return the interaction pointer.

*<Interactions: public>+≡*

```

public :: external_link_get_ptr

```

*<Interactions: sub interfaces>+≡*

```

module function external_link_get_ptr (link) result (int)

```

*<Interactions: procedures>+≡*

```

module function external_link_get_index (link) result (i)
integer :: i
type(external_link_t), intent(in) :: link
i = link%i
end function external_link_get_index

```

Return a pointer to the momentum of the corresponding particle. If there is no association, return a null pointer.

*<Interactions: sub interfaces>+≡*

```

module function external_link_get_momentum_ptr (link) result (p)
type(vector4_t), pointer :: p
type(external_link_t), intent(in) :: link
end function external_link_get_momentum_ptr

```

```

<Interactions: procedures>+=
  module function external_link_get_momentum_ptr (link) result (p)
    type(vector4_t), pointer :: p
    type(external_link_t), intent(in) :: link
    if (associated (link%int)) then
      p => link%int%p(link%i)
    else
      p => null ()
    end if
  end function external_link_get_momentum_ptr

```

### 12.2.2 Internal relations

In addition to the external links, particles within the interaction have parent-child relations. Here, more than one link is possible, and we set up an array.

```

<Interactions: types>+=
  type :: internal_link_list_t
  private
  integer :: length = 0
  integer, dimension(:), allocatable :: link
  contains
  <Interactions: internal link list: TBP>
  end type internal_link_list_t

```

Output, non-advancing.

```

<Interactions: internal link list: TBP>=
  procedure :: write => internal_link_list_write

<Interactions: sub interfaces>+=
  module subroutine internal_link_list_write (object, unit)
    class(internal_link_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine internal_link_list_write

<Interactions: procedures>+=
  module subroutine internal_link_list_write (object, unit)
    class(internal_link_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    do i = 1, object%length
      write (u, "(1x,I0)", advance="no") object%link(i)
    end do
  end subroutine internal_link_list_write

```

Append an item. Start with an array size of 2 and double the size if necessary.

Make sure that the indices are stored in ascending order. To this end, shift the existing entries right, starting from the end, as long as they are larger than the new entry.

```

<Interactions: internal link list: TBP>+=
  procedure :: append => internal_link_list_append

```

*<Interactions: sub interfaces>+≡*

```
module subroutine internal_link_list_append (link_list, link)
class(internal_link_list_t), intent(inout) :: link_list
integer, intent(in) :: link
end subroutine internal_link_list_append
```

*<Interactions: procedures>+≡*

```
module subroutine internal_link_list_append (link_list, link)
class(internal_link_list_t), intent(inout) :: link_list
integer, intent(in) :: link
integer :: l, j
integer, dimension(:), allocatable :: tmp
l = link_list%length
if (allocated (link_list%link)) then
if (l == size (link_list%link)) then
allocate (tmp (2 * l))
tmp(:l) = link_list%link
call move_alloc (from = tmp, to = link_list%link)
end if
else
allocate (link_list%link (2))
end if
link_list%link(l+1) = link

if (i <= link_list%length) then
link = link_list%link(i)
else
call msg_bug ("Internal link list: out of bounds")
end if
end function internal_link_list_get_link

```

### 12.2.3 The interaction type

An interaction is an entangled system of particles. Thus, the interaction object consists of two parts: the subevent, and the quantum state which technically is a trie. The subnode levels beyond the trie root node are in correspondence to the subevent, so both should be traversed in parallel.

The subevent is implemented as an allocatable array of four-momenta. The first **n\_in** particles are incoming, **n\_vir** particles in-between can be kept for bookkeeping, and the last **n\_out** particles are outgoing.

Distinct interactions are linked by their particles: for each particle, we have the possibility of links to corresponding particles in other interactions. Furthermore, for bookkeeping purposes we have a self-link array **relations** where the parent-child relations are kept, and a flag array **resonant** which is set for an intermediate resonance.

Each momentum is associated with masks for flavor, color, and helicity. If a mask entry is set, the associated quantum number is to be ignored for that particle. If any mask has changed, the flag **update** is set.

We can have particle pairs locked together. If this is the case, the corresponding mask entries are bound to be equal. This is useful for particles that go through the interaction.

The interaction tag serves bookkeeping purposes. In particular, it identifies links in printout.

```

<Interactions: public>+≡
  public :: interaction_t

<Interactions: types>+≡
  type :: interaction_t
  private
  integer :: tag = 0
  type(state_matrix_t) :: state_matrix
  integer :: n_in = 0
  integer :: n_vir = 0
  integer :: n_out = 0
  integer :: n_tot = 0
  logical, dimension(:), allocatable :: p_is_known
  type(vector4_t), dimension(:), allocatable :: p
  type(external_link_t), dimension(:), allocatable :: source
  type(internal_link_list_t), dimension(:), allocatable :: parents
  type(internal_link_list_t), dimension(:), allocatable :: children
  logical, dimension(:), allocatable :: resonant
  type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
  integer, dimension(:), allocatable :: hel_lock
  logical :: update_state_matrix = .false.
  logical :: update_values = .false.
  type(qn_index_map_t) :: qn_index
  contains
  <Interactions: interaction: TBP>
  end type interaction_t

```

Initialize the particle array with a fixed size. The first `n_in` particles are incoming, the rest outgoing. Masks are optional. There is also an optional tag. The interaction still needs fixing the values, but that is to be done after all branches have been added.

Interaction tags are assigned consecutively, using a `saved` variable local to this procedure. If desired, we can provide a seed for the interaction tags. Such a seed should be positive. The default seed is one. `tag=0` indicates an empty interaction.

If `set_relations` is set and true, we establish parent-child relations for all incoming and outgoing particles. Virtual particles are skipped; this option is normally used only for interactions without virtual particles.

```

<Interactions: interaction: TBP>≡
  procedure :: basic_init => interaction_init

<Interactions: sub interfaces>+≡
  module subroutine interaction_init &
    (int, n_in, n_vir, n_out, &
    tag, resonant, mask, hel_lock, set_relations, store_values)
  class(interaction_t), intent(out) :: int
  integer, intent(in) :: n_in, n_vir, n_out
  integer, intent(in), optional :: tag

```

```

## 12.2.4 Methods inherited from the state matrix member

Until F2003 is standard, we cannot implement inheritance directly. Therefore, we need wrappers for “inherited” methods.

Make a new branch in the state matrix if it does not yet exist. This is not just a wrapper but it introduces the interaction mask: where a quantum number is masked, it is not transferred but set undefined. After this, the value array has to be updated.

```

<Interactions: interaction: TBP>+≡

```

### 12.2.7 Handling Linked interactions

Store relations between corresponding particles within one interaction. The first particle is the parent, the second one the child. Links are established in both directions.

These relations have no effect on the propagation of momenta etc., they are rather used for mother-daughter relations in event output.

```

<Interactions: interaction: TBP>+≡
  procedure :: relate => interaction_relate

<Interactions: sub interfaces>+≡
  module subroutine interaction_relate (int, i1, i2)
  class(interaction_t), intent(inout), target :: int
  integer, intent(in) :: i1, i2
  end subroutine interaction_relate

<Interactions: procedures>+≡
  module subroutine interaction_relate (int, i1, i2)
  class(interaction_t), intent(inout), target :: int
  integer, intent(in) :: i1, i2
  if (i1 /= 0 .and. i2 /= 0) then
  call int%children(i1)%append (i2)
  call int%parents(i2)%append (i1)
  end if
  end subroutine interaction_relate

```

Transfer internal parent-child relations defined within interaction `int1` to a new interaction `int` where the particle indices are mapped to. Some particles in `int1` may have no image in `int`. In that case, a child entry maps to zero, and we skip this relation.

Also transfer resonance flags.

```

<Interactions: interaction: TBP>+≡
  procedure :: transfer_relations => interaction_transfer_relations

```

```

<Interactions: sub interfaces>+≡
  module subroutine interaction_transfer_relations (int1, int2, map)
    class(interaction_t), intent(in) :: int1
    class(interaction_t), intent(inout), target :: int2
    integer, dimension(:), intent(in) :: map
  end subroutine interaction_transfer_relations

<Interactions: procedures>+≡
  module subroutine interaction_transfer_relations (int1, int2, map)
    class(interaction_t), intent(in) :: int1
    class(interaction_t), intent(inout), target :: int2
    integer, dimension(:), intent(in) :: map
    integer :: i, j, k
    do i = 1, size (map)
      do j = 1, int1%parents(i)%get_length ()
        k = int1%parents(i)%get_link (j)
        call int2%relate (map(k), map(i))
      end do
      if (map(i) /= 0) then
        int2%resonant(map(i)) = int1%resonant(i)
      end if
    end do
  end subroutine interaction_transfer_relations

```

Make up internal parent-child relations for the particle(s) that are connected to a new interaction `int`.

If `resonant` is defined and true, the connections are marked as resonant in the result interaction. Also, the children of the resonant connections are untagged if they were tagged with hard-interaction flags previously.

```

<Interactions: interaction: TBP>+≡
  procedure :: relate_connections => interaction_relate_connections

<Interactions: sub interfaces>+≡
  module subroutine interaction_relate_connections &
    (int, int_in, connection_index, &

end subroutine interaction_declare_subtraction

```

### 12.2.8 Recovering connections

When creating an evaluator for two interactions, we have to know by which particles they are connected. The connection indices can be determined if we have two linked interactions. We assume that `int1` is the source and `int2` the target, so the connections of interest are stored within `int2`. A connection is found if either the source is `int1`, or the (ultimate) source of a particle within `int2` coincides with the (ultimate) source of a particle within `int1`. The result is an array of index pairs.

To make things simple, we scan the interaction twice, once for counting hits, then allocate the array, then scan again and store the connections.

The connections are scanned for `int2`, which has sources in `int1`. It may happen that the order of connections is interchanged (crossed). We require the indices in `int1` to be sorted, so we reorder both index arrays correspondingly before returning them. (After this, the indices in `int2` may be out of order.)

```

<Interactions: public>+≡
public :: find_connections

## 12.3 Matrix element evaluation

The `evaluator_t` type is an extension of the `interaction_t` type. It represents either a density matrix as the square of a transition matrix element, or the product of two density matrices. Usually, some quantum numbers are summed over in the result.

The `interaction_t` subobject represents a multi-particle interaction with incoming, virtual, and outgoing particles and the associated (not necessarily diagonal) density matrix of quantum state. When the evaluator is initialized, this interaction is constructed from the input `interaction(s)`.

In addition, the initialization process sets up a multiplication table. For each matrix element of the result, it states which matrix elements are to be taken from the input `interaction(s)`, multiplied (optionally, with an additional weight factor) and summed over.

Eventually, to a processes we associate a chain of evaluators which are to be evaluated sequentially. The physical event and its matrix element value(s) can be extracted from the last evaluator in such a chain.

Evaluators are constructed only once (as long as this is possible) during an initialization step. Then, for each event, momenta are computed and transferred among evaluators using the links within the interaction subobject. The multiplication tables enable fast evaluation of the result without looking at quantum numbers anymore.

```

### 12.3.1 Array of pairings

The evaluator contains an array of `pairing_array` objects. This makes up the multiplication table.

Each pairing array contains two lists of matrix element indices and a list of numerical factors. The matrix element indices correspond to the input interactions. The corresponding matrix elements are to be multiplied and optionally multiplied by a factor. The results are summed over to yield one specific matrix element of the result evaluator.

```

<Evaluators: types>≡
  type :: pairing_array_t
    integer, dimension(:), allocatable :: i1, i2
    complex(default), dimension(:), allocatable :: factor
  end type pairing_array_t

  <Evaluators: sub interfaces>≡
    elemental module subroutine pairing_array_init (pa, n, has_i2, has_factor)

end if
end subroutine pairing_array_write

```

### 12.3.2 The evaluator type

Possible variants of evaluators:

```

<Evaluators: parameters>≡
integer, parameter :: &
EVAL_UNDEFINED = 0, &
EVAL_PRODUCT = 1, &
EVAL_SQUARED_FLOWS = 2, &
EVAL_SQUARE_WITH_COLOR_FACTORS = 3, &
EVAL_COLOR_CONTRACTION = 4, &
EVAL_IDENTITY = 5, &
EVAL_QN_SUM = 6

```

The evaluator type contains the result interaction and an array of pairing lists, one for each matrix element in the result interaction.

```

(Evaluators: public)+≡
  public :: evaluator_t

(Evaluators: types)+≡
  type, extends (interaction_t) :: evaluator_t
  private
  integer :: type = EVAL_UNDEFINED
  class(interaction_t), pointer :: int_in1 => null ()
  class(interaction_t), pointer :: int_in2 => null ()
  type(pairing_array_t), dimension(:), allocatable :: pairing_array
  contains
  (Evaluators: evaluator: TBP)
  end type evaluator_t

```

Output.

```

(Evaluators: evaluator: TBP)≡
  procedure :: write => evaluator_write

### 12.3.3 Auxiliary structures for evaluator creation

Creating an evaluator that properly handles all quantum numbers requires some bookkeeping. In this section, we define several auxiliary types and methods that

organize and simplify this task. More structures are defined within the specific initializers (as local types and internal subroutines).

These types are currently implemented in a partial object-oriented way: We define some basic methods for initialization etc. here, but the evaluator routines below do access their internals as well. This simplifies some things such as index addressing using array slices, at the expense of losing some clarity.

## Index mapping

Index mapping are abundant when constructing an evaluator. To have arrays of index mappings, we define this:

```

(Evaluators: types)+≡
  type :: index_map_t
  integer, dimension(:), allocatable :: entry
end type index_map_t

(Evaluators: sub interfaces)+≡
  elemental module subroutine index_map_init (map, n)
  type(index_map_t), intent(out) :: map
  integer, intent(in) :: n
end subroutine index_map_init

(Evaluators: procedures)+≡
  elemental module subroutine index_map_init (map, n)
  type(index_map_t), intent(out) :: map
  integer, intent(in) :: n
  allocate (map%entry (n))
  map%entry = 0
end subroutine index_map_init

(Evaluators: procedures)+≡
  function index_map_exists (map) result (flag)
  logical :: flag
  type(index_map_t), intent(in) :: map
  flag = allocated (map%entry)
end function index_map_exists

(Evaluators: interfaces)+≡
  interface size
  module procedure index_map_size
end interface

(Evaluators: sub interfaces)+≡
  module function index_map_size (map) result (s)
  integer :: s
  type(index_map_t), intent(in) :: map
end function index_map_size

(Evaluators: procedures)+≡
  module function index_map_size (map) result (s)
  integer :: s
  type(index_map_t), intent(in) :: map
  if (allocated (map%entry)) then

```

```

s = size (map%entry)
else
s = 0
end if
end function index_map_size

<Evaluators: interfaces>+≡
interface assignment(=)
module procedure index_map_assign_int
module procedure index_map_assign_array
end interface

<Evaluators: sub interfaces>+≡
elemental module subroutine index_map_assign_int (map, ival)
type(index_map_t), intent(inout) :: map
integer, intent(in) :: ival
end subroutine index_map_assign_int
module subroutine index_map_assign_array (map, array)
type(index_map_t), intent(inout) :: map
integer, dimension(:), intent(in) :: array
end subroutine index_map_assign_array

<Evaluators: procedures>+≡
elemental module subroutine index_map_assign_int (map, ival)
type(index_map_t), intent(inout) :: map
integer, intent(in) :: ival
map%entry = ival
end subroutine index_map_assign_int

module subroutine index_map_assign_array (map, array)
type(index_map_t), intent(inout) :: map
integer, dimension(:), intent(in) :: array
map%entry = array
end subroutine index_map_assign_array

<Evaluators: sub interfaces>+≡
elemental module subroutine index_map_set_entry (map, i, ival)

type(index_map_t), intent(in) :: map
integer, intent(in) :: i
ival = map%entry(i)
end function index_map_get_entry

```

## Index mapping (two-dimensional)

This is a variant with a square matrix instead of an array.

```

<Evaluators: types>+≡
type :: index_map2_t
integer :: s = 0
integer, dimension(:,:), allocatable :: entry
end type index_map2_t

```

```

<Evaluators: procedures>+≡
elemental subroutine index_map2_init (map, n)
type(index_map2_t), intent(out) :: map
integer, intent(in) :: n
map%s = n
allocate (map%entry (n, n))
end subroutine index_map2_init

```

```

<Evaluators: procedures>+≡
function index_map2_exists (map) result (flag)
logical :: flag
type(index_map2_t), intent(in) :: map
flag = allocated (map%entry)
end function index_map2_exists

```

```

<Evaluators: interfaces>+≡
interface size
module procedure index_map2_size
end interface

```

```

<Evaluators: sub interfaces>+≡
module function index_map2_size (map) result (s)
integer :: s
type(index_map2_t), intent(in) :: map
end function index_map2_size

```

```

<Evaluators: procedures>+≡
module function index_map2_size (map) result (s)
integer :: s
type(index_map2_t), intent(in) :: map
s = map%s
end function index_map2_size

```

```

<Evaluators: interfaces>+≡
  interface assignment(=)
    module procedure index_map2_assign_int
  end interface

<Evaluators: sub interfaces>+≡
  elemental module subroutine index_map2_assign_int (map, ival)
    type(index_map2_t), intent(inout) :: map
    integer, intent(in) :: ival
  end subroutine index_map2_assign_int

<Evaluators: procedures>+≡
  elemental module subroutine index_map2_assign_int (map, ival)
    type(index_map2_t), intent(inout) :: map
    integer, intent(in) :: ival
    map%entry = ival
  end subroutine index_map2_assign_int

<Evaluators: procedures>+≡
  elemental subroutine index_map2_set_entry (map, i, j, ival)
    type(index_map2_t), intent(inout) :: map
    integer, intent(in) :: i, j
    integer, intent(in) :: ival
    map%entry(i,j) = ival
  end subroutine index_map2_set_entry

<Evaluators: procedures>+≡
  elemental function index_map2_get_entry (map, i, j) result (ival)
    integer :: ival
    type(index_map2_t), intent(in) :: map
    integer, intent(in) :: i, j
    ival = map%entry(i,j)
  end function index_map2_get_entry

```

## Auxiliary structures: particle mask

This is a simple container of a logical array.

```

<Evaluators: types>+≡
  type :: prt_mask_t
    logical, dimension(:), allocatable :: entry
  end type prt_mask_t

<Evaluators: procedures>+≡
  subroutine prt_mask_init (mask, n)
    type(prt_mask_t), intent(out) :: mask
    integer, intent(in) :: n
    allocate (mask%entry (n))
  end subroutine prt_mask_init

```

```

⟨Evaluators: interfaces⟩+≡
  interface size
  module procedure prt_mask_size
  end interface

```

```

⟨Evaluators: sub interfaces⟩+≡
  module function prt_mask_size (mask) result (s)
    integer :: s
    type(prt_mask_t), intent(in) :: mask
  end function prt_mask_size

```

```

⟨Evaluators: procedures⟩+≡
  module function prt_mask_size (mask) result (s)
    integer :: s
    type(prt_mask_t), intent(in) :: mask
    s = size (mask%entry)
  end function prt_mask_size

```

## Quantum number containers

Trivial transparent containers:

```

⟨Evaluators: types⟩+≡
  type :: qn_list_t
  type(quantum_numbers_t), dimension(:,:), allocatable :: qn
end type qn_list_t

  type :: qn_mask_array_t
  type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
end type qn_mask_array_t

```

## Auxiliary structures: connection entries

This type is used as intermediate storage when computing the product of two evaluators or the square of an evaluator. The quantum-number array **qn** corresponds to the particles common to both interactions, but irrelevant quantum numbers (color) masked out. The index arrays **index\_in** determine the entries in the input interactions that contribute to this connection. **n\_index** is the size of these arrays, and **count** is used while filling the entries. Finally, the quantum-number arrays **qn\_in\_list** are the actual entries in the input interaction that contribute. In the product case, they exclude the connected quantum numbers.

Each evaluator has its own **connection\_table** which contains an array of **connection\_entry** objects, but also has stuff that specifically applies to the evaluator type. Hence, we do not generalize the **connection\_table\_t** type.

The filling procedure **connection\_entry\_add\_state** is specific to the various evaluator types.

```

⟨Evaluators: types⟩+≡
  type :: connection_entry_t
  type(quantum_numbers_t), dimension(:), allocatable :: qn_conn
  integer, dimension(:), allocatable :: n_index
  integer, dimension(:), allocatable :: count

```

```

type(index_map_t), dimension(:), allocatable :: index_in
type(qn_list_t), dimension(:), allocatable :: qn_in_list
end type connection_entry_t

```

*(Evaluators: procedures)*+≡

```

subroutine connection_entry_init &
(entry, n_count, n_map, qn_conn, count, n_rest)
type(connection_entry_t), intent(out) :: entry
integer, intent(in) :: n_count, n_map
type(quantum_numbers_t), dimension(:), intent(in) :: qn_conn
integer, dimension(n_count), intent(in) :: count
integer, dimension(n_count), intent(in) :: n_rest
integer :: i
allocate (entry%qn_conn (size (qn_conn)))
allocate (entry%n_index (n_count))
allocate (entry%count (n_count))
allocate (entry%index_in (n_map))
allocate (entry%qn_in_list (n_count))
entry%qn_conn = qn_conn
entry%n_index = count
entry%count = 0
if (size (entry%index_in) == size (count)) then
call index_map_init (entry%index_in, count)
else
call index_map_init (entry%index_in, count(1))
end if
do i = 1, n_count
allocate (entry%qn_in_list(i)%qn (n_rest(i), count(i)))
end do
end subroutine connection_entry_init

```

*(Evaluators: procedures)*+≡

```

subroutine connection_entry_write (entry, unit)
type(connection_entry_t), intent(in) :: entry
integer, intent(in), optional :: unit
integer :: i, j
integer :: u
u = given_output_unit (unit)
call quantum_numbers_write (entry%qn_conn, unit)
write (u, *)
do i = 1, size (entry%n_index)
write (u, *) "Input interaction", i
do j = 1, entry%n_index(i)
if (size (entry%n_index) == size (entry%index_in)) then
write (u, "(2x,I0,4x,I0,2x)", advance = "no") &
j, index_map_get_entry (entry%index_in(i), j)
else
write (u, "(2x,I0,4x,I0,2x,I0,2x)", advance = "no") &
j, index_map_get_entry (entry%index_in(1), j), &
index_map_get_entry (entry%index_in(2), j)
end if
call quantum_numbers_write (entry%qn_in_list(i)%qn(:,j), unit)
write (u, *)

```

```

end do
end do
end subroutine connection_entry_write

```

These are the different connection tables for the three different cases of evaluators for matrix elements, squared diagonal and non-diagonal matrix elements, respectively.

*(Evaluators: types)+≡*

```

type :: connection_table_t
integer :: n_conn = 0
integer, dimension(2) :: n_rest = 0
integer :: n_tot = 0
integer :: n_me_conn = 0
type(state_matrix_t) :: state
type(index_map_t), dimension(:), allocatable :: index_conn
type(connection_entry_t), dimension(:), allocatable :: entry
type(index_map_t) :: index_result
end type connection_table_t

type :: connection_table_diag_t
integer :: n_tot = 0
integer :: n_me_conn = 0
type(state_matrix_t) :: state
type(index_map_t) :: index_conn
type(connection_entry_t), dimension(:), allocatable :: entry
type(index_map_t) :: index_result
end type connection_table_diag_t

type :: connection_table_nondiag_t
integer :: n_tot = 0
integer :: n_me_conn = 0
type(state_matrix_t) :: state
type(index_map2_t) :: index_conn
type(connection_entry_t), dimension(:), allocatable :: entry
type(index_map_t) :: index_result
end type connection_table_nondiag_t

```

## Color handling

For managing color-factor computation, we introduce this local type. The `index` is the index in the color table that corresponds to a given matrix element index in the input interaction. The `col` array stores the color assignments in rows. The `factor` array associates a complex number with each pair of arrays in the color table. The `factor_is_known` array reveals whether a given factor is known already or still has to be computed.

*(Evaluators: types)+≡*

```

type :: color_table_t
integer, dimension(:), allocatable :: index
type(color_t), dimension(:, :), allocatable :: col
logical, dimension(:, :), allocatable :: factor_is_known
complex(default), dimension(:, :), allocatable :: factor

```

```
end type color_table_t
```

This is the initializer. We extract the color states from the given state matrices, establish index mappings between the two states (implemented by the array `me_index`), make an array of color states, and initialize the color-factor table. The latter is two-dimensional (includes interference) and not yet filled.

```
(Evaluators: procedures)+≡
subroutine color_table_init (color_table, state, n_tot)
type(color_table_t), intent(out) :: color_table
type(state_matrix_t), intent(in) :: state
integer, intent(in) :: n_tot
type(state_iterator_t) :: it
type(quantum_numbers_t), dimension(:), allocatable :: qn
type(state_matrix_t) :: state_col
integer :: index, n_col_state
allocate (color_table%index (state%get_n_matrix_elements ()))
color_table%index = 0
allocate (qn (n_tot))
call state_col%init ()
call it%init (state)

end do
end do
end if
end subroutine color_table_write

```

This subroutine sets color factors, based on information from the hard matrix element: the list of pairs of color-flow indices (in the basis of the matrix element code), the list of corresponding factors, and the list of mappings from the matrix element index in the input interaction to the color-flow index in the hard matrix element object.

We first determine the mapping of color-flow indices from the hard matrix element code to the current color table. The mapping could be nontrivial because the latter is derived from iterating over a state matrix, which may return states in non-canonical order. The translation table can be determined because we have, for the complete state matrix, both the mapping to the hard interaction (the input `col_index_hi`) and the mapping to the current color table (the component `color_table%index`).

Once this mapping is known, we scan the list of index pairs `color_flow_index` and translate them to valid color-table index pairs. For this pair, the color factor is set using the corresponding entry in the list `col_factor`.

*(Evaluators: procedures)+≡*

```

subroutine color_table_set_color_factors (color_table, &
col_flow_index, col_factor, col_index_hi)

integer :: n_cflow
integer :: hi_index, me_index, ct_index, cf_index
integer, dimension(2) :: hi_index_pair, ct_index_pair
n_cflow = size (col_index_hi)
if (size (color_table%index) /= n_cflow) &
call msg_bug ("Mismatch between hard matrix element and color table")
allocate (hi_to_ct (n_cflow))
do me_index = 1, size (color_table%index)
ct_index = color_table%index(me_index)
hi_index = col_index_hi(me_index)
hi_to_ct(hi_index) = ct_index

```

```

end do
do cf_index = 1, size (col_flow_index, 2)
hi_index_pair = col_flow_index(:,cf_index)
ct_index_pair = hi_to_ct(hi_index_pair)
color_table%factor(ct_index_pair(1), ct_index_pair(2)) = &
col_factor(cf_index)
color_table%factor_is_known(ct_index_pair(1), ct_index_pair(2)) = .true.
end do
end subroutine color_table_set_color_factors

```

This function returns a color factor, given two indices which point to the matrix elements of the initial state matrix. Internally, we can map them to the corresponding indices in the color table. As a side effect, we store the color factor in the color table for later lookup. (I.e., this function is impure.)

*(Evaluators: procedures)+≡*

```

color_table%factor_is_known(i1,i2) = .true.
end if
end function color_table_get_color_factor

```

### 12.3.4 Creating an evaluator: Matrix multiplication

The evaluator for matrix multiplication is the most complicated variant.

The initializer takes two input interactions and constructs the result evaluator, which consists of the interaction and the multiplication table for the product (or convolution) of the two. Normally, the input interactions are connected by one or more common particles (e.g., decay, structure function convolution).

In the result interaction, quantum numbers of the connections can be summed over. This is determined by the `qn_mask_conn` argument. The `qn_mask_rest` argument is its analog for the other particles within the result interaction. (E.g., for the trace of the state matrix, all quantum numbers are summed over.)

Finally, the `connections_are_resonant` argument tells whether the connecting particles should be marked as resonant in the final event record. If true, this also implies that the second interaction is not the hard process, so any corresponding tags should be removed from the outgoing particles. This applies to decays.

The algorithm consists of the following steps:

1. **find\_connections**: Find the particles which are connected, i.e., common to both input interactions. Either they are directly linked, or both are linked to a common source.
2. **compute\_index\_bounds\_and\_mappings**: Compute the mappings of particle indices from the input interactions to the result interaction. There is a separate mapping for the connected particles.
3. **accumulate\_connected\_states**: Create an auxiliary state matrix which lists the possible quantum numbers for the connected particles. When building this matrix, count the number of times each assignment is contained in any of the input states and, for each of the input states, record the index of the matrix element within the new state matrix. For the connected particles, reassign color indices such that no color state is present twice in different color-index assignment. Note that helicity assignments of the connected state can be (and will be) off-diagonal, so no spin correlations are lost in decays.

Do this for both input interactions.

4. **allocate\_connection\_entries**: Allocate a table of connections. Each table row corresponds to one state in the auxiliary matrix, and to multiple states of the input interactions. It collects all states of the unconnected particles in the two input interactions that are associated with the particular state (quantum-number assignment) of the connected particles.
5. **fill\_connection\_table**: Fill the table of connections by scanning both input interactions. When copying states, reassign color indices for the unconnected particles such that they match between all involved particle sets (interaction 1, interaction 2, and connected particles).
6. **make\_product\_interaction**: Scan the table of connections we have just built. For each entry, construct all possible pairs of states of the unconnected particles and combine them with the specific connected-particle state. This is a possible quantum-number assignment of the result interaction. Now mask all quantum numbers that should be summed over, and append this to the result state matrix. Record the matrix element index of the result. We now have the result interaction.
7. **make\_pairing\_array**: First allocate the pairing array with the number of entries of the result interaction. Then scan the table of connections again. For each entry, record the indices of the matrix elements which have to be multiplied and summed over in order to compute this particular matrix element. This makes up the multiplication table.
8. **record\_links**: Transfer all source pointers from the input interactions to the result interaction. Do the same for the internal parent-child relations and resonance assignments. For the connected particles, make up appropriate additional parent-child relations. This allows for fetching momenta from other interactions when a new event is filled, and to reconstruct the event history when the event is analyzed.

After all this is done, for each event, we just have to evaluate the pairing arrays (multiplication tables) in order to compute the result matrix elements in their proper positions. The quantum-number assignments remain fixed from now on.

```

```

### Color-summed squared matrix (diagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. The mask must be such that off-diagonal matrix elements are excluded.

If `color_flows` is set, the evaluator keeps color-flow entries separate and drops all interfering color structures. The color factors are set to unity in this case.

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to multiplication, with a few notable differences:

1. The connected particles are known, the correspondence is one-to-one. All particles are connected, and the mapping of indices is trivial, which simplifies the following steps.
2. `accumulate_connected_states`: The matrix of connected states encompasses all particles, but color indices are removed. However, ghost states are still kept separate from physical color states. No color-index reassignment is necessary.
3. The table of connections contains single index and quantum-number arrays instead of pairs of them. They are paired with themselves in all possible ways.
4. `make_squared_interaction`: Now apply the predefined quantum-numbers mask, which usually collects all color states (physical and ghosts), and possibly a helicity sum.
5. `make_pairing_array`: For each pair of input states, compute the color factor (including a potential ghost-parity sign) and store this in the pairing array together with the matrix-element indices for multiplication.
6. `record_links`: This is again trivial due to the one-to-one correspondence.

### Color-summed squared matrix (support nodiagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. Unless requested otherwise by the quantum-number mask, the result contains off-diagonal matrix elements. (The input interaction must be diagonal since it represents an amplitude, not a density matrix.)

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to the previous one, with some additional complications due to the necessity to loop over two helicity indices.

### Copy with additional contracted color states

This evaluator involves no square or multiplication, its matrix elements are just copies of the (single) input interaction. However, the state matrix of the interaction contains additional states that have color indices contracted. This is used for copies of the beam or structure-function interactions that need to match the hard interaction also in the case where its color indices coincide.

```

### Auxiliary procedure for initialization

This will become a standard procedure in F2008. The result is true if the number of true values in the mask is odd. We use the function for determining the ghost parity of a quantum-number array.

[tho:] It's not used anymore and `mod (count (mask), 2) == 1` is a cooler implementation anyway.

```

<(UNUSED) Evaluators: procedures>≡
function parity (mask)
logical :: parity
logical, dimension(:) :: mask
integer :: i
parity = .false.
do i = 1, size (mask)
if (mask(i)) parity = .not. parity
end do
end function parity

### 12.3.6 Creating an evaluator: identity

The identity evaluator creates a copy of the first input evaluator; the second input is not used.

All particles link back to the input evaluator and the internal relations are copied. As evaluation does take a shortcut by cloning the matrix elements, the pairing array is not used and does not have to be set up.

```

<Evaluators: evaluator: TBP>+≡
  procedure :: init_identity => evaluator_init_identity

<Evaluators: sub interfaces>+≡
  module subroutine evaluator_init_identity (eval, int)
    class(evaluator_t), intent(out), target :: eval

  end subroutine evaluator_init_identity

```

```

call it%init (state)
do while (it%is_valid ())
call eval%add_state (it%get_quantum_numbers (), &
it%get_me_index ())
call it%advance ()
end do
call eval%freeze ()

end subroutine evaluator_init_identity

```

### 12.3.7 Creating an evaluator: quantum number sum

This evaluator operates on the diagonal of a density matrix and sums over the quantum numbers specified by the mask. The optional argument **drop** allows to drop a particle from the resulting density matrix. The handling of virtuals is not completely sane, especially in connection with dropping particles.

When summing over matrix element entries, we keep the separation into entries and normalization (in the corresponding evaluation routine below).

```

<Evaluators: evaluator: TBP>+≡
  procedure :: init_qn_sum => evaluator_init_qn_sum

<Evaluators: sub interfaces>+≡
  module subroutine evaluator_init_qn_sum (eval, int, qn_mask, drop)
    class(evaluator_t), intent(out), target :: eval
    class(interaction_t), target, intent(in) :: int
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask
    logical, intent(in), optional, dimension(:) :: drop
  end subroutine evaluator_init_qn_sum

<Evaluators: procedures>+≡
  module subroutine evaluator_init_qn_sum (eval, int, qn_mask, drop)
    class(evaluator_t), intent(out), target :: eval
    class(interaction_t), target, intent(in) :: int

### 12.3.8 Evaluation

When the input interactions (which are pointed to in the pairings stored within the evaluator) are filled with values, we can activate the evaluator, i.e., calculate the result values which are stored in the interaction.

The evaluation of matrix elements can be done in parallel. A `forall` con-

struct is not appropriate, however. We would need `do concurrent` here. Nevertheless, the evaluation functions are marked as `pure`.

```

(Evaluators: evaluator: TBP)+≡
  procedure :: evaluate => evaluator_evaluate

(Evaluators: sub interfaces)+≡
  module subroutine evaluator_evaluate (eval)
    class(evaluator_t), intent(inout), target :: eval
  end subroutine evaluator_evaluate

### 12.3.9 Unit tests

Test module, followed by the corresponding implementation module.

```

<evaluators_ut.f90>≡
  <File header>

  module evaluators_ut
  use unit_tests
  use evaluators_uti

  <Standard module head>

  <Evaluators: public test>

  contains

  <Evaluators: test driver>

  end module evaluators_ut
<evaluators_uti.f90>≡
  <File header>

  module evaluators_uti

  <Use kinds>
  use lorentz
  use flavors
  use colors
  use helicities
  use quantum_numbers
  use interactions
  use model_data

  use evaluators

  <Standard module head>

  <Evaluators: test declarations>

  contains

  <Evaluators: tests>

  end module evaluators_uti
API: driver for the unit tests below.
<Evaluators: public test>≡
  public :: evaluator_test

```

```

<Evaluators: test driver>≡
  subroutine evaluator_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
    <Evaluators: execute tests>
  end subroutine evaluator_test

```

Test: Create two interactions. The interactions are twofold connected. The first connection has a helicity index that is kept, the second connection has a helicity index that is summed over. Concatenate the interactions in an evaluator, which thus contains a result interaction. Fill the input interactions with values, activate the evaluator and print the result.

```

## Chapter 13

# Sindarin Built-In Types

Here, we define a couple of types and objects which are useful both internally for WHIZARD, and visible to the user, so they correspond to Sindarin types.

**particle\_specifiers** Expressions for particles and particle alternatives, involving particle names.

**pdg\_arrays** Integer (PDG) codes for particles. Useful for particle aliases (e.g., 'quark' for  $u, d, s$  etc.).

**jets** Define (pseudo)jets as objects. Functional only if the **fastjet** library is linked. (This may change in the future.)

**subevents** Particle collections built from event records, for use in analysis and other Sindarin expressions

**analysis** Observables, histograms, and plots.

### 13.1 Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag **polarized** and a string **decay**. If the **polarized** flag is set, particle polarization information should be kept when generating events for this process. If the **decay** string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the **polarized** flag is indicated by an asterisk (\*) in brackets, and the **decay** is indicated by its ID in brackets.

The **read** and **write** procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

```
<particle_specifiers.f90>≡  
  <File header>
```

```
  module particle_specifiers
```

```
    <Use strings>
```

```
    <Standard module head>
```

Figure 13.1: Module dependencies in `src/types`.

```

    <Particle specifiers: public>

    <Particle specifiers: types>

    <Particle specifiers: interfaces>

    interface
    <Particle specifiers: sub interfaces>
    end interface

    contains

    <Particle specifiers: main procedures>

    end module particle_specifiers
<particle_specifiers_sub.f90>≡
    <File header>

    submodule (particle_specifiers) particle_specifiers_s

    use io_units
    use diagnostics

    implicit none

    contains

    <Particle specifiers: procedures>

    end submodule particle_specifiers_s

```

### 13.1.1 Base type

This is an abstract type which can hold a single particle or an expression.

```

<Particle specifiers: types>≡
    type, abstract :: prt_spec_expr_t
    contains
    <Particle specifiers: prt spec expr: TBP>
    end type prt_spec_expr_t

```

Output, as a string.

```

<Particle specifiers: prt spec expr: TBP>≡
    procedure (prt_spec_expr_to_string), deferred :: to_string
<Particle specifiers: interfaces>≡
    abstract interface
    function prt_spec_expr_to_string (object) result (string)
    import
    class(prt_spec_expr_t), intent(in) :: object
    type(string_t) :: string
    end function prt_spec_expr_to_string

```

```
end interface
```

Call an `expand` method for all enclosed subexpressions (before handling the current expression).

```
<Particle specifiers: prt spec expr: TBP>+≡
  procedure (prt_spec_expr_expand_sub), deferred :: expand_sub

<Particle specifiers: interfaces>+≡
  abstract interface
    subroutine prt_spec_expr_expand_sub (object)
    import
    class(prt_spec_expr_t), intent(inout) :: object
  end subroutine prt_spec_expr_expand_sub
end interface
```

### 13.1.2 Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can make variadic arrays.

```
<Particle specifiers: public>≡
  public :: prt_expr_t

<Particle specifiers: types>+≡
  type :: prt_expr_t
  class(prt_spec_expr_t), allocatable :: x
  contains
  <Particle specifiers: prt expr: TBP>
  end type prt_expr_t
```

Output as a string: delegate.

```
<Particle specifiers: prt expr: TBP>≡
  procedure :: to_string => prt_expr_to_string

<Particle specifiers: sub interfaces>≡
  recursive module function prt_expr_to_string (object) result (string)
  class(prt_expr_t), intent(in) :: object
  type(string_t) :: string
  end function prt_expr_to_string

<Particle specifiers: procedures>≡
  recursive module function prt_expr_to_string (object) result (string)
  class(prt_expr_t), intent(in) :: object
  type(string_t) :: string
  if (allocated (object%x)) then
    string = object%x%to_string ()
  else
    string = ""
  end if
  end function prt_expr_to_string
```

Allocate the expression as a particle specifier and copy the value. Due to compiler bugs in gfortran 7-9 not in submodule.

```

<Particle specifiers: prt expr: TBP>+≡
  procedure :: init_spec => prt_expr_init_spec

<Particle specifiers: main procedures>≡
  subroutine prt_expr_init_spec (object, spec)
    class(prt_expr_t), intent(out) :: object
    type(prt_spec_t), intent(in) :: spec
    allocate (prt_spec_t :: object%x)
    select type (x => object%x)
    type is (prt_spec_t)
    x = spec
    end select
  end subroutine prt_expr_init_spec

```

Allocate as a list/sum and allocate for a given length Due to compiler bugs in gfortran 7-9 not in submodule.

```

<Particle specifiers: prt expr: TBP>+≡
  procedure :: init_list => prt_expr_init_list
  procedure :: init_sum => prt_expr_init_sum

<Particle specifiers: main procedures>+≡
  subroutine prt_expr_init_list (object, n)
    class(prt_expr_t), intent(out) :: object
    integer, intent(in) :: n
    allocate (prt_spec_list_t :: object%x)
    select type (x => object%x)
    type is (prt_spec_list_t)
    allocate (x%expr (n))
    end select
  end subroutine prt_expr_init_list

  subroutine prt_expr_init_sum (object, n)
    class(prt_expr_t), intent(out) :: object
    integer, intent(in) :: n
    allocate (prt_spec_sum_t :: object%x)
    select type (x => object%x)
    type is (prt_spec_sum_t)
    allocate (x%expr (n))
    end select
  end subroutine prt_expr_init_sum

```

Return the number of terms. This is unity, except if the expression is a sum.

```

<Particle specifiers: prt expr: TBP>+≡
  procedure :: get_n_terms => prt_expr_get_n_terms

<Particle specifiers: sub interfaces>+≡
  module function prt_expr_get_n_terms (object) result (n)
    class(prt_expr_t), intent(in) :: object
    integer :: n
  end function prt_expr_get_n_terms

```

```

<Particle specifiers: procedures>+≡
module function prt_expr_get_n_terms (object) result (n)
class(prt_expr_t), intent(in) :: object
integer :: n
if (allocated (object%x)) then
select type (x => object%x)
type is (prt_spec_sum_t)
n = size (x%expr)
class default
n = 1
end select
else
n = 0
end if
end function prt_expr_get_n_terms

```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

```

<Particle specifiers: prt_expr: TBP>+≡
procedure :: term_to_array => prt_expr_term_to_array

<Particle specifiers: sub interfaces>+≡
recursive module subroutine prt_expr_term_to_array (object, array, i)
class(prt_expr_t), intent(in) :: object
type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
integer, intent(in) :: i
end subroutine prt_expr_term_to_array

<Particle specifiers: procedures>+≡
recursive module subroutine prt_expr_term_to_array (object, array, i)
class(prt_expr_t), intent(in) :: object
type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
integer, intent(in) :: i
integer :: j
if (allocated (array)) deallocate (array)
select type (x => object%x)
type is (prt_spec_t)
allocate (array (1))
array(1) = x
type is (prt_spec_list_t)
allocate (array (size (x%expr)))
do j = 1, size (array)
select type (y => x%expr(j)%x)
type is (prt_spec_t)
array(j) = y
end select
end do
type is (prt_spec_sum_t)
call x%expr(i)%term_to_array (array, 1)
end select
end subroutine prt_expr_term_to_array

```

### 13.1.3 The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

#### Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and decays may not be set simultaneously.

```
<Particle specifiers: public>+≡
  public :: prt_spec_t

<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_t
  private
  type(string_t) :: name
  logical :: polarized = .false.
  type(string_t), dimension(:), allocatable :: decay
  contains
  <Particle specifiers: prt spec: TBP>
  end type prt_spec_t
```

#### I/O

Output. Old-style subroutines.

```
<Particle specifiers: public>+≡
  public :: prt_spec_write

<Particle specifiers: interfaces>+≡
  interface prt_spec_write
  module procedure prt_spec_write1
  module procedure prt_spec_write2
  end interface prt_spec_write

<Particle specifiers: sub interfaces>+≡
  module subroutine prt_spec_write1 (object, unit, advance)
  type(prt_spec_t), intent(in) :: object
  integer, intent(in), optional :: unit
  character(len=*), intent(in), optional :: advance
  end subroutine prt_spec_write1

<Particle specifiers: procedures>+≡
  module subroutine prt_spec_write1 (object, unit, advance)
  type(prt_spec_t), intent(in) :: object
  integer, intent(in), optional :: unit
  character(len=*), intent(in), optional :: advance
  character(3) :: adv
  integer :: u
  u = given_output_unit (unit)
  adv = "yes"; if (present (advance)) adv = advance
  write (u, "(A)", advance = adv) char (object%to_string ())
  end subroutine prt_spec_write1
```

Write an array as a list of particle specifiers.

```
<Particle specifiers: sub interfaces>+≡
  module subroutine prt_spec_write2 (prt_spec, unit, advance)
    type(prt_spec_t), dimension(:), intent(in) :: prt_spec
    integer, intent(in), optional :: unit
    character(len=*), intent(in), optional :: advance
  end subroutine prt_spec_write2
```

```
<Particle specifiers: procedures>+≡
  module subroutine prt_spec_write2 (prt_spec, unit, advance)
    type(prt_spec_t), dimension(:), intent(in) :: prt_spec
    integer, intent(in), optional :: unit
    character(len=*), intent(in), optional :: advance
    character(3) :: adv
    integer :: u, i
    u = given_output_unit (unit)
    adv = "yes"; if (present (advance)) adv = advance
    do i = 1, size (prt_spec)
      if (i > 1) write (u, "(A)", advance="no") " ", "
      call prt_spec_write (prt_spec(i), u, advance="no")
    end do
    write (u, "(A)", advance = adv)
  end subroutine prt_spec_write2
```

Read. Input may be string or array of strings.

```
<Particle specifiers: public>+≡
  public :: prt_spec_read

<Particle specifiers: interfaces>+≡
  interface prt_spec_read
    module procedure prt_spec_read1
    module procedure prt_spec_read2
  end interface prt_spec_read
```

Read a single particle specifier

```
<Particle specifiers: sub interfaces>+≡
  pure module subroutine prt_spec_read1 (prt_spec, string)
    type(prt_spec_t), intent(out) :: prt_spec
    type(string_t), intent(in) :: string
  end subroutine prt_spec_read1

<Particle specifiers: procedures>+≡
  pure module subroutine prt_spec_read1 (prt_spec, string)
    type(prt_spec_t), intent(out) :: prt_spec
    type(string_t), intent(in) :: string
    type(string_t) :: arg, buffer
    integer :: b1, b2, c, n, i
    b1 = scan (string, "(")
    b2 = scan (string, ")")
    if (b1 == 0) then
      prt_spec%name = trim (adjustl (string))
    else
      prt_spec%name = trim (adjustl (extract (string, 1, b1-1)))
      arg = trim (adjustl (extract (string, b1+1, b2-1)))
      if (arg == "*") then
```

```

prt_spec%polarized = .true.
else
n = 0
buffer = arg
do
if (verify (buffer, " ") == 0) exit
n = n + 1
c = scan (buffer, "+")
if (c == 0) exit
buffer = extract (buffer, c+1)
end do
allocate (prt_spec%decay (n))
buffer = arg
do i = 1, n
c = scan (buffer, "+")
if (c == 0) c = len (buffer) + 1
prt_spec%decay(i) = trim (adjustl (extract (buffer, 1, c-1)))
buffer = extract (buffer, c+1)
end do
end if
end if
end subroutine prt_spec_read1

```

Read a particle specifier array, given as a single string. The array is allocated to the correct size.

*(Particle specifiers: sub interfaces)+≡*

```

pure module subroutine prt_spec_read2 (prt_spec, string)
type(prt_spec_t), dimension(:), intent(out), allocatable :: prt_spec
type(string_t), intent(in) :: string
end subroutine prt_spec_read2

```

*(Particle specifiers: procedures)+≡*

```

    allocate (prt_spec%decay (size (decay)))
    prt_spec%decay = decay
  end function new_prt_spec_unstable
```

## Access Methods

Return the particle name without qualifiers

```
<Particle specifiers: prt spec: TBP>≡  
  procedure :: get_name => prt_spec_get_name  
  
<Particle specifiers: sub interfaces>+≡  
  elemental module function prt_spec_get_name (prt_spec) result (name)  
    class(prt_spec_t), intent(in) :: prt_spec  
    type(string_t) :: name  
  end function prt_spec_get_name  
  
<Particle specifiers: procedures>+≡  
  elemental module function prt_spec_get_name (prt_spec) result (name)  
    class(prt_spec_t), intent(in) :: prt_spec  
    type(string_t) :: name  
    name = prt_spec%name  
  end function prt_spec_get_name
```

Return the name with qualifiers

```
<Particle specifiers: prt spec: TBP>+≡  
  procedure :: to_string => prt_spec_to_string  
  
<Particle specifiers: sub interfaces>+≡  
  module function prt_spec_to_string (object) result (string)  
    class(prt_spec_t), intent(in) :: object  
    type(string_t) :: string  
  end function prt_spec_to_string  
  
<Particle specifiers: procedures>+≡  
  module function prt_spec_to_string (object) result (string)  
    class(prt_spec_t), intent(in) :: object  
    type(string_t) :: string  
    integer :: i  
    string = object%name  
    if (allocated (object%decay)) then  
      string = string // "("  
      do i = 1, size (object%decay)  
        if (i > 1) string = string // " + "  
        string = string // object%decay(i)  
      end do  
      string = string // ")"  
    else if (object%polarized) then  
      string = string // "(*)"  
    end if  
  end function prt_spec_to_string
```

Return the polarization flag

```
<Particle specifiers: prt spec: TBP>+≡  
  procedure :: is_polarized => prt_spec_is_polarized  
  
<Particle specifiers: sub interfaces>+≡  
  elemental module function prt_spec_is_polarized (prt_spec) result (flag)  
    class(prt_spec_t), intent(in) :: prt_spec  
    logical :: flag  
  end function prt_spec_is_polarized
```

```

<Particle specifiers: procedures>+≡
  elemental module function prt_spec_is_polarized (prt_spec) result (flag)
  class(prt_spec_t), intent(in) :: prt_spec
  logical :: flag
  flag = prt_spec%polarized
  end function prt_spec_is_polarized

```

The particle is unstable if there is a decay array.

```

<Particle specifiers: prt spec: TBP>+≡
  procedure :: is_unstable => prt_spec_is_unstable

<Particle specifiers: sub interfaces>+≡
  elemental module function prt_spec_is_unstable (prt_spec) result (flag)
  class(prt_spec_t), intent(in) :: prt_spec
  logical :: flag
  end function prt_spec_is_unstable

<Particle specifiers: procedures>+≡
  elemental module function prt_spec_is_unstable (prt_spec) result (flag)
  class(prt_spec_t), intent(in) :: prt_spec
  logical :: flag
  flag = allocated (prt_spec%decay)
  end function prt_spec_is_unstable

```

Return the number of decay channels

```

<Particle specifiers: prt spec: TBP>+≡
  procedure :: get_n_decays => prt_spec_get_n_decays

<Particle specifiers: sub interfaces>+≡
  elemental module function prt_spec_get_n_decays (prt_spec) result (n)
  class(prt_spec_t), intent(in) :: prt_spec
  integer :: n
  end function prt_spec_get_n_decays

<Particle specifiers: procedures>+≡
  elemental module function prt_spec_get_n_decays (prt_spec) result (n)
  class(prt_spec_t), intent(in) :: prt_spec
  integer :: n
  if (allocated (prt_spec%decay)) then
    n = size (prt_spec%decay)
  else
    n = 0
  end if
  end function prt_spec_get_n_decays

```

Return the decay channels

```

<Particle specifiers: prt spec: TBP>+≡
  procedure :: get_decays => prt_spec_get_decays

<Particle specifiers: sub interfaces>+≡
  module subroutine prt_spec_get_decays (prt_spec, decay)
  class(prt_spec_t), intent(in) :: prt_spec
  type(string_t), dimension(:), allocatable, intent(out) :: decay
  end subroutine prt_spec_get_decays

```

```

<Particle specifiers: procedures>+≡
module subroutine prt_spec_get_decays (prt_spec, decay)
class(prt_spec_t), intent(in) :: prt_spec
type(string_t), dimension(:), allocatable, intent(out) :: decay
if (allocated (prt_spec%decay)) then
allocate (decay (size (prt_spec%decay)))
decay = prt_spec%decay
else
allocate (decay (0))
end if
end subroutine prt_spec_get_decays

```

## Miscellaneous

There is nothing to expand here:

```

<Particle specifiers: prt spec: TBP>+≡
procedure :: expand_sub => prt_spec_expand_sub

<Particle specifiers: sub interfaces>+≡
module subroutine prt_spec_expand_sub (object)
class(prt_spec_t), intent(inout) :: object
end subroutine prt_spec_expand_sub

<Particle specifiers: procedures>+≡
module subroutine prt_spec_expand_sub (object)
class(prt_spec_t), intent(inout) :: object
end subroutine prt_spec_expand_sub

```

### 13.1.4 List

A list of particle specifiers, indicating, e.g., the final state of a process.

```

<Particle specifiers: public>+≡
public :: prt_spec_list_t

<Particle specifiers: types>+≡
type, extends (prt_spec_expr_t) :: prt_spec_list_t
type(prt_spec_expr_t), dimension(:), allocatable :: expr
contains
<Particle specifiers: prt spec list: TBP>
end type prt_spec_list_t

```

Output: Concatenate the components. Insert brackets if the component is also a list. The components of the `expr` array, if any, should all be filled.

```

<Particle specifiers: prt spec list: TBP>≡
procedure :: to_string => prt_spec_list_to_string

<Particle specifiers: sub interfaces>+≡
recursive module function prt_spec_list_to_string (object) result (string)
class(prt_spec_list_t), intent(in) :: object
type(string_t) :: string
end function prt_spec_list_to_string

```

```

<Particle specifiers: procedures>+≡
recursive module function prt_spec_list_to_string (object) result (string)
class(prt_spec_list_t), intent(in) :: object
type(string_t) :: string
integer :: i
string = ""
if (allocated (object%expr)) then
do i = 1, size (object%expr)
if (i > 1) string = string // ", "
select type (x => object%expr(i)%x)
type is (prt_spec_list_t)
string = string // "(" // x%to_string () // ")"
class default
string = string // x%to_string ()
end select
end do
end if
end function prt_spec_list_to_string

```

Flatten: if there is a subexpression which is also a list, include the components as direct members of the current list.

```

<Particle specifiers: prt spec list: TBP>+≡
procedure :: flatten => prt_spec_list_flatten

<Particle specifiers: sub interfaces>+≡
module subroutine prt_spec_list_flatten (object)
class(prt_spec_list_t), intent(inout) :: object
end subroutine prt_spec_list_flatten

<Particle specifiers: procedures>+≡
module subroutine prt_spec_list_flatten (object)
class(prt_spec_list_t), intent(inout) :: object
type(prt_expr_t), dimension(:), allocatable :: tmp_expr
integer :: i, n_flat, i_flat
n_flat = 0
do i = 1, size (object%expr)
select type (y => object%expr(i)%x)
type is (prt_spec_list_t)
n_flat = n_flat + size (y%expr)
class default
n_flat = n_flat + 1
end select
end do
if (n_flat > size (object%expr)) then
allocate (tmp_expr (n_flat))
i_flat = 0
do i = 1, size (object%expr)
select type (y => object%expr(i)%x)
type is (prt_spec_list_t)
tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
i_flat = i_flat + size (y%expr)
class default
tmp_expr (i_flat + 1) = object%expr(i)
i_flat = i_flat + 1
end select

```

```

end do
end if

        call object%expr(i)%expand ()
      end do
    end if
  end subroutine prt_spec_list_expand_sub

```

### 13.1.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

```

⟨Particle specifiers: public⟩+≡
  public :: prt_spec_sum_t

⟨Particle specifiers: types⟩+≡
  type, extends (prt_spec_expr_t) :: prt_spec_sum_t
  type(prt_spec_expr_t), dimension(:), allocatable :: expr
  contains
  ⟨Particle specifiers: prt spec sum: TBP⟩
  end type prt_spec_sum_t

```

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the `expr` array, if any, should all be filled.

```

⟨Particle specifiers: prt spec sum: TBP⟩≡
  procedure :: to_string => prt_spec_sum_to_string

⟨Particle specifiers: sub interfaces⟩+≡
  recursive module function prt_spec_sum_to_string (object) result (string)
    class(prt_spec_sum_t), intent(in) :: object
    type(string_t) :: string
  end function prt_spec_sum_to_string

```

```

<Particle specifiers: procedures>+≡
recursive module function prt_spec_sum_to_string (object) result (string)
class(prt_spec_sum_t), intent(in) :: object
type(string_t) :: string
integer :: i
string = ""
if (allocated (object%expr)) then
do i = 1, size (object%expr)
if (i > 1) string = string // " + "
select type (x => object%expr(i)%x)
type is (prt_spec_list_t)

i_flat = i_flat + 1
end select
end do
end if
if (allocated (tmp_expr)) &
call move_alloc (from = tmp_expr, to = object%expr)
end subroutine prt_spec_sum_flatten

```

Apply `expand` to all terms in the sum.

```

<Particle specifiers: prt spec sum: TBP>+≡
  procedure :: expand_sub => prt_spec_sum_expand_sub

<Particle specifiers: sub interfaces>+≡
  recursive module subroutine prt_spec_sum_expand_sub (object)
  class(prt_spec_sum_t), intent(inout) :: object
  end subroutine prt_spec_sum_expand_sub

<Particle specifiers: procedures>+≡
  recursive module subroutine prt_spec_sum_expand_sub (object)
  class(prt_spec_sum_t), intent(inout) :: object
  integer :: i
  if (allocated (object%expr)) then
  do i = 1, size (object%expr)
  call object%expr(i)%expand ()
  end do
  end if
  end subroutine prt_spec_sum_expand_sub

```

### 13.1.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \rightarrow a, b, c \quad (13.1)$$

$$a + (b + c) \rightarrow a + b + c \quad (13.2)$$

$$a, b + c \rightarrow (a, b) + (a, c) \quad (13.3)$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated. Do to compiler bug in gfortran 7-9 not in submodule.

```

<Particle specifiers: prt expr: TBP>+≡
  procedure :: expand => prt_expr_expand

<Particle specifiers: main procedures>+≡
  recursive subroutine prt_expr_expand (expr)
  class(prt_expr_t), intent(inout) :: expr
  if (allocated (expr%x)) then
  call distribute_prt_spec_list (expr%x)
  call expr%x%expand_sub ()

```

```

select type (x => expr%x)
type is (prt_spec_list_t)
call x%flatten ()
type is (prt_spec_sum_t)
call x%flatten ()
end select
end if
end subroutine prt_expr_expand

```

### 13.1.7 Unit Tests

Test module, followed by the corresponding implementation module.

## 13.2 PDG arrays

For defining aliases, we introduce a special type which holds a set of (integer) PDG codes.

```

⟨pdg_arrays.f90⟩≡
  ⟨File header⟩

  module pdg_arrays

    ⟨Standard module head⟩

    ⟨PDG arrays: public⟩

    ⟨PDG arrays: types⟩

    ⟨PDG arrays: interfaces⟩

    interface
      ⟨PDG arrays: sub interfaces⟩
    end interface

  end module pdg_arrays

⟨pdg_arrays_sub.f90⟩≡
  ⟨File header⟩

  submodule (pdg_arrays) pdg_arrays_s

    use io_units
    use sorting
    use physics_defs

    implicit none

    contains

    ⟨PDG arrays: procedures⟩

  end submodule pdg_arrays_s

```

### 13.2.1 Type definition

Using an allocatable array eliminates the need for initializer and/or finalizer.

```

⟨PDG arrays: public⟩≡
  public :: pdg_array_t

```

```

<PDG arrays: types>≡
  type :: pdg_array_t
  private
  integer, dimension(:), allocatable :: pdg
  contains
  <PDG arrays: pdg array: TBP>
  end type pdg_array_t

```

Output.

```

<PDG arrays: pdg array: TBP>≡
  procedure :: write => pdg_array_write

<PDG arrays: sub interfaces>≡
  module subroutine pdg_array_write (aval, unit)
  class(pdg_array_t), intent(in) :: aval
  integer, intent(in), optional :: unit
  end subroutine pdg_array_write

<PDG arrays: procedures>≡
  module subroutine pdg_array_write (aval, unit)
  class(pdg_array_t), intent(in) :: aval
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(A)", advance="no") "PDG("
  if (allocated (aval%pdg)) then
  do i = 1, size (aval%pdg)
  if (i > 1) write (u, "(A)", advance="no") ", "
  write (u, "(I0)", advance="no") aval%pdg(i)
  end do
  end if
  write (u, "(A)", advance="no") ")"
  end subroutine pdg_array_write

<PDG arrays: public>+≡
  public :: pdg_array_write_set

<PDG arrays: sub interfaces>+≡
  module subroutine pdg_array_write_set (aval, unit)
  type(pdg_array_t), intent(in), dimension(:) :: aval
  integer, intent(in), optional :: unit
  end subroutine pdg_array_write_set

<PDG arrays: procedures>+≡
  module subroutine pdg_array_write_set (aval, unit)
  type(pdg_array_t), intent(in), dimension(:) :: aval
  integer, intent(in), optional :: unit
  integer :: i
  do i = 1, size (aval)
  call aval(i)%write (unit)
  print *, "
  end do
  end subroutine pdg_array_write_set

```

### 13.2.2 Basic operations

Assignment. We define assignment from and to an integer array. Note that the integer array, if it is the l.h.s., must be declared allocatable by the caller.

```
(PDG arrays: public)+≡
  public :: assignment(=)

(PDG arrays: interfaces)≡
  interface assignment(=)
    module procedure pdg_array_from_int_array
    module procedure pdg_array_from_int
    module procedure int_array_from_pdg_array
  end interface

(PDG arrays: sub interfaces)+≡
  module subroutine pdg_array_from_int_array (aval, iarray)
    type(pdg_array_t), intent(out) :: aval
    integer, dimension(:), intent(in) :: iarray
  end subroutine pdg_array_from_int_array
  elemental module subroutine pdg_array_from_int (aval, int)
    type(pdg_array_t), intent(out) :: aval
    integer, intent(in) :: int
  end subroutine pdg_array_from_int
  module subroutine int_array_from_pdg_array (iarray, aval)
    integer, dimension(:), allocatable, intent(out) :: iarray
    type(pdg_array_t), intent(in) :: aval
  end subroutine int_array_from_pdg_array

(PDG arrays: procedures)+≡
  module subroutine pdg_array_from_int_array (aval, iarray)
    type(pdg_array_t), intent(out) :: aval
    integer, dimension(:), intent(in) :: iarray
    allocate (aval%pdg (size (iarray)))
    aval%pdg = iarray
  end subroutine pdg_array_from_int_array

  elemental module subroutine pdg_array_from_int (aval, int)
    type(pdg_array_t), intent(out) :: aval
    integer, intent(in) :: int
    allocate (aval%pdg (1))
    aval%pdg = int
  end subroutine pdg_array_from_int

  module subroutine int_array_from_pdg_array (iarray, aval)
    integer, dimension(:), allocatable, intent(out) :: iarray
    type(pdg_array_t), intent(in) :: aval
    if (allocated (aval%pdg)) then
      allocate (iarray (size (aval%pdg)))
      iarray = aval%pdg
    else
      allocate (iarray (0))
    end if
  end subroutine int_array_from_pdg_array
```

Allocate space for a PDG array

```
<PDG arrays: pdg array: TBP>+≡

This function is a convenience function for the determination of possible compatibility of flavor structures of processes with certain orders of QCD and QED/EW coupling constants. It assumes the Standard Model (SM) as underlying physics model. The function is based on a naive counting of external particles which are connected to the process by the specific kind of couplings depending on the underlying theory (QCD and/or QED/EW) of which the corresponding particle is a part of. It is constructed in a way that the exclusion of coupling power combinations is well-defined.

```

Comparison. Here, we take the PDG arrays as-is, assuming that they are sorted.

The ordering is a bit odd: first, we look only at the absolute values of the PDG codes. If they all match, the particle comes before the antiparticle, scanning from left to right.

### 13.2.5 PDG array list

A PDG array list, or PDG list, is an array of PDG-array objects with some convenience methods.

```

<PDG arrays: public>+≡
  public :: pdg_list_t

<PDG arrays: types>+≡
  type :: pdg_list_t
  type(pdg_array_t), dimension(:), allocatable :: a
  contains
  <PDG arrays: pdg list: TBP>
  end type pdg_list_t

```

Output, as a comma-separated list without advancing I/O.

```

<PDG arrays: pdg list: TBP>≡
  procedure :: write => pdg_list_write

<PDG arrays: sub interfaces>+≡
  module subroutine pdg_list_write (object, unit)
    class(pdg_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
  end subroutine pdg_list_write

<PDG arrays: procedures>+≡
  module subroutine pdg_list_write (object, unit)
    class(pdg_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    if (allocated (object%a)) then
      do i = 1, size (object%a)
        if (i > 1) write (u, "(A)", advance="no") ", "
        call object%a(i)%write (u)
      end do
    end if
  end subroutine pdg_list_write

```

```
end subroutine pdg_list_write
```

Initialize for a certain size. The entries are initially empty PDG arrays.

```
<PDG arrays: pdg list: TBP>+≡
  generic :: init => pdg_list_init_size
  procedure, private :: pdg_list_init_size

<PDG arrays: sub interfaces>+≡
  module subroutine pdg_list_init_size (pl, n)
  class(pdg_list_t), intent(out) :: pl
  integer, intent(in) :: n
  end subroutine pdg_list_init_size

<PDG arrays: procedures>+≡
  module subroutine pdg_list_init_size (pl, n)
  class(pdg_list_t), intent(out) :: pl
  integer, intent(in) :: n
  allocate (pl%a (n))
  end subroutine pdg_list_init_size
```

Initialize with a definite array of PDG codes. That is, each entry in the list becomes a single-particle PDG array.

```
<PDG arrays: pdg list: TBP>+≡
  generic :: init => pdg_list_init_int_array
  procedure, private :: pdg_list_init_int_array

<PDG arrays: sub interfaces>+≡
  module subroutine pdg_list_init_int_array (pl, pdg)

```

Compare sorted lists. The result is undefined if some entries are not allocated.

The ordering is quite complicated. First, a shorter list comes before a longer list. Comparing entry by entry, a shorter entry comes first. Next, we check the first PDG code within corresponding entries. This is compared by absolute value. If equal, particle comes before antiparticle. Finally, if all is equal, the result is false.

```

## 13.3 Jets

The FastJet library is linked externally, if available. The wrapper code is also in a separate directory. Here, we define WHIZARD-specific procedures and tests.

```
<jets.f90>≡  
  <File header>  
  
  module jets  
  
    use fastjet !NODEP!  
  
    <Standard module head>  
  
    <Jets: public>  
  
    contains  
  
    <Jets: procedures>  
  
  end module jets
```

### 13.3.1 Re-exported symbols

We use this module as a proxy for the FastJet interface, therefore we re-export some symbols.

```
<Jets: public>≡  
  public :: fastjet_available  
  public :: fastjet_init  
  public :: jet_definition_t  
  public :: pseudojet_t  
  public :: pseudojet_vector_t  
  public :: cluster_sequence_t  
  public :: assignment (=)
```

The initialization routine prints the banner.

```
<Jets: procedures>≡  
  subroutine fastjet_init ()  
    call print_banner ()  
  end subroutine fastjet_init
```

The jet algorithm codes (actually, integers)

```
<Jets: public>+≡  
  public :: kt_algorithm  
  public :: cambridge_algorithm  
  public :: antikt_algorithm  
  public :: genkt_algorithm  
  public :: cambridge_for_passive_algorithm  
  public :: genkt_for_passive_algorithm  
  public :: ee_kt_algorithm  
  public :: ee_genkt_algorithm  
  public :: plugin_algorithm  
  public :: undefined_jet_algorithm
```

### 13.3.2 Unit tests

Test module, followed by the corresponding implementation module.

```
<jets_ut.f90>≡  
  <File header>
```

```
  module jets_ut  
    use unit_tests  
    use jets_uti
```

```
  <Standard module head>
```

```
  <Jets: public test>
```

```
  contains
```

```
  <Jets: test driver>
```

```
  end module jets_ut
```

```
<jets_uti.f90>≡  
  <File header>
```

```
  module jets_uti
```

```
  <Use kinds>
```

```
  use fastjet !NODEP!
```

```
  use jets
```

```
  <Standard module head>
```

```
  <Jets: test declarations>
```

```
  contains
```

```
  <Jets: tests>
```

```
  end module jets_uti
```

API: driver for the unit tests below.

```
<Jets: public test>≡  
  public :: jets_test
```

```
<Jets: test driver>≡
```

```
  subroutine jets_test (u, results)
```

```
    integer, intent(in) :: u
```

```
    type (test_results_t), intent(inout) :: results
```

```
  <Jets: execute tests>
```

```
  end subroutine jets_test
```

This test is actually the minimal example from the FastJet manual, translated to Fortran.

Note that FastJet creates pseudojet vectors, which we mirror in the `pseudojet_vector_t`, but immediately assign to pseudojet arrays. Without automatic finalization available in the compilers, we should avoid this in actual code and rather introduce intermediate variables for those objects, which we can finalize explicitly.

```

<Jets: execute tests>≡
  call test (jets_1, "jets_1", &
    "basic FastJet functionality", &
    u, results)

<Jets: test declarations>≡
  public :: jets_1

<Jets: tests>≡
  subroutine jets_1 (u)
    integer, intent(in) :: u

    type(pseudojet_t), dimension(:), allocatable :: prt, jets, constituents
    type(jet_definition_t) :: jet_def
    type(cluster_sequence_t) :: cs

    integer, parameter :: dp = default
    integer :: i, j

    write (u, "(A)")  "* Test output: jets_1"

write (u, "(A)")
write (u, "(A)")  "* Test output end: jets_1"

end subroutine jets_1

```

## 13.4 Subevents

The purpose of subevents is to store the relevant part of the physical event (either partonic or hadronic), and to hold particle selections and combinations which are constructed in cut or analysis expressions.

```
<subevents.f90>≡
  <File header>

  module subevents

    use, intrinsic :: iso_c_binding !NODEP!

    <Use kinds>
    use numeric_utils, only: pacify
    use c_particles
    use lorentz
    use pdg_arrays
    use jets

    <Standard module head>

    <Subevents: public>

    <Subevents: parameters>

    <Subevents: types>

    <Subevents: interfaces>

    interface
      <Subevents: sub interfaces>
    end interface

  end module subevents

<subevents_sub.f90>≡
  <File header>

  submodule (subevents) subevents_s

    use io_units
    use format_defs, only: FMT_14, FMT_19
    use format_utils, only: pac_fmt
    use physics_defs
    use sorting

    implicit none

    contains

    <Subevents: procedures>

  end submodule subevents_s
```

### 13.4.1 Particles

For the purpose of this module, a particle has a type which can indicate a beam, incoming, outgoing, or composite particle, flavor and helicity codes (integer, undefined for composite), four-momentum and invariant mass squared. (Other particles types are used in extended event types, but also defined here.) Furthermore, each particle has an allocatable array of ancestors – particle indices which indicate the building blocks of a composite particle. For an incoming/outgoing particle, the array contains only the index of the particle itself.

For incoming particles, the momentum is inverted before storing it in the particle object.

```
<Subevents: parameters>≡
  integer, parameter, public :: PRT_UNDEFINED = 0
  integer, parameter, public :: PRT_BEAM = -9
  integer, parameter, public :: PRT_INCOMING = 1
  integer, parameter, public :: PRT_OUTGOING = 2
  integer, parameter, public :: PRT_COMPOSITE = 3
  integer, parameter, public :: PRT_VIRTUAL = 4
  integer, parameter, public :: PRT_RESONANT = 5
  integer, parameter, public :: PRT_BEAM_REMNANT = 9
```

#### The type

We initialize only the type here and mark as unpolarized. The initializers below do the rest. The logicals `is_b_jet` and `is_c_jet` are true only if `prt_t` comes out of the `subevt_cluster` routine and fulfils the correct flavor content.

```
<Subevents: public>≡
  public :: prt_t

<Subevents: types>≡
  type :: prt_t
  private
  integer :: type = PRT_UNDEFINED
  integer :: pdg
  logical :: polarized = .false.
  logical :: colorized = .false.
  logical :: clustered = .false.
  logical :: is_b_jet = .false.
  logical :: is_c_jet = .false.
  integer :: h
  type(vector4_t) :: p
  real(default) :: p2
  integer, dimension(:), allocatable :: src
  integer, dimension(:), allocatable :: col
  integer, dimension(:), allocatable :: acl
  end type prt_t
```

Initializers. Polarization is set separately. Finalizers are not needed.

```
<Subevents: procedures>≡
  subroutine prt_init_beam(prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
```

```

type(vector4_t), intent(in) :: p
real(default), intent(in) :: p2
integer, dimension(:), intent(in) :: src
prt%type = PRT_BEAM
call prt_set (prt, pdg, - p, p2, src)
end subroutine prt_init_beam

subroutine prt_init_incoming (prt, pdg, p, p2, src)
type(prt_t), intent(out) :: prt
integer, intent(in) :: pdg
type(vector4_t), intent(in) :: p
real(default), intent(in) :: p2
integer, dimension(:), intent(in) :: src
prt%type = PRT_INCOMING
call prt_set (prt, pdg, - p, p2, src)
end subroutine prt_init_incoming

subroutine prt_init_outgoing (prt, pdg, p, p2, src)
type(prt_t), intent(out) :: prt
integer, intent(in) :: pdg
type(vector4_t), intent(in) :: p
real(default), intent(in) :: p2
integer, dimension(:), intent(in) :: src
prt%type = PRT_OUTGOING
call prt_set (prt, pdg, p, p2, src)
end subroutine prt_init_outgoing

subroutine prt_init_composite (prt, p, src)
type(prt_t), intent(out) :: prt
type(vector4_t), intent(in) :: p
integer, dimension(:), intent(in) :: src
prt%type = PRT_COMPOSITE
call prt_set (prt, 0, p, p**2, src)
end subroutine prt_init_composite

```

This version is for temporary particle objects, so the `src` array is not set.

```

## Tools

Two particles match if their `src` arrays are the same.

```

<Subevents: public>+≡
public :: operator(.match.)

<Subevents: interfaces>+≡
interface operator(.match.)
module procedure prt_match

```

```
end interface
```

```
<Subevents: sub interfaces>+≡
  elemental module function prt_match (prt1, prt2) result (match)
    logical :: match
    type(prt_t), intent(in) :: prt1, prt2
    end function prt_match

<Subevents: procedures>+≡
  elemental module function prt_match (prt1, prt2) result (match)
    logical :: match
    type(prt_t), intent(in) :: prt1, prt2
    if (size (prt1%src) == size (prt2%src)) then
      match = all (prt1%src == prt2%src)
    else
      match = .false.
    end if
  end function prt_match
```

The combine operation makes a pseudoparticle whose momentum is the result of adding (the momenta of) the pair of input particles. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

The result is `intent(inout)`, so it will not be initialized when the subroutine is entered.

If the particles carry color, we recall that the combined particle is a composite which is understood as outgoing. If one of the arguments is an incoming particle, its color entries must be reversed.

```
<Subevents: procedures>+≡
  subroutine prt_combine (prt, prt_in1, prt_in2, ok)
    type(prt_t), intent(inout) :: prt
    type(prt_t), intent(in) :: prt_in1, prt_in2
    logical :: ok
    integer, dimension(:), allocatable :: src
    integer, dimension(:), allocatable :: col1, ac11, col2, ac12
    call combine_index_lists (src, prt_in1%src, prt_in2%src)
    ok = allocated (src)
    if (ok) then
      call prt_init_composite (prt, prt_in1%p + prt_in2%p, src)
      if (prt_in1%colorized .or. prt_in2%colorized) then
        select case (prt_in1%type)
        case default
          call prt_get_color_indices (prt_in1, col1, ac11)
          case (PRT_BEAM, PRT_INCOMING)
            call prt_get_color_indices (prt_in1, ac11, col1)
          end select
        select case (prt_in2%type)
        case default
```

```

call prt_get_color_indices (prt_in2, col2, acl2)
case (PRT_BEAM, PRT_INCOMING)
call prt_get_color_indices (prt_in2, acl2, col2)
end select
call prt_colorize (prt, [col1, col2], [acl1, acl2])
end if
end if
end subroutine prt_combine

```

This variant does not produce the combined particle, it just checks whether the combination is valid (no common src entry).

*<Subevents: public>+≡*

```
public :: are_disjoint
```

*<Subevents: sub interfaces>+≡*

```

module function are_disjoint (prt_in1, prt_in2) result (flag)
logical :: flag
type(prt_t), intent(in) :: prt_in1, prt_in2
end function are_disjoint

```

*<Subevents: procedures>+≡*

```

module function are_disjoint (prt_in1, prt_in2) result (flag)
logical :: flag
type(prt_t), intent(in) :: prt_in1, prt_in2
flag = index_lists_are_disjoint (prt_in1%src, prt_in2%src)
end function are_disjoint

```

src Lists with length > 1 are built by a combine operation which merges the lists in a sorted manner. If the result would have a duplicate entry, it is discarded, and the result is unallocated.

*<Subevents: procedures>+≡*

```

subroutine combine_index_lists (res, src1, src2)
integer, dimension(:), intent(in) :: src1, src2
integer, dimension(:), allocatable :: res
integer :: i1, i2, i
allocate (res (size (src1) + size (src2)))
if (size (src1) == 0) then
res = src2
return
else if (size (src2) == 0) then
res = src1
return
end if
i1 = 1
i2 = 1
LOOP: do i = 1, size (res)
if (src1(i1) < src2(i2)) then
res(i) = src1(i1); i1 = i1 + 1
if (i1 > size (src1)) then
res(i+1:) = src2(i2:)
exit LOOP
end if
else if (src1(i1) > src2(i2)) then
res(i) = src2(i2); i2 = i2 + 1

```

```

    if (i2 > size (src2)) then
    res(i+1:) = src1(i1:)
    exit LOOP
    end if
    else
    deallocate (res)
    exit LOOP
    end if
    end do LOOP
end subroutine combine_index_lists

```

This function is similar, but it does not actually merge the list, it just checks whether they are disjoint (no common `src` entry).

*<Subevents: procedures>+≡*

```

function index_lists_are_disjoint (src1, src2) result (flag)
logical :: flag
integer, dimension(:), intent(in) :: src1, src2
integer :: i1, i2, i
flag = .true.
i1 = 1
i2 = 1
LOOP: do i = 1, size (src1) + size (src2)
if (src1(i1) < src2(i2)) then
i1 = i1 + 1
if (i1 > size (src1)) then
exit LOOP
end if
else if (src1(i1) > src2(i2)) then
i2 = i2 + 1
if (i2 > size (src2)) then
exit LOOP
end if
else
flag = .false.
exit LOOP
end if
end do LOOP
end function index_lists_are_disjoint

```

### 13.4.2 subevents

Particles are collected in subevents. This type is implemented as a dynamically allocated array, which need not be completely filled. The value `n_active` determines the number of meaningful entries.

#### Type definition

*<Subevents: public>+≡*

```
public :: subevt_t
```

*<Subevents: types>+≡*

```
type :: subevt_t
```

```

private
integer :: n_active = 0
type(prt_t), dimension(:), allocatable :: prt
contains
  <Subevents: subevt: TBP>
end type subevt_t

```

Initialize, allocating with size zero (default) or given size. The number of contained particles is set equal to the size.

```

  <Subevents: public>+≡
    public :: subevt_init

  <Subevents: sub interfaces>+≡
    module subroutine subevt_init (subevt, n_active)
      type(subevt_t), intent(out) :: subevt
      integer, intent(in), optional :: n_active
    end subroutine subevt_init

  <Subevents: procedures>+≡
    module subroutine subevt_init (subevt, n_active)
      type(subevt_t), intent(out) :: subevt
      integer, intent(in), optional :: n_active
      if (present (n_active)) subevt%n_active = n_active
      allocate (subevt%prt (subevt%n_active))
    end subroutine subevt_init

```

(Re-)allocate the subevent with some given size. If the size is greater than the previous one, do a real reallocation. Otherwise, just reset the recorded size. Contents are untouched, but become invalid.

```

  <Subevents: subevt: TBP>≡
    procedure :: reset => subevt_reset

  <Subevents: sub interfaces>+≡
    module subroutine subevt_reset (subevt, n_active)
      class(subevt_t), intent(inout) :: subevt
      integer, intent(in) :: n_active
    end subroutine subevt_reset

  <Subevents: procedures>+≡
    module subroutine subevt_reset (subevt, n_active)
      class(subevt_t), intent(inout) :: subevt
      integer, intent(in) :: n_active
      subevt%n_active = n_active
      if (subevt%n_active > size (subevt%prt)) then
        deallocate (subevt%prt)
        allocate (subevt%prt (subevt%n_active))
      end if
    end subroutine subevt_reset

```

Output. No prefix for the headline 'subevt', because this will usually be printed appending to a previous line.

```

  <Subevents: subevt: TBP>+≡
    procedure :: write => subevt_write

```

```

<Subevents: sub interfaces>+≡
  module subroutine subevt_write (object, unit, prefix, pacified)
  class(subevt_t), intent(in) :: object
  integer, intent(in), optional :: unit
  character(*), intent(in), optional :: prefix
  logical, intent(in), optional :: pacified
  end subroutine subevt_write

## Operations with subevents

The join operation joins two subevents. When appending the elements of the second list, we check for each particle whether it is already in the first list. If yes, it is discarded. The result list should be initialized already.

If a mask is present, it refers to the second subevent. Particles where the mask is not set are discarded.

```

<Subevents: public>+≡
