Abstract

I describe parameterizations of realistic e^\pm - and γ -beam spectra at future linear e^+e^- -colliders. Emphasis is put on simplicity and reproducibility of the parameterizations, supporting reproducible physics simulations. The parameterizations are implemented in a library of distribution functions and event generators.

Program Summary:

- **Title of program:** Circe, Version 1.02 β (September 1996)
- **Program obtainable** by anonymous ftp from the host `crunch.ikp.physik.th-darmstadt.de` in the directory `pub/ohl/circe`.
- **Licensing provisions:** Free software under the GNU General Public License.
- **Programming language used:** Fortran77 originally, transferred to Fortran90
- **Number of program lines in distributed program, including test data, etc.:** ≈ 1100 (excluding comments)
- **Computer/Operating System:** Any with a Fortran90 programming environment.
- **Memory required to execute with typical data:** Negligible on the scale of typical applications calling the library.
- **Typical running time:** A small fraction (typically a few percent) of the running time of applications calling the library.
- **Purpose of program:** Provide simple and reproducible, yet realistic, parameterizations of the e^\pm - and γ -beam spectra for linear colliders.
- **Nature of physical problem:** The intricate beam dynamics in the interaction region of a high luminosity linear collider at $\sqrt{s} = 500\text{GeV}$ result in non-trivial energy spectra of the scattering electrons, positrons and photons. Physics simulations require simple and reproducible, yet realistic, parameterizations of these spectra.
- **Method of solution:** Parameterization, curve fitting, Monte Carlo event generation.
- **Keywords:** Event generation, beamstrahlung, linear colliders.

1 Introduction

Despite the enormous quantitative success of the electro-weak standard model up to energies of 200GeV, neither the nature of electro-weak symmetry breaking (EWSB) nor the origin of mass are understood.

From theoretical considerations, we know that clues to the answer of these open questions are hidden in the energy range below $\Lambda_{\text{EWSB}} = 4\pi v \approx 3.1\text{TeV}$. Either we will discover a Higgs particle in this energy range or signatures for a strongly interacting EWSB sector will be found. Experiments at CERN's Large Hadron Collider (LHC) will shed a first light on this regime in the next decade. In the past it has been very fruitful to complement experiments at high energy hadron colliders with experiments at e^+e^- -colliders. The simpler initial state allows more precise measurements with smaller theoretical errors. Lucid expositions of the physics opportunities of high energy e^+e^- colliders with references to the literature can be found in [1].

However, the power emitted by circular storage rings in form of synchrotron radiation scales like $(E/m)^4/R^2$ with the energy and mass of the particle and the radius of the ring. This cost becomes prohibitive after LEP2 and a Linear Collider (LC) has to be built instead.

Unfortunately, the “interesting” hard cross sections scale like $1/s$ with the square of the center of mass energy and a LC will have to operate at extremely high luminosities in excess of $10^{33}\text{cm}^{-2}\text{s}^{-1}$. To achieve such luminosities, the bunches of electrons and positrons have to be very dense. Under these conditions, the electrons undergo acceleration from strong electromagnetic forces from the positron bunch (and vice versa). The resulting synchrotron radiation is called *beamstrahlung* [2] and has a strong effect on the energy spectrum $D(x_1, x_2)$ of the colliding particles. This changes the observable e^+e^- cross sections

$$\frac{d\sigma_0^{e^+e^-}}{d\Omega}(s) \rightarrow \frac{d\sigma^{e^+e^-}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{e^+e^-}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{e^+e^-}}{d\Omega'}(x_1 x_2 s) \quad (1a)$$

and produces luminosity for $e^\pm\gamma$ and $\gamma\gamma$ collisions:

$$\frac{d\sigma^{e^\pm\gamma}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{e^\pm\gamma}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{e^\pm\gamma}}{d\Omega'}(x_1 x_2 s) \quad (1b)$$

$$\frac{d\sigma^{\gamma\gamma}}{d\Omega}(s) = \int_0^1 dx_1 dx_2 D_{\gamma\gamma}(x_1, x_2; \sqrt{s}) J(\Omega', \Omega) \frac{d\sigma_0^{\gamma\gamma}}{d\Omega'}(x_1 x_2 s) \quad (1c)$$

Therefore, simulations of the physics expected at a LC need to know the spectra of the e^\pm and γ beams precisely.

Microscopic simulations of the beam dynamics are available (e.g. ABEL[3], CAIN[4] and Guinea-Pig[5]) and their predictions are compatible with each other. But they require too much computer time and memory for direct use in physics programs. Circe provides a fast and simple parameterization of the results from these simulations. Furthermore, even if the computational cost of the simulations would be negligible, the input parameters for microscopic simulations are not convenient for particle physics applications. Due to the highly

Table 1: Accelerator parameters for three typical designs at $\sqrt{s} = 500\text{GeV}$ and $\sqrt{s} = 1\text{TeV}$. The resulting distributions are shown in figure 1. The design efforts are currently concentrated on a 350GeV-800GeV LC. Therefore the Tesla parameters for 1TeV are slightly out of date.

non-linear beam dynamics, the optimization of LC designs is a subtle art [6], that is best practiced by the experts. Furthermore, particle physics applications need benchmarking and easily reproducible parameterizations are required for this purpose.

The parameterizations in **Circe** are not based on approximate solutions (cf. [7]) of the beamstrahlung dynamics. Instead, they provide a “phenomenological” description of the results from full simulations. The parameterizations are as simple as possible while remaining consistent with basic physical principles:

1. *positivity*: the distribution functions $D(x_1, x_2)$ *must not* be negative in the physical region $[0, 1] \times [0, 1]$.
2. *integrability*: the definite integral of the distribution functions over the physical region $[0, 1] \times [0, 1]$ *must* exist, even though the distributions can have singularities.

This paper is organized as follows: I start in section 2 with a discussion of the input for the microscopic simulations. In section 3 I describe the usage of the **Circe** library and in section 4 I discuss some technical details of the implementation. After discussing the parameterizations available in version 1.02 β in section 5, I conclude in section 8.

2 Parameters

The microscopic simulation program **Guinea-Pig** [5] used for the current version of the parameterizations in **Circe** simulates the passage of electrons through a

bunch of electrons (and vice versa). It takes the following accelerator parameters as input:

E : the energy of the particles before the beam-beam interaction.

$N_{\text{particles}}$: the number of particles per bunch.

$\epsilon_{x,y}$: the normalized horizontal and vertical emittances.

$\beta_{x,y}^*$: the horizontal and vertical beta functions.

$\sigma_{x,y,z}$: the horizontal, vertical and longitudinal beam size. A Gaussian shape is used for the charge distribution in the bunches.

f_{rep} : the repetition rate.

n_{bunch} : the number of bunches per train.

The transversal beam sizes, beta functions and normalized emittances for relativistic particles are related by

$$\beta_{x,y}^* = \frac{\sigma_{x,y}^2}{\epsilon_{x,y}} \frac{E}{m_e} \quad (2)$$

The parameters used in the most recent revision of the parameterizations are collected in tables 1 and 2. The resulting factorized electron/positron and photon distributions in version 1 of the parameterizations are depicted in figures 1 and 2.

The most important purpose of **Circe** is to map the manifold of possible beam spectra for the NLC to a *finite* number of *reproducible* parameterizations. The distributions

$$D_{p_1 p_2}^{\alpha \nu \rho}(x_1, x_2; \sqrt{s}) \quad (3)$$

provided by **Circe** are indexed by three integers

Figure 4: *Experimental:* Version 1, revision 0 of the factorized e^- - and γ -distributions for Tesla- e^-e^- in a doubly logarithmic plot. The accelerator parameters are taken from table 2 and have *not* been endorsed for use in an e^-e^- -machine yet!.

α : the *accelerator design class*: currently there are three options: S-band [9], Tesla [8], X-band [10, 11]. More variety will be added later, in particular the e^-e^- mode and the $e^-\gamma$ and $\gamma\gamma$ laser backscattering modes of these designs.

ν : the *version of the parameterization*: over the years, the form of the parameterizations can change, either because better approximations are found or because new simulation programs become available. All versions will remain available in order to be able to reproduce calculations.

ρ : the *revision date for the parameterization*: a particular parameterization can contain bugs, which will be fixed in subsequent revisions. While only the most recent revision should be used for new calculations, old revisions will remain available in order to be able to reproduce calculations.

The continuous parameter \sqrt{s} in (3) is misleading, because accelerator parameters have been optimized for discrete values of the energy. Therefore the distributions are not available for all values of \sqrt{s} .

The usage of the distributions in application programs is discussed in section 3.1. Circe provides for each of the distributions a non-uniform random variate generator, that generates energy fractions according to the distributions. The usage of these generators is discussed in section 3.2.

3 Usage

3.1 Distributions

A generic interface to all distributions $D_{p_1 p_2}(x_1, x_2)$ is given by the `circe` function

11a \langle API documentation 11a $\rangle \equiv$

```
function circe, d, x1, x2
    real(kind=double) :: circe
    integer :: p1, p2
    d = circe (x1, x2, p1, p2)
```

Uses `circe` 31b.

where the energy fractions are specified by $x_{1,2}$ and the particles $p_{1,2}$ are identified by their standard Monte Carlo codes (we use C1 as a prefix to avoid name clashes when using CIRCE1 inside WHIZARD):[13]

11b \langle Particle codes 11b $\rangle \equiv$

```
integer, parameter, public :: C1_ELECTRON = 11
integer, parameter, public :: C1_POSITRON = -11
integer, parameter, public :: C1_PHOTON = 22
```

Defines:

C1_ELECTRON, used in chunks 21d, 31b, 70b, and 75.
 C1_PHOTON, used in chunks 31b, 70b, 75, and 82.
 C1_POSITRON, used in chunks 22 and 75c.

The distributions can have integrable singularities at the end points, therefore the calling functions *must not* evaluate them at the endpoints 0 and 1. This is usually not a problem, since standard mapping techniques (cf. (10) below) will have to be used to take care of the singularity anyway. Nevertheless, all applications should favor open quadrature formulae (i.e. formulae not involving the endpoints) over closed formulae. The distributions are guaranteed to vanish unless $0 < x_{1,2} < 1$, with two exceptions. Firstly, the value -1 allows to pick up the integral of the continuum contribution:

$$D_{p_1 p_2}(-1, x_2) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_1 D_{p_1 p_2}(x_1, x_2) \quad (4a)$$

$$D_{p_1 p_2}(x_1, -1) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_2 D_{p_1 p_2}(x_1, x_2) \quad (4b)$$

$$D_{p_1 p_2}(-1, -1) = \lim_{\epsilon \rightarrow +0} \int_{\epsilon}^{1-\epsilon} dx_1 dx_2 D_{p_1 p_2}(x_1, x_2) \quad (4c)$$

The other exception is that the strength of δ -function contributions at the endpoint can be picked up from the value at this endpoint:

$$D_{e^+ e^-}(x_1, x_2) = D_{e^+ e^-}(1, 1) \delta(1 - x_1) \delta(1 - x_2) + \text{smooth and single } \delta \quad (5a)$$

$$D_{e^\pm \gamma}(x_1, x_2) = D_{e^\pm \gamma}(1, x_2) \delta(1 - x_1) + \text{smooth} \quad (5b)$$

$$D_{\gamma e^\pm}(x_1, x_2) = D_{\gamma e^\pm}(x_1, 1) \delta(1 - x_2) + \text{smooth} \quad (5c)$$

The use of these special values is demonstrated in an example in section 3.1.1 below.

The distributions are normalized such that

$$\lim_{\epsilon \rightarrow +0} \int_{-\epsilon}^{1+\epsilon} dx_1 dx_2 D_{e^+ e^-}(x_1, x_2) = 1. \quad (6)$$

and the nominal $e^+ e^-$ -luminosity of the currently active accelerator design can be retrieved from the database with the subroutine `circel`. The value is given in units of

$$\text{fb}^{-1} v^{-1} = 10^{32} \text{cm}^{-2} \text{sec}^{-1} \quad (7)$$

where $v = 10^7 \text{sec} \approx \text{year}/\pi$ is an “effective year” of running with about 30% up-time.

12a `<API documentation 11a>+≡`
`real(kind=dobule) :: lumi`
`call circel (lumi)`

Uses `circel 40f`.

A particular parameterization is selected by the `circes` function:

12b `<API documentation 11a>+≡`
`real(kind=double) :: x1m, x2m, roots`
`integer :: acc, ver, rev, chat`
`call circes (x1m, x2m, roots, acc, ver, rev, chat)`

Uses `circes 32a`.

The parameter **roots** corresponds to the nominal center of mass energy \sqrt{s} /GeV of the collider. Currently $\sqrt{s} = 350\text{GeV}, 500\text{GeV}, 800\text{GeV}, 1\text{TeV}$ (i.e. 350D0, 500D0, 800D0 and 1000D0) are supported. Application programs can *not* assume that energy values are interpolated. For convenience, e.g. in top threshold scans around 350GeV, a small interval around the supported values will be accepted as synonymous with the central value, but a warning will be printed. Section 5 should be consulted for the discrete values supported by a particular version of the parameterizations. Negative values of **roots** will keep the currently active value for \sqrt{s} .

The parameters **x1m** and **x2m** will set thresholds $x_{1,\min}$ and $x_{2,\min}$ for the event generation in the routines described in section 3.2.

The parameter **acc** selects the accelerator design. Currently the following accelerator codes are recognized:

13 $\langle \text{Accelerator codes 13} \rangle \equiv$

```
integer, parameter :: SBAND = 1
integer, parameter :: TESLA = 2
integer, parameter :: XBAND = 3
integer, parameter :: JLCNLC = 3
integer, parameter :: SBNDEE = 4
integer, parameter :: TESLEE = 5
integer, parameter :: XBNDEE = 6
integer, parameter :: NLCH = 7
integer, parameter :: NACC = 7
```

Defines:

JLCNLC, used in chunks 17, 18, 35b, 56b, 59–62, 65e, 67a, and 86b.

NACC, used in chunks 17, 34b, 35a, 39, 40, 44–46, 51b, 53c, 55c, 58c, 61c, and 65c.

SBAND, used in chunks 35b, 39f, 40a, 43–46, 49, 86b, 102a, and 103a.

SBNDEE, used in chunks 34b, 35b, 40c, 44–46, 48, and 86b.

TESLA, used in chunks 32, 35b, 39f, 40a, 43–46, 49–56, 58d, 59b, 61d, 62a, 65d, 66b, 86, and 102–104.

TESLEE, used in chunks 34b, 35b, 48a, and 86b.

XBAND, used in chunks 39f, 40a, 43–46, 49, 56e, 102a, and 103a.

XBNDEE, used in chunks 34b, 35b, 48, and 86.

The **ver** parameter is used to determine the version as follows:

ver > 0 : a frozen version which is documented in section 5. For example, version 1 is a family of factorized Beta distributions: $D(x_1, x_2) \propto x_1^{a_1} (1 - x_1)^{b_1} x_2^{a_2} (1 - x_2)^{b_2}$.

ver = 0 : the latest experimental version, which is usually not documented and can change at any time without announcement.

ver < 0 : keep the currently active version.

The **rev** parameter is used to determine the revision of a version as follows:

rev > 0 : a frozen revision which is documented in section 5. The integer **rev** is constructed from the date as follows: $\text{rev} = 10^4 \cdot \text{year} + 10^2 \cdot \text{month} + \text{day}$, where the year is greater than 1995. Since Fortran77 ignored whitespace, it could be written like 1996 07 11 for readability. In Fortran90 the white space have been erased. If there is no exact match, the most recent revision before the specified date is chosen.

`rev = 0` : the most recent revision.

`rev < 0` : keep the currently active revision.

Finally, the parameter `chat` controls the “chattiness” of `circe`. If it is 0, only error messages are printed. If it is 1, the parameters in use are printed whenever they change. Higher values of `chat` can produce even more diagnostics.

In addition to the generic interface `circe`, there are specialized functions for particular particle distributions. Obviously

$$D_{e^\pm\gamma}^{\alpha\nu\rho}(x_1, x_2, s) = D_{\gamma e^\pm}^{\alpha\nu\rho}(x_2, x_1, s) \quad (8)$$

and there are three independent functions $D_{e^-e^+}$, $D_{e^-\gamma}$ and $D_{\gamma\gamma}$ for the e^+e^- colliders with reasonable mnemonics:

14a `<API documentation 11a>+≡`
`real(kind=double) :: circee, circeg, circgg`
`d = circee (x1, x2)`
`d = circeg (x1, x2)`
`d = circgg (x1, x2)`

Uses `circee 41a`, `circeg 42a`, and `circgg 42d`.

Calling the latter three functions is marginally faster in the current implementation, but this can change in the future.

3.1.1 Example

For clarification, let me give a simple example. Imagine we want to calculate the integrated production cross section

$$\sigma_X(s) = \int dx_1 dx_2 \sigma_{e^+e^- \rightarrow X}(x_1 x_2 s) D_{e^+e^-}(x_1, x_2, s) \quad (9)$$

Since the distributions are singular in the $x_{1,2} \rightarrow 1$ limit, we have to map away this singularity with

$$x \rightarrow t = (1 - x)^{1/\eta} \quad (10a)$$

Therefore

$$\int_0^1 dx f(x) = \int_0^1 dt \eta t^{\eta-1} f(1 - t^\eta) \quad (10b)$$

with η sufficiently large to give the integrand a finite limit at $x \rightarrow 1$. If f diverges like a power $f(x) \propto 1/(1 - x)^\beta$, this means $\eta > 1/(1 - \beta)$.

As a specific example, let us “measure” a one particle s -channel exchange cross section

$$\sigma(s) \propto \frac{1}{s} \quad (11)$$

14b `<circe1_sample.f90: public 14b>≡`
`public :: sigma`
 Uses `sigma 15a`.

```

15a <circe1_sample.f90: subroutines 15a>≡
    function sigma (s)
        real(kind=double) :: s, sigma
        sigma = 1d0 / s
    end function sigma

```

Defines:

`sigma`, used in chunks 14–16, 18, and 20d.

I will present the example code in a bottom-up fashion, which should be intuitive and is described in some more detail in appendix A. Assuming the existence of a one- and a two-dimensional Gaussian integration function `gauss1` and `gauss2`,¹ we can perform the integral as follows:

```

15b <Gauss integration 15b>≡
    s = sigma (1d0) * circee (1d0, 1d0) &
        + gauss1 (d1, 0d0, 1d0, EPS) &
        + gauss1 (d2, 0d0, 1d0, EPS) &
        + gauss2 (d12, 0d0, 1d0, 0d0, 1d0, EPS)
    write (*, 1000) 'delta(sigma) (Gauss) =', (s-1d0)*100d0
    1000 format (1X, A22, 1X, F6.2, '%')

```

Uses `circee` 41a, `d1` 15f, `d12` 15d, `d2` 16b, `gauss1` 84b, `gauss2` 85b, and `sigma` 15a.

Note how the four combinations of continuum and δ -peak are integrated separately, where you have to use three auxiliary functions `d1`, `d2` and `d12`. The continuum contribution, including the Jacobian:

```

15c <circe1_sample.f90: public 14b>+≡
    public :: d12

```

Uses `d12` 15d.

```

15d <circe1_sample.f90: subroutines 15a>+≡
    function d12 (t1, t2)
        real(kind=double) :: d12, t1, t2, x1, x2
        <EPS & PWR 16c>
        x1 = 1d0 - t1**PWR
        x2 = 1d0 - t2**PWR
        d12 = PWR*PWR * (t1*t2)**(PWR-1d0) &
            * sigma (x1*x2) * circee (x1, x2)
    end function d12

```

Defines:

`d12`, used in chunk 15.

Uses `circee` 41a and `sigma` 15a.

the first product of continuum and δ -peak:

```

15e <circe1_sample.f90: public 14b>+≡
    public :: d1

```

Uses `d1` 15f.

```

15f <circe1_sample.f90: subroutines 15a>+≡
    function d1 (t1)
        real(kind=double) :: t1, x1, d1

```

¹They are provided in the example program `circe1_sample.f90`.

```

      <EPS & PWR 16c>
      x1 = 1d0 - t1**PWR
      d1 = PWR * t1**(PWR-1d0) * sigma (x1) * circee (x1, 1d0)
    end function d1

```

Defines:

d1, used in chunks 15, 41–43, and 70–73.

Uses circee 41a and sigma 15a.

and the second one:

```

16a <circe1_sample.f90: public 14b>+≡
      public :: d2
    Uses d2 16b.

16b <circe1_sample.f90: subroutines 15a>+≡
      function d2 (t2)
        real(kind=double) :: t2, x2, d2
        <EPS & PWR 16c>
        x2 = 1d0 - t2**PWR
        d2 = PWR * t2**(PWR-1d0) * sigma (x2) * circee (1d0, x2)
      end function d2

```

Defines:

d2, used in chunks 15, 16, 41–43, and 70–73.

Uses circee 41a and sigma 15a.

Below you will see that the power of the singularity of the e^+e^- distributions at $x \rightarrow 1$ is $\approx -2/3$. To be on the safe side, we choose the power η in (10) as 5. It is kept in the parameter PWR, while EPS is the desired accuracy of the Gaussian integration:

```

16c <EPS & PWR 16c>≡
      real(kind=double), parameter :: EPS = 1d-6, PWR = 5d0

```

The Gauss integration of the non-singular version converges to the cotrrect value only if the final bin is integrated separately:

```

16d <Second Gauss integration 16d>≡
      s = gauss2 (d12a, 0d0, 1d0-KIREPS, 0d0, 1d0-KIREPS, EPS) &
        + gauss2 (d12a, 0d0, 1d0-KIREPS, 1d0-KIREPS, 1d0, EPS) &
        + gauss2 (d12a, 1d0-KIREPS, 1d0, 0d0, 1d0-KIREPS, EPS) &
        + gauss2 (d12a, 1d0-KIREPS, 1d0, 1d0-KIREPS, 1d0, EPS)
      write (*, 1000) 'delta(sigma) (Gauss) =', (s-1d0)*100d0
    Uses d12a 16g, gauss2 85b, and sigma 15a.

```

```

16e <EPS & PWR 16c>+≡
      real(kind=double), parameter :: KIREPS = 1D-6

```

```

16f <circe1_sample.f90: public 14b>+≡
      public :: d12a
    Uses d12a 16g.

```

```

16g <circe1_sample.f90: subroutines 15a>+≡
      function d12a (x1, x2)
        real(kind=double) :: x1, x2, d12a
        d12a = sigma (x1*x2) * kirkee (x1, x2)

```

```
end function d12a
```

Defines:

d12a, used in chunk 16.

Uses kirkee 70d and sigma 15a.

These code fragments can now be used in a main program that loops over energies and accelerator designs

```

```

Uses JLCNLC 13 and sigma 15a.

We almost forgot to declare the variables in the main program

```

19 <Other variables in sample 19>≡
    real(kind=double) :: s

```

This concludes the integration example. It should have made it obvious how to proceed in a realistic application.

In section 3.2.1 below, I will describe a Monte Carlo method for calculating such integrals efficiently.

3.2 Generators

The function `circe` and its companions are opaque to the user. Since they will in general contain singularities, applications will *not* be able to generate corresponding samples of random numbers efficiently. To fill this gap, four random number generators are provided. The subroutine `girce` will generate particle types $p_{1,2}$ and energy fractions $x_{1,2}$ in one step, according to the selected distribution.² Particle p_1 will be either a positron or a photon and p_2 will be either an electron or a photon. The energy fractions are guaranteed to be above the currently active thresholds: $x_i \geq x_{i,\min}$. This can be used to cut on soft events—the photon distributions are rather soft—which might not be interesting

²The implementation of the flavor selection with non-vanishing thresholds $x_{1,\min}$ and $x_{2,\min}$ is moderately inefficient at the moment. It can be improved by a factor of two.

in most simulations.

20a *<API documentation 11a>+≡*
`call girce (x1, x2, p1, p2, rng)`

Uses `girce 75b`.

The output parameters of `girce` are identical to the input parameters of `circe`, with the exception of `rng`. The latter is a subroutine with a single double precision argument, which will be assigned a uniform deviate from the interval $[0, 1]$ after each call:

20b *<API documentation 11a>+≡*
`subroutine rng (r)`
`real(kind=double) :: r`
`r = <uniform deviate on $[0, 1]$ (never defined)>`
`end subroutine rng`

Typically, it will be just a wrapper around the standard random number generator of the application program. For studies with a definite initial state, three generator functions are available.

20c *<API documentation 11a>+≡*
`call gircee (x1, x2, rng)`
`call girceg (x1, x2, rng)`
`call gircgg (x1, x2, rng)`

Uses `gircee 76d`, `girceg 77b`, and `gircgg 77f`.

3.2.1 Example

Returning to the example from section 3.2.1, I present a concise Monte Carlo algorithm for calculating the same integral:

20d *<Monte Carlo integration 20d>≡*
`s = 0d0`
`s2 = 0d0`
`do n = 1, NEVENT`
`call gircee (x1, x2, random)`
`w = sigma (x1*x2)`
`s = s + w`
`s2 = s2 + w*w`
`end do`
`s = s / dble(NEVENT)`
`s2 = s2 / dble(NEVENT)`
`write (*, 1000) 'delta(sigma) (MC) =', (s-1d0)*100d0`
`write (*, 1000) ' +/-', sqrt((s2-s*s)/dble(NEVENT))*100d0`

Uses `gircee 76d`, `random 21a`, and `sigma 15a`.

20e *<Other variables in sample 19>+≡*
`real(kind=double) :: w, s2, x1, x2`
`integer, parameter :: NEVENT = 10000`
`integer :: n`

Here is a simple linear congruential random number generator for the sample program. Real applications will use their more sophisticated generators instead.

20f *<circe1_sample.f90: public 14b>+≡*

```
public :: random
```

Uses random 21a.

```
21a (circe1_sample.f90: subroutines 15a)+≡
subroutine random (r)
  real(kind=double), intent(out) :: r
  integer :: m = 259200, a = 7141, c = 54773
  integer, save :: n = 0
  ! data n /0/
  n = mod(n*a+c,m)
  r = real (n, kind=double) / real (m, kind=double)
end subroutine random
```

Defines:

random, used in chunks 20 and 21c.

If the cross section is slowly varying on the range where the $x_{1,2}$ distributions are non-zero, this algorithm is very efficient.

However, if this condition is not met, the explicit form of the parameterizations in section 5 should be consulted and appropriate mapping techniques should be applied. The typical example for this problem is a narrow resonance just below the nominal beam energy.

3.2.2 Event Generators

For Monte Carlo event generators that use the standard /hepevt/ common block [14], the addition of the Circe library is trivial. During the initialization of the event generator, the circes subroutine is called to set up Circe's internal state. For example:

```
21b (Initialize event generator 21b)≡
call circes (0d0, 0d0, roots, acc, ver, 1996 07 11, 1)
```

Uses circes 32a.

During event generation, before setting up the e^+e^- initial state, the gircee subroutine is called with the event generator's random number generator:

```
21c (Event generation 21c)≡
call gircee (x1, x2, random)
```

Uses gircee 76d and random 21a.

The resulting energy fractions x_1 and x_2 are now available for defining the initial state electron

```
21d (Event generation 21c)+≡
isthep(1) = 101
idhep(1) = C1_ELECTRON
phep(1,1) = 0d0
phep(2,1) = 0d0
phep(3,1) = x1 * ebeam
phep(4,1) = x1 * ebeam
phep(5,1) = 0d0
```

Uses C1_ELECTRON 11b.

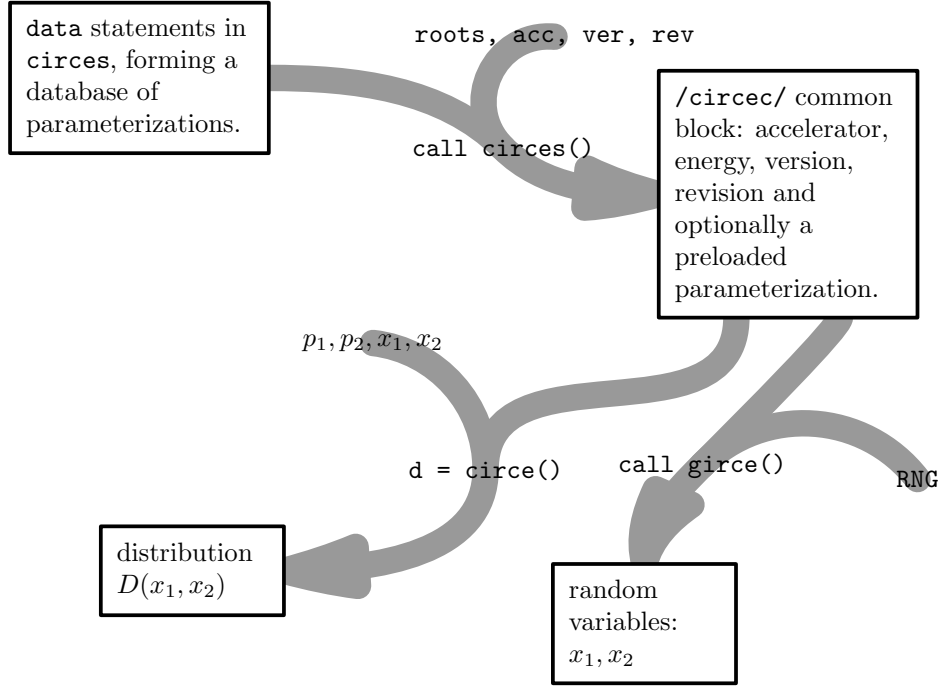

Figure 5: Architecture of **Circe**: `circes()` selects energy and accelerator and loads the parameterization. The function `circe()` calculates the values of the selected distribution function at the given energy fractions. The subroutine `girce()` generates energy fractions using a specified random number generator in accordance with the selected distribution.

and positron.

```

22 <Event generation 21c>+≡
    isthep(2) = 102
    idhep(2) = C1_POSITRON
    phep(1,2) = 0d0
    phep(2,2) = 0d0
    phep(3,2) = - x2 * ebeam
    phep(4,2) = x2 * ebeam
    phep(5,2) = 0d0

```

Uses C1_POSITRON 11b.

Using **Circe** with other event generators should be straightforward as well.

4 Technical Notes

The structure of **Circe** is extremely simple (cf. figure 5) and is mainly a book-keeping exercise. All that needs to be done is to maintain a database of available parameterizations and to evaluate the corresponding functions. The only non trivial algorithms are used for the efficient generation of random deviates.

Table 5: Version 1, revision 1997 04 16 of the beam spectra at 500 GeV. The rows correspond to the luminosity per effective year, the integral over the continuum and the powers in the factorized Beta distributions (12).

I have avoided the use of initialized `common` blocks (i.e. `block data` subroutines), because the Fortran77 standard does not provide a *portable* way of ensuring that `block data` subroutines are actually executed at loading time³. Instead, the `/circom/` common block is tagged by a “magic number” to check for initialization and its members are filled by the `circes` subroutine when necessary.

A more flexible method would be to replace the `data` statements by reading external files. This option causes portability problems, however, because I would have to make sure that the names of the external files are valid in all files systems of the target operating systems. More significantly, splitting the implementation into several parts forces the user to keep all files up to date. This can be a problem, because Fortran source files and data input files will typically be kept in different parts of the file system.

The option of implementing `Circe` statelessly, i.e. with pure function calls and without `common` blocks, has been dismissed. While it would have been more straightforward on the side of the library, it would have placed the burden of maintaining state (accelerator, energy, etc.) on the application program, thereby complicating them considerably. Keeping an explicit state in `Circe` has the additional benefit of allowing to precompute certain internal variables, resulting in a more efficient implementation.

5 Parameterizations

Version 1.02 β of `Circe` supports just one version of the parameterizations. Future versions will provide additional parameterizations.

5.1 Version 1

The first version of the parameterization uses a simple factorized *ansatz*

$$D_{p_1 p_2}^{\alpha 1 \rho}(x_1, x_2, s) = d_{p_1}^{\alpha 1 \rho}(x_1) d_{p_2}^{\alpha 1 \rho}(x_2) \quad (12a)$$

³In Fortran90 the common blocks have been replaced by saved module variables.

Table 10: *Experimental* Version 1, revision 0 of the beam spectra at 1 TeV.

where the distributions are simple Beta distributions:

$$d_{e^\pm}^{\alpha 1\rho}(x) = a_0^{\alpha\rho} \delta(1-x) + a_1^{\alpha\rho} x^{a_2^{\alpha\rho}} (1-x)^{a_3^{\alpha\rho}} \quad (12b)$$

$$d_\gamma^{\alpha 1\rho}(x) = a_4^{\alpha\rho} x^{a_5^{\alpha\rho}} (1-x)^{a_6^{\alpha\rho}} \quad (12c)$$

This form of the distributions is motivated by the observation [2] that the e^\pm distributions diverge like a power for $x \rightarrow 1$ and vanish at $x \rightarrow 0$. The behavior of the γ distributions is similar with the borders exchanged.

5.1.1 Fitting

The parameters a_i in (12) have been obtained by a least-square fit of (12) to histograms of simulation results from **Guinea-Pig**. Some care has to be taken when fitting singular distributions to histogrammed data. Obviously equidistant bins are not a good idea, because most bins will be almost empty (cf. figures 1 and 2) and consequently a lot of information will be wasted. One solution to this problem is the use of logarithmic bins. This, however, maps the compact region $[0, 1] \times [0, 1]$ to $[-\infty, 0] \times [-\infty, 0]$, which is inconvenient because of the missing lower bounds.

$(1 - x_\gamma)^\alpha$	$60.1882^{+0.5882}_{-0.5797}$	$36.1286^{+0.3027}_{-0.2991}$	$19.3944^{+0.1681}_{-0.1660}$

Table 11: *Experimental* Version 1, revision 0 of the beam spectra for TESLEE.

The more appropriate solution is to use two maps

$$\begin{aligned}\phi : [0, 1] &\rightarrow [0, 1] \\ x &\mapsto y = x^{1/\eta}\end{aligned}\tag{13}$$

where $x = x_\gamma$ or $x = 1 - x_{e\pm}$, and to bin the result equidistantly. If η is chosen properly (cf. (10)), the bin contents will then fall off at the singularity. The fits in tables 5, 6, and 7 have been performed with $\eta = 5$ and the resulting bin contents can be read off from figures 6–9.

Using this procedure for binning the results of the simulations, the popular fitting package MINUIT [15] converges quickly in all cases considered. The resulting parameters are given in tables 5, 6, and 7. Plots of the corresponding distributions have been shown in figures 1 and 2. It is obvious that an *ansatz* like (12) is able to distinguish among the accelerator designs. Thus it can provide a solid basis for physics studies.

In figures 6–9 I give a graphical impression of the quality of the fit, which appears to be as good as one could reasonably expect for a simple *ansatz* like (12). Note that the histograms have non-equidistant bins and that the resulting Jacobians have not been removed. Therefore the bin contents falls off at the singularities, as discussed above.

The errors used for the least-square fit had to be taken from a Monte Carlo (MC) study. **Guinea-Pig** only provides the \sqrt{n} from Poissonian statistics for each bin, but the error accumulation during tracking the particles through phase space is not available. The MC studies shows that the latter error dominates the former, but appears to be reasonably Gaussian. A complete MC study of all parameter sets is computationally expensive (more than a week of processor time on a fast SGI). From an exemplary MC study of a few parameter sets, it appears that the errors can be described reasonably well by rescaling the Poissonian error in each bin with appropriate factors for electrons/positrons and photons and for continuum and delta. This procedure has been adopted.

The $\chi^2/\text{d.o.f.}$'s of the fits are less than $\mathcal{O}(10)$. The simple *ansatz* (12) is therefore very satisfactory. In fact, trying to improve the ad-hoc factorized Beta distributions by the better motivated approximations from [7] or [16], it turns out [17] that (12) provides a significantly better fit of the results of the simulations. The price to pay is that the parameters in (12) have no direct

physical interpretation.

5.1.2 Generators

For this version of the parameterizations we need a fast generator of Beta distributions:

$$\beta^{a,b}(x) \propto x^{a-1}(1-x)^{b-1} \quad (14)$$

This problem has been studied extensively and we can use a published algorithm [18] that is guaranteed to be very fast for all a, b such that $0 < a \leq 1 \leq b$, which turns out to be always the case (cf. tables 5, 6, and 7).

5.2 Future Versions

There are two ways in which the parameterizations can be improved:

more complicated functions: the factorized fits can only be improved marginally by adding more positive semi-definite factors to (12). More improvement is possible by using sums of functions, but in this case, the best fits violate the positivity requirement and have to be discarded.

correlations: the parameterization in section 5.1 is factorized. While this is a good approximation, the simulations nevertheless show correlations among x_1 and x_2 . These correlations can be included in a future version.

interpolation: the parameterization in section 5.1 is based on fitting the simulation results by simple functions. Again, this appears to be a good approximation. But such fits can not uncover any fine structure of the distributions. Therefore it will be worthwhile to study interpolations of the simulation results in the future. A proper interpolation of results with statistical errors is however far from trivial: straightforward polynomial or spline interpolations will be oscillatory and violate the positivity requirement. Smoothing algorithms have to be investigated in depth before such a parameterization can be released.

other simulations: besides [5], other simulation codes are invited to contribute their results for inclusion in the Circe library.

6 Implementation of circe1

Now we can move on to the implementation.

6.1 Symbolic Constants

The file `circe.h` contains symbolic names for various magic constants used by Circe:

```

30b <circe.h 30b>≡
c circe.h -- canonical beam spectra for linear collider physics
c $Id: circe1.nw 67 2002-03-28 17:13:06Z ohl $
Uses circe 31b.

30c <Main module 30c>≡
module circe1
  use kinds

  implicit none
  private
  <Public subroutines 31a>

  <Particle codes 11b>
  <Accelerator codes 13>
  <Private parameters 36d>

  integer, parameter, public :: MAGIC0 = 19040616
  real(kind=double), parameter :: KIREPS = 1D-6

```

```

    <Declaration: circe1 parameters 32c>

    type(circe1_params_t), public, save :: circe1_params

contains

    <Module subroutines 31b>
end module circe1

```

6.2 Distributions

6.2.1 Version 1

We start with a convenience function which dispatches over the valid particle types. The hardest part is of course to avoid typos in such trivial functions ...

```

31a <Public subroutines 31a>≡
    public :: circe
    Uses circe 31b.

31b <Module subroutines 31b>≡
    function circe (x1, x2, p1, p2)
    real(kind=double) :: x1, x2
    integer :: p1, p2
    real(kind=double) :: circe
    <Initialization check 32g>
    circe = -1.0
    if (abs(p1) .eq. C1_ELECTRON) then
        if (abs(p2) .eq. C1_ELECTRON) then
            circe = circee (x1, x2)
        else if (p2 .eq. C1_PHOTON) then
            circe = circeg (x1, x2)
        end if
    else if (p1 .eq. C1_PHOTON) then
        if (abs(p2) .eq. C1_ELECTRON) then
            circe = circeg (x2, x1)
        else if (p2 .eq. C1_PHOTON) then
            circe = circgg (x1, x2)
        end if
    end if
end function circe

```

Defines:

`circe`, used in chunks 11a, 31, 30–32, 82, 88a, 104c, and 110a.

Uses `C1_ELECTRON` 11b, `C1_PHOTON` 11b, `circee` 41a, `circeg` 42a, and `circgg` 42d.

```

31c <Public subroutines 31a>+≡
    public :: circes
    Uses circes 32a.

```

32a *<Module subroutines 31b>+≡*

```

subroutine circes (xx1m, xx2m, xroots, xacc, xver, xrev, xchat)
  real(kind=double) :: xx1m, xx2m, xroots
  integer :: xacc, xver, xrev, xchat
<Local variables for circes 33b>
<Initializations for circes 35b>
  if (circe1_params%magic .ne. 19040616) then
    circe1_params%magic = 19040616
    <Initialize circe1 parameters 32h>
  end if
<Update circe1 parameters 33a>
<formats for circes 37e>
end subroutine circes

```

Defines:

circes, used in chunks 32a, 12b, 17, 32a, 21b, 31, 32, 82, and 86a.

32b *<Public subroutines 31a>+≡*

```

public :: circe1_params_t

```

32c *<Declaration: circe1 parameters 32c>≡*

```

type :: circe1_params_t
<8-byte aligned part of circe1 parameters 32d>
<4-byte aligned part of circe1 parameters 32e>
end type circe1_params_t

```

32d *<8-byte aligned part of circe1 parameters 32d>≡*

```

real(kind=double) :: x1m = 0d0
real(kind=double) :: x2m = 0d0
real(kind=double) :: roots = 500D0

```

32e *<4-byte aligned part of circe1 parameters 32e>≡*

```

integer :: acc = TESLA
integer :: ver = 0
integer :: rev = 0
integer :: chat = 1

```

Uses TESLA 13.

Instead of using fragile `block data` subroutines, we use a magic number to tag `circe1_params` as initialized:

32f *<4-byte aligned part of circe1 parameters 32e>+≡*

```

integer :: magic

```

Since negative values are no updated, we can call `circes` with all negative variables to ensure initialization:

32g *<Initialization check 32g>≡*

```

if (circe1_params%magic .ne. MAGIC0) then
  call circes (-1d0, -1d0, -1d0, -1, -1, -1, -1)
endif

```

Uses `circes` 32a.

32h *<Initialize circe1 parameters 32h>≡*

```

circe1_params%x1m = 0d0
circe1_params%x2m = 0d0

```

```

circe1_params%roots = 500D0
circe1_params%acc = TESLA
circe1_params%ver = 0
circe1_params%rev = 0
circe1_params%chat = 1
if (xchat .ne. 0) then
  call circem ('MESSAGE', 'starting up ...')
  call circem ('MESSAGE', &
    '$Id: circe.nw 67 2002-03-28 17:13:06Z ohl $')
endif

```

Uses TESLA 13, circe 31b, and circem 81c.

```

33a <Update circe1 parameters 33a>≡
  if ((xchat .ge. 0) .and. (xchat .ne. circe1_params%chat)) then

      end if
      circeg = d1 * d2

```

Uses circeg 42a, d1 15f, and d2 16b.

```

42c  <Public subroutines 31a>+≡
      public :: circgg

```

Uses circgg 42d.

```

42d  <Module subroutines 31b>+≡
      function circgg (x1, x2)
        real(kind=double) :: x1, x2
        real(kind=double) :: circgg
        real(kind=double) :: d1, d2
      <Initialization check 32g>
      circgg = -1.0
      if ((circe1_params%ver .eq. 1) .or. (circe1_params%ver .eq. 0)) then
      <Calculate version 1 of the  $\gamma\gamma$  distribution 43a>
      <else handle invalid versions 36c>
      end function circgg

```

Defines:

circgg, used in chunks 14a, 31b, 42c, 43a, and 75c.

Uses d1 15f and d2 16b.

43a *(Calculate version 1 of the $\gamma\gamma$ distribution 43a)*≡

```
if (x1 .lt. 1d0 .and. x1 .gt. 0d0) then
  d1 = circe1_params%a1(4) * x1**circe1_params%a1(5) * (1d0 - x1)**circe1_params%
elseif (x1 .eq. -1d0) then
  d1 = circe1_params%a1(7)
else
  d1 = 0d0
endif
if (x2 .lt. 1d0 .and. x2 .gt. 0d0) then
  d2 = circe1_params%a1(4) * x2**circe1_params%a1(5) * (1d0 - x2)**circe1_params%
elseif (x2 .eq. -1d0) then
  d2 = circe1_params%a1(7)
else
  d2 = 0d0
endif
circgg = d1 * d2
```

Uses circgg 42d, d1 15f, and d2 16b.

Revision 2. New Tesla parameters, including 350 GeV and 800 GeV.

43b *(Initializations for circes 35b)*+≡

6.4 Non-Singular Distributions

70a *<Public subroutines 31a>+≡*

```
public :: kirke
```

Uses kirke 70b.

70b *<Module subroutines 31b>+≡*

```
function kirke (x1, x2, p1, p2)
  real(kind=double) :: x1, x2
  real(kind=double) :: kirke
  integer :: p1, p2
  <Initialization check 32g>
  kirke = -1.0
  if (abs(p1) .eq. C1_ELECTRON) then
    if (abs(p2) .eq. C1_ELECTRON) then
      kirke = kirkee (x1, x2)
    else if (p2 .eq. C1_PHOTON) then
      kirke = kirkeg (x1, x2)
    end if
  else if (p1 .eq. C1_PHOTON) then
    if (abs(p2) .eq. C1_ELECTRON) then
      kirke = kirkeg (x2, x1)
    else if (p2 .eq. C1_PHOTON) then
      kirke = kirkgg (x1, x2)
    end if
  endif
end function kirke
```

Defines:

kirke, used in chunk 70a.

Uses C1_ELECTRON 11b, C1_PHOTON 11b, kirkee 70d, kirkeg 73a, and kirkgg 73c.

70c *<Public subroutines 31a>+≡*

```
public :: kirkee
```

Uses kirkee 70d.

70d *<Module subroutines 31b>+≡*

```
function kirkee (x1, x2)
  real(kind=double) :: x1, x2
  real(kind=double) :: kirkee
  real(kind=double) :: d1, d2
  <Initialization check 32g>
  kirkee = -1.0
  if ((circe1_params%ver .eq. 1) .or. (circe1_params%ver .eq. 0)) then
    <Calculate version 1 of the non-singular  $e^+e^-$  distribution 71e>
  else
    <else handle invalid versions 36c>
  end function kirkee
```

Defines:

kirkee, used in chunks 16g, 70, and 71e.

Uses d1 15f and d2 16b.

71a $\langle 8\text{-byte aligned part of circe1 parameters 32d} \rangle + \equiv$
`real(kind=double) :: elect0, gamma0`

$$\int_{1-\epsilon}^{1+} dx d_{e^\pm}^{\alpha 1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{1-\epsilon}^{1-} dx x^{a_2^{\alpha\rho}} (1-x)^{a_3^{\alpha\rho}} \quad (18)$$

Approximately

$$\int_{1-\epsilon}^{1+} dx d_{e^\pm}^{\alpha 1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{1-\epsilon}^{1-} dx (1-x)^{a_3^{\alpha\rho}} = a_0^{\alpha\rho} + a_1^{\alpha\rho} \int_{0+}^{\epsilon} d\xi \xi^{a_3^{\alpha\rho}} \quad (19)$$

and therefore

$$\int_{1-\epsilon}^{1+} dx d_{e^\pm}^{\alpha 1\rho}(x) = a_0^{\alpha\rho} + a_1^{\alpha\rho} \frac{1 - \epsilon^{a_3^{\alpha\rho}+1}}{a_3^{\alpha\rho} + 1} \quad (20)$$

This simple approximation is good enough

71b $\langle \text{Update circe1 parameters 33a} \rangle + \equiv$
`circe1_params%elect0 = circe1_params%a1(0) + circe1_params%a1(1) * KIREPS**(circe1_params%elect0 / KIREPS)`
`circe1_params%gamma0 = circe1_params%a1(4) * KIREPS**(circe1_params%a1(5)+1) / (circe1_params%gamma0 / KIREPS)`

but we can also use incomplete Beta functions for the exact result:

71c $\langle \text{Alternative: Update circe1 parameters 71c} \rangle + \equiv$
`circe1_params%elect0 = circe1_params%a1(0) + circe1_params%a1(1) * beta (circe1_params%elect0 / KIREPS, 1d0 - betinc (circe1_params%a1(2)+1, circe1_params%a1(3)+1, 1d0 - circe1_params%elect0 / KIREPS), 1d0 - circe1_params%elect0 / KIREPS)`
`circe1_params%gamma0 = circe1_params%a1(7) + circe1_params%a1(4) * beta (circe1_params%gamma0 / KIREPS, betinc (circe1_params%a1(5)+1, circe1_params%a1(6)+1, KIREPS), 1d0 - circe1_params%gamma0 / KIREPS)`

Uses beta 99.

71d $\langle \text{Alternative: Local variables for circes 71d} \rangle + \equiv$
`real(kind=double) :: betinc`
`external betinc`

71e $\langle \text{Calculate version 1 of the non-singular } e^+e^- \text{ distribution 71e} \rangle + \equiv$
`if (x1 .gt. 1d0) then`
`d1 = 0d0`
`elseif (x1 .ge. (1d0 - KIREPS)) then`
`d1 = circe1_params%elect0`
`elseif (x1 .ge. 0d0) then`
`d1 = circe1_params%a1(1) * x1**circe1_params%a1(2) * (1d0 - x1)**circe1_params%a1(3)`
`else`
`d1 = 0d0`
`endif`
`if (x2 .gt. 1d0) then`
`d2 = 0d0`
`elseif (x2 .ge. (1d0 - KIREPS)) then`
`d2 = circe1_params%elect0`
`elseif (x2 .ge. 0d0) then`
`d2 = circe1_params%a1(1) * x2**circe1_params%a1(2) * (1d0 - x2)**circe1_params%a1(3)`

```

else
    d2 = 0d0
endif
kirkee = d1 * d2

```

Uses d1 15f, d2 16b, and kirkee 70d.

72a \langle Calculate version 1 of the non-singular $e^\pm\gamma$ distribution 72a $\rangle \equiv$

```

if (x1 .gt. 1d0) then

  end if
```

⟨x1m, x2m kludge, part 2 76b⟩

```
end subroutine girce
```

Defines:

girce, used in chunks *75b*, *20a*, and *75*.

Uses *C1_ELECTRON 11b*, *C1_PHOTON 11b*, *gircee 76d*, *girceg 77b*, and *gircgg 77f*.

75c *⟨Select particles p1 and p2 75c⟩*≡

```
w = 1d0 / (1d0 + circgg (-1d0, -1d0))
call rng (u)
if (u*u .le. w) then
  p1 = C1_POSITRON
else
  p1 = C1_PHOTON
end if
call rng (u)
if (u*u .le. w) then
  p2 = C1_ELECTRON
else
```

```

        p2 = C1_PHOTON
    end if

```

Uses C1_ELECTRON 11b, C1_PHOTON 11b, C1_POSITRON 11b, and circgg 42d.

The flavor selection is incorrect, because the relative weights depend on the minimum energy fractions. We resort to a moderately inefficient kludge, because we don't have the distribution functions available yet. We'll have to implement incomplete Beta functions and other horrible things for this. Fortunately, the efficiency can not drop below the relative contribution of e^+e^- .

```

76a <x1m, x2m kludge, part 1 76a>≡
    do

```

Crude rejection:

```

76b <x1m, x2m kludge, part 2 76b>≡
    if ((x1 .ge. circe1_params%x1m) .and. (x2 .ge. circe1_params%x2m)) exit
    end do

```

```

76c <Public subroutines 31a>+≡
    public :: gircee

```

Uses gircee 76d.

```

76d <Module subroutines 31b>+≡
    subroutine gircee (x1, x2, rng)
        real(kind=double), intent(out) :: x1, x2
        external rng
        real(kind=double) :: u
        <Initialization check 32g>
        if ((circe1_params%ver .eq. 1) .or. (circe1_params%ver .eq. 0)) then
            <Generate version 1 of the  $e^+e^-$  distribution 76e>
            <else handle invalid versions 36c>
        end subroutine gircee

```

Defines:

gircee, used in chunks 20, 76d, 21c, 75b, and 76c.

For version 1 of the parametrizations we rely on girceb, a fast generator of β -distributions:

$$\beta_{x_{\min}, x_{\max}}^{a,b}(x) = x^{a-1}(1-x)^{b-1} \cdot \frac{\Theta(x_{\max}-x)\Theta(x-x_{\min})}{I(x_{\min}, a, b) - I(x_{\max}, a, b)} \quad (21)$$

$$I(x, a, b) = \int_x^1 d\xi \xi^{a-1}(1-\xi)^{b-1} \quad (22)$$

```

76e <Generate version 1 of the  $e^+e^-$  distribution 76e>≡

```

```

    call rng (u)
    if (u .le. circe1_params%a1(0)) then
        x1 = 1d0
    else
        x1 = 1d0 - girceb (0d0, 1d0-circe1_params%x1m, circe1_params%a1(3)+1d0, circe1_
    endif
    call rng (u)
    if (u .le. circe1_params%a1(0)) then
        x2 = 1d0

```

```

        else
            x2 = 1d0 - girceb (0d0, 1d0-circe1_params%x2m, circe1_params%a1(3)+1d0, circe1_
        endif
    Uses girceb 78b.

            end subroutine gircgg

    Uses gircgg 77f.
77f  <Generate version 1 of the  $\gamma\gamma$  distribution 77f>≡
        x1 = girceb (circe1_params%x1m, 1d0, circe1_params%a1(5)+1d0, circe1_params%a1(6)+
        x2 = girceb (circe1_params%x2m, 1d0, circe1_params%a1(5)+1d0, circe1_params%a1(6)+
    Defines:

```

gircegg, used in chunks 20c, 75b, and 77.
 Uses girceb 78b.

6.5.2 Version 2

Retired.

6.5.3 Version 3 and 4

Identical to version 1.

6.6 Utilities

For version 1 of the parametrizations we need a fast generator of β -distributions:

$$\beta_{x_{\min}, x_{\max}}^{a,b}(x) = x^{a-1}(1-x)^{b-1} \cdot \frac{\Theta(x_{\max} - x)\Theta(x - x_{\min})}{I(x_{\min}, a, b) - I(x_{\max}, a, b)} \quad (23)$$

with the *incomplete Beta-function* I :

$$I(x, a, b) = \int_x^1 d\xi \xi^{a-1} (1-\xi)^{b-1} \quad (24)$$

$$B(a, b) = I(0, a, b) \quad (25)$$

This problem has been studied extensively [?] and we can use an algorithm [18] that is very fast for $0 < a \leq 1 \leq b$, which turns out to be the case in our application.

78a *<Public subroutines 31a>+≡*
 public :: girceb

Uses girceb 78b.

78b *<Module subroutines 31b>+≡*
 function girceb (xmin, xmax, a, b, rng)
 real(kind=double) :: xmin, xmax, a, b
 real(kind=double) :: girceb
 external rng
 real(kind=double) :: t, p, u, umin, umax, x, w
 <Check a and b 79a>
 <Set up girceb parameters 79b>
 do
 <Generate a trial x and calculate its weight w 79c>
 call rng (u)
 if (w .gt. u) exit
 end do
 girceb = x
 end function girceb

Defines:

girceb, used in chunks 78b and 76–80.

In fact, this algorithm works for $0 < a \leq 1 \leq b$ only:

```

79a <Check a and b 79a>≡
      if ((a .gt. 1d0) .or. (b .lt. 1d0)) then
        girceb = -1d0
        call circem ('ERROR', 'beta-distribution expects a<=1<=b')
        return
      end if

```

Uses `circem 81c` and `girceb 78b`.

The trick is to split the interval $[0, 1]$ into two parts $[0, t]$ and $[t, 1]$. In these intervals we obviously have

$$x^{a-1}(1-x)^{b-1} \leq \begin{cases} x^{a-1} & \text{for } x \leq t \\ t^{a-1}(1-x)^{b-1} & \text{for } x \geq t \end{cases} \quad (26)$$

because we have assumed that $0 < a \leq 1 \leq b$. The integrals of the two dominating distributions are t^a/a and $t^{a-1}(1-t)^b/b$ respectively and therefore the probability for picking a random number from the first interval is

$$P(x \leq t) = \frac{bt}{bt + a(1-t)^b} \quad (27)$$

We postpone the discussion of the choice of t until later:

```

79b <Set up girceb parameters 79b>≡
      <Set up best value for t 81a>
      p = b*t / (b*t + a * (1d0 - t)**b)

```

The dominating distributions can be generated by simple mappings

$$\phi : [0, 1] \rightarrow [0, 1] \quad (28)$$

$$u \mapsto \begin{cases} t \left(\frac{u}{p}\right)^{\frac{1}{a}} & < t \text{ for } u < p \\ t & = t \text{ for } u = p \\ 1 - (1-t) \left(\frac{1-u}{1-p}\right)^{\frac{1}{b}} & > t \text{ for } u > p \end{cases} \quad (29)$$

The beauty of the algorithm is that we can use a single uniform deviate u for both intervals:

```

79c <Generate a trial x and calculate its weight w 79c>≡
      call rng (u)
      u = umin + (umax - umin) * u
      if (u .le. p) then
        x = t * (u/p)**(1d0/a)
        w = (1d0 - x)**(b-1d0)
      else
        x = 1d0 - (1d0 - t) * ((1d0 - u)/(1d0 - p))**(1d0/b)
        w = (x/t)**(a-1d0)
      end if

```

The weights that are derived by dividing the distribution by the dominating distributions are already normalized correctly:

$$w : [0, 1] \rightarrow [0, 1] \quad (30)$$

$$x \mapsto \begin{cases} (1-x)^{b-1} & \in [(1-t)^{b-1}, 1] \text{ for } x \leq t \\ \left(\frac{x}{t}\right)^{a-1} & \in [t^{1-a}, 1] \text{ for } x \geq t \end{cases} \quad (31)$$

To derive $u_{\min, \max}$ from $x_{\min, \max}$ we can use ϕ^{-1} :

$$\phi^{-1} : [0, 1] \rightarrow [0, 1] \quad (32)$$

$$x \mapsto \begin{cases} p \left(\frac{x}{t}\right)^a & < p \text{ for } x < t \\ p & = p \text{ for } x = t \\ 1 - (1-p) \left(\frac{1-x}{1-t}\right)^b & > p \text{ for } x > t \end{cases} \quad (33)$$

We start with u_{\min} . For efficiency, we handle the most common cases (small x_{\min}) first:

```
80a <Set up girceb parameters 79b> +=
    if (xmin .le. 0d0) then
        umin = 0d0
    elseif (xmin .lt. t) then
        umin = p * (xmin/t)**a
    elseif (xmin .eq. t) then
        umin = p
    elseif (xmin .lt. 1d0) then
        umin = 1d0 - (1d0 - p) * ((1d0 - xmin)/(1d0 - t))**b
    else
        umin = 1d0
    endif
```

Same procedure for u_{\max} ; again, handle the most common cases (large x_{\max}) first:

```
80b <Set up girceb parameters 79b> +=
    if (xmax .ge. 1d0) then
        umax = 1d0
    elseif (xmax .gt. t) then
        umax = 1d0 - (1d0 - p) * ((1d0 - xmax)/(1d0 - t))**b
    elseif (xmax .eq. t) then
        umax = p
    elseif (xmax .gt. 0d0) then
        umax = p * (xmax/t)**a
    else
        umax = 0d0
    endif
```

Check for absurd cases.

```
80c <Set up girceb parameters 79b> +=
    if (umax .lt. umin) then
        girceb = -1d0
        return
    endif
```

Uses girceb 78b.

It remains to choose the best value for t . The rejection efficiency ϵ of the algorithm is given by the ratio of the dominating distribution and the distribution

$$\frac{1}{\epsilon(t)} = \frac{B(a,b)}{ab} (bt^a + at^{a-1}(1-t)^b). \quad (34)$$

It is maximized for

$$bt - bt(1-t)^{b-1} + (a-1)(1-t)^b = 0 \quad (35)$$

This equation has a solution which can be determined numerically. While this determination is far too expensive compared to a moderate loss in efficiency, we could perform it once after fitting the coefficients a , b . Nevertheless, it has been shown,[\[18\]](#) that

$$t = \frac{1-a}{b+1-a} \quad (36)$$

results in non-vanishing efficiency for all values $1 < a \leq 1 \leq b$. Empirically we have found efficiencies of at least 80% for this choice, which is enough for our needs.

```

81a <Set up best value for t 81a>≡
      t = (1d0 - a) / (b + 1d0 - a)

81b <Public subroutines 31a>+≡
      public :: circem
      Uses circem 81c.

81c <Module subroutines 31b>+≡
      subroutine circem (errlvl, errmsg)
      character(len=*) :: errlvl, errmsg
      integer, save :: errcnt = 0
      if (errlvl .eq. 'MESSAGE') then
        print *, 'circe1:message: ', errmsg
      else if (errlvl .eq. 'WARNING') then
        if (errcnt .lt. 100) then
          errcnt = errcnt + 1
          print *, 'circe1:warning: ', errmsg
        else if (errcnt .eq. 100) then
          errcnt = errcnt + 1
          print *, 'circe1:message: more than 100 messages'
          print *, 'circe1:message: turning warnings off'
        end if
      else if (errlvl .eq. 'ERROR') then
        if (errcnt .lt. 200) then
          errcnt = errcnt + 1
          print *, 'circe1:error: ', errmsg
        else if (errcnt .eq. 200) then
          errcnt = errcnt + 1
          print *, 'circe1:message: more than 200 messages'
          print *, 'circe1:message: turning error messages off'
        endif
      else if (errlvl .eq. 'PANIC') then
        if (errcnt .lt. 300) then
          errcnt = errcnt + 1
          print *, 'circe1:panic: ', errmsg

```

```

        else if (errcnt .eq. 300) then
            errcnt = errcnt + 1
            print *, 'circe1:message: more than 300 messages'
            print *, 'circe1:message: turning panic messages off'
        end if
    else
        print *, 'circe1:panic:    invalid error code ', errlvl
    end if
end subroutine circem

```

Defines:

circem, used in chunks 32-38, 49, 50, 52-54, 56, 60, 62-64, 79a, and 81b.

6.7 Examples

6.7.1 Distributions

```

82 <circe1_plot.f90 82>≡
    program circe1_plot
        use kinds
        use circe1

        implicit none

        real(kind=double) :: xmin, xmax, y, roots
        integer :: xory, nstep, p1, p2, acc, ver, rev, i
        real(kind=double) :: x, logx, d
        read *, xory, xmin, xmax, nstep, y, p1, p2, roots, acc, ver, rev
        call circses (0d0, 0d0, roots, acc, ver, rev, 0)
        do i = 0, nstep
            logx = log (xmin) + i * log (xmax/xmin) / nstep
            x = exp (logx)
            d = 0d0
            if (xory .eq. 1) then
                if (p1 .eq. C1_PHOTON) then
                    d = circe (x, y, p1, p2)
                else
                    d = circe (1d0 - x, y, p1, p2)
                end if
            else if (xory .eq. 2) then
                if (p1 .eq. C1_PHOTON) then
                    d = circe (y, x, p1, p2)
                else
                    d = circe (y, 1d0 - x, p1, p2)
                end if
            end if
            if (d .gt. 1d-4) print *, x, d
        end do
    end program circe1_plot

```

Uses C1_PHOTON 11b, circe 31b, and circes 32a.

6.7.2 Library functions

If Fortran77 only had first class functions, then the following cruft would not be necessary. OK, here's the outline of the adaptive Gauss integration routine from CERNLIB:

```
83a  <Part one of Gaussian integration 83a>≡
      real(kind=double) :: f, a, b, eps
      external f
      real(kind=double), parameter :: Z1 = 1, HF = Z1/2, CST = 5*Z1/1000
      integer :: i
      real(kind=double) :: h, const, aa, bb, c1, c2, s8, s16, u
      <Gaussian weights 85c>
      h = 0
      if (b .eq. a) go to 99
      const = CST / dabs(b-a)
      bb = a
1 continue
      aa = bb
      bb = b
2 continue
      c1 = HF*(bb+aa)
      c2 = HF*(bb-aa)
      s8 = 0
      do i = 1, 4
         u = c2*x(i)
```

Here are now the first two function calls that we have to fill in later in various ways:

```
83b  <Function call stub 83b>≡
      s8 = s8 + w(i) * (f (c1+u) + f (c1-u))
```

Continuing

```
83c  <Part two of Gaussian integration 83c>≡
      end do
      s16 = 0
      do i = 5, 12
         u = c2*x(i)
```

And here are the other two function calls:

```
83d  <Function call stub 83b>+≡
      s16 = s16 + w(i) * (f (c1+u) + f (c1-u))
```

Terminating:

```
83e  <Part three of Gaussian integration 83e>≡
      end do
      s16 = c2*s16
      if (dabs(s16-c2*s8) .le. eps*(1+dabs(s16))) then
         h = h + s16
         if (bb .ne. b) go to 1
```

```

else
  bb = c1
  if (1 + const*dabs(c2) .ne. 1) go to 2
  h = 0
  print *, 'gauss: too high accuracy required'
  go to 99
end if
99 continue

```

This one is still reasonably straightforward

$$\text{gauss1} : (f, a, b) \mapsto \int_a^b dx f(x) \quad (37)$$

```

84a <circe1_sample.f90: public 14b>+≡
    public :: gauss1
    Uses gauss1 84b.

84b <circe1_sample.f90: subroutines 15a>+≡
    function gauss1 (f, a, b, eps)
    real(kind=double) :: gauss1
    <Part one of Gaussian integration 83a>
    s8 = s8 + w(i) * (f (c1+u) + f (c1-u))
    <Part two of Gaussian integration 83c>
    s16 = s16 + w(i) * (f (c1+u) + f (c1-u))
    <Part three of Gaussian integration 83e>
    gauss1 = h
    end function gauss1

```

Defines:

gauss1, used in chunks 84b, 15b, and 84.

But this almost identical repeat

$$\text{gaussx} : (f, a, b) \mapsto \left(y \mapsto \int_a^b dx f(y, x) \right) \quad (38)$$

would not be necessary in a modern programming language with currying:

```

84c <circe1_sample.f90: public 14b>+≡
    public :: gaussx
    Uses gaussx 84d.

84d <circe1_sample.f90: subroutines 15a>+≡
    function gaussx (f, y, a, b, eps)
    real(kind=double) :: y
    real(kind=double) :: gaussx
    <Part one of Gaussian integration 83a>
    s8 = s8 + w(i) * (f (y, c1+u) + f (y, c1-u))
    <Part two of Gaussian integration 83c>
    s16 = s16 + w(i) * (f (y, c1+u) + f (y, c1-u))
    <Part three of Gaussian integration 83e>
    gaussx = h
    end function gaussx

```

Defines:

`gaussx`, used in chunks 84 and 85b.

Fortunately, this is the last one we need

$$\text{gauss2} : (f, a, b, a_1, b_1) \mapsto \int_a^b dx \int_{a_1}^{b_1} dy f(x, y) \\ = \text{gauss1}(\text{gaussx}(f, a, b), a_1, b_1) \quad (39)$$

```
85a <circe1_sample.f90: public 14b>+≡
    public :: gauss2
    Uses gauss2 85b.

85b <circe1_sample.f90: subroutines 15a>+≡
    function gauss2 (f, a, b, a1, b1, eps)
        real(kind=double) :: a1, b1
        real(kind=double) :: gauss2
        <Part one of Gaussian integration 83a>

    f(ndata+1,ndata+1), df(ndata+1,ndata+1)
t = t + f(ndata+1,0) + f(ndata+1,ndata+1)

Guinea-Pig does not provide the full error. A Monte Carlo study shows that it
is a reasonable approximation to rescale the bin error by suitable factors. These
factors are different for each distribution and the factors for the  $\delta$ -pieces are
bigger than those for the continuum parts. The follows factors are for the slow
parameter set.

91d <Fixup errors 91d>≡
    call fixerr (NDATA, dfec, 20d0, 30d0, 40d0)
    call fixerr (NDATA, dfeg, 15d0, 20d0, 0d0)

95f \langle Local variables for fct (v1) 90c \rangle + \equiv

\langle Declare NPARAM 88b \rangle

real(kind=double), dimension(NPARAM) :: a1

integer, parameter :: REV = 1

Uses NPARAM 88b.

The average elektron energy in the continuum can be calculated analytically:

$$\begin{aligned}\langle E_{e^\pm} \rangle_{\text{cont}} &= E_{\text{beam}} \langle x_{e^\pm} \rangle_{\text{cont}} = E_{\text{beam}} \frac{\int dx x^{a_2} (1-x)^{a_3} x}{B(a_2, a_3)} \\ &= E_{\text{beam}} \frac{B(a_2+1, a_3)}{B(a_2, a_3)} = E_{\text{beam}} \frac{a_2+1}{a_2+a_3+2} \quad (40)\end{aligned}$$

96a *<Write output (v1) 95e>+≡*
`delta = 1d0 - a1(1) * beta(a1(2)+1d0,a1(3)+1d0)`
`print *, '< x_e > = ', delta + (1d0-delta)*(a1(2)+1d0)/(a1(2)+a1(3)+2d0)`
 Uses beta 99.
 similarly:

$$\langle E_\gamma \rangle = E_{\text{beam}} \frac{a_5+1}{a_5+a_6+2} \quad (41)$$

96b *<Write output (v1) 95e>+≡*
`print *, '< x_g > = ', (a1(5)+1d0)/(a1(5)+a1(6)+2d0)`

Count the degrees of freedom in ndof:

96c *<Write output (v1) 95e>+≡*
`ndof = 0`
`do i = 0, ndata+1`
`do j = 0, ndata+1`
`if (dfec(i,j) .gt. 0d0) ndof = ndof + 1`
`if (dfeg(i,j) .gt. 0d0) ndof = ndof + 1`
`if (dfge(i,j) .gt. 0d0) ndof = ndof + 1`
`if (dfgg(i,j) .gt. 0d0) ndof = ndof + 1`
`end do`
`end do`
`print *, 'CHI2 = ', f / ndof`

96d *<Local variables for fct (v1) 90c>+≡*
`integer :: ndof`

The error on the luminosity is just the (possibly rescaled) counting error:

96e *<Write output (v1) 95e>+≡*
`open (10, file = 'Errors.tex')`
`write (10, 1099) tee / 1d32, dtee / 1d32, dtee / 1d32`
`1099 format ('$ ', F8.2, '_{-', F4.2, '}^{+', F4.2, '} $')`

After retrieving the error from MINUIT, we have to take care of the mapping of the parameters

$$a'_{1/4} = e^{a_{1/4}} B(a_{2/5} + 1, a_{3/6} + 1) N_{\text{bins}} \eta^{-1} \implies \delta a'_{1/4} = a'_{1/4} \delta a_{1/4} \quad (42)$$

ignoring the errors in the integral (i.e. the Beta function).

96f *<Write output (v1) 95e>+≡*
`call mnerrs (1, eplus, eminus, epara, corr)`
`ab = a1(1) * beta(a1(2)+1d0,a1(3)+1d0)`
`write (10, 1100) ab, abs(ab*eminus), abs(ab*eplus)`
`1100 format ('$ ', F8.4, '_{-', F6.4, '}^{+', F6.4, '} $')`
 Uses beta 99.

97a \langle Local variables for fct (v1) 90c $\rangle + \equiv$
`real(kind=double) :: ab`

The other mappings are even more trivial:

$$a'_{2/6} = a_{2/6} - 1 + \eta^{-1} \implies \delta a'_{2/6} = \delta a_{2/6} \quad a'_{3/5} = a_{3/5} - 1 + \eta^{-1} \implies \delta a'_{3/5} = \delta a_{3/5} \quad (43)$$

97b \langle Write output (v1) 95e $\rangle + \equiv$
`do i = 2, 3`
`call mnerrs (i, eplus, eminus, epara, corr)`
`write (10, 1100) a1(i), abs (eminus), abs (eplus)`
`end do`
`call mnerrs (4, eplus, eminus, epara, corr)`
`ab = a1(4) * beta(a1(5)+1d0,a1(6)+1d0)`
`write (10, 1100) ab, abs (ab*eminus), abs (ab*eplus)`
`do i = 5, 6`
`call mnerrs (i, eplus, eminus, epara, corr)`
`write (10, 1100) a1(i), abs (eminus), abs (eplus)`
`end do`
`close (10)`

Uses beta 99.

97c \langle Local variables for fct (v1) 90c $\rangle + \equiv$
`real(kind=double) :: eplus, eminus, epara, corr`
`integer :: n`

97d \langle Write output (v1) 95e $\rangle + \equiv$

7.3 Version 2

8 Conclusions

I have presented a library of simple parameterizations of realistic e^\pm - and γ -beam spectra at future linear e^+e^- -colliders. The library can be used for integration and event generation. Emphasis is put on simplicity and reproducibility of the parameterizations for supporting reproducible physics simulations.

Acknowledgements

Daniel Schulte made his simulation code **Guinea-Pig** available and answered questions. Harald Anlauf and Torbjörn Sjöstrand have contributed useful suggestions. The Tesla group at DESY/Zeuthen made error estimates feasible by donating time on the multi-headed number cruncher **Hydra**. The 1996 ECFA/Desy Linear Collider Workshop got me started and provided support. Thanks to all of them.

A Literate Programming

A.1 Paradigm

I have presented the sample code in this paper using the *literate programming* paradigm. This paradigm has been introduced by Donald Knuth [19] and his programs T_EX [20] and METAFONT [21] provide excellent examples of the virtues of literate programming. Knuth summarized his intention as follows ([19], p. 99)

“Let us change our traditional attitude to the construction of programs. Instead of imagining that our main task is to instruct a *computer* what to do, let us concentrate rather on explaining to *human beings* what we want a computer to do.”

Usually, literate programming uses two utility programs to produce two kinds of files from the source

tangle produces the computer program that is acceptable to an “illiterate” (Fortran, C, etc.) compiler. This process consists of stripping documentation and reordering code. Therefore it frees the author from having to present the code in the particular order enforced by a compiler for purely technical reasons. Instead, the author can present the code in the order that is most comprehensible.

weave produces a documents that describes the program. Extensive cross referencing of the code sections is usually provided, which has been suppressed in this paper. If a powerful typesetting system (such a T_EX) is used, the document can present the algorithms in clear mathematical notation alongside the code. These features improve readability and maintainability of scientific code immensely.

A.2 Practice

Circe uses the **noweb** [22] system. This system has the advantage to work with any traditional programming language and support the essential features described in section A.1 with minimal effort. **noweb**’s **tangle** program only reorders the code sections, but does not reformat them. Therefore its output can be used just like any other “illiterate” program.

The examples above should be almost self-explaining, but in order to avoid any ambiguities, I give another example:

120a \langle Literate programming example 120a $\rangle \equiv$
 \langle Code that has to be at the top 120c \rangle
 \langle Other code 120b \rangle

I can start the presentation with the first line of the “other code”:

120b \langle Other code 120b $\rangle \equiv$
 line 1 of the other code

If appropriate, the first line of the code that has to appear *before* the other code can be presented later:

120c \langle Code that has to be at the top 120c $\rangle \equiv$
 line 1 of the code at the top

Now I can augment the sections:

```
121a <Other code 120b>+≡  
    line 2 of the other code  
121b <Code that has to be at the top 120c>+≡  
    line 2 of the code at the top
```

The complete “program” will be presented to the compiler as

```
line 1 of the code at the top  
line 2 of the code at the top  
line 1 of the other code  
line 2 of the other code
```

The examples in section 3.1.1 show that this reordering is particularly useful for declaring variables when they are first used (rather than at the beginning) and for zooming in on code inside of loops.

B Fortran Name Space

In addition to the ten procedures and one `common` block discussed in section 3

- `circe`, `circee`, `circeg`, `circgg`,
- `girce`, `gircee`, `girceg`, `gircgg`,
- `circes`, `circel`, `/circom/`,

there are two more globally visible functions which are used internally:

- `circem`: error message handler,
- `girceb`: efficient Beta distribution generator.

Even if the `/circom/` is globally visible, application programs *must not* manipulate it directly. The `circes` subroutine is provided for this purpose and updates some internal parameters as well.

With features from the current Fortran standard (Fortran90), I could have kept the last two functions and the `common` block private.

Application programs wishing to remain compatible with future versions of Circe must not use `common` blocks or procedures starting with `circe` or `girce`.

C Updates

Information about updates can be obtained

- on the World Wide Web:

`http:http://projects.hepforge.org/whizard/`

Contributions of results from other simulation programs and updated accelerator designs are welcome at

`ohl@physik.uni-wuerzburg.de`
